In one class, and that an important one, in the cut flower section, I mean the one in which nurserymen compete for honours, there is, in my opinion, ample scope for improvement. They are usually arranged in huge banks at a particular angle, like the roof of a house, and packed far too closely together, with little or no thought as to harmony of colouring, yet the material at hand at that time of the year is practically inexhaustible.

In the classes provided for fruit a generous provision is made in the way of prizes and cups and medals, from the great classes for Grapes and collections of fruit to single dishes of every kind and variety grown. No section of the show is invested with greater interest, especially to gardeners, than the Grapes and the decorated tables of fruit by the crowds surrounding these tables. They are a source of interest to the public as well. These decorated tables are gems of the gardener's art, and to Shrewsbury, I believe, belongs the credit of instituting them. For the kitchen garden and hardy fruit department of the show the provision of prizes is as generous and liberal as in the other sections, and the response by exhibitors as good. The humble vegetable may suffer somewhat in attractiveness when displayed in association with flowers and fruit. Its intrinsic value to the nation is, however, as great, if not more so. Were this great exhibition merely to be considered as a show to satisfy the curiosity and minister to the fleeting pleasure of visitors it would answer as useful a purpose in this respect as the produce of any other art or industry in the kingdom, but above and beyond this it is not too much to say that its influence is immense and far-reaching. Many a budding Paxton, a Thomson, a Baines, and followers of the great gardeners owe the inspiration of their lives to excel in their calling to the examples of splendid culture seen at Shrewsbury. As regards the public, who annually attend the show in scores of thousands, who can state the value of the pleasure thus brought into their lives? It is a source of interesting conversation from one year's end to the other in the county, and, indeed, throughout the country where gardening is thought or talked of, and a strong incentive to many to engage in the work itself as a recreation.

To working men who may possess a garden (may the day soon dawn when every one will) the encouragement given by this show to the cultivation of hardy fruit and vegetables is of the greatest value in their simple lives, encouraging them to apply their leisure to a healthy and interesting pastime, in which the whole family may associate and help, and resulting in materially swelling their slender incomes by the value of the crops they produce. It is because of the paramount and permanent success this show has attained, and in consideration of the great value of its work to the nation, that I think were its services better known it would not be long before it received the coveted distinction and honour of a Royal charter. The exhibition is managed throughout by a body of gentlemen for the love of the work without fee or reward. Besides paying away thousands of pounds every year in prizes and other contingent expenses of the show, the committee and honorary secretaries have been enabled by the great financial success of the show to devote a large sum to the improvement of the quarry ground where the show is held, to the erection of a handsome monument to the memory of their distinguished townsman, Charles Darwin, and in many other ways have benefited the good old town of Shrewsbury. T. E.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

September 15.—National Dahlia Society (Committee Meeting); Royal Horticultural Society (Meeting of Committees), twelve noon; National Rose Society (Special Meeting to consider alteration of date of Metropolitan Exhibition).

September 16.—Hull (two days); London Dahlia Show at Earl's Court Exhibition (two days).

National Rose Society—alteration of date.—There has been a ready response to the appeal to the members of the National Rose Society which we published last week (page 161). The Rev. Joseph H. Pemberton, Havering, Essex, writes: "May I ask those members of the National Rose Society who have not received the circular, and who, approving of the memorial, desire that their names should be added, kindly to communicate with me." There is no doubt whatever that a later date should be chosen, judging from past experiences.

National Dahlia Society.—By permission of the Royal Horticultural Society an inspection by our committee of the Cactus Dahlias grown for trial at Chiswick will be held at Chiswick Gardens on Thursday next, at 2 p.m. A prize of 10s. 6d., the gift of Mr. A. Dean, will be awarded to the raiser of the best variety for garden decoration.—P. W. TULLOCH, *Hon. Secretary*.

Royal Horticultural Society.—Exhibition of edible fungi.—On Tuesday next the above society will hold an educational exhibition of edible fungi in the Drill Hall, Buckingham Gate, Westminster, 1—5 p.m., and an illustrated lecture upon them will be given by Dr. M. C. Cooke, M.A., V.M.H., at three o'clock. All interested in extending or acquiring the knowledge of the edible species are invited to send collections. Collections should, if sent, be delivered at the Drill Hall on Monday afternoon next, or if brought should arrive at or before 9 a.m. on Tuesday, so that they may be properly grouped and arranged by the fungus specialists. Intimation of an intention to exhibit should, if possible, be sent a few days before to the secretary, Royal Horticultural Society's office, 117, Victoria Street, Westminster, S.W.

Fruit and Vegetable show at Chiswick, September 29, 30, and October 1.—Alteration in schedule. The prizes offered in class 52 for Apple Charles Ross will be open to nurserymen and market growers, as well as to gardeners and amateurs, see Division V., page 24. Intending exhibitors at this show can obtain a copy of the schedule, with the official entry form, on application to the secretary, Royal Horticultural Society, 117, Victoria Street, S.W. Entries for this show close on Tuesday, the 22nd inst. At a general meeting of the society, held on Tuesday, the 1st inst., twenty-two new Fellows were elected, making a total of 1,117 elected since the beginning of the present year.

The Edinburgh show.—Our correspondent wires that the exhibition of the Royal Caledonian Horticultural Society, held on Wednesday and Thursday last, was one of the best held of late years, so that the adverse season we have experienced has apparently not affected fruit crops in the north to the same extent as in the south and midlands. The best Apples in competition for the Malcolm Dunn Memorial Cup were shown by Mr. Sinclair of Congalton. In the class for a decorated table of dessert fruit Mr. Goodacre won first prize for fruit and third for decoration, and Mr. Kidd, Carberry Towers Gardens, was first for decoration and second for fruit. Mr. Goodacre was first in the class for ten dishes of fruit, and Messrs. Buchanan, Kippen-by-Stirling won first prize for six bunches of Grapes. A full report will be given next week.

Chrysanthemum show at Dumfries.—For the first time for many years a Chrysanthemum show is to be held at Dumfries on November 18. The show is promoted by the Dumfriesshire and Galloway Horticultural Society, and from the preparations being made in the district it is expected that there will be a good show of Chrysanthemums and other flowers of the season. The show is "open to all," and there are classes for fruit and vegetables, in addition to those for Chrysanthemums, zonal Pelargoniums, Begonias, Primulas, and other winter-blooming plants. Mr. R. G. Mann, *Courier* office, is the secretary. The band of the Grenadier Guards has been engaged to supply the music for the day.

A good Apple crop.—In this year of the failure of hardy fruit I wish to say that in my garden Apples are a good all-round crop, which is quite an exception in the district. The garden

slopes from east to west, the soil is a light loam over chalk, and the Apple trees are bushes grafted on the Paradise. The crop last year was above an average. To the garden there is no shelter, so that it is fully exposed to the sun, and also to all the winds of heaven. It is to this open position, affording plenty of light and air to the plants, to proper summer pruning, and to the daily visits of numerous bees that I attribute the result. The only fault I have to find is that the large Apples now fall faster than they should do; but is this to be wondered at with such storms of rain and wind? The crop is not special to a few sorts, but is fairly distributed. The varieties grown are mostly the following: Worcester Pearmain, Lane's Prince Albert, New Hawthornden, Cor's Orange Pippin, Bismarck, Beauty of Bath, Cor's Pomona, Ecklinville Seeding, Stirling Castle, Bramley's Seedling, and Tower of Glamis.—W. R. MAYFIELD, *Meopham, Kent*.

Mr. W. B. Hemsley, F.R.S.—It is a great pleasure to know that Mr. Hemsley has been appointed to assist Sir Joseph Hooker in his labours connected with the *Botanical Magazine*. We have heard rumours that this famous magazine was about to cease publication, but with Mr. Hemsley to help Sir Joseph Hooker it is hoped that the rumours are without foundation.

Mr. W. B. Latham.—With reference to the complimentary dinner and testimonial to be given to Mr. Latham upon his retirement from the Birmingham Botanic Gardens, a general meeting of subscribers will be held at the Athletic Institute, John Bright Street, Birmingham, on Monday evening next, at eight o'clock, to consider and decide upon the form of testimonial to be presented. Comments or suggestions from subscribers invited.—J. HUGHES, *Hon. Secretary*.

Solanum crispum.—The beautiful photograph and notes of the above plant (page 149 of *THE GARDEN*) are very refreshing to those who grow this Solanum. I think it is much harder than most readers of *THE GARDEN* are aware. I have seen it growing out of doors at Henley-on-Thames. In St. James's Garden, West Malvern, it was full of flower last week and 15 feet high. There it has had no protection since it was planted, and it is out back very severely every year with the knife. Also it is growing in Messrs. R. Smith and Co.'s nursery, Worcester, and in the Cambridge Botanic Gardens Mr. R. J. Lynch grows it in the corridor, where I have seen it fruiting. In each instance it has been planted against a wall or fence.—W. HORSMAN, *Laugherne Road, Worcester*.

Lælia elegans at the Woodlands, Streatham.—This natural hybrid is not appreciated nearly as much as its beauty deserves. At this season of the year no Orchid can compare with this in beauty and variety. The Woodlands is the home of this plant without doubt, and this year they are even finer than in previous seasons. Mr. Measures finds no difficulty attending their culture. They grow and flower under Mr. Measures' head gardener's care with remarkable vigour. At the time of my visit about 2,000 flowers were in full beauty, and some of the inflorescences must have been carrying quite a dozen or more flowers, the growths being nearly 3 feet in height. Such a show of *Lælia elegans* has never before been seen in cultivation in any country, or at any time probably, and what is eminently satisfactory is the fact that these beautiful Orchids improve year by year. Certainly this collection is finer now than it has ever been at any time previously. Many of the specimens of this *Lælia* are of huge size, and in robust health; so big are they, that they were named "King of the Woods," "Elephant's load," "The Giant," and other descriptive names by the original collectors of the plants in their native habitat. Among the finest varieties of this year for size and colouring are Maggie Hodgson, *Cyanthus superbus*, *Alexandrea* and *Edward VII*. The intense dark maroon purple of the labellum of the var. *Cyanthus superbus* is indescribable. *Matuta* Rupert, *Ivonia*, and *Sylvia* are also among the very finest, the latter being, both in size and colouring of the flowers, magnificent.—ARGUTUS.

Mesembryanthemum elegans roseum.—I got this from the gardens of the Royal Horticultural Society, and it is a subject admirably adapted for pot culture. It makes a free growth in gritty soil, and blooms at the points of the shoots; the colour is of a pleasing rosy pink, and the large blossoms are fully 2½ inches to 3 inches across. The flowers expand by day, but, as is common with many of the Mesembryanthemums, they close towards evening. It is a plant that will delight anyone who may be disposed to cultivate it.—R. D.

Ixora macrothyrsa.—Few autumn flowering stove plants can compare with this in brilliancy. The flowers are, in colour, widely removed from the ordinary garden varieties of Ixora, most of which claim parentage from *I. coccinea*. From their neat, compact habit they were at one time very popular for growing into specimen plants, but *I. macrothyrsa* is of entirely different growth. It forms a strong, upright, sparsely branched shrub, clothed with dark green, oblong lanceolate leaves, nearly a foot in length. The flower heads, which are equal in size to a well-grown Hydrangea, consist of an immense number of closely packed brilliant crimson-scarlet flowers. It should not be pinched in the endeavour to form a bushy plant, but is seen to the best advantage when carrying about three heads of its showy blossoms. Being of a tall, stately habit it is especially valuable for grouping. This Ixora is a native of Sumatra, and has been in cultivation here for about a quarter of a century. At first it was distributed as *Ixora Duffii*, a name under which it is still to be found in many gardens.

Costus speciosus.—This representative of the Ginger-wort family (the different members of which are, as a class, rarely met with in gardens) is just now flowering freely in the Nepenthes house at Kew, the heat and moisture of which provide it with a congenial home. Like most of its allies it forms a mass of thick fleshy roots, from which are pushed up stout Bamboo-like shoots, but of a succulent nature. These shoots, which reach a height of 4 feet to 5 feet, are clothed with pale green leaves, in the strongest examples nearly a foot long, and 4 inches to 5 inches wide. The inflorescence is particularly striking, the shoots being terminated by a cone-like head of reddish bracts, from whence the flowers are produced. These flowers, which are of a satiny white tint, and in texture suggestive of tissue paper, do not remain long in perfection, but a succession is kept up from one head for a considerable time. They are from 3 inches to 4 inches in diameter. This plant is a native of India, where it is said to grow in the vegetable debris collected in shallow water-courses and such spots. It was introduced as long ago as 1799. A second species in flower in the same structure is *C. igneus*, introduced from Bahia by M. Linden in 1882. It is dwarfier than the preceding, while the flowers are also somewhat smaller, but of an intense deep orange colour, which makes them very conspicuous. This species flowers at various periods of the year, and in the half-light of a dull autumn or early winter's day it is even more noticeable than at this season.—T.

Senecio Galpini.—This Senecio, just now flowering freely in a cool house at Kew, is one of those uncommon yet striking plants that one would expect soon to become popular. Such, however, is not the case, for outside of Kew, where it has been grown for about a dozen years, it is very rarely seen. The genus *Senecio* is a decidedly comprehensive one, some members of which differ greatly in general appearance from others, and anyone taking the common Rag-wort as the type would not recognise this species as belonging to the same family. It bears a considerable resemblance in foliage to an *Echeveria*, the leaves being of a thick, fleshy nature and very glaucous. The flower stems, which reach a height of 1 foot to 2 feet, branch freely, the flowers being borne on the apex of every shoot. They are disposed in a closely packed head over an inch across, of a brilliant orange colour, and not only remain fresh a considerable time, but a succession is kept up for some weeks. Though flowering freely just now at Kew, its period of blooming is not limited to this particular period

of the year, as it may be sometimes met with flowering there in the depth of winter. It is a native of the Transvaal, and, in common with many subjects from that region, a dry atmosphere is necessary to its well doing.—H. P.

Flowers in South Devon.—I notice that on the 8th ult. the Editor's table was brightened by a collection of flowers from Torquay, and that the sender expressed his surprise at the lack of tender shrubs and climbers in South Devon gardens. Villa gardens are certainly poor in this respect, but when villas are bought or taken on lease their proprietors as a rule care little and know less about flowers, hardly evergreen shrubs, bedding plants, and perhaps an *Araucaria* content them, not one in fifty realising and taking advantage of the possibilities of floriculture existing under the genial atmospheric conditions prevalent in the south-west. It is not in the gardens of Devon villas that one must look for what are generally considered greenhouse plants, though there are meritorious exceptions to the general rule, but in those attached to country houses, in many of which both rare and beautiful flowering shrubs and climbers are to be met with. In these *Rhynchospermum jasmoides*, *Swainsonias*, and *Clematis indivisa lobata*, spoken of by your correspondent, are by no means uncommon, and I have also seen the two other plants alluded to, namely, *Magnolia fuscata* and *Lonicera Hildebrandti*, though the latter has not flowered. Other tender subjects to be found doing well in South Devon gardens include *Embothrium coccineum*, *Callistemon*, *Abutilon vexillarium*, *A. vitifolium*, *Sollya heterophylla*, *Cassia corymbosa*, *Cesalpinia Gilliesii*, many species of greenhouse *Acacias*, *Philæa buxifolia*, *Crinodendron Hookeri* (*Triacanthopanax hexapetala*), *Boronia*, *Tasmania mollissima*, *Inga pulcherrima*, *Bigonias*, *Manettia bicolor*, *Mutisia decurrens*, *Mandevilla suaveolens*, *Mitrasia coccinea*, *Semele androgyna*, *Colquhounia coccinea*, *Lapageria*, *Clinanthus puniceus* and its white variety, *Ozothamnus rosmarinifolius*, *Eucryphia pinnatifolia*, *Guevina avellana*, and many more too numerous to mention.

Flowers for butterflies.—Many notes on this subject have appeared of late in the columns of THE GARDEN, but although Sunflowers, single Dahlias, Scabious, and *Sedum spectabile*, of which the last-named is certainly particularly attractive to butterflies, have been mentioned, the flower that is undoubtedly their favourite on sunny September days in the south-west has not been named by any correspondent. This is doubtless owing to the fact that the plant which bears it cannot be considered hardy. I allude to *Escallonia Montevicensis*, now known as *E. floribunda*. The white, pyramidal bloom panicles, though to the human sense of smell only very slightly scented, are irresistibly attractive to butterflies. On a bush barely 5 feet high and of about the same diameter I have counted over three dozen Red Admirals together with a few Peacocks and small Tortoiseshells. All day long the butterfly of September, the Red Admiral, may be seen in numbers with satin-black, vermilion barred wings outspread on the white flower clusters, a charming picture. Later on, when the *Escallonias'* blossoms have faded, the favourite plant is *Eupatorium weinmannianum*, great bushes of which, 8 feet high and as much through, bear the latest of their flat flower-heads well into December. Butterflies are also fond of the single China Aster (*Callistephus sinensis*). The Michaelmas Daisies are also much appreciated, but more especially by moths, the silver gamma often haunting the plants in hundreds. The favourite of all the Starworts with these appears to be the dwarf Aster *dumosus*.—S. W. FITZHERBERT.

The Humming-bird moth and scarlet Geraniums.—Lately some very interesting notes have appeared in THE GARDEN relative to moths and butterflies and the flowers they are most fond of. The cliffs and moors round here have, as long as I can remember them, been a favourite haunt of both, and I frequently in the summer meet men and boys with butterfly nets; but what a change this season, hardly a butterfly is to be seen about the place save a few odd white

ones. Along the drive in front of this cottage, for many years, during the summer, have been placed, at equal distances, very large pots filled with scarlet geraniums, and these have always been an attraction to the Humming-bird moths. As soon as the pots were put out dozens of these moths were fluttering round them, from dawn till sunset. When I was here at Easter (the first week in May) I was transplanting some Hollyhocks, and brushing against a small shrub out flew a Humming-bird moth. I wondered at seeing it so early in the season, but it was the first and last up to the present. For fifteen years they have always been in numbers round these plants. I suppose the wet season accounts for its absence.—A. H. TYRRELL, Peak Cottage, Sidmouth.

Flowers in Ravenscourt Park, Hammersmith.—In spite of the unpropitious weather the flowers in this always well-kept and attractive little park, under the able superintendence of Mr. W. B. Gingell, are worthy of note. To refer briefly to a few of the combinations: *Fuchsias* in an undergrowth of *Pansy virginialis*—a fine white—were an effective arrangement. A very fine bedding *Begonia* of the *semperflorens* type is Sutton's *Crimson Gem*, associated with the elegant *Grevillea robusta*, with its Fern-like foliage, and edged with *Iberis*, a pretty effect was produced. Noticeable were some French flowering *Cannas*, very dark foliage, used as a centre, banded with the broad silvery-white foliage of *Centaurea ragusina* (candidissima), and edged with *sempervivum*. Golden foliaged *Abutilons* served as an effective contrast to dark leaved *Iresines*. A good mixture was noted in *Begonias* and *Mesembryanthemum cordifolium* variegatum with its rosy purple flowers. *Lobelia cardinalis*, with its vivid scarlet flowers and intensely dark foliage, was relieved by *Phalangium variegatum*, edged with *Lobelia*. It was instructive to note the effective use made in various mixtures of that beautiful decorative plant *Francoa ramosa*, or *Bridal Wreath* as it is popularly called, a half-hardy perennial, with its elegant arching sprays of pure white flowers. *Fuchsias* on grass near the Public Library made a good feature, whilst the walls of this building were wreathed with the lovely bright *Ceanothus azureus*. A small conservatory adjacent was furnished with splendidly-flowered examples of *Campanula pyramidalis*, blue and white, amongst which the well-known *Salvia splendens* was interspersed. Effective use is made in the shrubberies—just now looking very gay—scattered about the park, of that fine New Zealand shrub *Olearia Haastii*, bearing a profusion of white Aster-like honey-scented flowers. It was pleasant to see a fine bed of beautiful *Pentstemons*, their prolonged flowering season making them valuable plants for the garden. A good piece of planting on one of the lawns was furnished by *Prunus pissardi*, remarkable for the beauty of its deep maroon-coloured foliage springing out of an undergrowth of *Acer Negundo* variegata. How striking were some glorious bushes of *Rosa rugosa*! In the winter effectively covered with bunches of large scarlet fruit—an excellent group of *Roses* for town.—QUO.

Asters in the West.—It was curious to notice that while at the Taunton flower show quilled Asters, generally a very fine feature there, were too poor in quality to deserve a prize, at Trowbridge, a week later, they were shown in astonishingly very fine quality for the season. There is probably something in the soil about Bath which suits the Aster, for Mr. W. J. Jones of that city was placed first at Trowbridge, with twenty-four blooms of quilled in one class, with twenty-four blooms of the Victoria type in another class, and the same number of Comet Asters in a third class, the blooms generally large, full, clean and well-coloured. The Comet and the Victoria Asters are the types which come in fine character without much special cultivation, provided the soil be good, but the quilled and Truffant's *Paony*-flowered require painstaking cultivation to have them in the finest character. It is because the *Paony*-flowered type requires high cultivation to develop the fine, full, symmetrically incurved character which is so attractive in the type that

it has largely fallen out of cultivation. The form of the flower is so distinct from that of any other type of Aster that it is most valuable as affording variety, and the plants are stately, and, like the quilled, the blooms are produced on long stems, and therefore of added value for cutting purposes; besides, the Peony Asters provide colours scarcely to be found in any other section. It is, therefore, matter for regret that Truffaut's Aster is actually falling out of cultivation. Annual Asters generally are now at their best in our gardens. Asters do not need continuous sunshine to bring them to perfection, they may be said to delight in heavy dews, and cloudy, but fine days with intermittent sunshine. Could we be favoured with a few weeks of such weather, Asters would rapidly recover from the paralysed appearance some plantations have taken on. A cultivator of my acquaintance finds his bed of quilled Asters of great value to him now and during the next few weeks, as he can cut large quantities of blooms, and the act of cutting causes the plants to make an effort to throw other flowers. The side blooms, which are in this way more plentifully produced, are especially suitable for vases, being on long, stiff stems, while the pure white Snowball and the delicate Unique are in contrast with Purple Prince and other deeper colours, though they are but few in comparison with the pale varieties of various shades. Probably the value of the quilled Aster in floral decorations within the house is not sufficiently appreciated, and although the quilled Aster is shown somewhat formally on boards, the blooms arranged in lines, their exquisite form and diversity of shade are always attractive. Flowers of quilled Asters will last for a long time in a cut state, and need but little attention. Those who are desirous of maintaining a high standard of quality in their strains should select a few of the finest blooms for the purpose, removing all side blooms from these plants, so that the whole force of the plants might be concentrated upon the production of plump seed grains pregnant with vitality.—R. DEAN.

Note from Jamaica.—A hurricane is by no means the all-destroyer that it is usually represented as being. The Jamaica garden which has been described in your columns is a wreck certainly, but the damage is of a spar here and there, and of a good deal of rigging; the deck remains sound, by which figure I mean that the damage to trees and small plants is incon siderable, and that the climbers have suffered most. The reason is that the dense mass into which these grow offers a wall-like surface to the onrushing wind, yet, not having the resistance of a wall, they are swept away, together with that to which they are attached. A hurricane gives a good lesson as to the advantages of solid structure. All the weak pergolas are down; the well made stand. The staunchest of trees are Palms, with the exception of Cocanuts, all the Orange family, Star Apple, Loquat, Grevillea, Champali, Apple, and Calabash. These have not suffered at all. Forest trees, on the contrary, have fared badly. Great limbs are wrenched from the Cedars (Cedrela) and Cotton trees, and the chief damage to small plants was caused by the boughs, which were hurled from far off into the garden. Otherwise the harm to small plants is surprisingly little. Lily clumps are stiff, Geraniums look less miserable than after a gale in England, Lavender bushes are neat and trim—even the fragile Impatiens Sultani is for the most part unharmed, while, strangest of all, a weak spike of Tuberose stands erect. The fable of Oak and Bulrush is everywhere exemplified. The stiff suffers where the limber escapes. The brittle Bread Fruit is mutilated and disfigured for a time. In a few months kindly Nature will heal the torn bark and fill up gaps with new shoots. Another sufferer is the Avocado Pear, which hangs down helplessly. Fruit of all kinds is blown off, yet some remains. Many trees have completely lost their leaves, though the Mangoes still hold most of theirs. Bananas are, of course, utterly swept away, and we shall have none for nearly a year to come. A moderate wind suffices to throw down most of these, and none can resist a severe gale. Roses have stood remarkably well, even

climbers getting no more than a salutary pruning. Oleanders, too, have escaped on the whole. The garden has lost its beauty for a time. It has not lost its interest—rather, it has gained some. We are at work clearing away debris, and there is the pleasure of seeing order evolved from chaos. And there is the new rapid growth to look forward to. Week by week the gaps will fill, and in six months at the latest the garden will be beautiful again.—W. J., Port Royal Mountains, 2,000 feet.

THE ROSE GARDEN.

ROSE FRAU PETER LAMBERT.

ALTHOUGH so many new Roses are of a pink colour, I think there is room for the above beautiful Hybrid Tea. It is said to be a pink Kaiserin Augusta Victoria, but it does not hold up its bloom in the same fashion as the splendid white Rose alluded to. There are, however, traces of the variety under notice having some of the nature of Kaiserin Augusta Victoria in its constitution; in fact, according to the raiser, a seedling which sprung from a cross with the Kaiserin and Caroline Testout was crossed again with Mme. Abel Chatenay, which accounts for the lovely salmon tint of the centre petals. The possibilities of this dual and treble crossing will entirely alter our collection of varieties, so much so that it is doubtful whether more than one half of the varieties now grown will be cultivated ten years hence.

GRUSS AN TEPLITZ AND GUSTAVE REGIS.

I DOUBT if two more useful Roses were ever raised than the above. The first-named is not of much account in the early weeks of the summer, but in August and September it is a glorious mass of colour. The rich maroon shading on the scarlet petals is grand, each flower like a moderate-sized Duke of Edinburgh. The splendid towering trusses of blossom, starting almost from the base and rising to a height of 3 feet to 4 feet, show up well on a spacious lawn, and the beautiful brown tender foliage serves as an additional charm to the mass. Whilst this Rose is quite hardy I would yet advise rather hard pruning, believing as I do that the plants are less subject to insect and fungoid pests, and they certainly have a better appearance when the growths are fairly uniform and not too straggling. Then, too, the fragrance is delightful, a point often overlooked by raisers. One truss I observed recently consisted of thirty buds and blossoms, not a close bunch, but spreading in a charming way. This Rose, too, makes a glorious standard or half-standard, which planters can turn to good account when making large plantations of the variety.

The other lovely Rose, Gustave Regis, I purposely named in conjunction with Grüss an Teplitz in order to point out its peculiar fitness to go with the latter. The canary yellow elongated buds and huge semi-double, almost white, open flower would make a fine contrast with the scarlet sort. I think we might do more of this dual bedding. I do not see any objection to it if harmonious contrasts are selected both in colour and growth, and certainly no two sorts I could name would make a finer mass. Plant fairly close and prune well.

ROSE MERCEDES (RUGOSA).

THIS beautiful Rugosa must become a general favourite. The flower is so shapely and of such a delicate colouring that it looks more like a lovely Tea Rose than a Rugosa. It reminds me of Blairi No. 2, but perhaps there is not quite so much colour as in that well-known Rose; in fact, it may almost be called a Perpetual Blairi. I do not mean to say it grows so vigorously, but I imagine that for an ordinary wall or as a standard it will be equally valued as the old favourite. Like many

pale Roses the flowers suffer in a wet season, the soiled outer petals detracting somewhat from the general beauty. Yet, being moderately double, the blooms expand easily. Mercedes and Conrad F. Meyer will long continue two of our best recent novelties, both being equal to any Hybrid Perpetual. Their vigour fits them for cold, blank situations, as they seem to possess the iron constitution of the type.

ROSE CLIMBING MME. DE WATTEVILLE.

THERE is something remarkable about these climbing sports of old and well-known Roses. Here we have a Rose sent out by that prince of Tea Rose raisers, M. Guillet, as far back as 1833, suddenly developing an extremely vigorous growth apparently as rampant as Maréchal Niel. We are much indebted to the discoverer of this new sport, which must take high rank among conservatory climbers. Who does not know the original, which, when well grown, is perhaps one of the loveliest of Tea Roses, as it certainly is one of the sweetest. To have a roof or back wall of a glass structure covered with the salmon-white, pink-edged buds and blossoms would be a feature in any establishment. I should hesitate to recommend the variety for outdoors, save on a very sheltered wall, for if it is one of the best it is also one of the most tender sorts.

PHILOMEL.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit tree, shrub, Orchid, or hardy flower, and they will be addressed to The Editor, 20, Tavistock Square, Covent Garden, London.

CARNATIONS FROM SEED.

Mr. W. A. Watts, Bronwylla, St. Asaph, has a superb gathering of Carnations from seed. The colours are very fine, and the flowers show signs of bursting, so great an evil in many varieties. A pure white should be named. The flower is large, but not coarse, with broad petals and a sweet fragrance. We also noticed a good yellow, a brilliant scarlet, a blush, and a yellow ground with pink edge, altogether a selection of which the raiser may well be proud.

SEEDLING PENTSTEMONS.

Mr. Beckett sends from the well-known Aldenham House Gardens, Elstree, a delightful gathering of Pentstemons, which he well says are difficult to beat in usefulness at this season. The spikes are tall and the flowers of good colours, a very bright and interesting series.

MRS. SINKINS PINK AND WALLFLOWERS.

A very fragrant contribution to our table comes from Mrs. Simonds, Audleys Wood, Basingstoke. It consists of a bunch of Mrs. Sinkins Pink, which are as fine as anything we have had in mid-June. Our correspondent writes: "I send you a bunch of Mrs. Sinkins Pink from a border which is full of bloom, and I am told they are rather unusual. The cuttings were wintered in boxes and put out this spring. We have had Paris Early Wallflower out a fortnight and more in full bloom, but it seems so out of season in a summer garden."

NEW ICELAND POPPIES.

Messrs. Storrie and Storrie of Dundee send a series of Iceland Poppy forms, all of very soft and pretty colourings. It is, as they describe it, quite a "new strain," and was certificated by the Royal Horticultural Society in June last. There must be

a great demand for flowers so delicate and beautiful in colour as these, soft buff, apricot, and shades we have not hitherto seen in this graceful Poppy.

THE STAR PHLOXES.

"Junica" sends flowers of the pretty Star group of Phlox Drummondii. They may be had in many colourings, and the shape of the flower is quaint and unusual, the petals narrow, long, and pointed, like a little star, and quite showy in the garden.

BRYOPHYLLUM CALYCINUM.

Mr. Kingmill, The Holt, Harrow Weald, sends leaves of the interesting Bryophyllum calycinum, with the following note: "Not beautiful, but very interesting, is the enclosed leaf of Bryophyllum calycinum, well named the 'Leaf of Life.' In May last I pinned it to the wall of my library, where it has remained until to-day (August 27), untouched and unaided in any way. A few days ago it had two bright green and healthy growths upon it, from the side notches, although, as you see, the leaf itself is dried up and shrivelled. One of these growths has just been accidentally knocked

effective little edging where such a good yellow is desired. Erica cinerea rosea is a brilliant flower. No Heath is brighter than this, and as beautiful in its way is the variety alba, E. vagans carnea, and E. alba, and the two beautiful Menziesias, M. polifolia alba and the intensely coloured atropurpurea, completed the series. We hope shortly to again publish several articles about the Heaths, but those written by Mr. Bean in the number referred to form one of the most important contributions to the subject hitherto published.

ANDROMEDA ARBOREA.

Mr. Anthony Waterer sends from Knap Hill, Woking, flowers of this beautiful shrub. It is a pity this is not more grown; its creamy colouring is very beautiful.

A NEW CARNATION—SUNSET.

Mr. James Douglas, Edenside Gardens, Great Bookham, sends a superb flower of a new Carnation called Sunset. It belongs to the fancy class, and is remarkably bright, a brilliant rose and grey. We

Apples; they are showing blossom when they should be bearing fruit."

LONICERA HILDEBRANDTI.

We are reminded of this remarkable species by flowers from Mr. Palmer, Blythwood, St. Mary Church Road, Torquay. Mr. Palmer writes: "My Lonicera Hildebrandti has now reached the eaves of my house. The large evergreen leathery leaves go well with the handsome golden flowers, and when the trusses have attained their natural size it will be a very fine sight."

EARLY CHRYSANTHEMUMS.

A most interesting contribution comes to our table from Mr. Crane of Highgate. It consists of five varieties of the beautiful Mme. Marie Masse group of Chrysanthemums. All the sorts are excellent for the border, being bushy, early, and very free and vigorous. They are as follows:—Horace Martin, yellow; Crimson Marie Masse, chestnut; Ralph Curtis, cream; Rabbie Burns, salmon-cerise; and Mme. Marie Masse the original, mauve. Mr. Crane also sends flowers of the Pompon Blushing Bride and Satisfaction.

A CURIOUS GERANIUM LEAF.

Mr. Hare sends a curious Geranium leaf, the segments joined together in the form of a cup. It is not unusual, but we record it as a contribution to this column.

A PURPLE-FLOWERED CARNATION.

Mr. Aylward sends from Bounds Green, New Southgate, flowers of a seedling purple-flowered Carnation, which is of a peculiarly bright colour. The plants are on a heavy clay soil sloping towards the south-east, and a two year old specimen has sixty buds after it has been disbudded. Wet weather has no effect upon it.

NOTES ON HARDY PLANTS.

EREMURI FROM SEED.

EREMURI, a race of liliaceous plants of noble stature, have proved sterling acquisitions indeed, and when one considers the few years they have been in cultivation, and their proverbial slowness of root increase, it is remarkable that they should be found so widely distributed, for every garden of repute has a representative specimen or two.

Like their close allies, the Asphodels, they are very slow in growth in the seedling stages, and their after growth and increase, though moderately free under the best cultivation, is not fast enough for those who would like to have them in quantity. Those who think the long wait of several years too much for their patience would find little difficulty in raising hundreds of Eremurus from seeds, provided they exercise the ordinary care which every plant from drier countries than our own invariably demands.

Fresh and ripe seeds are necessary for a good start, and they should be sown as soon as gathered and perfectly dried, and that as early in the autumn as the weather will permit. If the sowing is delayed till spring they will remain dormant and at the mercy of slugs and other insect life for the whole of that year, and the survivors will germinate poorly twelve to eighteen months from the time the seed was gathered.

For general purposes it is best to grow in the open, choosing a light sandy soil, raised somewhat above the general level to prevent undue saturation, and in order that the site may be perfectly dried

EREMURI FROM SEED. (From a photograph by Miss Willmott.)

off, and before a similar fate befalls the other I send the leaf to you as a natural curiosity. I also enclose a freshly-gathered leaf to be pinned upon your office wall. The side-growths will begin to show in about a fortnight."

We are afraid the atmosphere of Tavistock Street is likely to try even the Bryophyllum's tenacity, but it shall have a chance.

HEATHS FROM MR. ANTHONY WATERER.

Mr. Anthony Waterer, Knaphill, Woking, sends a few varieties of Erica with these truthful words: "These are a class of plant not half enough planted for effect at this season of the year." We dealt fully with the whole genus in THE GARDEN of last year, and this interesting contribution from Knaphill will remind our readers again of their beauty in the autumn months of the year. The varieties of Calluna (Erica) vulgaris were of great interest, especially the double form flore-pleno, which is rarely seen in gardens. Alportii, alba, and Hammondii are varieties that should be in every Heath collection. One named Aurea is of quite a good golden colour, and makes an

have never seen a fancy variety so rich in colour and so excellent in form. It was raised by Mr. Martin Smith, and is being sent out this year by Mr. Douglas. Our correspondent says: "It is a continuous bloomer, nearly all the plants now showing a second flower." Exhibitors of fancy Carnations and others interested in this class should add this to their collections.

APPLE BLOSSOM.

Sprays of Apple flowers come from Mrs. A. H. Tyrrell, Peak Cottage, Sidmouth, with the following note: "That this has been a bad fruit season is only too well known, and down here in Devonshire the Apples have been very badly hit. In place of trees covered with fruit the crops are very thin and hardly coloured at all, but passing through one of the best gardens here, where they grow a good many dwarf espaliers, some of the trees which usually bear well have in place of fruit bunches of blossom, some of which I send with this note. With regard to flowers of every garden kind, due to rain, most have made growth and shown very little bloom. Perhaps the same applies to the

when necessary. The seedling's first year's growth will be slight, and normally of two months' duration only—a tiny blanched leaf, a few inches long will be all that is noticeable, and this, under ordinary conditions, dies away before midsummer. It must be the cultivator's object, however, to prevent this happening so long as it is possible, and he can effect this by continuing to water and shade the site to keep it cool and moist as long as a perfect leaf remains. Thus encouraged, the seedlings continue to grow till August, when they will gradually go to rest for the season, a glazed light being placed over them to keep them dormant and dry. The need of thus encouraging the first year's growth to do its best is two-fold. In the first place the extended season of growth enables the seedlings to develop store roots twice the size they would normally make, and if not thus encouraged they go to rest with the first drought before or about midsummer imperfectly developed, and remain dormant till the cooler rains of autumn start them into growth again, and thenceforward there is trouble.

If covered with a light to keep them dry and resting, the period of rest is too long for such tiny roots to sustain unharmed, and if allowed to grow as they will their leaves just meet the full brunt of wintry storms, reaching their fullest development in March if they survive the winter, and the cold winds of that month play havoc with them.

With full encouragement during their growing season they make good growth during early summer, their root store is well maintained in early autumn, and they rest quietly through the early

winter, thus fitting their season of growth to the climatic conditions of this country.

Their second season's growth is merely a repetition of the first. It is not necessary to lift them, but better to leave them where they are. Should they develop leaves too early a light covering of litter will prevent serious damage to them. In the third year they will all form the characteristic forked rootstock of considerable thickness and produce several leaves. At this stage and when fully ripe they will be better for lifting and replanting in a richer soil for development into flowering roots. The length of time necessary for the excellent results shown in the accompanying photograph is a matter depending merely upon cultural skill. *Eremurus*, such as *himalaicus*, *robustus*, and *Elwesianus*, with thickened, rigid, cartwheel-like rootstocks, broad, bright green leaves, and stout stems will grow in any well-tilled and well-drained soil; but species such as *Bungei* and its hybrids, with *Olgae*, whose root-stocks are thin and very long leaves glaucous and narrow, and whose stems are slender, thrive best in a soil overlying limestone, or in ordinary garden soil freely dressed with weathered lime rubble, especially in the seedling stages of growth.

G. B. MALLETT.

HEUCHERA SANGUINEA.

On pages 129 and 130 of *THE GARDEN* a most interesting article appeared from Mr. Mallett respecting the best *Heucheras*. I note that Mr. Mallett remarks upon the poor constitution of *H. sanguinea* and the variety *splendens*, and with many growers

these two plants generally prove most disappointing, but having succeeded in growing and flowering both for several years past a few remarks respecting our method of cultivation may not be out of place. We have always found *H. sanguinea*, when planted in a sunny position, fail completely, and the best results have been obtained from a bed planted under an east wall where very little sun reaches it. In this position it grows and flowers with great freedom, the spikes averaging from 18 inches to 2 feet in length. We find division of the clumps necessary every two or three years, and copious supplies of water are given in dry weather. The soil is a good deep loam, and when replanting the border is deeply dug and plenty of sharp road grit freely incorporated, which *H. sanguinea* seems extremely fond of. A good top-dressing of road sand is given when the flowering season commences, and under these conditions it succeeds well. I should like to call attention to a new *Heuchera*, which I recently saw at the hardy plant nursery of Messrs. Ladhams at Southampton, as it appeared to me to be the finest of all. This was a variety of *H. sanguinea* named *Shirley*, which I believe originated at the above

nursery. It grows about 3 feet in height, with larger flowers individually than those of any other variety, very bright in colour, and the stems are so robust as to need no support. The soil in which it was growing was a poor and sandy one, and when given better cultivation much finer results still might be expected. This *Heuchera*, upon the production of which Messrs. Ladhams are to be congratulated, will be distributed next year, and I can recommend it as a good addition to our border plants.

A. E. THATCHER.

Aldenham House Gardens, Elstree.

ARGEMONE GRANDIFLORA.

I know few plants to be compared with this, yet I never meet with it. It is an old introduction; I grew it more than sixty years ago, and it was known to Dioscorides eighteen hundred years before that. What has induced me to mention it just now is that I have before my eyes at this moment a plant (I might almost call it a bush) at least 5 feet in height and 15 feet in circumference with not less than fifty flowers, each flower about 4 inches across. The flower has the effect of delicate dazzling white satin, with an orange tassel and black centre, not very unlike *Romneya Coulteri*, but without the intermixture of so much foliage. Though better raised in heat, it is perfectly hardy, not only in the southern counties, but in Northumberland, where I used to grow this variety as well as *A. mexicana*. It is usually grown as an annual, reaching the height of 2 feet or 3 feet, and flowering freely, but the large plant I am speaking of lived through the winter, hence its unusual size. I am the more induced to call attention to this plant because it has been so universally admired, and, strange to say, unknown to many of my garden friends. The contrasts between the *Argemone* and the scarlet *Tigridias* is very striking. A further recommendation is that the season lasts fully three months, with a continuous succession of flowers.

T. H. ARCHER-HIND.

Coombe Fishacre, South Devon.

NOTES ON SOME LATER-FLOWERING ALPINES.

The forms of *Silene maritima* are still showing plenty of bloom, and have been flowering since June. *Trifolium alpinum* is just fading. It is a plant seldom met with. The lovely heads of soft rosy blooms, resembling those of *Ononis rotundifolia*, but longer, are very distinct among the *Trefoils*. On the low and damp parts of the rockery near the walk our British *Mimulus luteus* is still showing a bright yellow. The now rather scarce, very dwarf *Oxalis lobata* is in good bloom in a partially shaded plunge-bed. Although a native of Chili, it proves to be perfectly hardy. The flowers are of a brownish yellow faintly spotted red.

Campanulas Profusion, *carpatica* and its forms, *rotundifolia* and its white form, with var. *Hostii*, *waldsteiniana*, and *tommasiniana* have still some bloom left. *Campanula Hendersoni* has produced one or two fine stems of large blue bells. Some consider this plant to be of miffy constitution, but given a well-drained soil in a sheltered position it seems all right, but I do not think it does well with frame treatment. *Geum Heldreichii* is a fine thing for long succession of bloom. When well grown its flowers are 1½ inches across, and of a vivid orange-scarlet.

Aster Thompsoni seems more suited to the rockery than the border. If put among the coarser growing *Michaelmas Daisies* it is almost sure to be lost, owing to its rather tardy growth and dwarf habit, besides the fact that the beautiful large lilac blooms are shown to the best advantage on rockwork. In a damp spot is *Parnassia palustris*. A more lovely dwarf bog plant could scarcely be imagined. My patch of about fifty plants has been in bloom six weeks now, and is still very showy. A heavy top-dressing of coarse sand seems to suit.

At this time of the year, when many of our rockeries are, in the ordinary course of things,

THE THINNER OR STARRY FORM OF WHITE LILY.

beginning to show a lack of their former beauty and interest, one may often hear from visitors just returned from alpine travels a sad and even disgusted reference to the dulness in appearance of their rockery at home. The fact that very many alpine flowers in England much earlier than in their native habitats has, no doubt, something to do with this, but then we have at our disposal a flora much larger than that of any of the alpine districts, consisting as it does of almost all the more worthy representatives of each of these places.

The following alpine plants in bloom here now are perhaps worthy of note on account of their late show. In a warm and damp position *Calceolaria amplexicaulis* is doing splendidly with its heads of large clear pale yellow, relieved by the delicate green foliage. It looks like flowering up to the frosts, and in a favourable position is reputed to be hardy. *Androsace lanuginosa* is still in bloom, but its more compact variety, *A. oculata*, seems more floriferous with its heads of crimson-eyed flowers. *Dianthus Freynii* is flowering for a second time in rather a peculiar manner, the stem being longer than usual, surmounted by a head of three or four flowers surrounded by a small cluster of foliage. *Silene quadrifida* mixed with *Tunica Saxifraga* makes a most dainty and effective combination, both being wonderful plants for quantity of bloom and long succession.

A small plant of *Antirrhinum asarina* (the creeping yellow Alpine Snapdragon) if planted in spring will cover 2 square feet by autumn, and flower well from May until the frosts. It is a perennial, but liable to damp off in winter, so seeds or self-sown seedlings should be saved. A dry wall is the place it loves best. *Silene Schafta* must be regarded almost as a necessity among late alpine plants. It will grow almost anywhere, and produces its masses of bloom as freely as the May-flowering *Saponaria ocyroides*, to which it bears some resemblance.

Kirkcaldy.

J. WOOD.

THE BEST FORM OF WHITE LILY.

MAY I draw the attention of your readers, now that the bulb-ordering time has come round again, to the importance of getting the best form of the beautiful white Lily (*Lilium candidum*). One is quite a starchy, poor-looking variety, with florets that, so to say, taper to a point and stick out, but the other has broad florets, stout, and with a look of strength. This is the one I grow, and let me remind growers of this, and, indeed, all Lilies, that protection from spring frosts is essential to success. The disease in most cases is due to the want of a little help when the leaves are tender.

VIATOR.

TREES AND SHRUBS.

SPIRÆA LINDLEYANA.

IN a note on this handsome *Spiræa* on page 95 a correspondent writes that "it is a great mistake to put single plants of it in a shrubbery," and suggests that it should be grouped on a bank by the side of water. It is certainly a mistake to plant any flowering shrubs in the crowded collection of heterogeneous subjects too often dignified by the name of "shrubbery," and it is equally certain that no objection can be raised to planting this *Spiræa* and other ornamental shrubs valuable for the beauty of their blossoms in groups, but it is as a single isolated specimen that a fine example of *Spiræa lindleyana* appears to the best advantage. A bush 15 feet in height and 18 feet through, such as I have measured before now, with its deeply-cut foliage sweeping the ground and crowned with numbers of spreading, ivory-white

THE BEST FORM OF WHITE LILY.

bloom panicles 18 inches to 2 feet in length, presents a picture equalled by few of the best of our flowering shrubs, the blossoming period of the majority of which is long past when this native of the Himalayas attains the zenith of its beauty. Large specimens which have reached maturity, such as that I have alluded to, require a certain amount of thinning out and a shortening in of the longest shoots in order to keep them in vigorous health.

S. W. F.

SAMBUCUS CANADENSIS.

THIS appears to be the correct name of the Elder, which is occasionally met with in nurseries as *Sambucus pubens maxima*. Its merits as a late summer or early autumn flowering shrub have until now been very generally overlooked. It forms a bold-growing shrub, not so strictly woody as the common European Elder (*Sambucus nigra*), but at the same time it reaches a height of 6 feet to 9 feet, or even more. The leaflets are often more numerous than the ordinary forms, but by far the most notable feature, apart from the season of blooming, is the size of the flattened clusters of whitish flowers, as in vigorous examples they may be met with as much as 18 inches across, and a specimen laden with them forms, as may well be imagined, a notable August feature. A certain amount of pruning is necessary in order to see this Elder at its best, for if the weak and exhausted shoots are cut out the vigorous ones have more space for their development. If this be really the *Sambucus canadensis* referred to by London as having been introduced in 1761 (and on this point there seems some doubt), it is surprising that its merits as an August-flowering shrub have not been more generally recognised.

H. P.

SOME LESSER-KNOWN JAPAN TREES AND SHRUBS.

(Continued from page 168.)

THE Horse Chestnut has been confused with *Æsculus chinensis*, but the true *Æ. chinensis* is probably not to be found in cultivation in European countries. I have a vivid recollection of several isolated specimens on Mount Hakkoda; stately trees with stems 3 feet to 4 feet in diameter, and 80 feet to 90 feet high; usually at an elevation

of 1,500 feet to 3,000 feet. In this country the tree is quite hardy, and makes a graceful symmetrical specimen.

Japan, like America, has sent us the handsomest Dogwoods or Cornels, and there is reason to believe there is still something in this way to be obtained from China, where it is more than probable all those species first found in Japan are endemic.

Cornus macrophylla, said to be synonymous with *C. brachypoda*, is a handsome, graceful tree, and flowers well in England, though its cultivation in America has hitherto not met with success. Professor Sargent holds it to be one of the most beautiful of all Cornels, an opinion which can be endorsed from experience of the tree in this country. The pointed leaves are dark green on the upper surface, almost white beneath, borne thickly on branches at right angles to the main stem, forming flat tiers of foliage. It flowers with great freedom—as with many deciduous flowering Eastern trees in this country—every other year, unable apparently to annually sustain such an exhausting effort. Under the name of *C. brachypoda*, my firm has a handsome Dogwood, some 15 feet high, clearly distinct from the above in several ways, but botanical authorities have difficulty in, as yet, determining its exact position in the family. Of this undetermined species a variegated form is unusually attractive. Of the behaviour of *C. Kousa* under cultivation too much cannot be said. Though possibly its blossoms are individually not so large nor so handsome as those of the American *C. florida*, it succeeds on the whole better. It flowers freely, and has proved a striking and valuable addition to the deciduous trees worthy of a place in our gardens.

Clethra barbinervis (*C. canescens*), a beautiful small tree found all through the Far East from Java to Corea, grows well, and produces freely in the early autumn its white-panicked racemes, often a foot in length.

The nearly allied *Enkianthus campanulatus*, much esteemed in Japan for its quaint beauty, flowers freely when left undisturbed in a sheltered corner.

Most of the *Viburnums* are well known, but the handsome *V. dilatatum* should not be overlooked, and *V. tomentosum* Mariessii, allied to *V. plicatum*, from which it differs in its more graceful habit, its more hairy leaves, and in its

sterile flowers being confined to the outer part of the inflorescence, is an unusually handsome shrub.

Styrax japonicum and *S. Obassia* are becoming known, and are amongst the most ornamental of any trees found in British gardens. Though in the first-named the large dark green foliage of *S. Obassia* is missing, ample compensation is afforded by the extraordinary profusion with which the myriads of white bell-shaped flowers are produced. In Japan *S. Obassia* is certainly seen to greater advantage than in this country, its leaves often attaining a size of 10 inches in diameter and blooming with greater freedom than in our gardens. On the other hand, *S. japonicum* is as much at home and as beautiful here as in China or Japan. In Surrey it seeds freely, the seed germinating in one or two years, though a large proportion lies three years before showing signs of life.

The rich forest flora of Japan contains several Birches and Hornbeams, some of interest, notably *Betula Maximowiczii* and *Carpinus cordata*, both finer representatives of their genera than are usually cultivated.

Betula Maximowiczii is at its best in Yezo, where it forms handsome trees 80 feet to 90 feet in height, noticeable for their smooth orange-coloured bark and large leaves, larger than those of any other species. I have had a tree under observation for several years in this country, and am inclined to think, if it does not actually attain the noble proportions characteristic of this fine Birch in its native home, it will prove better than anything we yet possess. *B. Ermani* and our own *B. alba* are amongst the best known of several other Birches found in Japan. What *B. Maximowiczii* is to the Birches, *Carpinus cordata* is to the Hornbeams, beyond question the most beautiful and boldest of the family. In its native forests and in this country its leaves are 6 inches to 7 inches in length and 3 inches to 4 inches broad, the catkins 5 inches to 6 inches long, and very beautiful in their autumn colouring. Though in England I know of no tree of a greater height at present than 14 feet, in Japan a height of 30 feet to 40 feet is not uncommon. *Carpinus laxiflora* and *C. Carpinus* are graceful trees, but will not compare from an ornamental standpoint with *C. cordata*.

The Japanese forests are rich in Oaks, which in this country have not received the attention they deserve. That they will flourish, whether evergreen or deciduous, could be seen from photographs of two species in the Hall of trees 20 feet and 25 feet high.

Quercus dentata, remarkable for its giant leaves on young, vigorous growth 10 inches to 12 inches in length and 6 inches to 8 inches in width, has not been so successfully cultivated as one would wish, though the Dutch have obtained fair results. In the neighbourhood of Sapporo fine specimens 70 feet to 80 feet high are not uncommon, but unless our planters have greater good fortune than has hitherto attended their efforts we shall never see in this country in any thing like beauty one of the noblest of the Far Eastern forest trees. *Q. serrata* is a good tree — interesting

from the fact that the Japanese feed silkworms on its foliage. The leaves bear a strong resemblance to those of the Sweet Chestnut, and in England are semi-deciduous. Widely distributed in Japan, it grows here with vigour. It is, however, amongst the Evergreen Oaks we may look for the greatest additions to our gardens. Highly prized by the Japanese, they are largely planted in gardens and round temples, and in large centres are amongst the commonest trees.

Q. cuspidata and *Q. glauca* are both under cultivation, a variegated form of the first-named having met with some attention. *Q. acuta* is, however, the species which seems most at home in this climate, and forms a stately column of lustrous dark green 20 feet in height. It is a noble tree, for which we are indebted to Maries. The Japanese call it the Red Oak, from the redness of its wood, which deepens often to a reddish brown.

JAMES H. VEITCH, F.L.S.

(To be continued.)

[Reproduced, by permission, from the Journal of the Royal Horticultural Society.]

THE FLOWER GARDEN.

GERANIUM GRANDIFLORUM AND OTHERS.

A GOOD specimen of *Geranium grandiflorum* (Edgeworth), a Himalayan plant of great merit as a garden ornament, is represented in the illustration. There has been some uncertainty about the synonyms of this species, first described by Edgeworth in the transactions of the Linnean Society, Vol. XX. Sir J. Hooker, in his "Flora of British India," Vol. I., page 430, makes it synonymous with *G. palustre*, a widely-spread kind found both in the Himalayas and in Southern Europe. It will probably, however, when better known prove to be a distinct species. The flowers are much larger, and more blue than those of *G. palustre*, and the growth is dwarfer and of better habit than *G. pratense*, of which species some have thought it to be a local variety. It was introduced into cultivation a few years ago by Herr Max Leichtlin, and has multiplied so fast by its running

habit and by seeds, which it ripens plentifully, that it may now be seen in most gardens. Those who have the opportunity should raise it from seed for the sake of selection. The best I have seen were in the garden at Warley, where it is the most attractive ornament of its kind. It grows on level borders in any rich, well-drained soil, but gardeners must find out by experience the best position for it in their own gardens. Rules given for one garden do not always suit another.

From the same mountain home and not far behind in merit comes *G. wallichianum* (Dun), of which there is an uncomplimentary portrait in the *Botanical Magazine*, tab. 2377. This species wants selection even more than the last. Seed, plentifully ripened in September, should be picked from plants with the best-coloured flowers and the most compact growth. It is not easily increased by division or by cuttings, and is not a long-lived plant. Selection will be more easily made if the seedlings are grown singly in small pots till they flower. In hot soils and full sun, such as prevail in the herbaceous garden at Kew, *G. wallichianum* is never seen at its best, the flowers being generally of a dull red purple, and the foliage having a burnt appearance, but in stronger soil and in moderate shade the flowers ought to be rich blue, prettily veined, and becoming bluer as the night becomes cooler and moister; but perfect drainage is necessary, as the plant is liable to collapse suddenly if its roots reach stagnant moisture in the soil. Mr. E. C. Buxton of Bettws-y-Coed has a strain with the bluest flowers and the most compact growth I have seen. Some forms, especially in too much shade, trail over 6 feet or 8 feet in diameter, and become long-jointed, with long intervals between the flowers. The best are not more than 2 feet across when full grown.

A most useful and well-known Cranesbill is *G. ibericum*, named from Iberia, the Caucasian province, not Iberia of Horace and the ancient classics, which was Spain, so called from the River Ebro. This *Geranium*, too, requires discrimination and selection. There are poor forms with narrow petals giving a shabby appearance to the flower; others, more commonly seen in gardens, have petals imbricated near the base, and forming a more circular flower. These are called var. *platypetalum*, a name recognised by E. Boissier as describing a wild form. Another variety, more distinct in

habit, and made into a species by de Candolle, is *G. var. gymnocaulon* — i.e., bare-stalked. It has a closer habit, and the leaves are more flat with rounder lobes; but var. *platypetalum* is the best form, and as each tuft, if detached, easily and quickly grows into a plant, we may ornament our rough banks and shrubberies with as many as we like.

G. armenum (E. Boissier) has very large flowers of rich magenta, produced plentifully in summer, and the largest leaves of any Cranesbill. It thrives anywhere in either sun or shade, but rather poor soil in full sun checks too great luxuriance. It may be cut up for increase at any season, and seeds shot to a distance grow readily, and

GERANIUM GRANDIFLORUM. (From a photograph by Miss Willmott.)

make the supply abundant, besides which I have never known a plant die from old age. So we may easily have too much of it.

G. pratense in gardens seldom shows the bright clear blue flowers which make it so ornamental on the islands in the Kennet, and the sunny banks of other rivers. The white variety is not pure white. There is a double white as well as a double blue; both are fairly good, but require frequent division to keep them healthy and shapely, or they suffer from congestion of the dense shoots.

G. sanguineum is never so good in borders as when seen hanging from crevices of the limestone rocks at Llandudno, where it grows in great profusion. It runs underground too much to be good for a rockery, and in borders the preponderance of foliage over flowers is a fault. The white flowered variety is pretty good. The finest individual of the type I ever saw was in Mr. Buxton's garden at Bettws-y-Coed and labelled *G. nepalense*. This was certainly a wrong name, but the plant was said to have been brought from Nepal, a statement which did not bear investigation, so I presume it is a garden development.

G. sylvaticum is like a small edition of *G. pratense*, with similar leaves, but much smaller flowers, pale purple in the type, sometimes blue, and rarely white. It is native in Yorkshire, and is satisfied in any shady corner and poor soil. A double form received under the name was certainly *G. pratense*.

G. phæum, the dusky Cranesbill, with nearly black flowers, may be grown in the shade with *G. sylvaticum*, but requires to have the many seedlings weeded.

G. macrorrhizon (syn. *G. balkanum*) has dark red-purple flowers in bunches on long stalks, with tufts of rather ornamental lobed leaves, but with a rank smell; neither of these has much merit.

G. malviflorum (syn. *G. atlanticum*), from the mountains of Spain and Morocco, is an early-flowering, rather uncommon kind, with blue flowers and deeply-incised leaves. It does best in a south aspect and full sun, and is distinct.

Few gardens are without *G. Endressii* (Gay), from the Western Pyrenees. Its long flowering time and clear pink flowers should ensure it a welcome everywhere. It does best on a rockery, but must be restrained from running too much where small alpine grow near it. *G. striatum* seems to me to form hybrids intermediate in characters with this kind. *G. striatum*, with rather small flowers and a black spot on each leaf, though not showy, is grown for the very pretty veining of the flowers. It does in any semi-wild corner, and sows itself round the parents.

The above are some of the larger kinds of Cranesbill which may be grown in borders, and all are grown in the Edge Hall garden. There are a good many others which may be seen, correctly named, flowering in June and July, on the rockery at Kew. I have tried some of them, but have not found them of sufficient merit to record here.

Edge Hall, Malpas.

C. WOLLEY DOD.

CERASTIUM TOMENTOSUM.

It is almost needless to write about so free-growing and well-known a plant as this *Cerastium*. It is shown growing in a warm garden in the home counties, and when in bloom is a sheet of purest white. Little tufts put in during autumn or early spring quickly spread, almost too much so in some places, and severe restriction is needful. Now

that there is a growing interest in wall gardening it is well to first think of a few things that will quickly grow and flower, and this *Cerastium* is certainly one of the number. *Aubrietias* are also very free growing, and make sheets of blue in the early spring, when the *Alyssum saxatile* is also in beauty to keep it company. At this season the wall garden should be overhauled, as things have grown tremendously during the rainy season, so much so that I have been compelled to cut out masses of *Cerastium* and *Alyssum*. V.

BORDER CARNATIONS.

THE letter in your issue of the 29th ult. from Mr. Woodall on the subject of border Carnations

have had the same experience as Mr. Woodall with *Belladonna*. From a number of plants I have scarcely had a flower worth cutting, nearly all having burst, though the colour was good. The great difficulty is to get robust, free-flowering plants with flowers which do not burst. I have after years of selection, mostly from seedlings, succeeded in making a collection of plants which are satisfactory in the border on a fairly heavy soil, but I have only done this by discarding large numbers which do not come up to my standard, and each year selecting, hybridising, and raising seedlings, always endeavouring to work each colour up to the highest standard. I am not contented with a beautiful flower alone, but try to combine with the well-formed bloom a plant of good habit which will stand all weathers in the open border summer and winter. W. A. WATTS.

Bronwyffa, Et. Asaph.

EDIBLE FUNGI.

UNDER what circumstances fungi were first eaten by human beings will never be known. Probably some daughter of Eve, inheriting from her mother the desire to taste new things, and prompted by feminine curiosity, was tempted to make the experiment; or perhaps one of the male sex, goaded by hunger, had the temerity to investigate the edible qualities of these curious vegetable products. The boldness of the individual was only equalled by that of the person who first tasted an oyster; but it cannot compare with the rashness of those who in the present degenerate days, when bacteria and ptomaines are rampant, consume these favourite molluscs. Though the origin of the use of fungi as an article of food is lost in obscurity, it is very certain that they have been so used for a great number of years. The ancient Romans are supposed to have eaten them, though it is uncertain how many different kinds they made use of. At the present time they are much more employed on the Continent for culinary purposes than they are in this country, and many more kinds are partaken of. Here in England few persons ever think of tasting any other kind of fungus than the ordinary Mushroom (*Agaricus campestris*), although many other kinds are quite as palatable, and some are considered by many to have a decidedly more delicious flavour, but the general public and the man in the street class

them all as toadstools, and quite unfit for human consumption. The edible fungi are really very numerous. Among the *Agarics* there are probably some sixty species which are quite wholesome. It should always be remembered that the part of the fungus which is eaten is not the whole plant, but merely that which bears the spores, the plant itself is what is commonly known as the "spawn," and I have never heard of it being eaten. However, in this article the term "fungus" is meant to allude to the spore-bearing portion. The fungi which may be eaten with impunity and are useful as articles of food may be roughly divided into seven divisions. The first comprises

A MARGIN OF CERASTIUM TOMENTOSUM.

touches on a very important point in the culture of these useful plants. The only colour that has suffered to any extent with me this year is the rose, all the other colours having stood well. The white George Maquay seems to stand anything; the pale blush Countess of Paris is almost as good. Agnes Sorrel, deep maroon, stands wind and rain well. I have never had any great success with the orange or buff colours, but I am hoping to raise a strong plant with orange-coloured flowers. Ceres, a yellow of mine, stands wet weather well and does not burst. I have also two fancies—Otter, yellow ground, marked with red, after the style of Primrose League, and Pied Piper, yellow ground, marked with crimson—which are both perfect border varieties and very free. I

THE BRILLIANT FLY AGARIC (AGARICUS MUSCARIUS). DEADLY POISONOUS.

THE AGARICS,

which consist of a stem carrying a round, more or less flattened, cap, the underside of which is composed of a number of thin plates, radiating from the stem to the edge of the cap. On either side of these plates, which are known as "gills," the spores are produced. In this division are the Mushrooms and their near allies. The common Mushroom (*Agaricus campestris*) is consumed in far larger quantities than any other species, and is cultivated at the present time to an extent which would surprise our grand-parents, and now forms a very considerable industry, not only in this country, but also on the Continent. Near Paris they are very largely grown in caves. In one there are, it is said, some twenty-one miles run of beds. Another very common Mushroom frequently found in our fields, *A. arvensis*, and usually known by the name of the "horse Mushroom," is a much larger species, and has been found of the weight of 3lb., and measuring 4 feet in circumference. Small specimens very much resemble the other species; it is very largely used for making ketchup, and is often sold as the real Mushroom; it has, however, a stronger flavour. The true Mushroom has a collar or ring round the stem; it is never found in woods, and if laid for some hours on a white plate or sheet of paper the spores which it will deposit, if ripe, are of a purple colour. If there be any doubt as to the genuineness of any that may be obtained, they may be known by these characters. Another common species often found growing on old stumps is *A. melleus*. This is highly esteemed abroad, but in this country it is not considered palatable. *A. procureus*, sometimes known as the parasol fungus or Mushroom, is a very elegant species; it has a long slender stem some 8 inches or 9 inches in length, and occasionally even longer, surmounted by a greyish brown somewhat conical cap, which is rough and scaly. It is much esteemed on the Continent, but it is not often eaten in England. A very early species is the St. George's Mushroom (*Agaricus gambosus*); it may often be found in May or June growing in rings. In Italy and France it

is very highly valued, and will fetch as much as 10s. to 15s. per lb. when dried. The common Fairy Ring Champignon (*Marasmius oreades*) is one of the most delicious species; it is very small compared with those already named, but is very common. A bright golden yellow species, the Chantarelle (*Cantharellus cibarius*), is but seldom eaten in England, though on the Continent it is a universal favourite. There are many other species which are most wholesome and delicious, but it is impossible to enumerate them all in the present paper. The second division of edible fungi are

THE BOLETI.

They very much resemble the Agarics in form, and are nearly allied to them, but they differ in not having any gills on the underside of the cap, but instead there are an enormous number of very fine tubes placed close together so that the surface appears to be covered with fine pores. The spores are formed inside these tubes. The number of edible Boleti is small compared with the Agarics, but there are some fifteen or twenty species which are wholesome and palatable. *B. edulis* is a very common species, and is more eaten than any of the other species. *B. aestivalis* is considered by some to be one of the best species. The next division is

THE POLYPOREI,

which, as a rule, are very different looking to those which we have already considered, as they usually have no stems, or only very short ones, and the stems are generally at one side and not central, as in the Agarics and Boleti. The underside of the cap is covered with fine tubes like the Boleti. They grow on trees or timber, forming the large bracket-like growths often seen on the stems of trees, and instead of decaying in the course of a few days, as most fungi do, they remain for weeks, some species becoming very hard, woody, and very indigestible. Only a few species are considered edible, and they are not much sought after. Only quite young specimens should be used. One species known as the Beefsteak fungus (*Fistulina hepatica*), so called from its slight resemblance to a beefsteak in appearance, is more juicy and fleshy than the others, and is

much esteemed by mycophagists. It sometimes grows to a great size, one having been found by Dr. Badham, the author of a well-known work on edible fungi, weighing 8lb., and measuring 5 feet in circumference. It is said that "in Vienna it is sliced and eaten with salad like Beetroot, which it then much resembles."

THE CLAVARIEI (CLUB-SHAPED FUNGI),

which constitute another division, are very unlike any of the preceding. They are generally found in kind of tufts of more or less slender stems, sometimes branched at the top like the antlers of a stag. There are about half a dozen species that are edible. Nearly all the white-spored species may be eaten. Another division contains

THE "PUFF BALLS,"

or Lycoperdaceæ, which are too well known to require any description. The large species, *Lycoperdon giganteum*, is the one most generally eaten. It sometimes grows as large as a football, and has been known to attain a weight of 14lb., and the circumference of 4 feet 9 inches. This species, as well as the smaller ones, must be eaten when young, for old specimens

are nothing more than a mass of an almost felt-like substance filled with innumerable spores, but when young cut into slices and nicely fried they make a most palatable dish for breakfast, and one specimen will furnish a repast for several persons. Though by no means an uncommon species, it is never found in large numbers together. The smaller species, which are common on open downs, &c., are sometimes very plentiful. Another very distinct group of fungi are

THE "MORELS,"

which to some extent resemble the Agarics in outward appearance, but they are really very different. They consist of a short stem, surmounted by a conical or ball-like cap, which is very much wrinkled longitudinally. The spores are formed on the outside of the cap. The best known species is *Morchella esculenta*, which is considered quite a delicacy, but, unfortunately, it is by no means common here. There are two other species found in this country, but they are more rare. A very nearly allied genus, *Helvella*, contains several species which are edible. Only two, however, are found in this country—*H. crispa* and *H. lacunosa*.

THE TRUFFLES.

The last group which we have to mention contains the well-known Truffles or Tuberacei. These fungi are entirely subterranean. The English species which is in most request is *Tuber aestivum*, but in France they have other species, *T. melanospermum* and *T. magnatum*, which have a better flavour and are found in greater abundance, so that the industry of Truffle hunting in this country has declined and is now practically non-existent. The Truffle fungi are most plentiful in soils of a calcareous nature, and they grow under the shade of trees, but not where it is too dense. The two favourite trees are the Oak and Hornbeam, but they are also found under Chestnuts, Hazel, Birch, Box, and Beech, and in places where they grow something may be done to cause them to increase by judiciously thinning the trees, so that the ground should not be too shaded, but all attempts to really cultivate

Truffles have hitherto failed after a few years of indifferent success. These fungi consist of a considerable amount of spawn composed of a number of fine white threads, on which grow the Truffles, which are the spore-bearing part of the fungus. Many very interesting accounts have been written from time to time describing the cleverness of the dogs which are used for discovering the whereabouts of these subterranean fungi and the means used for training them, but however interesting it may be it is a subject which cannot now be entered into. Though it is unquestionable that very many different kinds of fungi are very desirable articles of food, as I have endeavoured to show, it must always be remembered that there are also many that are quite the reverse and are decidedly poisonous. Even the real Mushroom, like many other articles of food, if eaten when in a state of decay is decidedly unwholesome. Unfortunately, there are no rules which can be laid down by which edible fungi can be distinguished from those which are not, and the only way to ensure safety in this respect is to learn the characters of the edible ones that are most likely to be met with and some of the poisonous ones, so that they may be at once recognised. No fungus, however, should be eaten which when cut soon turns a blue colour or that has an acrid taste. Fungi should always be cooked, and are best stewed, broiled, fried, or baked, seasoned with pepper, salt, and vinegar. Fungi have no doubt a certain value as an article of food, but the value is not great. They contain a large amount of water, varying from 9 per cent. to 90 per cent., the woody Polyporei being those which contain least. A fair average for Agarics would be from 60 per cent. to 70 per cent. About 20 per cent. of the solid matter is composed of cellulose, which cannot be digested by the human stomach, though it can be by those of some of the lower animals. Of the remainder about 6 per cent. or 7 per cent. are albuminoides, which are valuable as food, as they contain a higher percentage of nitrogen, which is the nutritive element, than Peas or Beans, whose food value is well known.

It is to be hoped that the exhibition of fungi at the Drill Hall on the 15th inst. will create

much interest in the subject of edible fungi, and that many persons who have not hitherto eaten any but the common Mushroom will overcome any prejudice they may have against eating Toadstools, and come forward boldly and join the ranks of the true mycophagists.

G. S. SAUNDERS.

GARDENING OF THE WEEK.

CHRYSANTHEMUMS.

EARLY-FLOWERING border varieties are especially fine this year, the past wet weather having favoured their growth, and few late-flowering plants can surpass them for giving a wealth of bloom at this season, either for cut flowers or for brightening the beds and borders when many other kinds of plants are on the wane. Here we have a border about 70 yards long and 2 yards broad, planted with four varieties: Back row, Mrs. Cullingford (white); third row, Flora (bright golden yellow); second row, White St. Crouts; and the front line, Piercy's Seedling (orange), which at the present time is just developing finely, and will in a short time be in full beauty. The growth of these varieties is compact, and they are very free-flowering, and, being only of moderate height, they are not exposed to much damage from heavy winds. The last-named, Piercy's Seedling, though an old variety, is still one of the best for bedding. See that the growths are neatly supported, and give a slight dressing of artificial manure should the weather continue showery. Keep the roots well supplied with liquid manure should a spell of drought set in, when these will go on flowering for some long time to come.

TRAINED SPECIMEN PLANTS.

These are somewhat late this year, but otherwise looking well. If required for early shows in November no time should be lost in getting them under glass, as by so doing it will make ten days or a fortnight's difference to them. A light airy house is the best possible place, but, failing this, any old light, temporarily erected building may be made to answer the purpose. Place it in full sun, but in all cases elevate the plants as close to the glass as possible. The growths should be securely supported, and thoroughly dust the undersides of the foliage with sulphur and fumigate them two or

three nights in succession. The plants will require liberal feeding with manure water to ensure fully developed flowers and good healthy foliage. Do not bud immediately it is safe to do so. The final tying should not be done till the bud begins to unfold.

POMPONS.

This charming section is, perhaps, unsurpassed for home use when a suitable selection is made of the plants nicely grown. These always look the best in bush form from medium-sized plants, arranged neatly and naturally looped to one stout stake placed in the centre of the plant, and the same single varieties should be treated precisely in the same way. The disbudding of these should be done judiciously. Just sufficient should be taken off to allow each bloom to properly expand, but when overcrowded they are poor and are not nearly so effective. These will also require plenty of feeding; the growths should be kept free from insect pests, rust, and mildew by taking the necessary precautions.

PREPARATION AGAINST FROST.

It is quite possible in low-lying districts, as indeed in many parts of the country, that we may experience frost any time after this date sufficient severe to injure the young tender buds of the Chrysanthemum, especially on those plants that have been highly fed and well grown. Though Chrysanthemums, when allowed to grow natural in the borders, are practically hardy, I have known 3° or 4° do a considerable amount of damage to the buds when quite small on plants which have been cultivated for specimen blooms. Though this may not be apparent at the time, defective flowers will be the result, and the younger the buds the more susceptible are they to injury. Thin tissue should always be placed over the plants at night when the glass goes below 40°.

E. BECKETT.

Aldenham House Gardens, Elstree, Herts.

FLOWER GARDEN.

HEPATICAS.

Those who wish to increase their stock of the lovely flowers will find the present time the best for this operation. So persistently do they shrivel from the hand of the careless cultivator that when we meet with them in great flowering clumps we know they have long been left to grow in their own sweet way. It is easy enough to fail in the cultivation of Hepaticas. Plant them in borders that are regularly dug and scratched, and altered and muddled by that class of gardeners who inborn faith it is that a tree exists only to be cut down and the prettiest weed to be pulled up; trust to the order of genius and you will never see any Hepaticas a second time. The secret of success may be said to consist in first finding a proper place for them; and, secondly, in leaving them alone. They thrive best in peaty soil, but in this respect they are not particular. Almost any soil will suit these lovely plants. Partial shade is better for them than full sun, and a cold climate better than a warm one. They are very easily increased by division, and the sooner this is done the better. When divided and planted a little fresh soil, principally leaf-mould, or peat and sand, should be put to the roots of each patch; this will help them to start away freely. Should the weather be dry at the time of planting they should be watered, and the soil pressed firmly to each plant. Very small pieces are better potted in very small pots using light gritty soil. Plunge them in cool ashes in a partially shaded situation, and plant them when they have filled the pots with roots.

BULBS.

Various kinds of bulbs should now be planted as fast as they come to hand. The Daffodils or Narcissus

THE COMMON MUSHROOM (AGARICUS CAMPESTRIS).

should first be attended to; in mixed borders they do remarkably well if allowed to remain undisturbed for several years. When used for beds it is difficult to move them in time for the summer flowers without their suffering from removal before they are fully ripe. It is, however, for mixed borders they are principally recommended. Among others which should have early attention are Snowdrops, always best when planted early. Crocuses also will give far better results if planted in good time. The Musk and Feather Hyacinths should now be planted in a sunny spot where the bulbs may get well ripened. Erythroniums (Dog's-tooth Violets) do well in a partially shaded place. If the soil is really damp so much the better. Leucojums may be planted almost anywhere, and if planted deeply the beds or plots may be dug over and replanted for summer or autumn effect. Chionodoxas and Scillas should be planted in quantity wherever room can be found for them; they will help materially to brighten up the garden in early spring.

PENTSTEMONS.

These are doing well this season. Cuttings of the best types should now be put in, choosing only those varieties which show healthy growth. They strike well in a cold frame placed on a hard ash bottom with about 4 inches of soil. Only a few cuttings should be taken at a time, as they should not be allowed to flag badly, and they should be well watered and kept close and shaded for a few days until they begin to revive. T. B. FIELD.
Ashwellthorpe Hall Gardens, Norwich.

KITCHEN GARDEN.

TOMATOES.

In this neighbourhood the only Tomatoes that have given anything like good results in the open are those planted against walls having a warm aspect. The plants in open quarters have grown freely, but the amount of fruit that will finish properly is not nearly commensurate with the labour bestowed upon them. Two pounds per plant is about the average weight of fruit, and it is doubtful if these will finish sufficiently well to pay for the trouble incurred. As a matter of fact, there is but little to choose between this season and last. The varieties that do best with us in the open are Up-to-Date, Sutton's A1, and Ham Green. These plants, growing on south walls, are carrying fairly heavy crops of good-sized fruits, and all they now need is bright sunny weather. Gather the fruits when they become yellow and lay them on a bed of wood-wool in a vinery or other structure where a little fire-heat is maintained. Small fruits that cannot be expected to ripen should be removed. All side growths and some part of the strong main leaves may also be cut away to admit light to the fruits.

Plants for winter fruiting should now be growing freely and nearly ready for shifting into their fruiting pots. Admit abundance of air to the structure on all favourable occasions to ensure sturdy growth, and when the weather becomes cold and frosty a little fire-heat must be applied, but avoid excess until the fruit is set.

PEAS.

This has been a good season for Peas in general, and late varieties in particular. That grand variety Autocrat is yielding many dishes of rich full-flavoured Peas, and they have the appearance of continuing to bear for some time to come. The points of the shoots should now be pinched out, and if the haulm has a tendency to fall away from the supports a string must be passed down the whole length of the row on both sides.

BEANS.

Although late in coming into use, the Runner Beans have done well, both quality and quantity being all we could wish for. Keep the pods gathered closely, for it should be borne in mind that by allowing any to become old and seedy the season of bearing will be shortened. A sowing of Ne Plus Ultra or Osborn's Forcing may now be made for winter fruiting, provided proper convenience is at command. Pots 7 inches in diameter should be three parts filled with light,

rich soil and eight Beans placed at equal distances apart on the surface, and cover with half an inch of soil. A stage or shelf near the glass in a warm house should be accorded them, and when the seedlings are up give frequent copious syringings and grow on freely until flowering commences, when a dryer atmosphere should be maintained for a few days. A temperature of 60° to 65° will be necessary.

Stonleigh Abbey Gardens.

H. T. MARTIN.

INDOOR GARDEN.

BEGONIA GLOIRE DE LORRAINE AND VARIETIES.

ANY late-rooted plants of this Begonia should now receive all encouragement possible, as growth made after the month of September is too late to produce a satisfactory crop of flowers. Pinch off the flower-buds once more from those plants intended to bloom in October and November. Allow them plenty of room; overcrowding always results in inferior quality. Keep the shoots tied up, using for supports for this purpose light, green-painted stakes, but avoid using more stakes to a plant than are necessary; any plant overstaked has a stiff and objectionable appearance. These plants should be allowed a night temperature of 55° to 60°, with an increase of 10° or more during the day.

BEGONIA GLOIRE DE SCAUX.

Pot on the young stock of plants before the pots are full of roots. Any growth made during the next five or six weeks is more satisfactory than growth made during the short dull days of December. This plant requires more heat and moisture than the preceding.

POINSETTIAS

should now be allotted a light position, with a night temperature of 60° in a well-ventilated house. Keep the plants well watered at the roots, but avoid anything approaching a damp stagnant atmosphere, and, until the floral bracts are beginning to develop, water with clear water only.

GARDENIAS.

The season's growth should be well ripened by this time, therefore, give the plants more air, light, and room, at the same time reduce the atmospheric moisture, and if the plants have been plunged up to this time it is now advisable to lift them out of the plunging material. Any roots found there must be checked, as the object now is to induce a short period of rest, during which the flower-buds form and gradually develop in preparation for the next crop of flowers.

SOLANUM CAPSICASTRUM

should now be allowed all the light and air that can be conveniently and safely given them, and for this purpose raise the plants on pots that will bring them within 6 inches or 8 inches of the glass of the frame in which they are growing. Should aphids show themselves dislodge them with a sharp syringing with Quassia Extract or dust them with Tobacco powder, which should afterwards be syringed off with clear water. It will now be necessary to prepare for housing Camellias, Azaleas, Ericas, Epacris, and any other greenhouse plants that may have been placed out of doors during the summer months. In all cases see that the drainage is not in any way obstructed, and in the case of Camellias, should bright periods of sun intervene, shade the plants with tiffany. Large plants of Ericas that require restaking and tying should be attended to when they are housed or the plants may get broken. These remarks apply also to Genetyllis, Dracophyllums, or any other plants requiring the support of stakes; if carefully tied as soon as they are placed under glass they present a neat appearance through the winter.

THYRSACANTHUS RUTILANS.

Plants from cuttings rooted in March or April should now receive their last shift for the season; 5-inch pots are usually large enough for April-struck plants, and 6-inch for the stronger of those rooted in March. Avoid placing them in too large pots, for to bloom them successfully the pots should be full of roots by the end of October. Give the plants a good light position in either a hot pit

or on the side stage of the stove. This plant is rather subject to brown scale, but with regular attention it is not difficult to keep clean; it should be grown on rapidly, and it will amply repay for all attention bestowed upon it by its graceful, pendulous, long racemes of flowers.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

VERONICA HULKEANA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—As (I believe) the first to raise and flower *Veronica hulkeana* in this country, such a charming illustration of my old favourite as that on page 115 gave me great pleasure, for it is, I think, as stated by Mr. Fitzherbert, the most beautiful of its section. It is certainly not half enough grown, for even in parts of the country where its hardiness is more than doubtful, it is a charming greenhouse shrub. Mr. Douglas, then of Loxford Hall, received a first-class certificate for it in the spring of 1882, and a few years after that I saw a number of well-flowered examples on a costermonger's barrow in the streets of London, grown in the regulation 5-inch pot. They would appear, however, to have been unremunerative, for I have not met with it since under such conditions, nor even in Covent Garden Market. T.

FRUIT TREE PRUNING.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I have read with much interest, mixed with considerable surprise, Mr. Thomas's paper on fruit pruning in your issue of the 22nd ult. It goes against all my preconceived ideas. I have always thought (and acted on the supposition) that after the pruning in the spring, subsequent to planting, bush Apples should be left severely alone, except to thin out the centres when getting crowded. Some eight years ago I planted a lot of Apples on Paradise stock, and have never, after the first year, put a knife to them. They have always borne remarkably well, and there have been none of the long barren branches Mr. Thomas speaks of. I have always found that when the shoots of this year are left alone and allowed to extend themselves the following one, they become thickly studded with fruit buds, and so I get both fruit and increased size of tree. However, Mr. Thomas is so great an authority, I determined to act on his advice, and carried out his directions on all my young trees, but I must say in a beautiful spirit of faith. If I find the result is only a production of a mass of wood I shall feel inclined to cross the Channel and proceed to fierce personal violence! But what does he say about those sorts which only bear on the tips of the shoots, such as Irish Peach and Scarlet Crofton? This last variety seems to be little known or planted in England, and yet I think it runs Cox's Orange Pippin very close indeed for the premiership of eating Apples. I should like to have this pruning subject ventilated by some more of the high priests of the profession, such as Mr. Bunyard or Mr. Pearson of Chilwell.

County Cavan.

D. K.

THE HOLLYHOCK.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—As you invite notes from your readers as to their mode of growing this choice garden plant, I may say that in this Yorkshire garden we find the Hollyhock invaluable in August and September. As I look out across the lawn I see four splendid spikes on the plant depicted on page 21 of *THE GARDEN*, January 10, and there are other eight or ten of this noble and picturesque family at present in bloom, some of which have been flowering already for over a month, and are by no means near their end yet. This long period of blooming is one of the greatest attractions of the plant, another is

the great variety of lovely colouring in its flowers, also its stately appearance as a plant for the back of the herbaceous border, and its ability, with a little help, to withstand the windy days that often startle the garden in early autumn. It is to be hoped we shall be saved from any monstrosities in Hollyhocks. Here we have only singles, and each plant is allowed to grow pretty much in its own way, putting up as many stems as it has strength to nourish. Even thus, we get them towering above a 5 foot hedge, which is a good protection to them from the west wind. Here they do quite as well under partial shade of trees as in the open; indeed, our best specimens are on the shady border. I see some writers strongly recommend heavily manured soil for Hollyhocks, and probably in sandy or poor soil they require help, but in good deep loam and a not too dry climate, they do not appear to require it. Biennials they may be, but each year new growth comes from the old stools or offshoots from them, and a can of liquid manure in early summer, and a 5 foot cane to support each of the larger spikes later on, is all the attention given to them. One of Messrs. Kelway's singles, Sulphur Queen, purchased in the spring, is now a most welcome addition.

Beechwood, Mewston.

WALTER JESPER.

HEUCHERA SANGUINEA WALKER'S VARIETY.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—This variety was extensively shown by Mr. Amos Perry at one of the recent meetings of the Royal Horticultural Society. It is all Mr. Perry claims for it, namely, that it is the most brilliant of all the Heucheras. To myself, as it appeared in Mr. Perry's group some six weeks ago, it was not only the most brilliant of its race, but decidedly the largest of the red flowered sorts. The shade is more akin to vermilion-crimson, and very effective even when set amongst many good things. The variety, which I believe really originated with Mr. Perry, first flowered as a seedling in the garden of the gentleman whose name it bears. This gentleman, a customer of Mr. Perry's, seeing the improvement in size and colour, decided to grow and increase the seedling plant, and presently discard the older variety. Mr. Perry, too, not slow to recognise the merit of the plant, secured all available stock, and is now making a specialty of what is doubtless the finest of all the red flowered Heucheras.

E. JENKINS.

THE USELESSNESS OF MALMAISON CARNATIONS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Replying to a previous note of mine, your correspondent C. J. Ellis writes, on page 154, in favour of the Malmaison section of Carnations. The principal defence, however, appears to me to be the fact that employers like them, and of course a gardener should above all things study his employer's wishes, but this does not make the flowers in question any more graceful or pleasing. As well might beauty be claimed for a pug dog on the ground that it is fondled by the highest in the land, simply because it happens to be fashionable to do so.

T.

BLUE WATER LILIES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Mr. Owen Thomas, writing on "Water Lilies" (page 31), says: "Unfortunately, so far we have no blue hardy Water Lilies. Let us hope that before long a hardly stellata or zanzibarensis may be forthcoming." There are certainly blue Water Lilies that grow in portions of Africa that are far cooler than the habitats of the two species above named, and that should, therefore, prove much hardier. In the Knysna district, that lies on the south coast of Cape Colony, between Cape Town and Port Elizabeth, blue Water Lilies are to be seen in the rivers running from the Outeniqua Mountains to the sea. This range is over 100 miles

in length, and its distance from the sea ranges from 20 miles to 5 miles. Even the highest peaks are by no means lofty, and from my recollection of them I should doubt if any exceeded 5,000 feet in

height, yet many have a coating of snow in the winter. In February, which is summer at the Cape, when camping-out by a river-side in a deep kloof, the mercury was only 10° above freezing at

2 a.m. on one occasion.

The region, which is splendidly timbered and is well watered by swift-running streams and rivers every few miles, abounds in flowers, Gladioli, Watsonias, Freesias, and all sorts of bulbous plants being met with in quantity, and the Scarborough Lily (*Vallota purpurea*) growing in hundreds by the side of a river that has cut itself a channel some 800 feet deep in the plateau through which it flows, these being often covered by 10 feet or 15 feet of roaring water after heavy rains. I have often thought that a collector might reap a rich harvest in the Knysna district and its continuation the Zitzikama Forest, that extends towards Humansdorp, and I am at least assured that the blue Water Lilies that live there would possess a far harder constitution than *N. stellata* or *N. zanzibarensis*.

S. W. FITZHERBERT.

KITCHEN GARDEN.

RUNNER BEAN HACKWOOD SUCCESS.

I WAS glad to notice that this splendid new Bean, raised by Mr. J. Bowerman of Hackwood Park, received an award of merit at the Royal Horticultural Society's meeting held at the Drill Hall on August 18. Mr. Bowerman kindly sent me a few seeds to try last spring, which I grew side by side with what I considered to be the best varieties in cultivation, and it proved itself to be far and away the best in every respect, being the earliest, most prolific, and giving the finest pods, and either for home use or exhibition this will undoubtedly prove to be a great acquisition. During the past few years there has been a very great improvement in the varieties of Runner Beans, and to me it is surprising that the old forms should still be grown so largely for market, many of which we see exposed for sale are miserable both in appearance and quality. Mr. Bowerman has been the means of giving the public other choice stocks of vegetables, his type of Ailsa Craig Onion being still unsurpassed, and the Hackwood Park Tomato still one of the best. His latest introduction, I fully believe, is destined to take a prominent position among our list of choice vegetables.

E. BECKETT.

A VALUABLE AUTUMN LETTUCE.

THERE are so many good Lettuces early in the season that it is diffi-

THE NEW RUNNER BEAN HACKWOOD SUCCESS.
(Reduced one-fifth. Given an award of merit, R.H.S., August 25, 1903.)

cult to make a note of their special qualities, but in the autumn, say from September and later, there is less choice, and any variety that does well is worth special attention. For the past few seasons I have grown Sutton's Favourite, and each year it is more appreciated. Although this season all green or succulent vegetables have grown without much attention, the Favourite Lettuce is so good, and in most cases so superior, that I think for autumn supplies it is unequalled. I can thoroughly recommend it for early winter supplies, as during the last few seasons it was not injured by frost in the early winter. It is most attractive in appearance, and the hearts are so tender that it requires care in handling. There is no variety at this season known to me that is so tender, and the plants, when full grown, remain a long time fit for use. Unlike some varieties, it does not run to seed quickly, and this is a great gain as some sorts are no sooner fit for use than they bolt, and are useless. I should mention that this is a Cabbage variety, and certainly one of the best of its section. When sown in June and July for autumn supplies it is most valuable. It is quite as good for spring sowing, owing to its freedom from running and its compact growth. G. W. S.

THE AUTUMN AND WINTER TURNIP SUPPLY.

Few vegetables are in greater demand in winter than good Turnips, and those sown now will be large enough for use at the season named. Many advise earlier sowing, but it must be remembered that large roots are bad keepers, and are not nearly as hardy as the medium or even small roots. In the North the culture differs from the South, and in Scotland there are few gardens of any size but that would give the golden or yellow-fleshed Turnip a goodly space for winter supplies, indeed such sorts as Golden Ball or the yellow Turnip under different names, will be found more serviceable for exposed positions or cold soils. The roots remain sound well into the spring. Often in February and March the earlier sown Turnips will have become soft and flavourless, especially the white ones. In a measure the roots are greatly influenced by the soil, so that it is well to study varieties more carefully at this season.

There is no lack of varieties, and the best for the winter are well known by most growers, but I think we could with advantage grow more solid roots and get less size and better quality; a root the size of a cricket ball is large enough for all purposes. As proved so often, both at exhibitions and at home, the large root is often poor and flavourless, whereas the smaller is solid and sweet.

Another point often overlooked is that the Turnip can be much improved in flavour by a little attention to culture, and often old garden soils would be better if not dressed with animal manure for a season, but quick-acting fertilisers. The best roots I ever grew were in poor soil dressed liberally with charcoal refuse and nitrates, and the plants winter well when not over-manured. I have referred to Golden Ball, and I may also place Yellow Perfection in the same list; as regards quality the latter matures very quickly, and is of very fine flavour, having a short top and rather flat root. For keeping I prefer a round root such as Golden Ball. The Messrs. Dobbie, of Rothsay, have a splendid golden-fleshed Turnip which is remarkably hardy, and much grown in Scotland. The Malta is excellent for keeping, and is a great favourite for heavy soils in the Northern Counties. I have also seen the Golden Ball, or a variety very much like it, grown under the name of Orange Jelly, but the true Golden Ball is, in my opinion, a better root.

Another yellow Turnip is called Golden Stone, also Goldball, but these are similar to the Orange Jelly. The yellow-fleshed Turnips are very sweet when young, and, I think, superior to the white. I am aware that many object to the colour, but I think it is a gain to have diverse colours in vegetables, especially when the flavour is so good.

No note on the autumn or winter supply would be complete without referring to Veitch's Red Globo. For use at the season named there is none

better. It is one of the finest garden roots we have, and very handsome, and specially adapted for present sowing. It is a white root with a red colour at the upper part of the bulb, and the flavour is first-rate. With attention to details good roots of this variety may be had well into March or even later. The Green Top Stone Turnips are also good keepers. These roots are noted for their solidity, and the Potrowsky or Finland is much grown abroad for use in winter. This is not a white root nor much favoured in this country. I consider our Golden Ball superior. A very distinct Turnip is the Chirk Castle or Black Stone, a very hardy white-fleshed Turnip with a black skin; it is a very good winter Turnip, and one that will thrive where others fail. This I have often seen sown merely to supply green tops in the spring. It is one of the last to run to seed, and the roots remain solid a long time, but it should not be grown large.

There are others, but those I have named are best for the season noted, and for keeping as long as possible. I would advise sowing in August for this purpose, and the giving of more room at this season, so that the roots can be kept free from weeds. Give an open position and well-cultivated land. G. WYTHES.

SIR J. LLEWELYN POTATO.

It sometimes happens that when an honoured name is coupled with some garden product this latter is worthy of its appellation. Unfortunately it is not always so; hence the adoption of personal names too often proves to be the reverse of a compliment. Thus we see well named the Prince Albert Apple, the Gladstone Pea, the Marquise de Salisbury Rose, the Beaconsfield Fuchsia, the Ellen Willmott Verbena, and so on, things that will live and be popular, not being, as so many ephemeral things are, named to-day and forgotten to-morrow. In the former category evidently comes the Sir J. Llewelyn Potato, though probably no one would be more surprised or amused at finding his name coupled with a Potato than the worthy baronet. It does not do well everywhere, but where it does so it is first-rate. Mr. Bowerman has it in splendid condition, and producing a grand crop, at Hackwood Park this year, and his noble employer, Lord Bolton, speaks of the cooked tuber in the highest terms. When originally grown at Chiswick the variety stood out beyond all others as a splendid cropper. A. D.

NOTABLE GARDENS.

NOTES FROM LOCKINGE, LADY WANTAGE'S BEAUTIFUL GARDENS.

CALCEOLARIA AMPLEXICAULIS. — A most charming bed of this fine old Calceolaria is just in front of the great conservatory at Lockinge. Not content with planting the bed, which is of irregular shape, with plants of ordinary height, arranged to make a good mass of bloom, Mr. Fyfe has inserted, but more thinly, standards, some 3 feet to 3½ feet in height, thus producing an effect that is quite uncommon, and is of the lightest and most pleasing description. Were the colour a deep yellow it would be rather offensive, but the pale straw yellow, almost lemon colour, of the flowers is very refined. Standards can be grown from cuttings in about two years. Their propagation is not difficult, and may be from cuttings put in at once, or from nice young shoots inserted in warmth in March. They should be induced to reach with clean stems the desired height, then be pinched, and good heads soon form.

Begonias as bedders.—Very pleasing indeed are small beds carpeted with the compact form of Sweet Alyssum (*Koniga maritima*), the plants being spreading and close to the ground, on which grow and flower finely Begonias, both single and small double flowered, white, pink, rose, scarlet, orange, and crimson. So employed, they are far more pleasing than when in big mixed masses, without any dress or relief plants. Using Begonias

in that way places the bedding very little above the normal type seen in big beds of scarlet or other coloured Geraniums. Large-flowered varieties are much less effective than those having rather small flowers. Close by these beds are growing, in large tubs, a few monster Sweet-scented Verbena (*Aloysia citriodora*). These are some 9 feet in height and 8 feet broad, are all in luxuriant leafage and flower, and emit a delicious perfume. These fine plants have been in existence about ten years.

Sweet Peas.—Whilst there are scores of fine clumps of these in the open ground, each one being restricted to a single variety, very interesting, standing slightly raised, and at the back of a flower border, are a dozen clumps in 18-inch tubs. These are generally quite as fine as those in the open ground, and their growth averages 7 feet in height, and abundant bloom tells of the admirable culture bestowed on them. Those who love Sweet Peas, and have limited garden areas, may well try tub culture. The tubs are 16 inches deep, and, of course, filled with good compost. As with so many others, a beautiful white-flowered spike was standing up out of a mass of Miss Willmott Pea, and a fine white it was also. Very effective, and greatly admired, are the single and semi-double Hollyhocks in the borders. These display singularly lovely hues of colour, and are most decorative. It is to be hoped that the florist will leave these beautiful singles alone.

The Conservatory.—In this house and in the corridor adjoining singularly charming effects are at present obtained by a fairly free use of the soft blue and pure white forms of *Campanula pyramidalis*, which, interspersed with other plants, gives a very delightful floral charm to the whole. Attached to a pillar in the house is a plant of *Bougainvillea sanderiana*, some 20 feet in height, literally a mass of floral bracts from top to bottom. It is thus evident that, allowed room, the assumed bush variety will also become a climber. It is here freer and less rampant than *glabra*. In the nursery plant houses are being grown on for the winter decoration of the conservatory, quantities of *Clerodendron fallax*, *Poinsettias*, *Euphorbia jacquiniiflora*, and other things that will be of inestimable value in due course, while outdoors are several hundreds of bush *Chrysanthemums*, such as will in their season give a wealth of flowers. In every direction flowers are in the ascendant.

Fruit.—Though there is an exceedingly poor show of fruit outside at Lockinge, within there are splendid crops of Grapes, Peaches, Figs, Melons, &c. For many years Muscat of Alexandria Grapes have been well done and there is a very fine crop this year, so there is of Madrasfield Court, Black Hamburg, Foster's Seedling, and other later varieties. In making both Vine and Peach borders Mr. Fyfe uses, among the turves, thin layers of wood ashes, mortar rubbish, bone dust, and some Vine manure. Borders are enlarged slowly and are rather narrow than overdone. It is a feature here to keep the fronts of the borders open, so that air can penetrate to them. Peach borders are served the same. It is a practice that is strongly recommended. All the same the soil is made very firm when so treated, it dries less rapidly, and roots are much more fibrous. Figs are not trained, as is customary, close to the glass, but grow in a semi-wild way. So treated they fruit with exceeding profusion.

Vegetables.—In Lockinge gardens these most important products are far from being neglected. It would indeed be possible just now to set up a collection that would probably surprise some of the champion exhibitors. If Mr. Fyfe should exhibit at Chiswick on the 29th he will be able to put up a highly meritorious collection. He has the finest Carrot bed seen anywhere this season. His Onions are indeed splendid, bulbs clean, bright, and well finished. Celery is massive, and is chiefly blanched by using bands of paper, by which cleaner growth seems to be assured than is the case when soil blanched. Peas, Beans, Leeks, Turnips, &c., are all full of vigour and promise. The soil is naturally so chalky that while singularly unsuitable for Peas, it has to be largely made for vegetables, yet the general produce is superb. It is pleasant to find that, where plants, flowers, and

fruits are so plentifully and well done, vegetables are equally good. The modern gardener has indeed to be a first-class all-round man. A. D.

RECENT PLANT PORTRAITS.

THE September number of the *Botanical Magazine* figures

Senecio tanguticus.—Native of Western China, also known as *S. Henryi*. This is a handsome herbaceous Groundsel, with tall branching spikes of small yellow flowers. Sent by Dr. A. Henry.

Draba Gilliesii.—Native of Chili. This is also known under the synonyms of *D. araucana*, *D. Davila*, *D. rosulata*, and *D. stolonifera*. It is a pretty little alpine with spikes of pure white flowers with yellow anthers. Sent to Kew by A. R. Bulley, Esq.

Iris Bucharica.—Native of Bokhara. This is a very beautiful and free-blooming Iris, closely allied to *I. orchioidea*. It has pale creamy centre petals and bright golden falls. It was sent to Mr. Van Tubergen of Haarlem by his collector, Sintenis, with *I. Warleyensis*.

Aloe Cameroni.—Native of Eastern tropical Africa, also known as *A. macrosiphon*. This is a very ornamental member of this family, with spikes of long tubular rose-coloured flowers with yellow tips.

Psychotria capensis.—Native of South Africa. It is known also as *Grumilia capensis*, *Logania capensis*, and *Grumilia globosa*. This is a very pretty shrub, with bunches of small yellow sweet-scented flowers and dark green foliage like *Pittosporum Tobira*. It flowers freely every spring in the temperate house at Kew.

The first number of the *Revue Horticole* for September figures

Eulophiella peetersiana.—Native of Madagascar. This is a very handsome Orchid, producing tall spikes of large rosy purple flowers.

The September number of the *Revue de l'Horticulture Belge* gives on a double plate a portrait of a handsome bramble,

Rubus reflexus var. *pictus*, which was somewhat inadequately figured in the sixth volume of the *Botanical Register* in 1820 under the name of the Canton Bramble. W. E. GUMBLETON.

A VILLAGE SHOW AND SPORTS.

We cannot help feeling that if private cottage garden shows of the kind inaugurated by the thoughtfulness and energy of Miss Willmott, for the united villages of Great and Little Warley, were more general much might be done to bring back somewhat of the old English heartiness and gaiety, with, perhaps, an element of betterment intermingled with it in the direction of refinement. They would, besides, help to draw classes together which are slowly but surely drifting apart to the detriment of both.

It was matter for rejoicing that the weather on the 3rd inst. was in happy mood, and lent its aid to the carrying out successfully of a most promising programme. Not the least part of the day's enjoyment was due to the throwing open of Miss Willmott's beautiful garden and grounds.

All efforts of this unselfish nature entail a great amount of labour upon their devisers, but it is work which, in the main, brings a well-earned reward. The absence of any professional element in the Warley cottage garden show proves the sympathetic interest taken by the promoters in the attempts of those who are often disheartened by the impossibility of competing against greater knowledge and advantages. A fair start and no favour appeals strongly to the best side of the sturdy British character. This feature should be noted by all who desire to emulate so good an example and to set on foot a similar enterprise for the welfare and cheer of their poorer neighbours. We have rarely seen a list of prizes more calculated to attract every member of a village community and to bring an interest throughout the whole year into homely working lives. The recent

words of the Dean of Rochester on the good influence of horticultural shows of this simple character are much to the point: "If you can induce a working man to take some pains with his vegetables, and teach his wife how to cook them, you will do more to keep him sober than all the blue ribbons and pledges worn or signed." May the pleasant gathering at Warley Place be fruitful in all excellent results.

Most indefatigable was the honorary secretary and treasurer, Colonel Whittington, C.B., of Codham Hall, and his painstaking endeavours to have everything done in a business way contributed materially to the success of this, the fifth cottage show, and we must not forget the work of his assistant, Mr. Preece, head gardener to Miss Willmott.

There were several groups not for competition which made the tents bright with colour. Messrs. R. Wallace and Co., Kilnfield Gardens, Colchester, set up a fine group of Lilies, Gladioli, and other bulbous and herbaceous plants. Of Lilies we noted the massive *Auratum* platyphyllum and its forms in excellent condition, the beautiful *L. Henryi*, the richly coloured forms of *L. speciosum*, such as the broad petalled *cruentum*, *rubrum*, and *album novum* (white); *L. Maximowiczii*, a refined Tiger Lily, with *L. Batemanii*, and the double and single forms of *Tigrinum*. Gladioli were in strong force, some fifty varieties were displayed in bold fashion, and of these we noted the singularly coloured *Mephistopheles*, deep red with white throat; *Van Dael*, pale salmon-pink, a plant that received the Royal Horticultural Society's award of merit at the last Drill Hall meeting; *Chrysolora*, a fine variety of yellow tint, with a carmine lip; some very beautiful blue, violet, and purple seedlings of the *Lemoinei* type; the magnificent *G. princeps*, whose enormous flowers of rich scarlet hue were greatly admired, and some large flowered varieties of the *Childsi* group, such as *Mezin* Scott, *Columbia*, and *Mrs. Beecher* were splendid in their richness. Of miscellaneous plants *Montbretia*, *Germania* (orange-red), and *Crocus* (old gold) were good; *Colchicum*, *Bornmulleri*, and a large variety of *Autumnale* are showy kinds of autumn *Crocus*, and the yellow cups of *Sternbergia macrantha* were well displayed in masses here and there. *Tigridias*, which appear wonderfully effective on the exhibition table, were shown in six varieties, all from buds cut the previous day and developed in water. Other good things included seedling *Delphiniums*, cut flowers of a new race of hybrid *Gazania*, some of the choicer *Tritomas*, such as *Macowani*, *Rufus*, and *Lemon Queen*; and the variegated *Water Reed*, *Phragmites* fol. var., an excellent plant for damp and marshy places.

Messrs. Russell and Sons, Richmond, had a beautiful collection of cut Roses and trees and shrubs.

A capital collection of fruit was shown by Mr. Preece, and flowers also; and Sweet Peas by Mr. Brown of Brentwood.

It was a most successful little show, and in the afternoon the sports were held near the house. These were organised most successfully by Mr. Berkeley, and Mrs. Berkeley also did everything possible to make the day a pleasant one for the villagers.

SOCIETIES.

DUMFRIESSHIRE AND GALLOWAY HORTICULTURAL SOCIETY.

THE floral fête, under the auspices of this society, held in Castledykes Park, Dumfries, on the 28th and 29th ult., was among the best it has held since its foundation in 1812, both the number of exhibits and the cultural skill they displayed being greatly in advance of last year. The show was gracefully opened by Mrs. Balfour-Browne, of Goldielee, followed by an eloquent speech by Mr. Balfour-Browne, K.C.

The tables and groups of plants and the dinner table decorations were among the best ever seen in Dumfries. In the class for table of plants arranged for decorative effect, Messrs. James Service and Sons were first, winning the Borough of Dumfries Cup and a money prize over last year's winner; Mr. J. M. Stewart, Mollaness, Castle Douglas, who also showed an exceedingly fine table, was second; Mr. J. Houston, Crichton Royal Institution, was third, and W. Middleton and Son, Dumfries, fourth. For a circular group of plants Messrs. Service were first; Mr. R. Grigor, Woodlands, being a good second; third, Mr. J. Houston.

There were six competitors for dinner table decorations,

and eventually Miss Jean Service, Janefeld, was placed first; Kerr Bros., Dumfries, second; and Miss L. Rutherford, Crichton House, third. The competition was very close indeed.

The open classes were well filled, Palmer and Son, Annan, being first for twenty-four Rose blooms; second, W. Learmont and Son, Dumfries; third, J. Bogle and Son, Dumfries. Eighteen Tea Rose blooms: First, Mrs. Rutherford, Crichton House; second, W. Learmont and Son. Collection of Dahlias: First, J. Bogle and Son. Twelve sprays Cactus Dahlias: First, J. M. Stewart, Mollaness; second, J. Bogle and Son. Carnations: First, Kerr Bros. Sweet Peas: First, W. Learmont and Son; second, W. Adamson, Woodbank; third, W. Middleton and Son. Hardy herbaceous flowers: First, W. Middleton and Son; second, T. Kennedy and Co., Dumfries; third, W. McGuffog, Balmac, Kirkcudbright.

Floriata Class.—Table glasses of flowers: First, Kerr Bros.; second, Middleton and Son; third, Miss Rutherford, Crichton House. Basket of flowers: First, K. Mackenzie, Conneath; second, W. Adamson; third, Miss Jean Service. Bouquets (showers): First, Kerr Bros.; second, W. Middleton and Son. Basket of Roses: First and second, K. Mackenzie; third, Miss Rutherford.

In the gardeners' and amateurs' classes there was very strong competition, the leading prize-taker with pot plants being C. M'iver, Lincluden.

In cut flowers the following led in various classes: Miss Whitelaw, Summerhill, and Messrs. C. M'iver, W. McGuffog, K. Mackenzie, J. Duff, Threave; J. Mundell, Allanbank; R. Young, Gracefield; T. and W. Tweedie, Monswald; J. M. Stewart, J. Wright, Locharbriggs; J. Houston, D. Whitelaw, Locharbriggs; and J. Henderson, Elmbank, Dumfries.

Outdoor fruit was not so good as last year, but that from under glass was superior. Mr. J. M. Stewart had the best collection of indoor fruit; Mr. B. Rutherford, Glenlair, that grown outdoors. Grapes were very fine, Mr. J. Henderson, Mr. B. McDonald, Mr. J. Duff, and Mr. J. Houston taking the chief prizes. Vegetables were a strong class with both gardeners and amateurs, Mr. J. Duff being first for a collection of twelve, and Mr. W. Anderson, Collin, for six.

Non-competitive exhibits were not numerous, the principal being tables of plants from T. Kennedy and Co., Dumfries, and Fotheringham and King, Dumfries; Roses from Palmer and Son, Limited, Annan; Dahlias from Mr. J. Kennedy, Dumfries; Onions from Mr. McGuffog, Balmac; and garden seats, &c., from Mr. Pollock, Tarbolton.

ROYAL HORTICULTURAL SOCIETY OF IRELAND.

AUTUMN SHOW.

THE autumn show of flowers under the auspices of the Royal Horticultural Society of Ireland was held in Merrion Square, a centre which, by reason of its easy access and pleasant situation, lends itself admirably to displays of this kind. His Excellency the Lord Lieutenant and the Countess of Dudley visited the flower show at four o'clock, and on arrival at the entrance they were met by the following gentlemen representing the council: Mr. Goodbody, Mr. Drummond, Mr. Bewley, Captain Ryall, and Mr. Walter Keating, jun., secretary, and conducted through the several tents in which the plants, blooms, and fruits were displayed. In the matter of exhibits it was very satisfactory to see that there was a considerable increase in every section, and in the quality of most of the displays there was an extremely creditable improvement noticeable. It was decidedly interesting to note that cut flowers were largely and well shown, notwithstanding the unfavourable climatic conditions under which they have been grown this season. Dahlias, especially the newer class of Cactus, were remarkably well exhibited, both in quantity and quality; but the centre of attraction and the feature of the show was the large table of Roses exhibited by Messrs. Alexander Dickson and Sons, Limited, Royal Irish Nurseries, Newtownards, and 61, Dawson Street, Dublin, who exhibited upwards of 100 blooms of the highest excellence. The flowers staged were of unusual size and substance for the season, and may be well described as a capital display. Fruit was also well represented, and, in fact, all the sections of this interesting show were extremely creditable, making the work of the following gentlemen, who acted as judges, not too easy: Plants, Mr. A. C. Campbell and Mr. R. Davis; cut blooms, Mr. W. E. Gumbleton and Mr. R. Anderson; fruit, Mr. Bedford and Mr. C. B. Hamilton. Taking the show generally, it was extremely satisfactory to notice that the exhibits were probably representative of a larger area of the country than on any previous occasion, and this fact would seem to indicate that a more satisfactory period is being entered upon. An apparatus for the destruction of weeds on lawns, tennis and croquet grounds, &c., without injury to the surrounding turf, received a good deal of attention from visitors to the show. The instrument is in the form of a sharp-pointed syringe, which is pushed down into the weeds and ejects sufficient of the fluid into the roots to kill them. Dandelions, Plantains, Docks, and other such troublesome weeds can thus be completely got rid of. The apparatus is manufactured by Messrs. Mark Smith and Co., Limited, and can be had from Mr. D. M. Watson, pharmaceutical chemist, 61, South Great George's Street, who is also the Irish agent for their well-known "Perfect" weed killer, liquid and powder. It is only right to say we are indebted to the *Daily Express* (Ireland) for the above particulars.

PLANTS.

Group of foliage and flowering plants, twelve, each different, Ferns excluded: First, Mr. F. A. Millar (gardener, Denis Colohan); second, Mr. David Drimble (gardener, J. Byrne). Exotic Ferns, six, each different: First, Mr. F. A. Millar; second, Mr. W. W. Goodbody (gardener, Thomas Doherty); third, Mr. David Drimble.

Six Coleus, each different: First, Mr. J. Millar (gardener, Phillip Geoghegan); second, Mrs. Meade (gardener, J. Colgan); third, Mr. F. A. Millar.

Dahlias, Cactus, stand of twenty-four, not less than twelve varieties. A challenge cup, value £5, and first prize

presented by Lord Ardilaun. Cup to be won three times before becoming the property of the winner. The society adds second and third prizes: First, Lady Frances Doyle (gardener, James Mitchell); second, the Right Hon. Lord Carew (gardener, John McLennan).

Dahlias, Cactus, twelve sprays, three blooms in each, each spray to be a distinct variety, and Dahlia foliage only to be used. The general effect and method of staging to be taken into consideration as well as the quality of the flowers. A challenge cup, value £5, presented by Messrs. William Watson and Sons, Clontarf Nurseries, Dublin. The cup to be won three times before becoming the property of the winner. Money prizes awarded by the society: First, Lady Frances Doyle; second, Right Hon. Lord Carew; third, Right Hon. Lord Ashtown (gardener, A. Porter).

Dahlias, Pompon, stand of twelve bunches of three blooms each, not less than six varieties: First, Colonel the Hon. C. F. Crichton (gardener, W. F. Mitchison); second, Mr. John Miller; third, Lady F. Doyle.

Roses, stand of twelve blooms, not less than six varieties: First, Mr. F. A. Millar; second, Captain Mark Munnell (gardener, John Ahern); third, Colonel the Hon. C. F. Crichton.

Roses, Tea, stand of twelve blooms, not less than six varieties: First, Mr. Edmund D'Olier (gardener, J. Harvey); second, Mr. F. A. Millar.

Gladioli, stand of twelve spikes, not less than six varieties: First, Sir Roger Palmer, Bart. (gardener, C. Brennan); second, Colonel Jervis-White (gardener, W. Fitzgerald).

Begonias, double tuberous, stand of thirty-six separate blooms, in at least eighteen varieties. Challenge cup, value £7, presented by Messrs. Hartland and Son, The Lough Nurseries, Cork, with money prizes added by the society. The cup to be won three times before becoming the property of the winner: First, the Right Hon. Lord Ashtown (gardener, A. Porter); second, Dr. Perrier Osborne (gardener, A. E. Bennett).

Begonias, double tuberous, stand of twelve separate blooms, not less than six varieties: First, the Right Hon. Lord Carew; second, Captain Mark Munnell.

Collection of hardy cut flowers, annuals and biennials excluded, to be shown in vases which will be provided by the society. Space not to exceed 16 feet by 4 feet. Prizes presented by Lord Ardilaun: First, the Right Hon. Lord Plunkett (gardener, W. Webster); second, the Right Hon. Lord Carew; third, Lady M. F. Doyle.

Asters, any variety, stand of twelve blooms. Prizes presented by Messrs. William Drummond and Sons, Limited: First, Mr. Reginald T. Harris; second, Mr. David Drimmlie.

Carnations or **Plochees**, stand of twelve bunches, three sprays of one variety with foliage to form a bunch, at least six varieties, Malmalsons excluded: First, Mr. John Smallman; second, Surgeon-General Beaumont (gardener, J. M'Linden); third, the Marquis of Sligo (gardener, James McKenzie).

Twelve bunches Sweet Peas, twelve distinct varieties named, to be shown in vases, which were provided by the society: First, Mr. H. J. R. Digges; second, Captain D. J. Palmer (gardener, J. Ford).

Six bunches Sweet Peas, six distinct varieties named, to be shown in vases, which were provided by the society: First, Colonel the Hon. C. F. Crichton; second, Lady M. F. Doyle.

Dahlias, show, stand of twenty-four blooms, not less than eighteen varieties: First prize and silver medal, Messrs. Alexander Dickson and Sons, Royal Nurseries, Newtownards; second, Messrs. W. Watson, Clontarf Nurseries.

Dahlias, Cactus, stand of twenty-four blooms, not less than eighteen varieties: First, Messrs. William Watson and Sons; second, Messrs. Richard Hartland and Sons; third, Messrs. Alexander Dickson and Sons.

Roses, stand of forty-eight blooms, not less than twenty-four varieties: First prize and society's silver medal, Messrs. Alexander Dickson and Sons. A cultural certificate was also given.

Gladioli, stand of twenty-four spikes, each different: First prize and society's silver medal, Messrs. Hartland and Son.

FRUIT AND VEGETABLES.

There was excellent competition in the many classes provided for these. For a stand of six bunches of Grapes the first prize and society's silver medal went to Lady Emily Bury (gardener, R. McKenna), the second prize going to Lord Ashtown, and the third to the Marquis of Downshire (gardener, Thos. Bradshaw).

In the open classes for fruits and vegetables the chief prize-winners were Lord Ashtown, Lady Emily Bury, Mrs. Meade (gardener, James Colgan), the Marquis of Downshire, Lady M. Doyle, the Marquis of Sligo, Mr. Hamilton Stubber (gardener, F. Flanagan), and the Right Hon. Lord Plunkett (gardener, W. Webster); and in vegetables Lord Ashtown, Captain D. C. Palmer (gardener, T. C. Ford), Colonel the Hon. C. F. Crichton, and Sir Roger Palmer (gardener, C. Brennan).

MISCELLANEOUS.

A cultural commendation was awarded to Colonel the Hon. C. F. Crichton for a collection of Sweet Peas.

Messrs. Hartland and Sons, Cork, showed Gladioli, hardy flowers, zonal Pelargoniums, and superb Begonias. Gold medal.

Messrs. Ramsay and Sons, the Royal Nurseries, Balls Bridge, had a beautiful stand of plants and floral designs, besides an interesting series of Gladioli. Gold medal.

Messrs. Drummond and Sons showed hardy flowers in great variety, Roses, Sweet Peas, and other things. A delightful exhibit. Gold medal.

Messrs. Edmondson and Sons, Dame Street, had Asters in fine variety, and received a special commendation.

Messrs. Dicksons, Chester, had hardy flowers in profusion; a very fine display. Silver medal.

Messrs. Watson and Sons, Clontarf, had Pompon and Cactus Dahlias in great variety, also Carnations of very fine sorts, one, a seedling, being specially noteworthy. We should like to know its name. Silver medal.

Valotta purpurea was superbly shown by Mr. F. A. Millar.

Messrs. Hogg and Robertson showed Gladioli in great variety.

Messrs. Alex. Dickson and Sons, Newtownards, had hardy flowers, which made a bright display.

The officials are to be congratulated on the success of the exhibition.

CROYDON HORTICULTURAL SOCIETY.

THE fourth annual outing of the Croydon and District Horticultural Mutual Improvement Society took place on Wednesday, the 2nd ult., about thirty members availing themselves of the day's pleasure. Starting from the headquarters in George Street, the party had a most enjoyable drive to Burford Lodge, where, through the kindness of Sir Trevor Lawrence, they were shown round the gardens by Mr. Baines, the able head gardener. The visit proved full of interest and enjoyment. Afterwards the drive was continued to Dorking, where luncheon was provided. In the afternoon, Albury Park, the residence of His Grace the Duke of Northumberland, was the rendezvous, and the spacious gardens and pleasure grounds were inspected. On the return journey a stop was made for tea, after which the homeward journey was continued.

A new departure in the programme of this society was successfully carried out at their rooms recently, when "Discussions on Floral Decorations with Demonstrations" created a very enjoyable two hours' entertainment. The principal interest was centred on three dinner tables, which had been tastefully decorated by Messrs. M. E. Mills, A. Maalen, and P. F. Bunyard respectively, and the decorative excellence in the floral art displayed by these gentlemen called forth much praise from all present. The discussion was principally on table decorations, but many useful suggestions were given on other decorations, which will prove beneficial to those who require fresh and pleasing ideas for this subject. As we are all aware, this part of the gardener's work forms a very important item, and new designs are eagerly sought after. To the amateur also it is very interesting, for no decoration in the house lends such brightness to the rooms as flowers. Other interesting exhibits came from Mr. W. Bentley, who brought *Drosera rotundifolia* (one of the British species of Sundew); from Messrs. Thompson and Sons, Wimpoleton, a specimen plant of the new double-flowered *Gypsophila paniculata*; from Messrs. Wells and Co., Earlswood, two new *Chrysanthemums*, *The Champion* and *Carrie*, the former having that day gained an award of merit at the Royal Horticultural Society's meeting in London; and from Mr. A. C. Koffey four excellent specimens of his Improved Telegraph Cucumber. A hearty vote of thanks to the exhibitors brought the evening to a close.

The next meeting will be on Tuesday next, when Mr. G. W. T. Shrubhall will take for his subject "Cryptogamic Plants."

CARDIFF GARDENERS' ASSOCIATION.

THROUGH the kind invitation of Mr. John Basham, F.R.H.S., Fair Oak Nurseries, Bassaleg, thirty of the members, starting from the Grand Hotel (headquarters) in brakes, drove to Bassaleg and were entertained by Mr. and Mrs. Basham to a sumptuous tea. Afterwards the party were conducted through the fruit gardens, where a fine stock of Apple and Pear trees are carrying very heavy crops, particularly the following varieties: Allington Pippin, remarkably fine; Bismarck, grand; Colonel Vaughan; Kilmville Seedling, an enormous crop; Lady Sudeley, Lane's Prince Albert, an enormous cropper and an abundant supply; The Queen, spoken of as a shy bearer, carrying enormous crops; Schoolmaster, good; as also were Stirling Castle and Warner's King, and very fine fruits of Peasgood's Nonsuch. Young Pear trees on walls were carrying good crops. Plum trees were remarkably good. A cleaner and healthier lot of fruit trees it would be impossible to find, and though Mr. Basham suffered failure last year he is amply rewarded this season, for tons of Apples are approaching maturity. Light refreshments were served in the gardens. After thanking Mr. and Mrs. Basham for their kind hospitality, the brakes conveyed the party back to headquarters after spending a most enjoyable outing.

JOHN JULIAN, Hon. Sec.

BRISTOL GARDENERS' ASSOCIATION.

THIS association held its monthly meeting at St. John's Rooms on Thursday evening, the 3rd ult., Mr. E. Poole, F.R.H.S., occupying the chair. The lecture for the evening was on "Bees," and was given by Mr. Jordon, of the Bristol Bee-keepers' Association, who in a very able and clever manner described the best methods of modern bee-keeping as against the old-fashioned and barbarous ways of our forefathers, showing that by the use of the modern bar-frame hive bees can be handled with impunity, examining at will and getting the fullest and best results from their labours. He advised bee-keepers to make a special study of these industrious insects, which would help them considerably to become successful bee-masters. Gentlemen were becoming more interested in agriculture, and were realising the advantages through keeping in their gardens a hive or two of bees for fertilising their flowers and fruit. The time at the disposal of Mr. Jordon was, unfortunately, too short for such an interesting subject, and he was asked to continue his lecture at some future date, which he promised to do. A discussion followed Mr. Jordon's lecture, and a cordial vote of thanks was passed for the most enjoyable evening.

CHARD FLOWER SHOW.

THIS show was held on a recent date, and the number of entries showed a gratifying increase over those of last year. The exhibits were staged in three large marquees. In the amateurs' tent, as usual, the ladies' exhibits were a great attraction, and we wish there had been many more visitors present to admire the exquisite taste and skill displayed by the exhibitors. In this section, Miss Grace Chaffey, of

Chard, was most successful, securing no fewer than three first prizes for, respectively, decorated dessert table for six persons, device for table decoration, and hand bouquet. In each case this was well deserved. There were seven tables arranged for dessert, and the judges must have had some difficulty in deciding the second honours, which went to Miss Florence Spicer, Mrs. F. W. Baker, of Arminster, being highly commended. In the class for buttonholes Miss Chaffey had to give way to Miss M. Powne. Miss Evans, of Forde Abbey, sent collections of flowering and foliage plants and fruit not for competition. Both were beautifully arranged, and the former was remarkable for the fact that the whole of the plants were either grown in a frame or the open air. It was, indeed, an object-lesson, showing what can be done at a nominal expense. The flowers in almost endless variety and very fine specimens.

Messrs. Jarman and Co., of the Chard Nurseries, represented by a grand lot of Dahlias and other plants. This firm had sent a splendid exhibit to Shrewsbury on the same day, for which they were awarded the gold medal.

Dahlias were, as usual, a strong class, Mr. B. C. Shaw and Mr. W. Heilair being the principal exhibitors.

Mr. Baker and Mr. Small took the prizes for Roses, Mr. Lionel Patton and Captain Elton showed charming varieties of Sweet Peas.

With regard to the flowers generally, it was remarked that the exhibits would have been far more attractive had they been shown with their natural foliage, instead of being laid out in their bare state or with "paper collars" round them.

Major Aldworth secured first prize for a perfect collection of vegetables, twelve kinds, and Mr. J. Wyley took the blue card for a collection of six.

The cottagers were well to the front in all classes. The collections of vegetables were especially good, whilst the prize-winning dish of twelve cooked Potatoes was an ideal exhibit. The children's bouquets and collections of wild flowers were altogether charming.

"JUDGING CACTUS DAHLIAS."

On the 1st inst. Mr. Wyatt gave a lecture before the Royal Horticultural Society on "Judging Cactus Dahlias." Our report was unavoidably crowded from last week's issue. Mr. Wyatt said that some standard for judging Cactus Dahlias was necessary. A good bloom should have long and narrow florets, recurved at the edges; there must be no flat florets. The following table of points for judges was recommended by the lecturer: Form, 4 points; size, 3 points; colour, 2 points; setting up, 1 point. With regard to the points for size, Mr. Wyatt said the maximum should never be given when the bloom was coarse. Concerning the judging of bunches of one variety, Mr. Wyatt said the whole bunch should be considered as one flower, and not each bloom judged on its merits.

The Rev. W. Wilks thought more points should be given to colour than size; he deprecated mere size in flowers. With respect to form Mr. Wilks thought that it was wise to fix too strict an ideal, as ideas as to the correct form of flowers change.

Mr. Stredwick said he preferred small Dahlias. Personally he would rather grow flowers of the Cactus Dahlia more than 8 inches across. With regard to setting up the blooms at exhibitions Mr. Stredwick thought points ought to be given for that. The flowers might be well grown, but not everyone could exhibit them well. At the forthcoming Earl's Court show Mr. Marshall will offer a prize for small Cactus Dahlias, and if these were successfully encouraged they would be much admired.

Mr. F. Treseder favoured size in a flower provided other qualities were present also. He thought the National Dahlia Society should not lay down specified rules as to what constitutes a Cactus Dahlia, as tastes differ. Another speaker also supported the contention that size is important provided the bloom does not lose in refinement. Mr. J. F. Hudson said that a false idea with regard to size was being put forth; a large bloom might be refined. He thought, however, that small blooms were more beautiful. Mr. Edward Mawley, the chairman, was of opinion that also ought to be considered, but not size alone.

Weather in North Wales.

—The following notes may be of interest to readers of THE GARDEN: The month of August was most unfavourable as regards rain, wind, and cold. Potatoes are showing signs of disease, and other crops are suffering from the extreme wet. We have registered the following for August: Rain, 5'34 inches. On seven days there was not enough rain to register, and only three really fine days. On three nights the thermometer fell below 37° Fahr., and on four nights below 40°, with very rough and cold east winds.—J. S. HIGGINS, *The Gardens, Râg, Corwen, North Wales.*

Mr. Robert Sydenham.—Many friends of this well-known horticulturist, who a short time ago started upon a voyage for the benefit of his health, will be gratified to learn that he has safely arrived at the Cape of Good Hope, and was feeling—to use his own words—"wonderfully better for the trip, and quite himself," and, after visiting the principal towns in that portion of Africa, he "hopes to return fit and ready for anything." In all probability he will be present at the exhibition of the National Chrysanthemum Society, to be held at the Crystal Palace early in November.

LADY WARWICK COLLEGE, STUDLEY CASTLE, WARWICKSHIRE, IS THE NEW AND PERMANENT HOME OF LADY WARWICK HOSTEL.

THE NEW COLLEGE.

Studley Park consists of 340 acres, of which some 20 acres are given to Gardens and Shrubberies.

Students thoroughly trained in all Branches of Horticulture, Fruit Growing and Market Gardening

Under Mr. W. TUGGLES, F.R.H.S., and Miss MAY CROOKE, F.R.H.S.

In Dairy Work, Butter and Cheese Making, Miss CONSTANCE HOARE, N.D.D.

In Poultry Keeping, Mr. GEO. A. PALMER and Miss BERTHA LA MOTHE, N.D.D.

In Bee Keeping, Mr. W. HERROD and Miss BERTHA LA MOTHE (Bee Expert).

In Fruit Bottling and Preserving, Miss MAY CROOKE. FEES, INCLUDING BOARD RESIDENCE AND TUITION, STUDY BEDROOMS, £100 TO £120. CUBICLES £60. The Session 1903-4 will commence about the middle of Sept.

Application for admission should be made to THE WARDEN, Lady Warwick Hostel, Reading. Illustrated Report, 74d. (Post Free).

THE OLD HOSTEL.

MAKE THE BUSINESS OF 1903 AN ORDER

FOR CLAY'S

(Should accompany that for Seeds, Plants, &c.)

Sold Everywhere in 6d. and 1/- Tins and Sealed Bags, 7lb., 2/6; 14lb., 4/6; 28lb., 7/0; 56lb., 12/6; 112lb., 20/-. Or direct from the Works, Carriage Paid in the United Kingdom, for Cash with Order (except 6d. Tins).

Every Tin, Bag and Seal bears the TRADE MARK as shown in centre of Cross; the only Guarantee of Genuineness.

FULL DIRECTIONS FOR USE APPEAR IN

CLAY'S SUCCESSFUL GARDENING.

Containing Instructions upon all Horticultural Topics by Eminent Writers. 144 pages, Illustrated. Second Edition, Enlarged and Revised, Sixpence, post free.

Write for full PRICE LIST of Manures, Chemicals, Sundries, &c.

Price 6/3 for 1-Gallon Drum, Delivered Free.

The THAMES CHEMICAL CO. (Dept. A.) 50, Fenchurch Street, London.

AGENTS WANTED.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—V. E. W.—*Isotoma longiflora* (see Bot. Register, xiv., t. 1200).—W. E.—1, *Elmagnus pungens* variegata; 2, *Cypripedium Curtisii*; 3, *Eunonymus radicans* variegatus; 4, *Olearia Haastii*; 5, *Cupressus lawsoniana*.—A. K.—*Gentiana asclepiadea*.—C. E. F.—*Hypericum androsaemum* (The Tuisan).—T. Walker.—*Hibiscus syriacus*.—Cyclist.—The sketch you sent certainly does not represent either *Malva* or *Mimulus*; the only plant that we can associate it with is *Hypericum humifusum*, it more resembles this than any other. —J. M. W.—*Saxifraga Alzoon rosularia*.

J. D.—Apparently *Lathyrus rotundifolius*. It is difficult to judge accurately from a spray of unexpanded blooms, and in such a case foliage should always accompany flowers, as it greatly assists identification.

Fungus (LETTER LOST).—The fungus sent is a common species, *Pholiota squarrosa*. It will not to any appreciable extent injure the trees, but the fungi may as well be destroyed as soon as they appear, in case they spread to an unusual extent. —G. S. S.

Vegetable growth on carriage drive (T. R. OWEN).—The vegetable growth which has appeared on your carriage drive is one of the Algae. I am away from home, but will let you know all about it on my return. Any of the ordinary weed killers would, I expect, destroy it. —G. S. S.

G. H.—We do not think much of your selection of Roses; Mme. Falcot, Souvenir de S. A. Prince, Rosierette Jacobs, Grisea on Tepitz, and Catherine Mermet are certainly not a good selection. We should substitute Maman Cochet, White Maman Cochet, Mme. Hoste, George Nabonnand, Dr. Grill, Anna Olivier, and Souv. de Catherine Guillot. We should try a bed of the pure scarlet *Princesse de Sagan*. Its flowers are of wonderful colour, but the growth of the plant is weak. The advice in the "Century Book of Gardening" is quite correct.

Destroying thrip and mealy bug (R. K.).—The best insecticide we know of for the destruction of the above pests is Richard's XL All fumigator. It may be had of all nurserymen and dealers in horticultural sundries. A good home-made solution is the following: To 1 lb. of soft soap add half a pint of paraffin and half a pound of black sulphur. Mix the whole well together in two quarts of warm rain water. For syringing the foliage of Peaches or plants add a pint of this mixture to three quarts of water. As a winter dressing for fruit trees it may be used stronger, say half a pint to a quart of water.

Peaches and Vines.—What are the relative merits of Dagmar, Crimson Galande, Dr. Hogg, Violette Hative, and Alexandra Noblesse?—R. K., St. Petersburg. [Our correspondent's observations on the merits of these varieties are so much to the point, and give evidence of such close and critical observations of their qualities, that we doubt if we can help him much further. We would observe that situations and soils exercise varying influences on varieties of Peaches, as they do on many other fruits, so that the grower himself, after a few years' experience and trial with many sorts, must be the best judge as to the varieties which succeed best with him, and with which he is best pleased. Speaking in a general way, it will be found that all fruits possessing the highest qualities as to richness and delicacy of flavour are less robust in growth, and more uncertain as to their cropping qualities than are the varieties possessing ordinary qualities of flavour. Therefore the grower must make up his mind whether to grow a variety of fairly good quality as to flavour, but a sure and heavy cropper, or to be satisfied with a variety possessing the highest quality of flavour but uncertain in cropping. Our estimate of Crimson Galande is very much on a par with our correspondent's. It is certainly handsome, and, we think, of more excellent flavour than Dagmar or Dr. Hogg. These, however, are heavier croppers. Moreover, Dagmar ripens a fortnight or three weeks earlier than Crimson Galande, and Dr. Hogg a week earlier. As regards Alexandra Noblesse, it is a better cropper than its parent, the old Noblesse, and equal to it in flavour and texture of flesh; but it is not a heavy and certain cropping variety, and it is more or less subject to stone splitting. Violette Hative is one of the best standard Peaches we have in England. It is of large size, handsome appearance, delicious flavour, a robust grower, and a good cropper. —E. J.]

The Ivy-leaved Pelargoniums, Abutilons, and Plumbago capensis (R.).—Plants such as may be seen in Hyde Park have taken several years to attain their present size, and are grown altogether in pots, being plunged outside during the summer months. The plants in question are not standards in the ordinary sense of the word, as they are not restricted to a single stem, but are allowed to grow naturally, with the exception of shortening back any particularly vigorous shoot that threatens to interfere with the shape of the plant. The subjects named can all be readily struck from cuttings, for which purpose good, clean short-jointed shoots should be chosen. As the object is to obtain large plants in as short a time as possible, they must be shifted into larger pots when necessary, and from the

commencement should be tied erect to a stout stake. If the cuttings are put in about April and grown in a greenhouse, giving them plenty of room during the summer, they will be well established by the autumn in 6-inch pots. In this stage they may be wintered in the same structure, and in spring shifted into pots 9 inches or 10 inches in diameter. After potting they should be kept somewhat warmer than in an ordinary greenhouse, and frequently syringed in order to start them freely into growth. It is necessary that they be thoroughly hardened off before bedding out time, when they may be plunged out of doors. Given fair sized plants to commence with effective specimens can of course be obtained in less time than from cuttings. When plunged out of doors a little stimulant during the growing season is beneficial. Being lifted in the autumn and wintered in a good light position in the greenhouse any that need it may be shifted in the spring into large pots. With regard to the latter part of your enquiry the plants will not need pruning, and a genial greenhouse temperature in early spring is sufficient for their requirements. For a standard proper, that is, plants with a certain amount of naked stem surmounted by a head, the Plumbago is not suited, while the Ivy-leaved Pelargonium needs a wire framework, as their branches are very brittle. Abutilons, however, readily lend themselves to this treatment, and compact heads can be maintained if the plants are spurred back every winter. The present backward season is against this class of plants, for a visit to Hyde Park on the 1st ult. revealed the fact that though the Ivy-leaved Pelargoniums were giving a moderate display of bloom, there was scarcely a flower on the Plumbago, and a bed of *Erythrina Crista-galli*, usually so telling, had but a solitary bloom expanded. The most effective of the flowering subjects plunged on the grass were some large plants of the dark-coloured *Heliotrope President Garfield*, which were laden with bloom.

Vines deteriorating (A. N.).—The details you give with respect to the change on the part of your Vines from comparative excellence in fruiting to now material badness, is hardly sufficient to enable a proper opinion to be formed by us. Changes of this kind do not occur all at once, but come gradually. If the Vines were so good last year and are so indifferent now, then it would be evident that some sudden check had been given them, such as might arise from the flooding or over-saturating the border in which the roots are by too heavy rains. If the process of deterioration has been spread over two or three years, then it is evident that the roots have got out of the good soil or proper border, into sour and, perhaps, wet soil, below where they fail to find proper nutriment. That is a common cause of deterioration in Vines, and can only be remedied by taking the drastic course of removing all the top soil, finding, lifting, and tying up the roots, removing 12 inches of the bottom soil, putting in 6 inches of coarse rubble, then adding 9 inches of good loamy soil on to that, relaying the roots carefully, adding some fresh soil, and covering them finally about 4 inches to 6 inches with the original soil. In doing this it is very important that a good proportion, say a bushel, or even a wheelbarrow full per carload of wood ashes, old mortar refuse, soot, and just a small quantity, a pint per bushel, of bone dust be added and mixed with all the soil used. This is the method adopted by the best Grape growers when their Vines get into the same condition as yours now are. Shanking of bunches and the production of aerial roots both arise from poor root action. Vine roots should never be buried deep. In the great market vineries they are encouraged to keep near the surface, and are during the fruiting season fed from the surface with top-dressings of patent manures and mulches of animal manures. The best book for your purpose is "Vines and Vine Culture," by the late Archibald F. Barron, price, per post, 5s. 6d. You may obtain it from the publisher, 12, Mitre Court Chambers, Fleet Street, London. The book treats very fully of Vine renovation. It is a book that should be in the hands of every Grape grower in the kingdom. The process of lifting roots may be commenced as soon as the leaves have fallen. When the work is completed, the soil has settled, and young roots have been in process of formation, all of which will soon follow, then hard prune the Vines. February will be a good time for that. Do not attempt to push new growth with the aid of heat until early in April.

Vines and summer production of surface roots.—Will you please tell me the best means to use for the summer production of surface roots and the best manure to apply for their sustenance and multiplication?—R. K. [This is an interesting subject, and we do not think it has received the attention at the hands of gardeners its importance as a factor in the successful cultivation of Grapes entitles it to. The best medium to apply for the encouragement of the growth of these surface roots in summer, according to our long experience, is fresh horse manure mixed with an equal quantity of loam and a slight sprinkling of bone-dust. The whole should be well mixed together before applying to the border, and should be laid over the border in the first instance as soon as the Vines have set a crop of Grapes 2 inches thick when well pressed down. It is astonishing in how short a time this new material will be completely filled with these newly-formed roots, and whenever they are observed clustering thickly on the surface they should be further encouraged to multiply by adding more of the top-dressing to the border. It is by encouraging the multiplication of these roots and by keeping them in good health as long as possible that we help the Vine to carry and mature a heavy crop of Grapes rather than by studying the best manual ingredients to use with water to water the roots with. At the same time water, of course, must be given copiously during summer, and manure water used on each occasion, but it must always be borne in mind that these tiny roots, the creation we may say of a few days or weeks, are extremely sensitive and tender, therefore if we wish to maintain them in good health we must guard them against contact with stimulating manures of a strong nature. We have found the best result to follow the application of manure water from the stable or cowyard in a weak solution and warmed to the same temperature as the vinery. The application of

stimulants may be varied with advantage by watering at one time with water from the stable yard, at another with soot water, at another with guano water, and so on, but always with the stimulants in weak solution to avoid the possibility of injuring these tender surface roots. These roots are of unusual growth, and should be removed each autumn to make way for the annual mulching, which should take place at this time, and also for the repetition of the top-dressing in spring and summer for the encouragement of these summer roots. —Ed.]

Caterpillar (AN OLD SUBSCRIBER).—The caterpillar you found on your Ivy is by no means a full-grown specimen of the caterpillar of the swallow-tailed moth (*Urapteryx sambucaria*), a fine pale yellow moth, with large wings measuring sometimes 2½ inches from tip to tip. The hind wings are produced into a tail-like point. The caterpillars, though common, are never very abundant, and are best destroyed by hand picking. When at rest they resemble a dead twig so closely that at times they are very difficult to find. —G. S. S.

Insects and Cucumbers (HASSOCKS).—This looks very much like the work of woodlice, but you will soon see if you go in the dark with a light, as they will then be at work. Beetles also are quite as troublesome, and do a lot of mischief in a short time, but you may soon get rid of either by using Vall's Beetle-ate, obtained from most seedsmen. This also kills woodlice and ants. The old plan of placing pieces of cut Potato or Carrot in pots attracts them. These are covered lightly with a little hay, and the insects emptied out each morning. Large ones hollowed out are a good bait, the hollowed portion being placed on the soil and the pest shaken out into boiling water each morning. You can obtain Vall's Beetle-ate direct from the maker, 16, Coleman Street, E.C. When your crop is over remove all old soil, dress the brickwork with a strong solution of soluble petroleum, and repaint the crevices to kill all young brood lurking in the soil ready for next season's plants.

Building a greenhouse (T. H. H.).—If the ground on the east side of your garden is free from shade, we should advise you to build your greenhouse there. 1. With regard to style, a plain span-roof structure is far better for plant growing than a more elaborate one, hence we should advise this, with ample top and side ventilation. 2. Though it may be necessary to go down for the foundations, the house itself should be on the ground level, for nothing is gained by sinking it, added to which the removal of the soil is a big item, or, in the event of very heavy rains, water may be troublesome. 3. Span-roof, as in this structure plants grow more symmetrically than in a lean-to. 4. Whichever method of heating is employed the furnace should be outside the structure, for gas or oil lamps inside rarely, if ever, give satisfaction. On the whole we are inclined to favour coal for the purpose, and a good form of boiler may be found in the advertisement pages of THE GARDEN. 5. We should not divide it, for very small structures are particularly liable to extreme fluctuations of temperature. 6. Wood, especially well-seasoned Fitch Pine, is much preferable to iron. In erecting a small house you will find it more economical to consult one of the large horticultural builders, as they keep large quantities of well-seasoned material always in stock.

CATALOGUES RECEIVED.

Bulbs.—Messrs. Sutton and Sons, Reading; Dobbie and Co. Rothesay; Fisher, Son, and Sibray, Limited, Handsworth, near Sheffield; Clibbens, Altrincham, Cheshire; Barr and Sons, King Street, Covent Garden, W.C.; Richard Smith and Co., Worcester; Dickson and Robinson, Manchester; J. R. Pearson and Sons, Chilwell Nurseries, Loughdam, Notts; E. P. Dixon and Sons, Hull; Kent and Brydon, Darlington; H. Cannell and Sons, Swanley, Kent; Frank Dicks and Co., 68, Deansgate, Manchester; John Jeffries and Son, Cirencester; Tuogood and Sons, Southampton; W. Smith and Son, Aberdeen; E. H. Krelage and Son, Haarlem, Holland; Haage and Schmidt, Erfurt; Little and Ballantyne, Carlisle; James Cocker and Sons, Aberdeen; Samson and Co., Kilmarnock; L. Spath, Baumchulenweg, Berlin; and Ant. van Velsen and Co., Haarlem, Holland.

LAW.

LOCAL RATING APPEAL.

MESSRS. WALTER T. WARE, LIMITED, florists, of Englecombe, were assessed to the Poor Rate on an assumed annual value of £370 9s. From this rating they appealed to the Union Assessment Committee, but the committee refused to alter the figure. Notice of appeal to the County Quarter Sessions was then given. Before the hearing came on it was arranged that the matter should be referred to Mr. J. B. Slade (Prothero and Morris), of London, and Mr. W. T. Howes (G. Nichols, Howes, Young, Alder, and Co.), of Bristol, as arbitrators, on behalf of the appellant company, and Mr. H. A. Castle (Castle and Castle), of London, and Mr. C. C. Spackman, of Bath, as arbitrators on behalf of the Union Assessment Committee. These gentlemen could not agree, but appointed Mr. John Alderson Foote, K.C., as umpire. Mr. Castle valued the property for rating purposes at £636. Mr. Foote held several sittings and visited the property, and his award has just been published. Mr. Foote fixes by his award the rateable value of the property at £233 19s. per annum. He also awards that his fee of £24 14s., and also the costs of the reference be paid by the Union Assessment Committee. The case is of considerable importance to nurserymen and owners of horticultural buildings, because the umpire decided that the cost or assumed cost of the buildings could not be taken into consideration for rating purposes, but that the only question was what rent such buildings would fetch. Mr. Isaac Williams was the solicitor for the Union Assessment Committee, and Messrs. Stone, King, Stone, and Thomas, represented Walter T. Ware, Limited. —Bath Herald.

THE GARDEN

No. 1661.—VOL. LXIV.]

[SEPTEMBER 19, 1903.]

THE ALPINE HOUSE IN AUTUMN.

IT is not unusual for those who possess an alpine house to leave it empty during the latter part of the year, which is surely to be regretted. Granted that most of the true alpine plants are all the better for summering out of doors, there are a good many autumn-flowering bulbs—to take bulbs alone—which might be better enjoyed during their season of flowering if brought under the shelter of glass. Many of these, like the autumnal Snowflake (*Acis autumnale*), are too small for the ordinary border, where they would be soon overrun by stronger growths, and are only fit for outdoor cultivation in a well-arranged rock garden. Even the later-blooming species run the risk of being overtaken by heavy rainstorms or cut off prematurely by October frosts. It would be just as well at planting time to reserve a portion of any available stock of such bulbs for potting, so that the alpine house, which is the best place for them during their decorative time, may serve its purpose at all seasons. Both for alpine plants and these rarer and smaller bulbs there is nothing more handy than the sort of cold frame which, when first introduced many years ago, was nicknamed "the curate's vinery." Why these frames are not in more constant use in all gardens is a mystery, as they are most convenient in more ways than one. They consist simply of a span roof of glass, with just so much woodwork as will suffice for strength, resting upon a brick or wooden curb. The more lightly these frames can be built the better, as they are then almost as portable as an ordinary hand-light, and any carpenter can put them together in 6-foot lengths for a few shillings. The inside space is filled with plunging material—either coarse sand or grit, cocoanut fibre, or even sifted coal ashes, which will answer every purpose and effectually keep out worms. Nothing can be better for low-growing hardy plants and alpine plants in pots than this form of cold frame, as they can be practically grown out of doors in them, the glass roof being entirely removed in summer unless heavy thunder showers or any other contingency should make it desirable to give protection. In winter a thick mat thrown over the glass may in some cases be an advantage. Half-hardy plants, whose growing time is in the summer, are generally all the better for the open air quarters which such a frame will provide for them.

Amongst the bulbs which would repay the shelter of an alpine house are the autumn-flowering Crocuses, which are not so familiar as those which come in the spring, and must not be confused with the stronger growing Colchicums. Perhaps the most beautiful of all the autumnal Crocuses is the one best known in gardens, *C. speciosus*, with violet-blue pencilled flowers and orange stigmas, but it is seldom met with in perfection. More often a straggler, here or there, greets us on some sunny day, making one long to see it in established colonies. Perhaps it possesses a rambling habit, or, it may be, the gardener's tidying fork disturbs its summer's sleep; anyhow, it does not often remain long in its appointed place. Besides, it is in flower during September and October, so that we are apt, through adverse chances, to get only a passing glimpse of the brightness that might be. These reasons combine to make it a fit subject for a pot or pan, where it may be restrained within due limits, and the lovely flowers allowed to live out their brief life in peace. A whole series of autumn Crocuses, beginning in August with the Caucasian *C. Scharojani*, the flowers of which are orange-yellow, succeed each other through the later months of the year. *C. iridiflorus*, a distinct purple flowered species, ought to come next in order, from September to October, but one cannot be sure of the vagaries of bulbs in the matter of flowering, as earlier or later ripening may alter their season. The Saffron Crocus (*C. sativus*) is as handsome as any, with its purple petals and the conspicuous scarlet stigma, so easily spoilt by weather. It is in flower during October and November, and there are several well-defined varieties. The flowers of *C. cancellatus* should last through November and December, and vary from white to delicately veined lilac. There are other autumn-blooming species, but these may be taken as a fair selection. Most of them show very little leafage at the time of flowering, and a surfacing of Moss on the pots is an improvement. The charming Italian species (*C. Imperati*), with buff and lilac colouring, may be reckoned as a winter flower, being seldom open before New Year's Day. But enough of Crocuses.

In September *Zephyranthes candida* should be in bloom, and its white flowers rising out of the grass-like tufts of leaves are extremely pretty. This species, with some of its kindred, which flower earlier, is called a swamp Lily, on account of its natural habitat being the marshlands of La Plata and Florida, consequently it

can scarcely have too much water during its growing season. *Z. rosea*, an alpine species from the mountains of Cuba, has rose-red flowers, which appear in September and October. The finest of all the zephyr flowers, however, is the half-hardy *Z. carinata*, a very striking plant, with large, bright pink flowers on stalks 6 inches to 9 inches high, which is said to flower naturally in July and August, though it was in great beauty a year or two ago in the Cape house at Kew in March. Six bulbs are not too many for a 5-inch pot, and the compost of sandy loam, which suits it best, should be mixed with a little crushed charcoal to keep it open and sweet, for, like many other bulbs, this species dislikes root disturbance, and should be repotted as seldom as possible. Few people will be disappointed with it, whether it chooses to flower in autumn or spring.

The bright little Irid, *Anomatheca cruenta*, with salmon-coloured flowers spotted with scarlet, makes no show in the garden, yet it is another of the small but satisfactory bulbs which should not be overlooked as a pot plant, the corms being set rather thickly together. *Oxalis*, again, gives us two charming little autumn-flowering species, *O. lobata*, the deep yellow flowers of which are set like gems amongst the vivid green foliage, and *O. versicolor*, white, with rims of rich Cherry-red edging its furled buds. All the bulbs mentioned, with one or two exceptions, like the parti-coloured *Oxalis* just referred to, are quite hardy, and might be safely wintered in the cold frame recommended above. *Z. carinata* would be classed with such easily-grown Cape bulbs as the smaller *Cyrtanthi*, which must be considered half-hardy and treated accordingly, never, of course, being trusted to the open border. Several of these would be specially well suited for an alpine house in autumn. *Cyrtanthus Mackenii* has ivory-white tubular flowers, and is both delicately beautiful and easily increased. At one time I had some hundreds of flowering bulbs of this species, all of which were raised from seed sown as soon as ripe. *C. lutescens*, with much the same habit, has canary yellow flowers, while *C. Macowani* is scarlet—a very pretty trio. With these may be included the pink-flowered *Nerine crispum*, a delicate little beauty which seldom fails to flower, as some of the larger and more gorgeous species sometimes forget to do. An autumn-flowering *Lachenalia* must not be omitted in this connexion (*L. pendula*), for it brightens the dark days of November with

its crimson-rose spikes, and is not half as much grown or known as it should be.

These are but a few of the smaller autumn-flowering bulbs which come to mind, but they are enough to show that there is certainly no good reason why an alpine house should be tenantless during the later months of the year.

MY FRIEND THE FLICKER OAK.

In the course of my pilgrimage through life I have had many friends that were kind, sincere, and trustworthy. I owe them much. It is a pleasure to acknowledge their helpful influence, their restraining counsels, and the healing balsam of their sympathy. Some of these friends were people, some were animals, and one of the most intimate and the oldest is the Flicker Oak at Rose Brake. It has known me all my life. Its great branches sheltered me when, as a small child, I played beneath it with the keys of the Maples, the pens of the Tulip trees, and the acorns of the Oak itself. But though it has stood guard over my home for so many years I have only known it in its extreme old age. It stands near the stone wall that divides the Oak grove on the west from a pasture field beyond. It is of unknown antiquity. It dates back to the time when there were many such giants in the land, when the primeval forest sheltered deer, wild cat, wolf, and panther, and the red man was lord of all.

The height of my lofty friend is 100 feet, and its mighty waist would require a belt, if Oaks wore belts, 20 feet in length. It is a red Oak, and received its name from a colony of flickers, as golden-winged woodpeckers are called in this neighbourhood, which return to their holes in its limbs promptly every April. From the vantage ground of their position high in the air they survey the grove and the surrounding country in undisturbed hilarity. They are genial company for the old Oak. Their gossip, which must be good-natured, to judge from its general tone, and their laughter are the best substitute that I know for the society of amusing and delighting people. They are only birds, but they inspire a feeling of good fellowship in their listener, for which she is grateful.

If one wishes to be taken into the intimate confidence of a great tree, and to get the full enjoyment of its strength and beauty, he should lie on his back on the green sward beneath it, cross his arms under his head by way of pillow, and let the eye climb slowly up the mighty trunk from root to topmost limb. Thus have I lain beneath my friend the Flicker Oak; thus watched the infinitely varied play of light and shade through the dense foliage; thus noted the delicate tracery of the leaves against the blue of the sky, and learned by heart each wrinkle of its rugged bark. This is the way to study the varying characteristics of trees, and to learn many a secret only revealed to the true lovers of Nature, upon whom she has graciously bestowed eyes to see, ears to hear, and a heart to feel her beauty, and her music, and her mystery.

Thus have I spent a summer afternoon moving slowly from trunk to trunk; from Oak to Maple; from Maple to sour Gum; from Gum to Walnut; and then to Ash, to Tulip tree, and back again to the Flicker Oak, most satisfying of all. Sometimes the sun would shine upon me through an opening in the boughs; or a light-hearted vireo warble a lullaby; the orioles whistle plaintively; the friendly squirrels pretend to scold, and scurry away from branch to branch, only to hasten back to peep again, and to drop a tiny acorn on my cheek. The great white clouds sailing far overhead; a distant hawk leisurely cleaving the air on his strong wings; a few drops from a flying scud—all these become stirring incidents, fraught with healing and refreshment to the heat-worn nerves and weary brain of the house-dweller. Should the eyes close into delicious slumber the great tree stands guard over its puny visitor, filling one with

a sense of security, and of being cared for as by a mighty and gentle nurse.

Thus has it chanced to me to be overtaken by a summer shower, and to be awakened by the first cool splash of raindrops upon my brow. The Oak had no need of mackintosh nor umbrella; it was only needful to turn the waterproof side of its varnished leaves uppermost, and stand quietly to take whatever came from Heaven, strong in the security gained by a hundred years of storm and sun. The foliage of the tree protected its sleeping guest as long as possible, but now, with a gentle warning splash, the drops fell more and more quickly; little streams ran down the trunk, following the corrugations in its rough bark; the leaves twinkled merrily as they shed their burden of moisture on my face. Then the sun came out a moment, and the old tree sparkled joyously, like the countenance of a friend that is bringing you welcome news.

The spring day, when the merry roll-call of the flickers is first heard in the grove, is always a happy one. Peals of laughter that resound at short intervals from the Flicker Oak tell of a joyous family reunion. It would seem as if each member of the little colony was recounting his most amusing experiences in foreign lands during the past winter. Again all burst into a triumphant pean of elation, rejoicing in chorus over the defeat of winter. To watch their frolicking fun at such times, one's self screened from observation, is to experience what Mrs. Carlyle would have called "a good joy." They fly, in their clumsy fashion, from limb to limb; they chase each other up and down the branches of the great tree; they dive headlong from the topmost bough to the ground below; they double, they turn somersaults in the air; they scream with excitement and joy in life.

If I might have my wish, or if a fairy godmother would present me with her magic wand, herewith wonders might be accomplished in the twinkling of an eye, a graceful spiral staircase, airy in effect, but strong in reality, should encircle the trunk of my friendly tree, and some 80 feet or 90 feet from the ground I would have an eyrie swung from a limb, and patterned somewhat after the fashion of a hang-bird's nest. And therein, in the company of the flickers and the squirrels, I would spend many a summer night, watched by the tranquil moon and her attendant stars, and cradled in the arms of my comrade tree.

DANSKE DANDRIDGE.

Shepherdstown, Jefferson County, West Virginia.

THE EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

A PERPETUAL FLOWERING PINK.

The enclosed Pink bloom will give you an idea of the progress now made in our new race of perpetual flowering varieties. The bed is simply a mass of buds and blooms, and has been for months.

—E. LADHAMS, Shirley Nurseries, Southampton.

A sweet-scented rose-lilac flower. Mr. Ladhams is doing good work in getting these beautiful long-flowering Pinks.

CARNATION MRS. L. ARMSTRONG.

Messrs. Watson and Sons, Clontarf Nurseries, Dublin, send a bunch of a new Carnation bearing the above name. The colour is perhaps best described as apricot-salmon; the calyx is remarkably firm. Messrs. Watson write: "We send a few blooms of a new Carnation (Mrs. Laura Arm-

strong), for which we received recently the certificate of the Royal Horticultural Society of Ireland. It was raised by Mr. J. Dowling, gardener to Mrs. L. Armstrong, Carrickmines, from whom we have now purchased the stock. These are, of course, only side flowers (as it is now so late in the season), but will serve to show the unique colour and vigorous constitution of this hardy border Carnation. From the comparatively large stock of the variety in his gardens, Mr. Dowling assures us not one flower had a burst calyx, and the stout erect stems make the blooms valuable for decoration. We have just received intimation that the Glasgow and West of Scotland Horticultural Society's award of merit was granted to this Carnation at their show in Glasgow."

ASTER SINENSIS.

Mr. W. Struignell of Rood Ashton Garden, Trowbridge, Wilts, sends flowers of the beautiful *Aster sinensis* with the following note: "I feel sure you will agree with me that this *Aster* is very decorative, both in the border and as a cut flower. The pink flower comes from the same packet of seed as that of the type. I have sown seed of both for three years, but present prospects are not promising for ripe seed in the open this year. The pink forms are less vigorous in the border, but they are very useful, and what is so good about these *Asters* of both colours is the length of time they remain gay." *A. sinensis* is very beautiful just now in the garden. The flower stands up well and is not destroyed by heavy rains. The pink form has a pure fresh colour, and suggests that a series of colourings in *Aster sinensis* would be a great gain in the garden.

FLOWERS FROM NEWRY.

From Mr. T. Smith, Daisy Hill Nursery, Newry, we have received an interesting gathering of hardy flowers, namely, *Verbascum Lewanika*, with brassy purple flowers; *V. phoeniceum album*, pale sulphur with prominent rich yellow anthers; *Tanacetum odessana*, a very graceful shrub of slender growth; *T. hispida asiatica*, more compact and erect than *T. odessana*, very pretty; *Carex japonica*, a striking plant, with tassel-like heads; *Watsonia Andromeda*, Gladiolus-like flowers of pure white, a lovely thing; *Eriogonum racemosum* has broadly lanceolate leaves, some 2½ inches long by 1½ inches wide, dense beneath, the tiny flowers are white turning to pink with age, and are produced in small clusters; *Potentilla Friedrichseni* has beautiful rich yellow flowers; *Spiraea tomentosa alba* is of stiff habit, with white flowers in erect terminal racemes, the leaves are white beneath, a distinct shrub; *Conium tinctoria elatior* is very free flowering, the yellow and green of flowers and foliage being very effective.

SEEDLING GLADIOLI.

I am sending a few spikes of my seedling Gladioli for your kind criticism. They are cut from beds practically in the open field, and have had no shading, boxing, or protection of any kind. Growers thus in deeply trenched soil, though dwarf in habit, the spikes are large, and the flowers have a stiffness of petal and a purity of colour not always found in plants grown in hot dry walled-in gardens. Not that I despise the shelter of a good high wall on the north and east side of a bed, if the soil is deep and in good tilth, provided it is not too close; in fact, I am working up stock of some of my finest seedlings in my walled-in garden behind the house, and have many plants 5 feet from the ground to the top of the spike. But then the soil has been worked 3 feet deep and well firmed before planting, and herein lies one of the secrets of success with Gladioli. They do seem to dislike loose soil. Spade and fork work needs to be done in the early autumn, and a good dressing of stable manure and steamed bone-flour put in at least 8 inches below the surface. In April a top-dressing of a good reliable chemical fertiliser dusted down the rows and raked in is a great help. W. C. BULL.

Flowers of great beauty, not merely in colouring, but in form and strength of spike. One was a brilliant scarlet, a quite unusual shade, another

heliotrope, while others were salmon and rose. We hope Mr. Bull will continue his interesting work. Ellington Belle, figured in THE GARDEN on the 22nd ult., page 134, was given an award of merit by the floral committee of the Royal Horticultural Society. It was raised by Mr. Bull, and is a flower of rare beauty.

NOTES FROM SCOTLAND.

AMATEURS AT THE EDINBURGH SHOW.

A most promising feature of flower shows in Scotland is the increasing number of amateurs who attend the larger exhibitions. They confine their efforts in the main to cut flowers, but occasionally make incursions into the plant classes too, as well as, but more rarely, into those set apart for fruits, an instance of this occurring at the Edinburgh show, where an amateur captured one or two prizes in the Grape classes. The extent to which they invaded the cut flower section at the show just named was very remarkable, some of the classes being filled entirely by exhibits from these enthusiasts, as happened in the case of Gladioli, and also, I think, of Dahlias; while in others they not only held their ground with gardeners, but beat them in fair fight. This occurred in the case of Sweet Peas, Carnations, double Begonias, Roses, herbaceous flowers, and border flowers, not to mention others. After a careful inspection of the cut flowers, which undoubtedly proved the best section at that exhibition, it was evident that if the exhibits of amateurs had been absent the show of these would have been a very poor one.

WHERE GARDENERS FAIL.

It is clear that the present race of gardeners either have not the time and the means or lack the inclination to cultivate the finer flowers in the manner those of a dozen or twenty years ago did; and this is certainly a retrogression that is to be deplored. The paper protections and the varied paraphernalia that the exhibitor requires to bring and to keep his flowers up to exhibition form are, perhaps, akin to an eyecore in gardens, but one cannot escape from the doubt that the race of young gardeners, being, as they must be, unacquainted with the careful painstaking methods required to produce flowers in the highest state of cultural perfection, will remain incapable, and, perhaps, undesirous of cultivating flowers in any but the most perfunctory manner. The same condition as regards exhibiting obtains at all the large shows, as, for instance, at Dundee, Glasgow, and, I believe, also over the Border at Carlisle; and at Newcastle, where the amateur steps out of the limits imposed in the section existing for his benefit, and boldly and successfully captures from the too easy-going professional the chief prizes offered for cut flowers.

UNNAMED EXHIBITS.

There generally exists a rule at our north country shows that all exhibits shall be correctly named, yet it is a regrettable fact that few exhibitors take the trouble to do so. Nurserymen, of course, find it to their benefit to attach names to what they exhibit, but in the case of private growers there appears to exist a petty fear that naming is a certain method of cheaply educating rivals. The executive of exhibitions, however, ought not to be biased by anything whatever, but should enforce the penalties that the bye-laws of the various associations empower them to use. A show is nothing if not educational, and no matter how careful anyone may be to keep abreast of the times there is no one but on occasion finds himself or herself attracted by some plant or flower with which they have hitherto been unacquainted. The absence of a name in such cases makes one feel it to be almost a crime.

MALCOLM DUNN MEMORIAL.

It was a great pleasure to know that the method adopted by the Scottish Horticultural and the Royal Caledonian Societies to perpetuate the memory of Malcolm Dunn was successful to a degree that surely no one expected in a season like the present.

It will be remembered that these associations invested their proportions of the monies subscribed after his death to provide a medal and a money prize, to be competed for alternately under the auspices of each society. As seen from the report of the show lately held in Edinburgh, it was offered for a collection of Scottish-grown Apples, no fewer than twelve competitors staging for the coveted memorial medal, which was secured by a comparatively unknown Apple grower from East Lothian. Many of the samples—and, indeed, the whole collection—were much below the average, but in the case of those awarded prizes it must be said that they were remarkably good for the season. With the return of our usual kindly summers we shall hope for a really grand competition in this new class. The

TUBEROUS BEGONIA AS AN AUTUMN FLOWER.

is becoming indispensable in our cold climate, which suits it to perfection. No plant presents fewer difficulties in its cultivation, and certainly none is more brilliant in effect, the result being that it is perhaps being overdone, in some gardens Begonias crushing many other good things out of existence. Popular as it is, it is not yet, however, generally recognised that the tuberous Begonia succeeds perfectly without the labour of starting the tubers in pots or boxes as most people do. If the buds are just started the tubers may be safely planted towards the end of May, covering each with 2 inches of soil. The plant is a vegetable gourmand, and previous to planting the ground requires to have incorporated with it a thick dressing of manure at least a year old, or where there is sufficient cow manure dried and rubbed through a half inch sieve that is to be preferred. Sifted pigeon manure is also most effective, and once top growth has freely commenced, surface dressings of this stimulating manure should be applied at least twice in July. Good strains under this treatment produce blooms 5 inches to 6 inches across with a setting of lovely dark foliage. I find there is some diversity of opinion as to the best method of harvesting the tubers, some people cleaning them of every bit of root and soil previous to storing. Personally I prefer to leave a coating of soil to dry on the tubers, which, when laid in heaps in a frame in May, shortly become alive with young roots produced from those preserved over winter. They winter best when a perfectly cool but frost-proof building can be made use of as a store. Hereabouts the cottagers place their Begonia and Dahlia tubers and Gladiolus corms under their beds to winter, where they usually keep in perfect condition, but are apt to start into growth too early.

R. P. B.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

September 29.—Royal Horticultural Society's Fruit and Vegetable Show at Chiswick (three days); Gardeners' Dinner, Holborn Restaurant. Reception, 6.30. Dinner, 7.

October 6.—National Chrysanthemum Society's Exhibition (three days).

October 13.—Royal Horticultural Society's Drill Hall Meeting.

October 14.—East Anglian Horticultural Club Meeting.

October 27.—Royal Horticultural Society's Drill Hall Meeting.

Royal Horticultural Society.—Prize for essay on "Cottage Gardening."—The president and council of this society offer a prize of £10 for the best essay on "Cottage and Allotment Gardening." The essay must not exceed 5,000 words, and all unnecessary technical expressions should be avoided. Notice must be taken of vegetable, fruit, and flower cultivation. The essay must have as an appendix (not included in the 5,000 words) a list of reliable but inexpensive books on the subject which could be recommended to a cottager. The prize essay to become the sole and absolute property of the society. The essays must reach the secretary of

the society, 117, Victoria Street, Westminster, S.W., before January 1, 1904. Each essay must be signed with a motto, and a sealed envelope must be enclosed bearing the same motto on the outside and the writer's name and address inside. These envelopes will not be opened until the judges shall have decided on the motto winning the prize. If any illustrations are added they should be of the simplest and plainest outline description.—W. WILKS, Secretary.

The rights of the rich.—In consequence of the wilful damage to the young trees, the chasing of deer, systematic poaching, and general bad behaviour of trippers, Earl Brownlow has, through his agent, announced that on and after October 1 the beautiful park at Ashridge and the gardens attached to Ashridge House, Herts, will be closed to all public pleasure vans, char-a-bancs, and motor-cars. For many years Earl Brownlow has freely thrown open his grounds, park, and the monument of the Duke of Bridgewater to visitors. Keen regret is felt at his decision, and much indignation is expressed against the trippers.

A substitute for Ivy.—Those who get tired of seeing Ivy-clothed fences, arbours, walls, and houses, and yet require a green covering, should try the Chilean shrub *Ercilla apicata*. It has broadly ovate, rather small leaves, and, like the Ivy, climbs by means of stem-roots. I do not advise anyone to uproot established Ivy plants to make room for *Ercilla*, for they would probably only experience disappointment. *Ercilla apicata* will not cover a building so quickly as Ivy, and therefore is not so valuable, but it is, I believe, quite hardy and evergreen. It has been out of doors in the Chelsea Physic Garden for some years, and growing against a south wall appears to be quite at home, although its progress is rather slow.—A. P. H.

Cassia corymbosa.—Ordinarily grown as a somewhat tender shrub outdoors, few seem to be fully aware of its remarkable decorative qualities. Just now it is in marvellous form and beauty at Cricket St. Thomas, Chard, Somerset, the residence of L. Fry, Esq., one of those charming places which it is a joy to visit in the spring or summer months. On the east front of the mansion projects a glass-roofed portico, some 6 feet wide and about 40 feet long. It has glass ends. At the back are three tall windows, and the intervening spaces of brickwork and ends, four in number, are about 6 feet wide and 14 feet in height. The whole of these brick walls is densely covered with *Cassia* growth, giving literally a mass of yellow bloom of the most attractive description. These four plants are some ten to twelve years old. They grow in boxes 6 feet long, 18 inches wide, and 10 inches deep. They are removed at the close of each autumn to an orangery for shelter. The soil in the boxes is on removal more than half taken away and renewed each spring. These plants merit the highest praise that could be given.—A. D.

Geranium sanguineum var. lancastricense.—Mr. Wolley Dod, in his interesting article on Geraniums, has forgotten to mention the Lancashire variety of *Geranium sanguineum* (*G. lancastricense*). This grows here into large bushy plants, much more compact than *sanguineum*, and not at all straggling. It blooms profusely, and its clear pink flowers make it, in my opinion, quite one of the best of the robust section of this family. It does not run underground at all freely in my garden, and it is one of the rock plants that I should miss most. I have ventured to write this short note, as possibly some of your readers do not know or appreciate this, to my mind, valuable little plant.—SAMUEL TAYLOR, Birkdale, Haverthwaite, via Ulverston.

A champion fruit grower.—In yet another season Mr. J. H. Goodacre, the veteran gardener at Elvaston Castle, Lord Harrington's Derbyshire home, has shown his prowess in the art of fruit growing. At the famous Shrewsbury show in August everyone was talking about the Elvaston fruit, as they had reason to, and at various other important fruit shows the name of Goodacre has been conspicuously among the prize-winners. Not contented with success in his own land, the veteran

crossed the borders and swept the boards at the great show at Edinburgh on the 9th inst. Evidently advancing age has not caused Mr. Goodacre's right hand to lose its cunning, for it seems a reasonable lifetime almost since he first made a name for himself as an exhibitor of fruit. Meteors have sprung up and flashed since Mr. Goodacre made his *début*, but the champion of many fights still remains, apparently evergreen, and certainly the leading figure on the stage.—H.

Echinops macrocephalus.—This is not the correct name of this fine plant (page 163). Professor Cornu gave me the seeds as *Echinops*, a *grand fruits*; and Professor Constantin has informed me lately that as yet the plant has not been named.—CANON ELLACOMBE, *Bilton*.

Mr. W. B. Latham.—The presentation to Mr. Latham of the testimonial from his numerous friends in and near Birmingham has been postponed until October 22. Mr. Owen Thomas, V.M.H., has been invited to preside on that occasion.

The Gardeners' Dinner.—This promises to be a great success; over 360 tickets have already been sent out, and it is anticipated that few will be returned. September 25 is the last date for receiving names, so those who are still undecided should bear this in mind.

Campanula Hendersonii.—I note on page 182 in reference to this Bellflower that some regard it as a "miffy" subject. Such is not my experience in the South of England. I find two year old plants on a low rockery do remarkably well, growing vigorously and flowering in profusion the second season. At the present time I have a plant so treated; it was, when in flower, fully 2 feet in diameter and nearly as high, and quite smothered with its medium-sized bell flowers of a pleasing shade of blue. I look upon this as quite one of the best of *Campanulas*. Plenty of grit, with a little peat, loam, and leaf-soil, with copious supplies of water at the roots during dry weather, appear to be all the special requirements of this *Campanula*.—E. M.

Lilium auratum.—The Hon. and Rev. Grey Neville, Waltham St. Lawrence, Twyford, Berks, writes: "I enclose a photograph of *Lilium auratum*. The bulb is five years old at least, and this year there are thirty-five blooms of unusual size."

United Horticultural Benefit Society.—The annual dinner will be held at the Holborn Restaurant, on Tuesday, October 27 next, at 6.30 p.m. Peter Barr, Esq., V.M.H., has kindly consented to preside on this occasion. The committee hope that all members and friends who can possibly attend will endeavour to do so.

National Rose Society.—At a committee meeting, held on Tuesday last, it was resolved that this society could not accept the invitation of the Royal Horticultural Society to hold their annual exhibition in connexion with the Royal Horticultural Society's Holland House Show. It was felt that the National Rose Society must have an independent show, and a resolution to hold a Temple Rose Show (provided the permission of the Benchers is obtained) was carried. The discussion of the memorial, urging the alteration of the date of the Temple Show, was deferred till the next meeting.

Royal Caledonian Horticultural Society.—At a meeting of the council of this society, held on Saturday, 12th inst., it was unanimously resolved at once to set about preparations for the holding of an International Fruit and Flower Show in Edinburgh, under the auspices of this society, in September, 1905. The last International Show held by the society was in 1891, and proved a great success. Looking to the strides which horticulture has taken in recent years, both at home and abroad, the council anticipate a greater success, and they are desirous to offer premiums, even better than in 1891, the total sum then offered being £1,300. The secretary is Mr. P. Murray Thomson, S.S.C., 5, York Place, Edinburgh.

Cottage garden prizes.—In many districts cottage gardening has been greatly improved by the offering of prizes for the best-kept gardens. When this is continued for several years the effects

are soon noticeable in the greater attractiveness of the cottages, and in the care taken by the occupants of their gardens. About twenty years ago the Countess of Selkirk instituted such competitions on the estate of St. Mary's Isle, Kirkcudbright, when the Earl of Selkirk was alive. Since the Countess removed to Balmae the prizes have been offered as before, and they have now been awarded for this season. Mr. William M'Coull, Stell, was adjudged to have the best-kept beds and borders, and his garden was very well cultivated. Another valuable class is that for the best climbing plants, and here the winner was Mr. J. Graham, Low Newton.—S. A.

Wasps and hornets.—It is some years since these fruit-eating pests were so few in number or so late as this season. The reason for this may possibly be explained in the wet and cold spring and summer interfering with the early nesting of the queens. Whatever may be the cause certainly

LILIAM AURATUM WITH THIRTY-FIVE FLOWERS.

there appears an adjustment of Nature to meet the exigencies of the season. That they do consume a large quantity of the smaller insects harmful to fruit and other trees is well known to most gardeners. Red spider, which is such a dreaded foe of the Peach and Vine, often affords an attractive hunting ground for the wasp. Whether this useful work of the wasp is ample compensation for the great damage done to ripening fruit is doubtful. Even the fewer numbers of the current year are inflicting much inconvenience and loss, and are aided in the task of spoliation by the blue-bottle fly and hornet. True, these latter are present in much fewer numbers than usual, as also are the flies. The mention of hornets brings to mind the varied experience of fruit growers as regards their habits. Some aver that the sound of a hornet on wing acts at once as a scare to wasps feeding on trees bearing ripe fruit, and they at once give place to the uninterrupted possession of the hornet. This may be true, and it can be exactly the opposite, for while some observers find the wasp to

hurriedly escape on the approach of the hornet, I have in the past and during the present season observed that they will feed together on the same tree though not perhaps on the same fruit, and both seemed unconcerned as to the other's company. The hornet has been known to chase and capture wasps, strip them of legs and wings, and carry them off to their nests for food. Exactly the same thing is done with flies by the wasp, and it may be a fortunate coincidence that such warfare is carried on between insects at once so noxious and destructive in the fruit garden. Of all fruits perhaps the Plum and Gooseberry appeal most strongly to the wasp. Now that these fruits are so scarce, Apples, what few sorts there are, engage their attention, and it does not matter what the variety may be they seem attracted most by those of bright colour. Although there are fewer numbers a search should be instituted for nests, destroying them with cyanide or other available remedy; this with a view not only to diminish their present numbers, but also to destroy possible nesting queens for another season. A dearth this year does not imply a similar immunity another season, but the destruction of nests will tend to a reduction if this is followed up now.—W. STRUGNELL.

Physianthus albens.—This climber, a note on which as a greenhouse plant appeared on page 146, is quite hardy in the south-west. It usually flowers in July, but this year I have seen two specimens in full bloom at the end of August. It is a native of Buenos Ayres, and is also known under the names of *Arauja albens* and *A. sericea*. Its creamy-white flowers when borne in profusion have a pretty effect, and the rather leathery, light green foliage is distinct and graceful. It is a quick grower, reaching a height of 30 feet or more in a few years. A large plant growing against a cliff face in the public gardens at Torquay, that spread over a large expanse of perpendicular rock, bore some five years ago over a dozen great oval corrugated seed-pods as large as cricket balls. This plant died, but there is another now in the same place fully 30 feet in height. Up to the present, however, I have seen no sign of seed-pods. I have also met with a plant fruiting in Cornwall.

Malvastrum lateritium.—This plant, of old known as *Malva lateritia*, is but rarely seen in gardens, yet one would imagine that the beauty of its flowers would have led to its general cultivation. An excellent coloured plate of the plant appeared in Vol. XXX., page 52, of THE GARDEN, together with a short description of it, but, with the exception of one short note, no other mention is made of it in the last fifty volumes. A native of South America, introduced into this country in 1840, it might naturally be supposed to be tender, but in "Nicholson's Dictionary of Gardening" it is alluded to as "a prostrate hardy perennial," and certainly it has proved hardy in the south-west. Its flowers, 1 inch to 1½ inches across, are of a soft salmon tint, with carmine-red shading at the base of the petals, and are very pretty. The three-lobed leaves are dark green, slightly rough, and measure 3 inches in length and 2 inches in breadth. A small plant put in two years ago has covered the stones, about 18 inches in height, supporting its bed of soil and is resting on the border below, while its breadth is fully 2 feet. It has been in bloom since the commencement of July, but its flowers are much appreciated by woodlice, and I usually find a dozen or more upon them when I take my nightly rounds with a lantern. *Malvastrum lateritium* is easily raised from cuttings.—S. W. FITZHERBERT.

Ailantus glandulosa in the flower garden.—The Tree of Heaven, as this Chinese introduction is popularly called, is fairly familiar as a tree in gardens, but I had never until last week seen it made use of in the flower garden. In Battersea Park, however, *Ailantus glandulosa* is effectively used both as a central plant in mixed beds, and also as an isolated specimen on the lawn. The plants were fairly tall, some 6 feet or 8 feet, and are evidently cut back every year, just as *Pawlonia imperialis* is treated, so that it is the current season's growth only that makes the display. They are restricted to a single stem, and the growth made in one season when the *Ailantus* is

treated as a cut-back is of astonishing vigour. Although *Pawlonia imperialis* forms a very handsome foliage plant, the *Ailantus* is even more attractive, for its leaves are deeply divided.

Giant Mushrooms.—Last season the Mushrooms in the fields grew to gigantic proportions, and it seems as though we are going to have a repetition of the peculiarity this year. The other day I passed a conveyance returning from the Romney Marsh district in Kent filled with baskets which were laden with immense Mushrooms. The freshness of the specimens proved that they must have grown very quickly, in spite of their size, and, except for their proportions, they seemed to vary little from the medium-sized members of the family that are so prized on the breakfast table. Still big Mushrooms are of no great value, and the demand for them for culinary purposes is not great judging from the huge quantities which grew in the district referred to last year, and which no one took the trouble to pick.—H.

Begonia carminata.—A hybrid member of the fibrous-rooted section of Begonias, this was obtained by fertilising flowers of the South African *B. Dregei* with pollen of the Brazilian *B. coccinea*, a well known and vigorous growing species with sturdy Bamboo-like shoots which attain a height of several feet. Where allowed space for development they will continue to bear their clusters of bright red flowers throughout the summer. In general appearance *B. carminata* bears a much greater resemblance to *B. coccinea* than to its other parent, but the influence of *B. Dregei*, which is quite a low-growing form, has had a considerable dwarfing influence on the progeny, the result being a valuable plant for the warm greenhouse or intermediate structure, where it will often flower from midsummer till autumn. *B. carminata* is naturally bushy, while the drooping flower clusters are bright carmine-pink. The male flowers quickly drop, but the females remain fresh for a considerable time.—H. P.

Bouvardia King of Scarlets.—When a few flowers of this variety opened on some stock plants in the spring I felt rather disappointed with it. However, now that it is flowering on some strong, healthy young plants I find that it deserves all that can be said in its favour. It is certainly a vigorous variety, and the flowers are fully double the size of those of any other scarlet variety, and of a bright clear colour. A curious feature is that the pistil extends above the tube, while in most varieties it reaches only about halfway up the tube. The Bouvardias are very useful winter-flowering plants, and there are none too many varieties, so that any improvement on existing sorts will always be welcome. I think their value would be even more appreciated if a little more care were paid to their requirements. A rich compost and a fair amount of pot room are essential. A temperature of from 50° to 60° Fahr., with plenty of light and air, will ensure free growth. Stopped for the last time about the middle of August they will begin to flower in October and continue to do so well through the winter.—A. HEMSLEY.

Runner Beans.—The trial of these climbing Beans, in considerable variety at Chiswick this year, serves to show how much harder the Dutch or rough runner types are than are those of the so-called French strain or other smooth Beans that also climb. Whilst the growth of the finer strains are first-rate and produce pods in great abundance, such varieties as Sutton's Prize-winner and Best of All, Dobbie's Champion, Carter's Elephant (white), the old scarlet, the old white, the Painted Lady, and others are doing remarkably well. But all the other section seem to have suffered very much from lack of warmth, and have very poor crops. Even the Dwarf Kidney Beans are not nearly so good as they were two years since, when we had a warm summer. Vegetable Marrows, which at one time promised to make a capital trial, later suffered severely. They seldom do well anywhere on the flat if the season be cold and wet. As a rule they are never better than when grown on raised mounds.

German Plums.—Because of the dearth of Plums at home this year the markets and shops have

been full of German Plums, there being a good crop in Germany. These fruits are naturally very acceptable to bewildered housewives, who, unable to obtain other fruit for domestic uses, have gladly availed themselves of such as Germany can send us. But the sample is, according to our insular fruit standard, but a sorry one. Generally it is such as we should call second crop or fourth-rate Victorias. Still, they sell at 2½d. per pound, which no doubt represents to the vendors a very good profit. The only good sample Plums seem to be those from California, but these are very dear, 8d. to 10d. per pound. Whilst we do not appraise Plums to the same extent that we do Apples as a crop, still it is very evident that Plums are in their season in great demand, and they have been this year very much missed. We may well hope that next year may see an abundant crop. To that end it is needful that we have a dry and warm autumn, otherwise wood will be soft and sappy, and buds deficient in strength.—A. D.

Dodder on Heather and Gorse.—With reference to the enquiry in your issue of the 5th inst. I enclose specimens of both Heather and Gorse covered with Dodder, which is quite plentiful on Chobham Common near this house.—G. EDEN, *Red Cottage, Long Cross, Surrey.*

With reference to the question whether Dodder is common on the Heather, Hooker's "Student's Flora" gives Furze, Thyme, and Ling as the plants which are mostly attacked by *Cuscuta Epithymum*. As a proof that it is common enough on the Heather in some localities I may state that in the early part of August it was particularly abundant on Black Hill, one of the highest points in East Devon, lying back inland between Exmouth and Budleigh Salterton. On this elevated position, from whence a large portion of the county of Devon and some parts of Somerset are visible on the one hand, and a stretch of sea on the other from Portland Bill almost to Berry Head, is a plateau of some extent covered chiefly with Heather, which has been a glorious sight for some time, the colour of which has been considerably heightened by the abundant admixture of the slender red stems of the Dodder, covering patches of many square yards in extent. I may say that Black Hill is a favourite resort of people in this part of the county, and belongs to the Hon. Mark Rolle, whose seat at Bickton lies almost at the foot of the hill on the Sidmouth side.—JOHN R. JACKSON, *Claremont, Lympstone, Devon.*

The Chiswick Vegetable show.—Way to get there.—Visitors coming to the Chiswick show from off the South-Eastern, Chatham and Dover, or Brighton Railways, should travel from the respective terminuses to Chiswick by the Metropolitan District Railway to Hammer-smith, thence by electric tram to Turnham Green Church, or by Ealing trains to Acton Green Station. Those coming from Liverpool Street, King's Cross, St. Pancras, Euston, Great Central, and Paddington terminuses should travel by the Metropolitan Railway, from the nearest stations, to Hammer-smith, and thence by electric tram. Those coming from Central London should travel by the Tube Railway to Shepherd's Bush, thence also by electric tram. Turnham Green Church is close to the gardens. Visitors coming by South-Western Railway main line should change at Clapham Junction, thence by loop line train to Kew Bridge, and thence by electric tram. Those coming from off the Windsor, Reading, and Thames Valley lines should change at Richmond, thence by frequent trains to Gunnersbury Station. All bringing heavy parcels can obtain cabs at Kew Bridge, Gunnersbury, and Turnham Green Stations. Visitors to the show purposing to attend the gardeners' dinner at the Holborn Restaurant should take tram from Turnham Green Church to Shepherd's Bush, thence by Tube Railway to British Museum Station.

Lantana delicatissima.—This is quite a distinct and pretty shade among Lantanas, and one that all those who use these plants for the purpose of bedding-out should make a note of. In fact, it seems to be only in public parks and gardens that Lantanas (and also many other plants that might be mentioned) are much used for summer

flower-beds, yet for the mixed beds that are now so popular they are among the most useful subjects. In one of the London parks Lantanas are very freely used in the handsome beds of mixed flowering plants, and invariably with good effect. *Lantana delicatissima* produces heads of flowers that are primrose colour in the centre, but pale purple towards the margin. Whether all the flowers open a primrose colour and become purple as they age, or whether some are primrose and some are purple from their opening I was not able to determine, but I imagine the former to be the case. A bed of this Lantana, especially when the plants are some 4 feet to 5 feet high, and well flowered from top to bottom, is very bright and attractive. Another Lantana that is unusually pretty and exceptionally suitable for bedding is the variety *Ne Plus Ultra*. The heads of flowers are pale yellow in the centre, this being surrounded by rose, a most effective combination. The foliage, too, is much better than usual, being sturdy and a rich dark green colour. The flowers are freely produced, so that plants bearing plenty of foliage and flowers make quite a good display in a bed without the addition of any other plant as a ground covering. We recently saw a bed filled solely with this Lantana, except for an edging of *Viola Blue Bell*. Another effective bed to be seen in the London parks contains large plants of *Heliotrope* var. *President Garfield*, while a yellow Lantana, the plants not more than 2 feet high, covers the spaces between. The association of blue and yellow is almost always pleasing, and this instance is no exception.

The Himalayan Strawberry. Among the many interesting things in the Chelsea Physic Gardens I recently came across some plants of the Himalayan Strawberry (*Fragaria indica*). My reason for drawing attention to it is not because of its large size or rich flavour, for it possesses neither, although when ripe the fruits are not at all unpleasant, but for its curious method of fruiting. The small fruits are borne singly at the end of stalks some 2 inches or 3 inches long, and are almost covered by the abnormally large segments of the calyx. The bright red fruit, partly visible inside its green covering, is curiously pretty. There appear to be two varieties of this Strawberry, one producing perfect fruits, while with the other, instead of the pistils producing fruits in the usual way, they develop leaves, and the fruit (or what is understood as the fruit), instead of ripening and becoming edible, remains green and foliaceous.—A. P. H.

THE FLOWER GARDEN.

A PLEA FOR THE DOUBLE HOLLYHOCK.

I CAN have no possible objection to anyone writing up the single Hollyhock; what I object to is the exaltation of the single forms at the expense of the double varieties. Charles Dickens has told us in one of his books that with some persons it is a perverted delight to pull deserving things down by setting undeserving things up, and this is, unfortunately, a common failing with some of the writers for the horticultural press. They, for reasons of their own, disparage the show Dahlia, the double Hollyhock, the large Chrysanthemums, and other flowers; apparently quite oblivious of the fact that to thousands they are a source of enormous interest and pleasure. There is garden ground enough in the wide world to grow everyone's fancies; the floral iconoclast is a nuisance in it. When recently at Trowbridge I walked along a pleasant roadway in the town, with houses on either side, having in many cases pleasant and well-kept fore-court gardens. In most of them I saw single Hollyhocks, but in no case could I count more than five expanded flowers at one time,

and those at the top of a long spike of seed-pods; the average was four. The business of the single Hollyhock is to produce seeds; the bees find in the flowers the thing they seek; the visit of the bee is speedy decay to the flower. In the case of the double Hollyhock—and especially so in the instance of the full double varieties—little seed is produced, but there is obtained for garden decoration a spike of bloom which in the case of well-cultivated plants is 2 feet and more in length. The spike is formed of many well-developed flowers, and as a consequence of their doubleness they are lasting; they remain in beauty for a considerable time. It is difficult to name a more stately plant than the double Hollyhock for the back of a border of hardy flowers. The single Hollyhock allows of but little scope for improvement; cultivation leads to the doubling of the blossoms. The single Hollyhock is of practically no value as a commercial item; neither plants nor seeds are of value. The double Hollyhock is an important commercial item; a particular variety which may be in demand can be increased only by means of some method of propagation, and employment is thereby given to many. The seed of a fine strain of double Hollyhocks is always of value, and the supply invariably considerably below the demand.

There is no floricultural progress in going back to an inferior type. It has recently been done in the case of the Chinese Primrose and the Cineraria; it was but commencing where a beginning was made many years ago. Nearly a century ago Charles Baron took the single Hollyhock in hand and led it on by stages of doubling until Messrs. Paul, Roake, Chater, Parsons, and others produced the magnificent double varieties of thirty years ago. Were the named double Hollyhocks of the present day blotted out of existence it would take years of toil to bring them up again to their present standard. The single Hollyhock, like the poor, will always be with us; it is a weed in the garden, seeding itself freely and never lacking progeny. The double Hollyhock must not be thrown aside.

R. DEAN.

PRUNING CLEMATIS MONTANA.

In reading up the back numbers of THE GARDEN after some weeks' absence from home, I came across, in an article entitled "Creepers and Climbers for all," the statement respecting *Clematis montana*, that "if we happen to meet with a very old one that has been allowed to wander unchecked all over the place, and is untidy at the bottom, it is quite useless to attempt to cut and prune it into shape. Such treatment would be certain to destroy; it is better to take it away bodily and put in a new one." I should much like to know if your practical readers endorse this assertion. Certainly my own experience is directly opposed to it. Rather over two years ago my opinion was asked as to what should be done to an old *Clematis montana*, with a stem nearly as thick as a man's leg, that was clambering over a balcony, and was bare of leaves for some feet from the ground. I had on previous occasions cut down two with good results, and suggested this treatment in the case mentioned. The owner feared that this would kill the plant, and suggested rooting it up and planting a young one in its place. I, however, carried my point on pointing out that if the *Clematis* died another could be easily planted. I sawed the stem through about a foot from the ground, and in a few weeks buds appeared, which developed into vigorous shoots, that now spread over a considerable portion of the balcony, and are covered with foliage to the base. A young plant would not have made half as much growth in the same time. If their appearance was unsightly, I should have no hesitation in cutting down old plants of *Clematis montana* in order to induce vigorous growth, and I should have little

fear as to the result, providing the operation was carried out in the spring just as the sap was beginning to rise.

It has been stated by a lady who is a recognised authority on gardening matters that *Clematis montana* is not a long-lived plant. It is a question what is to be considered long life. I, however, know of an example twenty-five years of age and still in good health.

S. W. F.

WHITE TUFTED PANSIES.

THE report of the Viola Conference, held at Edgbaston Botanical Gardens, Birmingham, in August, 1894, is interesting reading in view of what has taken place since then in Pansy development. On that occasion several matters regarding the Viola were considered, and useful and instructive papers were read and discussed. The late Mr. William Dean read a short paper on "Large-flowered Varieties as Bedding Plants," and the best varieties for the purpose according to colour, the best white Violas (tufted Pansies) were then described in detail, and it is interesting to recall those which were at that time regarded as the best. Countess of Hopetoun was placed first, and deservedly so, as it was then distinctly better than the majority of those in general cultivation. This variety and Dr. Stuart's Sylvia were thought well of as rayless flowers and pure selfs, also for their excellent habit. Marchioness of Tweeddale was another pretty sort, but this had a spreading, or what we should now consider a straggling growth. Countess of Wharnccliffe (also known as Lord Fitzgerald), another snow-white sort, of erect and sturdy habit and a good bedder, was also in beauty. In addition to those already described, the following varieties of earlier origin were alluded to: Croft-house, Lady Dundonald, Mrs. Gray, Mrs. Kinmont, Mrs. McDonald, and Victoria.

My reason for specially referring to the varieties that found favour in 1894 is that those interested in the tufted Pansies may be the better able to appreciate the great advance made since then. To what extent are the varieties enumerated in the list prepared in 1894 cultivated at the present time? Countess of Hopetoun, Sylvia, Marchioness of Tweeddale, Countess of Wharnccliffe, and Lady Dundonald are still grown. Of these five, preference should be given to the first two, and, if it came to a question of deciding which is the better of the two for general purposes, Sylvia should certainly be given the preference. But each of the foregoing is completely eclipsed by those of more recent introduction. Beautiful though the older ones undoubtedly were, and, comparatively speaking, are still, they will not compare with what the fancy specialists have provided to-day. The newer sorts in most instances are infinitely superior both in flower and growth, and, except in a few isolated cases, their constitution is good and their flowering time most protracted. Rayless flowers, too, have improved in form and substance, and an excellent trait in the character of the best plants is the erect and sturdy footstalks, which also carry the flowers well above the foliage.

Each season sees some advance, and it is now possible to obtain plants for almost any position—not the ordinary method of bedding only—where a free and continuous display of blossoms is desired. The following white sorts are the best that have come under my observation, and most of them I have seen planted in large breadths:

Seagull.—A pretty flower and a good rayless self; good habit and free flowering.

Snowdrop.—Introduced for the first time during last spring. The flowers are of the purest white, very large, with a neat yellow eye, and rayless. Each flower has a long footstalk, and the plant is free flowering.

White Beauty.—Introduced in 1899. This is a charming plant, with beautiful green foliage; it has a creeping habit of growth; a very hardy sort; pure white, with a faint suffusion of yellow in the eye, and rayless.

Suan.—Very pretty; to be distributed in the ensuing autumn or spring season by Mr. William Sydenham of Tamworth. The flowers are large, with a well-defined eye of an orange colour, rayless,

and of good substance. The plant is free flowering and robust.

White Empress (syn. *Blanche*).—This is a splendid tufted Pansy, and has been greatly admired all through the present wet summer. The flowers are large and circular, and freely developed; excellent constitution. The flowers have been described as pure white, but they are more of a pleasing creamy white, having a yellow eye and rayless. Introduced in 1896.

Cream King.—A 1901 introduction and a very fine flower—large, circular, and rayless. This variety well represents the cream-coloured sort. The habit is not so good as it might be, but, given a good open position, the display is very fine, especially in the early summer.

Duchess of York.—This is more of an exhibition than a bedding variety, and is usually well shown in the North. The plant is free flowering, but its habit is not so good as that of many sorts. The flowers are neatly pencilled or rayed.

Devonshire Cream.—Undoubtedly one of the freest tufted Pansies in cultivation. A good breadth or group of this variety gives one a proper idea of what these plants are capable of producing. As its name implies, the plant develops rayless cream-coloured blossoms in great profusion.

Elaine (1900).—Another free-flowering sort, very distinct; the flowers large, of the purest white, with a yellow centre, slightly rayed; most effective plant for the hardy border. There is a seedling which is being distributed this season under the name of Faultless Elaine. This is a rayless flower.

La Vierge.—Introduced in 1901. A charming white rayless flower, with a neat yellow eye.

Mrs. A. D. Parker (1899).—This variety has done well since its introduction, and is a good white self; very free.

Mrs. J. Donnelly.—Grown in almost any position this plant will succeed. It is a most persistent and continuous bloomer, free flowering and robust, of good habit, and with chaste bluish white flowers.

D. B. CRAWF.

GERANIUMS FOR BEDDING.

THE season is now at hand to commence propagating these popular bedding plants. The past season has been an unusually wet one, and growth is in consequence very sappy. The cuttings when taken off should be laid on a dry bench for a couple of days to allow the sap to dry a little. The general method of rooting Geranium cuttings is to insert several round the sides of a 4-inch pot or boxes. In establishments where large quantities are grown it is an excellent plan to strike them in beds under glass; these should be prepared early in August. To do this, place round the intended beds boards 1 foot deep, at the bottom place a layer of rough leaf-soil, and then fill up with a mixture composed of two parts loam and one part sand and leaf-soil. Make the beds firm with a brick, and then give them a thorough watering. Put the cuttings 3 inches apart, and 4 inches between the rows, making them firm. Syringe them lightly on bright days until rooted, and then cease; maintain a temperature of 45° at night and 50° by day. By November they should be sufficiently rooted to admit of their being potted into 4½-inch pots, and then placed on ashes. Keep the points of the shoots and flower-spikes picked out so as to make the plants bushy. When the pots are full of roots apply a little patent manure to help them. Cease stopping the shoots after the end of March, and afford plenty of air on all favourable occasions to harden the plants before they are placed out of doors prior to bedding them out.

The tricolor class of Geranium requires a somewhat different treatment to that advised for the green leaved varieties, and they also need more careful propagating. Insert the cuttings round the sides of a 4-inch or 4½-inch pot. If the soil is at all dry give the plants a good watering. This will suffice for some time, as the plants require to be kept on the dry side; this class of Geranium is more apt to damp off than the others, and great care is necessary in watering. Place them on a shelf so that they will receive all the available light and sun.

If it is possible to do so keep them in a temperature rather warmer than the others. Pot off singly into 4-inch pots as soon as rooted. Continue to keep on the dry side, and use weak soot water when water is applied. As regards the hardening off, treat them as advised for the other varieties.

JOHN R. MORGAN.

Waddesdon Gardens, Aylesbury, Bucks.

ANEMONES FROM SEEDS.

IN the issue of THE GARDEN for the 15th ult. a very interesting contribution appears from Ed. Heinrich, Bavaria, concerning the raising of certain Anemones from seeds. It is the more valuable to the amateur, because the right way has been obtained partly by previous failures. Notwithstanding this, one can only question whether it was prudent to cast away valuable pots of seedlings on the mere theory of the possibility of their having damped off. A very superficial examination would have revealed the error and likewise the tubers. In this latter connexion it is perhaps to be regretted that the tiny round corm or bulb-like excrescence that constitutes the first season's development in all tuberous sorts did not accompany the illustration on page 116, for then the information would have been complete, and of great value to the amateur. Minus this, however, it may be stated for the general guidance of all amateurs interested in bulbous plants that the season of growth, and of leaf growth above ground in particular—which, in reality, is what is regarded as growth by a large number—is an exceedingly short one. This is particularly noticeable in Narcissus, for instance, of which the first season's above-ground growth consists almost invariably of a tiny erect green blade that may bear strong resemblance to a single 3-inch or 4-inch blade, more or less, of a quite small Spring Onion. The duration of this above ground may be six weeks or three months. The longer the first season's growth is in sight so much larger in proportion will be the tiny bulbs below.

In Liliums, too, the above-ground duration is equally short, and generally with bulbous seedlings a brief term is the rule. These facts cannot be too widely known, as valuable seedlings may be saved for a future generation if not for the present race. So, too, with Anemones of the tuberous section. In these the growth in the first season may be confined entirely to the Cotyledons, and it is surprising how quickly some of these disappear altogether, while others are retained for quite four months. But whether short or long, it will be found on examination that a small roundish-ovoid brownish corm is attached to the Cotyledonous stem. Doubtless many have watched again and again for a further break from the central axis of the seed leaves, but, so far as my experience goes, it does not appear. Usually in the tuberous section only the Cotyledons are seen in the first year. If the seedlings start away well the second or trifoliate leaf growth may appear from the corm; but this is not general, and the Cotyledon, having served its function of first growth, perishes. In such herbaceous species, as the one in the illustration on page 116, the leaf development of the first season is of necessity a different thing, as a crown bud—as in Anthericum—has to be formed, and with this a basal root or two therefrom, thus making the complete seedling plant.

With some seedlings of the tuberous Anemone this year I have noticed a peculiarity I do not remember to have seen hitherto, which consists in not a few instances of no Cotyledons having been produced at all, but in place of this the trifoliate growth, as shown on the left-hand side of your illustration. I was very curious about this, and first regarded it as a second growth from the seedling corm. This view was entirely dispelled,

however, upon my lifting one or two for examination. I mentioned the circumstance to Mr. J. G. Baker at the Drill Hall, when that gentleman informed me he had no recollection of such a peculiarity. It was, however, no isolated example, and the lifted specimens were quite barren of any other form of leaf growth. The best way of raising Anemone seedlings in quantity is to sow seeds in prepared soil in the open ground, and sufficiently thin that a full season's growth may develop. Even with rare sorts, and where pans or boxes are used, the seeds may always be sown thinly with considerable advantage to the young plants.

Hampton Hill.

E. H. JENKINS.

OLD BEDS OF CARNATIONS FOR CUT FLOWERS.

MANY, I have no doubt, who carry out the following practice in regard to their Carnations,

A VASE OF SHIRLEY POPPY FLOWERS.

must find the usefulness of it. Instead of clearing away all plants out of beds after securing layers, I find it is a good practice to leave some of the plants in beds for two years. These I do not take layers from the first season after planting, but invariably take off all that are required the following year. It is astonishing what sheaves of flowers one can have off such sorts as the old Clove, Redbraes, &c., and I believe there are other varieties which would give quite as satisfactory results grown in the same way. The contrast to the few scraps one can have from one year old plants is very marked. The system here described by our correspondent is well worthy of being practised, and in the case of those varieties that do not produce many layers the first season it should prove particularly valuable. There are some varieties of Carnations that we can hardly have too many of, and many will doubtless be glad to know how to increase them.

J. M. B.

NOTES ON HARDY PLANTS

SALVIA GLUTINOSA.

IN the garden of the Countess of Selkirk at Balmae, Kirkcudbright, there are a number of interesting herbaceous plants, many seldom seen and little known. At the Dumfries show the other day a number of plants from Balmae were exhibited, among them being some finely-grown spikes of *Salvia glutinosa*, a plant I grow here, but not nearly so well as it appears to be cultivated in the garden of the Countess of Selkirk. It is not showy in the garden, but when grown as at Balmae, under trees, it is more interesting than in the ordinary border. The Balmae flowers were much larger, and the lips of the flowers much broader, than with me. The colour is a pale yellow, but just such a tint as would show up better under trees than elsewhere; while the fact that it will thrive in such a position gives it a value to many. It grows about 3 feet high, and is really a very old plant in gardens, though hardly ever met with now. Its old popular name is Jupiter's Distaff.

S. ARNOTT.

SHIRLEY POPPIES.

THE photograph of the Shirley Poppies, sent to us by Mr. W. Jesper, reminds us of the grace and delicacy of colouring of a good selection, and it is interesting to know how this famous race originated. They are the result of the Rev. W. Wilks' patient work in selection, and we give the story in his own words: "In 1880 I noticed, in a waste corner of my garden abutting on the fields, a patch of the common wild field Poppy (*Papaver Rhæas*), one solitary flower of which had a very narrow edge of white. This one flower I marked and saved the seed of it alone. Next year, out of perhaps 200 plants, I had four or five on which all the flowers were edged. The best of these were marked and the seed saved, and so for several years, the flowers all the while getting a larger infusion of white to tone down the red until they arrived at quite pale pink, and one plant absolutely pure white. I then set myself to change the black central portions of the flowers from black to yellow or white, and have at last fixed a strain with petals varying in colour from the brightest scarlet to pure white, with all shades of pink between and all varieties of flakes and edged flowers also, but all having yellow or white stamens, anthers, and pollen, and a white base. . . . My ideal is to get a yellow *P. Rhæas*, and I have already obtained many distinct shades of salmon. The Shirley Poppies have thus been obtained simply by selection and elimination. By 'selection' I mean the saving seed only from selected flowers, and by 'elimination' the instant and total eradication of any plant that bears inferior flowers. . . . Let it be noticed that the Shirley Poppies (1) are single; (2) always have a white base, with (3) yellow or white stamens, anthers, or pollen; (4) never have the smallest particle of black about them.

Double Poppies and Poppies with black centres may be greatly admired, but they are not Shirley Poppies. It is rather interesting to reflect that the gardens of the whole world—rich man's and poor man's alike—are to-day furnished with Poppies which are the direct descendants of one single capsule of seed raised in the garden of Shirley Vicarage so lately as August, 1880. Poppy seed should be sown in the autumn or in the spring, sowing very thinly because the seed is small, and thinning out the seedlings to fully 6 inches apart. Fine flowers in abundance and over a long season can never be expected unless the seed is sown thinly, the seedlings well thinned out, and the

dying flowers picked off to prevent seed forming and weakening the plant."

POLYGONUM AFFINE.

WHILE we have all been complaining of too much rain, and of the consequent destruction of the beauty of many flowers, there have been many plants which have positively revelled in the heavy rainfall. It is worth while to observe these, for their behaviour in a wet season tells us that a little more moisture than they usually receive is necessary at the roots. Among these wet-weather plants particularly noticeable is the Himalayan *Polygonum affine*, or *Brunonis*, as it is often

Dumfriesshire and Galloway Horticultural Society by Mr. M'Guffog, gardener to the Countess of Selkirk, at Balmae, Kirkcudbright, I observed with interest a good bunch of the white flowers of *Napaea dioica*, a tall plant hardly ever seen in gardens. It is not a new plant, as it was figured in the *Botanical Magazine* (table 2913) under the name of *Sida Napaea*, the *Sidas* being popularly known as the Indian Mallows, and belonging to the natural order Malvaceæ. The plant is now transferred to the genus *Napaea*, of which it now appears to be the only member, if we are to follow the "Index Kewensis." It is of tall growth, generally from 4 feet to 10 feet, and at Balmae it is about 9 feet high, the climate being a moist and

west to Minnesota and Iowa. While it is not what one would call a first-class plant, it is most useful in its proper place.

Carsethorn, by Dumfries, N.B. S. ARNOTT.

LEWISIA TWEEDYI.

IN THE GARDEN of the 11th July there is a life-like illustration of this beautiful Californian plant. At the same time particulars were requested concerning its general cultivation. This, so far as I am aware, means few, if any, obstacles to the gardener, and the plant may be well grown in a mixture of very gritty loam, leaf-mould, and finely sifted manure. This, indeed, is the mixture in

THE TERRACE GARDEN AT IMPNEY HALL, THE RESIDENCE OF DR. CORBETT.

called in gardens. During the twenty years or so in which I have grown it in my garden it has never been so fine as at present, a fact I attribute to the moist summer. Not only is it freer than usual, but it has finer and better coloured spikes. It is particularly pleasing with its many spikes of flowers, which come out flesh-coloured, or nearly so, and pass off almost crimson. Its fault is its spreading habit of growth, but that can be overcome.

NAPÆA DIOICA.

IN examining a very interesting stand of hardy herbaceous flowers set up at the recent show of the

genial one, close to the sea. The foliage is very handsome, being large, palmate, and pointed and toothed. It reminds one slightly of that of *Rodgersia podophylla*, but without its bronzy hue. The tall stems are surmounted by large umbellate corymbs of small white flowers with the general appearance of the plants of the Mallow order. Some may not consider *Napaea dioica* choice enough for the border, but for a wild garden it is excellent, having just the effect desired among the larger plants used in this delightful phase of gardening. It is a native of moist soil, and in the United States, where it flowers about July, extends from Southern Pennsylvania to Virginia,

which my original plant was grown, and not this alone, but a lovely colony of the plant in the Kew rock garden was in quite an ordinary mixture, and the plants grew away apace. Apart from the question of soil, the *Lewisia* evidently prefers a quite sunny spot, as do not a few others inhabiting the same region. Given this and a good depth of loam there is, so far, little difficulty in securing a good growth. The plant flowers profusely, and the yellowy buff shade with the delicate shading of pale rose is as beautiful a combination as it is rare. It is, indeed, a lovely blend of colours. The foliage is decidedly more persistent than in other species, and of course very distinct.

Its somewhat succulent nature suggests a plant suited to a position hot and dry, or at least comparatively so. My plant grew extremely well without this latter condition. Thus it may be gathered that from the cultivator's point of view there is little to fear. The real trouble, so far as the hardy plant garden is concerned, is that this beautiful species is not hardy. When the plant received acknowledgment from the Royal Horticultural Society at least one authority on hardy plants stated with some emphasis that it was "quite hardy." I regret I was unable to endorse that statement. But regarding my original plant, it was left more or less exposed, save for the shelter afforded by a greenhouse wall. Even here, and which in certain instances may be regarded good shelter, the plant was killed quite early in the winter. I know also that many plants at Kew perished, and from the complete failure in a somewhat mild winter I should not be surprised to find it unable to withstand any severe long-continued frost, even when protected in a cold frame. In a mild winter it may be safe, and all such plants are better if plunged in rather coarse coal ashes and kept studiously dry for a long season. So distinct and good a plant if generally hardy would have been a great gain to first-rate alpine. In much-favoured localities and in a dry position in the alpine wall the plant may yet pass the winter in safety.

E. H. JENKINS.

NOTABLE GARDENS.

IMPNEY HALL, DROITWICH.

AMONG the notable gardens of Worcestershire those surrounding Impney Hall take high place. Though neither laying claim to stateliness nor grandeur, they are attractive, and also contain much that is of interest. Of the terrace garden in front of the Hall we are able to give an illustration, which, although it shows well the design of the beds and arrangement of the plants, conveys no idea of their bright and varied colouring. We have seen few bits of formal gardening wherein plants were more tastefully grouped; the brilliantly coloured flowers, although they predominate, do not make the display one blaze of garish colouring; they are judiciously softened by a free planting among them of plants whose chief attraction is their foliage. The wall that bounds the terrace garden is covered with Ivy, Ampelopsis, Clematis, Honeysuckle, Crimson Rambler and other Roses, and there are groups here and there of shrubs, all of which, flowers and greenery, serve to form an admirable enclosure to the gay parterre. Beyond the terrace there is a delightful view across the lake and park to the wooded hill beyond. The park should, perhaps, be called garden, for during recent years it has assumed more and more the aspect of a garden, and many of the characteristics of a park have disappeared. The lake sides are planted with moisture-loving plants and groups and small plantations of flowering and other shrubs are numerous, while the forest trees, of which numbers remain, serve to show that park has given place to garden.

The Rose garden is a prominent feature at Impney, although it is some distance away from the Hall and terrace gardens. Herbaceous flowers and the Rose garden are on two sides of the kitchen garden respectively, and are a pleasant change from the Potato or Horseradish plots, or even rubbish heaps, that often greet the eye when one passes outside the kitchen garden walls. Roses in great variety are grown, and although we saw splendid beds of Caroline Testout, Marquise de Salisbury, Grüss an Tepitz, and numerous other free-flowering sorts, few were more attractive than the hedges of dwarf Polyantha Roses. Mr. Jordan uses them extensively as an edging to Rose beds and borders. Herbaceous perennials made a gorgeous display, although some of them had suffered a good deal from the effects of the bad

weather. Nothing, however, had done worse than the Peonies, and from what we have seen this year in other parts of the country the failure of Peonies is general.

There is little to say of the fruit crops out of doors at Impney, for like those in almost every garden they are poor; hardy fruits are conspicuous by their absence. With regard to fruit grown under glass, however, it is different. Mr. Jordan is one of the most successful exhibitors of fruit at the leading provincial shows, invariably carrying away a good share of the honours. Grapes are well grown at Impney, and one variety we noted as being unusually good, namely, Diamond Jubilee. Although this variety may not have so fine a flavour as some, it is a good exhibition Grape when well cultivated and perfectly finished. Mr. Jordan grows numerous varieties of Grapes, and considering the fact that many are grown together in the same house the results are remarkably good. Pine culture in pots also is a feature in Impney Gardens, and some really good fruits of the Queen variety are produced. Between the flavour of a home-grown Pine-apple and an imported one there is no comparison, and it seems regrettable that owners of gardens should have allowed Pine-apple culture almost to disappear. Melons, too, are among the fruits that are well grown at Impney. Although an expert fruit grower, Mr. Jordan is no less successful in the culture of flowering plants. Without exaggeration we may say that rarely, if ever, have we seen finer Cyclamen than here. They were from seed sown in August, 1902, and if one may judge from their vigorous appearance a few weeks ago the display of flower will be no less remarkable next spring than the foliage is now. Chironia ixifera is a plant rather largely grown by Mr. Jordan, who finds it most useful for decorative purposes, especially for the decoration of the dinner table.

Of the many interesting features at Impney, perhaps most notable of all is the winter garden or fernery; it is probably unique. For many years it was an open dell wherein grew Ferns, Foxgloves, Lilies, Bluebells, and numerous other shade-loving plants, and even in that condition was one of the prettiest bits in the gardens. The late Mr. John Corbett, however—knowing how suitable a site it was for the purpose—completely transformed it into a winter garden. All the English flowers were uprooted, and huge masses of rock imported and arranged so as to form what is really a rock garden, and the whole covered with a glass roof. A stream of water meanders through the centre of the erstwhile dell, spanned here by a rustic bridge or there made passable by "crossing stones," while Tree Ferns, as Dicksonia, Cyathea, give an almost tropical aspect to the scene, and smaller Ferns, as Pteris, Adiantum, Nephrolepis, &c., together with other plants of pleasing foliage, Dracænas, Palms,

TREE FERNS IN THE WINTER GARDEN AT IMPNEY.

Grevillea and Aspidistra, clothe the rocks, or are planted among the groundwork of greenery that consists of Lycopodium.

H. H. T.

TREES AND SHRUBS.

SOME LESSER-KNOWN JAPAN TREES AND SHRUBS.

(Continued from page 184.)

THOUGH in actual size of flower China and Japan have sent us no Magnolia to compare with the American Magnolia macrophylla, no one who has seen M. hypoleuca on its wooded hill slopes will easily forget the impression. It is one of the most striking of all trees in a country where the beauty of the inmates of the forests is not surpassed in any other part of the world. The long, spreading branches on trunks, often 80 feet to 100 feet high, the leaves 12 inches to 15 inches in length and 6 inches to 8 inches broad, of the palest green, the large creamy flowers 6 inches across when expanded, stamens with scarlet filaments, and in autumn the brilliant crimson cones of fruit, 6 inches to 8 inches in height, standing well above the leaves, surprise all who see them.

This tree requires age to flower, but should do so in this country in from fifteen to twenty years after planting. It will probably prove more adaptable than its near allies, the American M. macrophylla and M. tripetala. M. Kobus is

common in Japan, and makes a handsome symmetrical tree in England. *M. stellata*, *M. s. rosea*, *M. Watsoni*, and *M. parviflora* are well known.

M. salicifolia, new to cultivation, has not yet flowered in Europe, nor are its blossoms known to botanists. My own seed, collected on Mount Hakkoda, failed to germinate; but, thanks to the kindness of Professor Sargent, my firm now has a promising young tree, which it is hoped will flower in a few years' time. Though common in the district in which it is found, the position is not the most easily accessible, which, no doubt, accounts for the delay in introducing it to English gardens.

The large and interesting *Cercidiphyllum japonicum*, a member of the Magnolia family, does not seem to thrive with us as well as it does in New England where flourishing specimens are to be seen. Its bright pink spring foliage is attractive, and in its native forests the massive divided trunks give the whole landscape a peculiar appearance.

Nearly allied to the Magnolias are *Euptelea polyandra*, which has so far failed to establish itself, and that curious genus *Trochodendron*, containing but one species, *T. aralioides*. This is an

an excellent hedge plant. It certainly is impenetrable, and has the additional advantage of bearing in late spring a profusion of large white flowers a month before the leaves appear.

JAMES H. VEITCH, F.L.S.

[Reproduced, by permission, from the Journal of the Royal Horticultural Society.]

(To be continued.)

COLUTEAS.

THE Coluteas form a small genus of hardy Leguminosae, natives of South Europe and Asia Minor. They are distinct-looking shrubs, and can be grown where practically nothing else will thrive, but they are not so popular or so often seen as one might suppose. There are only four properly recognised species belonging to Colutea, but there are a multiplicity of names based on slight differences, often so much so that they can hardly be distinguished by those responsible for them. Their cultivation is simple, an annual cutting back each spring while the plants are young being all the pruning required.

C. cruenta.—This is a native of the East, and is 6 feet or so in height. The leaflets are usually seven to nine, and are more glaucous than those of *C. arborescens*. The flowers are bright reddish yellow or light brown colour, borne in axillary spikes of from three to five flowers on each. The seed-pod does not differ materially from that of *C. arborescens*.

C. istria (*C. halepica* or *haleppica*).—This is rather scarce at present in this country, but when well grown it is one of the handsomest of the Coluteas. It is a native of Asia Minor, and makes an upright shrub 4 feet to 6 feet in height. The stems are rather slender, and the pinnate leaves have smaller and more numerous leaflets than the preceding species. The leaves are of a bright glaucous hue; it is a pretty plant even when not in bloom. The flowers are large, yellow in colour, but are not produced in the same season that the plants are cut down. It is not so strong as the other Coluteas, and requires rather better treatment.

C. melanocalyx (*C. longialata*).—This is a native of Asia Minor, somewhat resembling *C. arborescens*, but is readily distinguished by the longer wings, extending beyond the keel of the flower and the dark hairs on the calyx and flower-stems.

C. media.—This is a name that has been given to a form that is probably not in cultivation now. From its description—orange yellow flowers and glaucous leaves—it is in all probability a hybrid between *C. arborescens* and *C. cruenta*, which has occurred in a batch of seedlings at some time.

Coluteas should never be planted singly, isolated specimens never produce the same effect that bold masses do.

Bagshot, Surrey.

J. CLARK.

THE ROSE GARDEN.

ROSE MARJORIE.

WITH reference to our illustration of this Rose, which was made from a photograph taken in the gardens of Hewell Grange, Mr. A. A. Pettiger, the head gardener there, writes: "Marjorie is a beautiful Hybrid Tea, white with blush centre, of medium height, a capital bedder, and equally as good as a cut flower." We saw it recently at Hewell, and were much attracted by the good qualities Rose Marjorie possesses. It is seldom met with in gardens, and appears to deserve extended culture.

AUTUMN-FLOWERING SINGLE ROSES.

If anyone asked me which was the best of all single Roses that flower in the autumn I should name

Bardou Job. It is a lovely flower. The huge petals, black shading, with a vivid crimson-scarlet ground, combined with an almost climbing habit and autumnal flowering, are excellent points, when we remember that the collection of autumn-flowering single Roses is limited. Some of the sorts I shall name below are not strictly single Roses, there being generally two rows of petals, in some cases three, but their appearance is so much like that of a single Rose that they may well be grouped here. Doubtless by this time

Irish Beauty and *Irish Glory* are well known. They are two of our best autumn-flowering single Roses; in fact, belonging as they do to the Tea Roses they are practically perpetual flowering. The first-named has large flowers of the palest white, being nearly 5 inches across. The large trusses are very showy when several flowers are open at one time, each blossom being held up well by a firm foot-stalk. The rich array of golden anthers is an additional charm, and, moreover, the foliage upon the young shoots is quite ruby-red, contrasting well with the pure white flowers. The

BED OF HYBRID TEA ROSE MARJORIE IN THE GARDENS AT HEWELL GRANGE, REDDITCH.

evergreen tree with rich dark glossy leaves 4 inches to 5 inches in length, attaining in Japan a height of 20 feet to 25 feet; extremely rare in a wild state, though much cultivated. In this country it is a handsome evergreen tree, which on more than one occasion has flowered and fruited freely.

Amongst other trees and shrubs undoubtedly hardy in England which Japan has sent us and which repay the careful planter are *Stuartia pseudo-camellia*, nearly allied to the *Stuartia* of America, but more suitable for our climate, and *Casalpinia japonica*, which flowered outside in England for the first time in 1887, though the genus is, generally speaking, a tropical one.

Clerodendron trichotomum, found all through the Far East and long known to science, is also a striking tree, the large, almost tropical foliage of established specimens being literally hidden every second summer by scores of large umbels of carmine and white flowers.

Amongst the Witch Hazels the distinct *Hamelia mollis* is now recognised as the most beautiful of the genus, the flowers being larger and more richly coloured than those of the other species.

The thorny *Citrus trifoliata* may yet prove to be

This will not prevent their blooming, the flowers, instead of opening in June, being a week or two later, and the plants will last six weeks or more in full flower. Almost any soil will do for them, a hot dry bank suiting them admirably, though they are equally at home in a better and moister position. Full exposure to the sun is, however, essential to their well-being. If they are planted in a dry spot they should have one or two good waterings for the first year, but when the long tough roots have struck down deeply they can take care of themselves. Propagation is effected by seeds, which are produced in considerable quantities, and germinate very rapidly.

C. arborescens (the Bladder Senna).—This shrub attains a height of 8 feet to 10 feet, or even more, with stout erect branches having a roughened spotted bark. The pinnate leaves consist of from nine to eleven nearly oval leaflets of a soft pleasing green. The flowers are yellow, borne in spikes of from six to eight, and freely produced from the axils of the leaves. The seeds are contained in a large, reddish-coloured, bladder-like pod, containing two rows of flattened seeds, which are black when ripe.

plant is vigorous yet not quite so strong as Irish Glory. This latter is as free and vigorous as Mme. Lambard; in fact, it looks like a great single blossom of that well-known sort. The long buds before they unfold are very beautiful. How well this Rose can be utilised for table decoration has been well exemplified at the Rose shows the last two or three years. The single

Indica Miss Willmott has a beauty of its own; the copper-coloured flowers suggest at once *L'ideal* in single form. A really pretty bed could be formed by planting *Bardou Job* against pillars as a centre, then a circle of *Irish Glory*, and another of *Irish Beauty*, with an outer ring of *Miss Willmott*. The

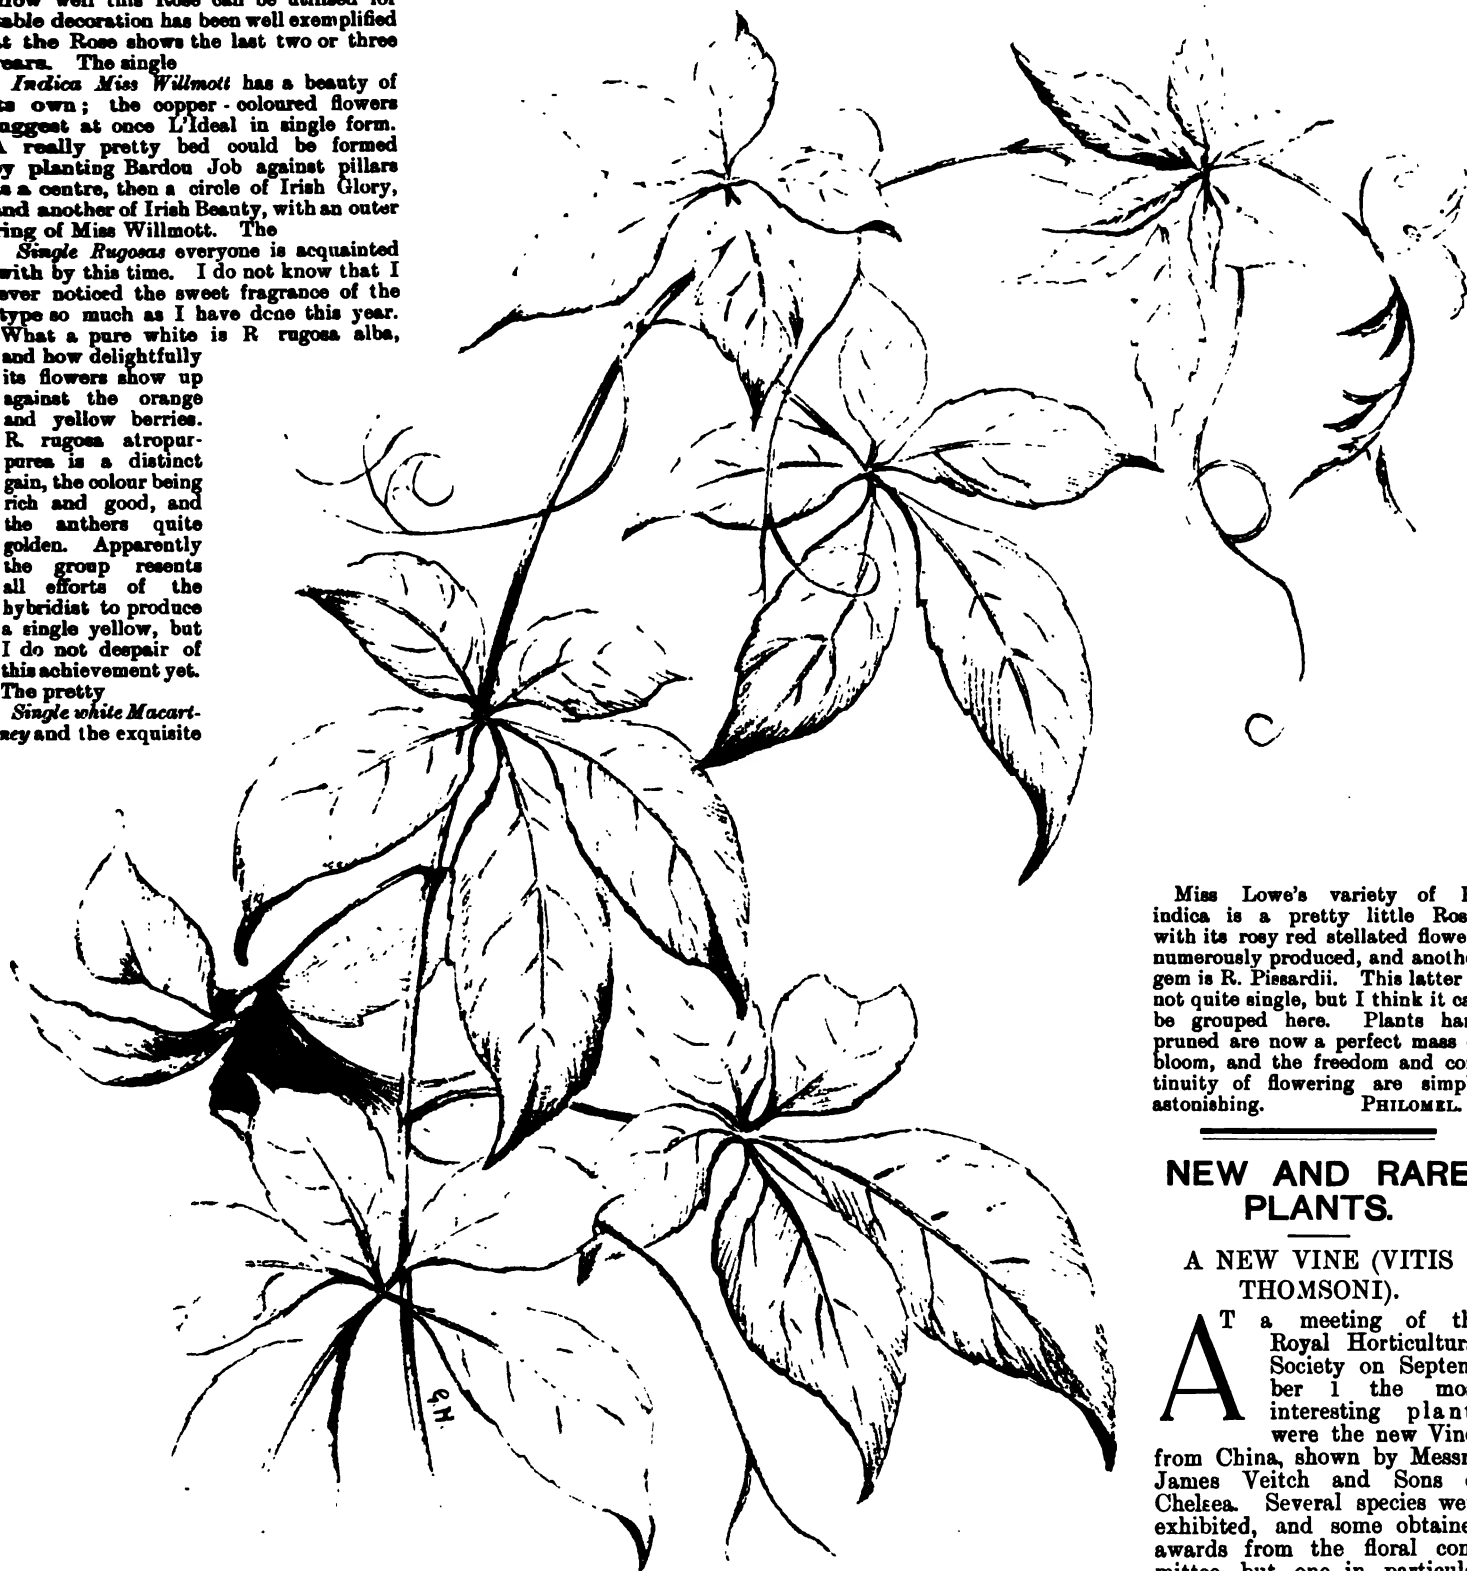

Single Rugosa everyone is acquainted with by this time. I do not know that I ever noticed the sweet fragrance of the type so much as I have done this year. What a pure white is *R. rugosa alba*, and how delightfully its flowers show up against the orange and yellow berries. *R. rugosa atropurpurea* is a distinct gain, the colour being rich and good, and the anthers quite golden. Apparently the group resents all efforts of the hybridist to produce a single yellow, but I do not despair of this achievement yet. The pretty

Single white Macartney and the exquisite

Paul's Single White. I think it is not known nearly so much as it deserves to be.

There seems to be a possibility of many additions to the autumn-flowering single Tea and Hybrid

lovers of this charming group. Though our collection of varieties has attained to such enormous dimensions, I imagine some really striking colours in single Tea Roses would be warmly welcomed.

THE NEW VINE (VITIS THOMSONI) FROM CHINA.

(Shown by Messrs. J. Veitch and Sons, Chelsea, at a recent meeting of the Royal Horticultural Society, and given a first-class certificate.)

R. Berberisfolia Hardii are too tender to commend as garden Roses, but they well deserve a sunny nook on the rockery or on a wall in front of a greenhouse. There is a fine pillar and arch Rose to be found in

Tea Roses. Anyone who has raised seedling Roses in quantity knows very well that a large percentage are single-flowered, and the delightful colours which thoughtful crossing can produce open up possibilities that are likely to astonish the

become as popular in gardens as any Vine of the present day. It received a first-class certificate. The leaves are very rich in colour, with quite a reddish shade on the upper

Miss Lowe's variety of *R. indica* is a pretty little Rose, with its rosy red stellated flowers numerous produced, and another gem is *R. Pissardii*. This latter is not quite single, but I think it can be grouped here. Plants hard pruned are now a perfect mass of bloom, and the freedom and continuity of flowering are simply astonishing. PHILOMEL.

NEW AND RARE PLANTS.

A NEW VINE (VITIS THOMSONI).

AT a meeting of the Royal Horticultural Society on September 1 the most interesting plants were the new Vines from China, shown by Messrs. James Veitch and Sons of Chelsea. Several species were exhibited, and some obtained awards from the floral committee, but one in particular was very distinct. This we have illustrated; it is *V. Thomsoni*, and in the future will probably

HERBACEOUS CALCEOLARIAS AND HYDRANGEAS IN THE GARDEN OF MR. J. HORDERN, HUDDERSFIELD.

surface and violet-purple underneath, while they are five-lobed, and, as our illustration suggests, the whole plant is graceful and very beautiful. We know little of these lovely Vines from China so far, but there is no doubt about their hardness.

BOOKS.

Packing and Selling Fruit and Vegetables.—Early in the year 1902 the Worshipful Company of Fruiterers, desiring to assist small cultivators in improving their methods of dealing with garden produce, offered a gold medal for the best essay on "Gathering, Packing, and Profitably Disposing of Home-grown Fruit and Vegetables," and Mr. Lewis Castle, Ridgmont, Bedfordshire, was the successful essayist. The present volume of some 130 pages is a reprint of Mr. Castle's work, although some paragraphs, omitted to bring the essay within the regulation respecting the number of words, have now been included. This book is intended primarily to assist cottagers and small holders of land, and by them will, without doubt, be found of great service. The first chapter, "Cottagers' Prospects: How to Succeed," will be read with interest. Here the author says: "A market can always be found for the best produce. It is the second and third rate fruits or vegetables which most severely tax the ingenuity of the grower to sell at an advantage. Every means must be adopted that is within the reach of the cultivator to bring his crops to the highest condition." And it is this that Mr. Castle endeavours to impress upon his readers throughout the book, and at the same time describing how the best results may be obtained. The essentials in fruit and vegetable culture are treated upon at some length, although the greater part of the work deals with packing and selling, as the title indicates. The author mentions that suitable packages for conveying produce are very necessary, but expensive to buy, he therefore advises cottagers to make their own. "Cottagers and others who are engaging in fruit and vegetable growing with the object of adding

to their means should at least endeavour to make all the bags, boxes, and baskets they are likely to require." Directions are given for the making of these various articles. "Baskets and Basket Making" is the title of a most useful chapter. As a packing material Mr. Castle recommends wood wool, and few will disagree with him. The work of gathering fruits receives recognition, as it properly should, for unless fruit is carefully gathered its market value is much lessened. "Grading and Packing Fruit and Vegetables," "Selling Garden Produce," "Storing Fruit and Vegetables," "Preserving and Drying Fruit and Vegetables," and some valuable remarks about "Markets" are other chapters included. That Mr. Castle has written a most interesting and valuable essay upon "Packing and Selling Fruit and Vegetables" is acknowledged by the gold medal of a Fruiterers' Company being awarded to it by a committee of experts, and we need only say that it is full of valuable information—that gained by a long experience.

THE INDOOR GARDEN.

HERBACEOUS CALCEOLARIAS AND HYDRANGEAS.

MR. BRAY, the grower of the Calceolarias represented in the illustration, writes: "Seed is sown the last week in May thinly in seed pans in a cold frame with north aspect. The soil is composed entirely of leaf-mould, with a sprinkling of sand on top, and the pan is well drained. Water the soil two hours before sowing. Everything must be in readiness before the packet of seed is opened, as the slightest puff of wind will sow it where it is not wanted. After sowing sprinkle a thin layer of sand over the seed, cover with glass, and turn every morning to dry off the moisture. When big enough to handle prick off into other pans 2 inches apart, having a little loam mixed with the previous soil. When selecting from a large number of seedlings preference should not be given to the sturdiest, as these bear yellow flowers. The weakly-looking ones are those which will yield the most charming colours. The next shift should be into 3-inch pots, taking a good mass of soil with

roots; keep in the cold frame, and sink the pots to the rims in ashes. When well established nip out the points of the leading shoots then side ones will break. Repot into 5-inch pots, and winter in these in a cold house on a shelf close to the glass. In February dew over early in the afternoon with a fine syringe, watching sharply for green-fly. When root-bound pot into larger-sized pots, and as soon as each break has formed two leaves pinch out the lead. This will encourage frequent breaking. About the latter end of March plants will probably be ready for their last shift into 8-inch pots. The soil for these should be of the following mixture: 1 bushel of yellow loam, 3 bushels of local loam, $\frac{1}{2}$ bushel of leaf-mould, 6-inch pot of bone-meal, 8-inch pot of fine Nut charcoal, and 5-inch pot of soot. Mix freely with sand to make the soil porous. While the flowers are developing give liquid manure. This is made with a handful of Thompson's Vine and Plant Manure in a gallon of water; stir it up well. This should be given about twice a week, stopping it when the flowers are out, when only clean water should be given. Attention should then be paid to staking and tying, and give a free circulation of air both top and bottom. During bright sun shade the flowers.

The Hydrangeas are grown in a similar mixture to that for Calceolarias, but with a 6-inch pot of borings of iron mixed with a barrowful of soil. Plants are ripened outside after blooming, taking care to lay down the pots on their sides to prevent too much watering. Remove the plants into a very cool house at Christmas. When showing signs of growth shake out and repot into clean and larger pots and make the soil firm. Good drainage is necessary. Feed with liquid cow manure when the plants are showing bloom about twice a week. This should be discontinued and clean water given when the flowers are fully open."

NURSERY GARDENS.

MESSRS. RICHARD SMITH AND CO., WORCESTER.

IN Messrs. Richard Smith and Co.'s Nursery at Worcester there is something of interest to be seen all the year round, and we recently noticed many good plants in flower in the herbaceous garden, which is under the charge of Mr. Horsman, who has got together an excellent collection of hardy plants. He seems to have succeeded in eliminating "doubtful and weedy" kinds, and to have retained only those which are of real value in the garden. The beds and borders of herbaceous plants made a very brilliant display on the occasion of our visit, and we had an opportunity of seeing some really good border plants well grown.

Delphinium sibiricum plenum, a double-flowered Larkspur of the richest blue, a very striking flower, was first pointed out, and close by we saw a group of *Petunia Countess of Ellesmere*, the most distinct we have met with for a long time, the flowers are rich rosy pink, very telling, and they look particularly well when the plants are grown in baskets or window boxes. Of the Sea Hollies, *Eryngium olivierianum* was most attractive. We saw the true *E. amethystinum*, which has small heads of flower produced in October. *E. alpinum*, with large violet-blue heads of flower, and *E. Bourgatti*, with variegated foliage, were also noticed. *Santolina viridis* (the American Sage) was splendid in the rock garden, a large mass of grey foliage and yellow flowers. *Convolvulus Oneorum*, supposed by some not to be hardy, braves the winter at Worcester, and even now its grey leaves are not unattractive.

Veronica salicifolia is a good plant, bearing drooping racemes of bluish-coloured flowers, and deserves to be noted. *Tropeolum speciosum* was perfectly happy in a hedge of *Arbor-vitæ*, the brilliant flowers were festooning the south side of the hedge, although, curiously enough, the plants were planted on the north side. The *Platycodons* were making a brave show, and so too was *Rudbeckia maxima*, with glaucous foliage and

* "Packing and Selling Fruit and Vegetables." By R. Lewis Castle, F.R.H.S. W. H. and L. Collingridge. Price 1s.

handsome, yellow, deep coned flowers. *Leucanthemum laciniatum robinsonianum* is a tall striking plant with large white flowers. *Potentilla formosa*, with pretty rose-coloured flowers, *P. f. flammea*, rich scarlet, and *P. hopwoodiana*, rich pink and cream, are three delightful Cinquefoils.

Rudbeckia hirta, with bright yellow black-centred flowers, is valuable on account of its early flowering, it is quite a month earlier than *R. speciosum*. *Prunella webbiana* (true) is a plant rarely seen, it bears strong spikes of rose purple flowers very freely. Other plants worthy of note are: *Digitalis ferruginea*, with pale buff blooms, and probably would prove very effective among brightly coloured flowers; *Dianthus giganteus*, *Hemerocallis thunbergiana*, pale yellow, late; *Lychnis vespertina plena*, double white; *Paliurus aculeata* (Christ's Thorn), and *Sedum himalaensis*. Among Bamboos, of which Messrs. Smith have a splendid collection, we noticed *A. undinaria marliacea*, *A. Hindi*, *Phyllostachys heterocycla*, *P. sulphurea*, with the best yellow stem of any, *P. Castillonis*, and *P. macrostema*, from North America.

THE WOODLAND.

THE BURR OAK (*Quercus macrocarpa*) succeeds well in very different situations, and I think it might with great advantage be more frequently planted than it is at present. The leaves constitute the greatest beauty of the tree, they being so large and neat, deep green above and almost silvery beneath, the latter colour being shown off to advantage when they are tossed about in a storm. There is no special treatment that I know of wanted by the Burr Oak, but it likes plenty of room for development, the twigs seeming to die off when the tree is crowded or overhung by others of larger growth. Like many others of the American Oaks, the one under notice is worthy of being extensively planted.

PRUNING BROKEN BRANCHES.—It often strikes me that this department of forest management does not receive the attention it deserves. If there is anything more than another that tends to make a park and the woods of an estate look well, it is paying strict attention to the pruning and clearing of all wind-twisted and dead and dying branches. But this is not all, for by carefully and judiciously pruning off broken and dead branches from a tree its value both now and hereafter is certainly increased. Allow the ragged wound caused by a branch being split or torn from a tree by the wind to remain without dressing the edges and so permitting the ingress of water, and very soon decay will set in and the stem of the tree become damaged in consequence. Dead branches and knots are quite as injurious, for the wood of the tree growing around these causes the planks and boarding cut from such to be almost worthless for building, &c. The knot soon gets loose and falls out once the boards have begun to season. By coating the amputated branch or wound with tar or paint, great benefit will be derived by preventing still further the taking in of water.

ORNAMENTAL WILLOWS.—Clumps here and there of some of the more ornamental Willows have a decided effect in adding beauty to the outskirts of plantations, or even to the sides and margins of woodland drives. What can be finer than a mass of the golden Willow (*Salix aurea*), especially when seen with the afternoon sun upon it? The red-twigged Willow is perhaps not one whit behind it, while the still better-known Bedford Willow is another of particular interest and beauty. Of the most brilliant orange colour are the branches of *S. bofordiana*, and a few specimens on any estate are a great acquisition. The Royal Willow

(*S. regalis*), too, is one of particular beauty, of very free growth, and, like many of the family, by no means exacting as to the quality of soil in which it is planted. But there are others as well as those mentioned that for ornament are well worthy of being planted. Such an one is the vermilion-barked *S. sanguinea*, probably the most distinct of the whole family. The orange-red barked *S. britzensis* should not be omitted. Its bark is very beautiful in winter.

THE WINGED ELM (*Ulmus alata*), although of small value as a timber tree, in this country at least, is yet one of the best species for withstanding prolonged storms and the effects of a fully exposed situation at high altitudes. It has been found to do well high up on some of the English hills, and where from the almost constant wind the Larch looked stunted and one-sided, and could raise its head but a few feet above the wall which surrounded one of the plantations to which I refer. The other trees that were doing well were the Austrian and Corsican Pines, the Alder, and the Sycamore. Moreover, the Winged Elm is so distinct and interesting that it well deserves to be cultivated in the park, for the curious wing-like appendage with which the branches are provided renders the tree unlike any other of my acquaintance. It is not of giant growth—a neat, regularly-branched specimen of about 35 feet to 40 feet high. Free of growth, even in gravel, neat in foliage, and curious in aspect, this Elm is worthy of being noted for the coming planting season.

SEEDLING AZALEAS AND RHODODENDRONS are readily procured in plenty by making artificial beds of peat in any shady, quiet corner. The beds need not be deep, say 6 inches of peat, and this not broken up too fine, but left as big as marbles or Potatoes, or, better still, cut the peat in turves and lay these side by side. Sow the seeds as soon as ripe, and place a few branches over to shade the bed. The seeds will soon germinate, and by the second year the plants will be ready for lining out. They are very useful for planting in various parts of the wild garden, even beneath other trees they do well, and would often give beauty to a spot that otherwise might remain bare and unsightly.

CORRESPONDENCE.

(The Editor is not responsible for the opinion expressed by correspondents.)

DAHLIA FANCIES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was at the National Dahlia show on the 1st inst., and spent some time there. The most beautiful exhibit in the show and the one that attracted the most attention was undoubtedly the stand of eighteen bunches of new Cactus Dahlias set up by Messrs. Stredwick of St. Leonards. Here were some lovely things, almost all new varieties, shown for the first time, graceful in shape, delicate in colour; in a word, beautiful. To decry these and evince a preference for the older coarse, flat-petalled decorative varieties, that look as though they had been sat upon, is surely to display a sort of rigid conservatism, which in gardening, at any rate, I had hoped we had got rid of. Your correspondent laments the decline of the older sorts, because they were superior to the new ones for gardening effect. No doubt they were in a way, in the same way as a double Sunflower excels an Iris, but I know which I admire most as a flower. And even here I do not know that I can admit your correspondent is correct, for I have half a dozen tubs of one of the newer Cactus Dahlias standing on my drive now which are as fine a sight as any lover of garden effects can wish for, a mass of scarlet bloom, every flower visible, and distinctly outlined against the foliage. None of the sorts mentioned could beat it for effect, and certainly not for grace and elegance. I have some of the newer Cactus Dahlias on the table in front of me as I write—Mrs. Edward Mawley, H. J. Jones, Ringdove, Alpha, Vesta, and the pure white and graceful Eva, and how anyone with half an eye for beauty can give these lovely things a second place to the old decorative sorts absolutely passes my comprehension.

F. H. C.
[The point we wished to emphasise was that a show Dahlia is not necessarily a good garden flower, and in striving to obtain a starry form the merits of the variety as a flower for the garden

TREE AND SHRUB BY WATERSIDE, WITH WATER LILY GROUP NEAR.
(From a photograph by Miss Willmott.)

may be overlooked. Much has been accomplished in raising Cactus Dahlias, which throw their flowers well above the foliage and give the same effect as the varieties mentioned in our leader, but there is still room for improvement.—Ed.]

SINGLE HOLLYHOCKS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Single-flowered Hollyhocks are quite useless as border plants to me; they are far too fleeting, and have a distinctly poor appearance as compared to the 12-foot or more plants of good double-flowering varieties, so stately standing at the back of a tall border clothed with formal or non-formal blossoms as the case may be. It is not necessary to adhere too strictly to formal blooms of even double-flowered varieties, as there are abundance of others nowadays. If I wish for single flowers of the Hollyhock in a dwarf form, as suggested by "A. D.," I grow *Lavatera*, which are much handsomer, free-flowering, and lasting. In my experience single Hollyhocks are more liable to disease than doubles. I gave this section a thorough trial during the last two years, and have come to the conclusion that the ground could be much better occupied. E. M.

WHITE PHLOXES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—With all deference to the views of "E. H. J.," regarding Mrs. E. H. Jenkins as a white Phlox, I think it is now quite superseded by *Tapis Blanc*, *Mathilde Srao*, and *Amazone*. The two former do not grow more than 15 inches high, yet carry enormous spikes of the purest white. The pipe themselves are 1½ inches in diameter. *Amazone* and *Sylphide*, too, I regard as better than Mrs. Jenkins; both have larger flowers, and *Amazone* especially is purer in its colouring. The flower-heads, too, are a trifle more compact; the habit of growth is all that could be desired, reaching 3 feet, and producing any number of stiff growths, each one clothed with deep green leaves. *Virgo Marie*, although an old variety as Phloxes go, is a charming sort where late flower-heads are required. With me it is now opening its flowers at a height of 4 feet, of the purest white, and especially compact. This variety deserves extended growth where late flowers are desired. E. M.

THE GLADSTONE PEA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—This Pea is certainly an acquisition, but as showing the variation in height on different soils, I may say that here in a row of 23 yards the lowest portions are 5 feet 6 inches and the highest 7 feet. The seed was sown on May 19, and I have just gathered the first dish. Autocrat, sown on May 30, is also doing well. Last year from this variety, sown on May 22, I was picking nice Peas in November. *Ne Plus Ultra* grows too tall altogether, so I have given it up. Veitch's Perfection is just podding, and, I think, will not exceed 5 feet in height. Peas generally have done splendidly this year, and promise a continuous supply to, at any rate, the end of October. C. H. HOWES.
The Gardens, Birr Castle, King's County.

MALMAISON CARNATIONS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—My attention has been called to a correspondence in *THE GARDEN* re Malmaison Carnations, and I venture to suggest that those who do not appreciate these flowers have probably not succeeded in their culture. My experience is that for size, scent, brilliancy of colour, and for their lasting quality, either as sprays to wear or for decoration of rooms, they are unequalled. Added to this, when properly treated the plants flower twice in the year, and by judicious management in layering young plants and repotting in succession, a good gardener produces blooms all the year round, which he would find difficult to do with other flowers or Orchids. With very limited accommodation in one double span greenhouse my gardener has provided

me with Malmaisons to wear every day in the year of the finest quality in size, form, and colour, and the question of quantity depends alone on the space available. For general purposes I recommend Lord Rosebery, Ivanhoe, Princess of Wales, and the old-fashioned blush Malmaison.

FANNY TWEEDMOUTH.

DISEASE AMONG POTATOES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—It cannot be denied that the present outlook for the winter as regards Potatoes becomes more serious day by day, the extent of decay in those already lifted and placed in store being quite alarming. That really good garden Potato *Snowdrop* is a great offender, quite half the bulk having already to be thrown out, and the length of life that remains to the other half is a matter of doubtful speculation. Under such circumstances and prospects Potatoes are better for the present left undug, so that the decayed ones can be more easily separated from the good. Allowed to remain only a few days unturned in the heap they soon become wet and soft, and their assortment is then offensive. Late varieties and stocks have not yet been proved, their fates are deferred in hopeful anticipation that they may turn out better than the main-crop supply. Early sorts, such as *Sharpe's Victor* and *Ringleader*, lifted before the disease scourge became so prevalent, remain free from taint, and a later lifting of Sir J. Llewelyn shows but little trace of disease. *Cosmopolitan*, another good early cropping sort, is free, or almost entirely free, some lifted early and others more recently being good. *Beauty of Hebron* would, like *Snowdrop*, be sure to be early affected. *Windsor Castle*, another good main-crop Potato, has, so far as I can find, suffered severely, even on ground not much manured. The stalks of all Potatoes have gone off badly with leaf disease, even late ones like *Up-to-Date*, which, it is feared, will ultimately develop decayed tubers. It will be necessary, indeed advisable, to allow them to remain as long as possible in the ground, and when lifted to dry them before storing in clamps or in large heaps indoors. Potatoes almost everywhere showed in leaf growth the results of an unsuitable season, and in many allotments and cottage gardens when journeying through rural districts it could be seen how attenuated was leaf and stalk; so much so, indeed, that few were observed completely to cover the ground.

IPOMÆA RUBRO-CÆRULEA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In *THE GARDEN* for July 25 I saw a note on *Ipomœa rubro-cærulea*, with the ending, "It would be interesting to learn whether anyone has tried it out of doors." I have this year planted three or four in different positions outside. One of them is now a mass of buds, though of course the plants do not grow as freely as under glass, and are not more than about 2 feet high, but this is, I think, partly due to the cold wet season, not a good one to try tender plants out of doors. I will if possible take a photograph of the plant when in bloom, as it will, I am sure, interest many. M. MITCHELL, F.R.H.S.

School of Horticulture, Torquay.

BLACK CURRANT BOSKOOP GIANT.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was particularly interested in reading the experience of "S. M." on page 147 with the above Currant, which appears to be working its way to the front. I can fully endorse all that your correspondent says regarding its free growth and excellent cropping, but the great point is whether it is proof against the bud mite pest. It is as an open question whether this can be said of any Black Currant, but after growing Boskoop Giant with other varieties for several years, I am convinced that it is less liable to attack than the old Baldwin for instance. Since the appearance

of the bud mite pest, Black Currant growing has fallen out of favour a good deal, but this year's prices prove what a profitable crop it is, and cultivators on this account will not readily give it up. It is obviously to their interest to pay attention to such a variety as the one under notice, which doubtless possesses some power to resist mite, though it may not be proof against it. H.

ALPINE FLOWERS IN AUGUST.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In travelling through Switzerland one is much struck with the absence of cultivated flowers about the houses of the peasantry. About the hotels, pensions, and in the towns there are plenty of flowers in the gardens, but the love of flowers shown by the Japanese and even by ourselves is quite absent here. Perhaps they are so surrounded by lovely wild flowers that they have ceased to notice them. The *Vallée des Bagnes* runs up from the Rhone Valley for miles. In the struggle for existence one cannot but admire the courage, resolution, and perseverance of the Swiss people; how passionately they love their beautiful land of mountain and valley. This little hamlet of three hotels, a post-office, and a few chalets is only occupied in the summer time. Far above me are giant crags and precipices, above them the Alpine pastures, or Alps, patches of grass, and slopes of meadow, but no tillage, for corn and vegetables are grown far down in the valley. A collection of log-built chalets are built and thatched with shingle. The first Hay crop has been gathered full of lovely spring flowers. Now the second Hay crop is being out and carried in the sloping meadows; each peasant has a patch marked off by a stone or stick. Far above we see the men cutting the succulent verdure of Dandelion, Plantain, Clover, Dock, Mountain Daisy, and *Gentiana lutea* with its handsome leaves and spikes, the women carrying it in great bundles like haycocks on their backs down to the valley, where they spread it out to dry in the sun. It is then put into the Hay barns or wooden chalets. The Silver Fir crowd each other at the foot of the crags and wherever they can get foothold, Nature making lovely groups. This valley is out of the run of the tourist; it is more a haunt of the Alpine climber, the botanist, and lover of Nature. Guides and porters throng the place, and everyone is working at high pressure. The snow has not long melted, as the place is only open for about four months, and the people migrate to Chablaz and lower down the valley for the winter. About the valley, woods, and ravines one sees great vigorous growths of *Mulgedium alpinum* and *Adenostyles alba* with leaves as large as a hat. The blue flowers of the *Mulgedium* or Alpine Sow-thistle are lovely in the dazzling sunlight. Great spikes of *Aconitum Lycoctonum* or yellow Monk's-hood grow with the white Cow Parsley, with the fritillary butterflies sporting about. About the low rocks we notice *Digitalis ambigua*, the yellow Foxglove, the yellow Mullein, and, in sunny bare patches, quantities of *Epilobium rosmarinifolium*, a low growing Willow Herb, which, I think, ought to be grown more at home, Trefoils in great variety, and Dandelions of all sorts.

As we mount higher, the masses of Alpine Rose or *Rhododendron* bushes cover the hills. In the open pastures *Gentiana lutea* with its great ribbed leaves and yellow spikes 4 feet or 6 feet high is a noble object. The most beautiful flowers are found as we mount upward. On the high Alpine pastures the grass and flowers are eaten off, for from above comes the sound of cow-bells, and one sees a herd of cattle looking no larger than red ants. Farther on is a hut, looking like a heap of stones, with smoke issuing out of it. We go inside and find they are making butter from the cream, and cheese from the milk. As we return in the evening the cows are down near the hut waiting to be milked.

Now we leave the mountain pastures and climb higher. The amphitheatre of mountains is grand, the Grand Combin, the third highest mountain in Switzerland, with snow-clad brow towers above, and pours its glaciers down to join the rest. Black serrated rocks and pure white snow form a glorious spectacle. From the hut my three boys ascended

the Combin de Corbassiere in a storm, a sublime climb. Now sunshine and fleecy clouds sail across the sunlit sky, and from the sublime mountain height we turn to look on the tiny flowers nestling among the rocks. What loveliness is here; the brilliant flowers of *Gentiana verna* half an inch high, the tufts of Mountain Daisy, a lichen-covered rock, and groups of the light blue *Myosotis alpestris*, a tall *Campanula* with serrated bells half an inch high, the brilliant red flowers of *Sempervivum arachnoideum*, the *Sedums* and *Saxifrages*, and many *Vetches*; *Linaria alpina*, a purple and yellow gem; *Helianthemum*, with its yellow or rose flowers; and many a gem flowering where no eye can see them in inaccessible places. *Gentiana acaulis* and many of the common flowers are over, but enough remain to delight the eye. Every patch of rock and every square foot of grass are pictures of beauty.

THEODORE WALKER, F.R.G.S.

Glen Hall, Leicester.

MISCELLANEOUS.

AN OUTDOOR FERNERY.

FEW garden retreats are more appreciated during the hot summer months than such as is shown in the accompanying illustration. Ferns and Foxgloves grow there with great luxuriance, the half-shaded situation and the variety of aspect afforded by the rockwork seem to suit them admirably. We are hardly correct, however, in using the word rockwork, for the "rocks" are made of "Pulhamite," a material made by Messrs. Pulham and Son, 71, Newman Street, Oxford Street, W. This is excellent for the construction of waterfalls, cascades and rocks, for margins of streams, lakes, &c., or wherever it comes into contact with water, for it is said to be more durable than stone. Where bold formations are desired with broad massive rocks, the artificial is specially recommended.

In the grounds surrounding many houses there is often to be found a lake, a stream, or, it may be, only a pond, and few realise the possibility of such features, and the effect to be gained by their skilful treatment. In a booklet called "Hints on Rock Formation," Messrs. Pulham and Son give some delightful illustrations of work in Pulhamite which they have carried out in various parts of the country, and those who are interested in rock formation could hardly fail to obtain some valuable ideas from the illustrations as well as good advice from the accompanying remarks.

THE PRIORY, NETTLESTONE, ISLE OF WIGHT.

It is a pleasure, after many years, to revisit this sunny southern island and to see again the *Fuchsias* and *Myrtles* as hardy bushes loaded with bloom, and to contemplate the many delightful possibilities of gardening in its mild climate and generally rich soil.

This pretty place, near the eastern end of the island, lies embowered among well-grown trees on a slope that finally dips down into a beautiful bay richly fringed by its thick woodland growth. It is a sunny, yet perfectly sheltered, spot. One hears a south-westerly gale roaring in the tops of the trees and the

waves beating up in the bay, but on the pretty lawns only pleasant airs come filtering through the protecting leafy screen.

A wide-spreading standard *Magnolia grandiflora* scents the air with its great white cups, and *Araucaria* is loaded with cones. But the pride of the garden is a *Myrtle* hedge that must be 120 feet long or more. It is from 7 feet to 9 feet thick, and every three years is cut down to a height of about 5 feet. Last winter nearly 100 faggots of stuff were cut out of it. Think of 100 *Myrtle* faggots! About half the length is of the small-leaved kind, looking, after its fresh summer growth, much like a neat hedge of *Veronica Traversi*. The other half, of the large-leaved *Myrtle*, is less uniform, the plant being much more variable. One could pick out half a dozen well-marked varieties. This year, after the severe cutting, there is very little bloom, but during the next two years it will flower strongly.

Two young trees of *Eucalyptus globulus* must be hard upon 50 feet high, and bear the mature scimitar-shaped leaves. They flowered freely last summer.

In a shady dell is a bush of *Desfontainea*

GARDENING OF THE WEEK.

KITCHEN GARDEN.

MUSHROOMS.

CONTINUE to make up fresh beds in accordance with the demand and the amount of suitable material obtainable. The aim should be to maintain an unbroken supply from this time until next summer, and to ensure this the material sufficient for one bed should be got together in an open shed and turned every two or three days until the rank steam has passed away, and be made up into a bed a few days after the last was spawned. In forming the bed the manure must be rammed fairly hard as the work of filling proceeds, and a depth of 18 inches or 20 inches is a suitable one. Plunge a pointed stick or a plunging thermometer, specially designed for the purpose, into the centre of the bed, and when the temperature is about 80° and just on the decline insert the spawn in pieces about the size of a hen's egg 2 inches deep and 10 inches apart evenly all over the bed. It should then be covered with an inch of finely sifted loamy soil that is just moist, and pass the back of the spade lightly over it to leave an even surface, but avoid beating it

FERNS AND FOXGLOVES ON "PULHAMITE" ROCKWORK.

spinosa, still carrying a good quantity of its brilliant red and yellow bloom; here also are large bushes of *Camellia*, that flower freely in the earlier year.

It is not the time to see *Orchids* in flower, but The Priory gardens have a fine collection, as well as an abundance of well-grown stove foliage plants, but among the *Orchids* in bloom *Peristeria elata* and the curious green and yellow *Catasetums* are well represented.

The fine lot of *Chrysanthemums*, of splendid growth and vigour, as well as the other departments of houses and grounds testify to the skill and mastery of his craft of the able gardener, Mr. James Nicholson. He has not been long in charge of the gardens, but hopes, by the introduction of a good many more of the plants and shrubs that can be successfully grown in the Isle of Wight, to do justice to the opportunities presented by its favourable climate and conditions.

into a plaster as is sometimes done. A humid atmosphere should be maintained in the structure at all times, and the temperature kept as equable as possible at from 55° to 60°. Some diversity of opinion exists as to whether it is best to cut the *Mushrooms* or to pull them. I am decidedly in favour of the latter mode, and if care be exercised but very few buttons that surround the larger *Mushrooms* will be destroyed. A sharp twist or pull in an oblique direction should be given.

LEeks.

Complete the earthing of those growing in trenches by banking up with soil in like manner to that practised with *Celery*, or, better still, by tying pieces of brown paper loosely round the stems above the earth already placed against them and working more soil to the paper. A well-grown *Leek* should have at least 12 inches of blanched stem, and, provided they have received proper attention hitherto, they will by now be ready for the final earthing-up. The main crop plants that were dropped into holes made with the

digber should now be filled up and some more earth drawn against them with the hoe.

Clearing the ground of crops that have done service, such as Peas, Beans, Cauliflowers, &c., that are of no further use, together with all weeds and other rubbish, will now be engaging attention. Anything that will burn should be taken to the compost yard or other spare piece of ground away from the dwelling and burnt when dry enough, the ashes from this being of inestimable value to the kitchen gardener. Most crops, as well as weeds, have made much growth owing to the dull, rainy season, and much labour will be needed to clean the ground before it becomes more unfit to work upon.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

INDOOR GARDEN.

HYACINTHS.

In selecting bulbs for pot culture care should be taken to secure solid and well-ripened bulbs in preference to large immature light ones, bearing in mind that weight in proportion to size is the most important test to apply when selecting bulbs of any kind, and for pot culture the best bulbs only should be used. The bulb merchants usually arrange their lists in a convenient manner for selecting the early midseason and late blooming varieties. The early ones should be potted during the first week in October, therefore the compost should be prepared forthwith. As a rule, far too little importance is attached to the preparation of soil for bulbous or other plants a few weeks in advance of the time when it must be used, but by so doing the various ingredients become more thoroughly mixed with the bulk of the compost than can possibly be the case if its preparation be deferred to the last moment. For the Hyacinth a sandy, but not too light, loam in the proportion of two-thirds to one-third of cow manure, with additional sand should the loam require it, and a small quantity of Clay's Fertilizer will make a good compost. In potting, 5-inch and 6-inch pots will be found to be the most useful sizes; fill them about three parts with soil pressed firmly, and put a handful of silver sand in the middle of the pot upon which to place the bulb perfectly upright, and so arranged that the apex of the bulb is half an inch above the level of the soil when finished. Afterwards water thoroughly through a fine rose, and allow the pots to drain for twenty-four hours, when they may be plunged to a depth of 6 inches in fine ashes on a hard border where worms are unable to work through.

ZONAL PELARGONIUMS FOR WINTER.

These should now be placed in a light and comparatively dry house, and for dwarf plants at a distance of about 2 feet from the glass. Any plants that have been standing on a loose border, in a pit, or frame should have the drainage examined, and where found necessary renewed, as stagnant moisture at the roots is very injurious to these plants. Those required to bloom in October will be benefited by a very light top-dressing of Clay's Manure sprinkled over the surface of the soil; successional plants must be exposed to all the light and sun possible, and have the flower-buds removed until about three weeks previous to the time they are required to be in bloom. Give them a light dressing of Clay's when the flower-buds are allowed to develop.

ANNUALS AND BIENNIALS.

A sowing in pots may now be made of *Schizanthus Grahami*, *S. G. carmineus*, *S. pinnatus nivenus*, *S. papilionaceus pyramidalis*, and *S. Wisetonensis*. Any light soil and cold frame treatment until severe frost occurs, suits these annuals when they should be placed on a shelf in a cool house. A few dozen pots of *Papaver nudicaule* (Island Poppy) may also be sown now, and given cold frame treatment all through the winter the flowers in early spring will be most welcome.

Wendover.

J. JAKES.

FLOWER GARDEN.

ROSES AND SUMMER PRUNING.

THESE when growing in rich soil often produce many strong shoots, which the French not inaptly

term *gourmands*, and such they truly are, because they rob the other and more moderate growers of their due share of nourishment. The heavy rains and hot weather experienced of late bring this important subject prominently before our notice. These strong shoots should be cut away as soon as they make their appearance, and so should all suckers rising from the roots, as also such shoots as rise from the stock upon which the Rose may be grafted or budded. When a number of shoots are thrown out equally strong, so as to become crowded, one-third of them should be removed entirely, but if it is desired to increase the size of the plant then a portion only should be removed and others shortened by pinching off their tops. Do not shorten any of the others, as that would cause them to send out a number of small, weakly shoots, upon which few or no Roses would be produced the following season. Summer pruning consists chiefly of thinning out superfluous shoots, such as the *gourmands* we have referred to, and also many of those which are weak or unhealthy, and this is best done immediately after the flowering is past. Too much dependence is sometimes placed on winter pruning alone, and too little on summer pruning or thinning of the shoots. Where the latter is disregarded the plants become in a short time exhausted by the production of shoots grown for no apparent purpose but to be cut in winter and thrown away, whereas if removed early in summer, before the flower-buds form, the sap which goes to the formation of these useless shoots would be thrown into those that must be left as well as into the flower-buds, ensuring a more abundant and perfect bloom, as well as giving additional strength to the tree to resist the attacks both of disease and insects.

HERBACEOUS PLANTS.

To those who look for good results the first season after planting, no time should be lost in getting the plants well established before the winter. Many things, such as the following, are better for being planted at this season: *Achillea Ptarmica* fl.-pl. and its charming variety *The Pearl*, both of which are excellent garden plants, and all of the greatest value for cutting purposes; the *Doronicums*, many of them most showy and useful for cutting—*D. plantagineum excelsum* (Harpur Crewe) is our best; the early-flowered *Adonis vernalis* and the pretty leaved *A. amurensis*, with many others may now be planted with almost a certainty of doing well. *Anthericum Liliaceum* and *A. Liliaceum* should be planted early; they require fairly good soil and a well sheltered position. *Delphiniums* are greatly improved by division and replanting. If allowed to remain too long in the same position they exhaust the soil and the flowering spikes become weak.

THE RESERVE GARDEN.

All plants that will be required for planting out towards the end of next month should now be carefully gone over, all weeds should be removed, and as much air and light as possible be given. Much of the future success depends on how the plants are treated now.

T. B. FIELD.

Ashwellthorpe Gardens, Norwich.

FRUIT GARDEN.

PEACHES.

THE lifting, root pruning, and rearrangement of the trees in the early house may be proceeded with at the earliest convenience. To perform this work successfully it should be taken in hand and carried out with as little delay as possible, and if the trees are completely lifted and removed to fresh stations the roots will require a good soaking of water to settle the soil about them, when new growth will set in. To have ripe Peaches in May, houses planted with the earliest sorts of recent introduction may be started in December; but for giving the best quality of fruit this section must give way to such Peaches as Abec and Early Grosse Mignonne, two varieties which require a little more time to finish them properly. For succession we have *Belle Bauce*, *Stirling Castle*, *Royal George*, *Violette Hative*, and *Bellegarde*, still one of the best Peaches in cultivation. To the above, for planting in mid-season and late houses, may be

added a very superior old Peach named *Dymond* (not Diamond), *Barrington*, *Gregory's Late*, and *Walburton Late Admirable*, a large pale Peach, equal to Noblesse in quality, but a shy setter unless the wood is thoroughly ripened. Where more than two varieties of Nectarine are grown *Lord Napier* and *Stanwick Elruge* should have a place, the one to precede and the other to succeed the indispensable *Elruge* or *Violette Hative*. All the yellow-fleshed Nectarines are excellent. As the time is now approaching for selecting trees from the nursery, the first consideration should be the stock, as the best sorts on bad stocks always end in disappointment and loss.

FIGS.

By removal of the roof lights and the withholding of water early-forced pot trees will now be losing their leaves and going to rest. If any small fruits remain on the points of the shoots rub them off, and leave all quiet and undisturbed until the end of October, when the annual thinning and cleansing may be performed. If, as is by no means improbable, the trees have been attacked by spider or scale, repeated washings with strong soapy water or Gishurst Compound will weaken the enemy before the final cleansing takes place. Where the early trees are planted out and space is limited annual root pruning is recommended. The period immediately preceding the fall of the leaf is the best time for lifting. Every tree should be well drained with broken bricks and old rubble, and the compost, consisting of strong turfy loam, old mortar, and crushed bones, should be mixed up and used in a dry state. Give particular attention to trees in late houses and cases against walls, as scarcity of open air Figs is very great, and a large dessert in September without a good dish of this delicious fruit is by no means complete.

STRAWBERRIES.

Let the most forward plants of the sorts intended for early forcing be examined and moved from time to time to prevent the roots from striking into the ground or bottom of the bed in which they are partly plunged. If, as is generally the case, they occupy very small pots they will require a supply of water every day to keep the soil from shrinking away from the sides, and an occasional syringing with clean sulphur water will do no harm in checking spider and mildew, which sometimes get a hold of the plants and breaks out in a very lively form when they are introduced to the genial warmth of the forcing house early in the spring. This must be looked to. Pay also particular attention to the mid-season and late sorts now making rapid growth, and move them to the most suitable places for ripening up the crowns and foliage. Keep all runner growth removed from young stock both planted out and in pots, giving an occasional surface sprinkling of either artificial or liquid manure, so as to build up solid, well ripened crowns, quite the secret of success for the coming season's crop.

Madresfield Court Gardens.

W. CRUMP.

SOCIETIES.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Held on the 9th and 10th inst., as usual, in the spacious Waverley Market, Edinburgh, this ever-popular autumn show presented one of the surprises of the season, for doubtless most people would expect to find the exhibition as a result of the unpropitious weather of the summer, one of the "lean" kind. As a matter of fact, while Grapes and fruit generally were staged in smaller quantities than usual, the display as a whole, particularly of cut flowers, left nothing to be desired. Some of the chief classes were as follow:—

Table of dessert fruit decorated with plants or cut flowers (Orchids excluded) and foliage. Prizes were offered for fruit as distinct from decoration, and judging was by points. Three competitors staged, Mr. Goodacre, Elvaston Castle, being first for fruit with a total of 106½ points, and third for decoration, with 15 points. The fruit included fine Madresfield Court, Black Hamburg, and Muscat of Alexandria Grapes, splendid Albert Victor Nectarines, Ribston Pippin and Washington Apples, fine Barrington Peaches, Margaret Marillat and Souvenir du Congrès Pears, &c. The floral adjuncts, though awarded third, were generally considered superior to the others; *Montbretia*, with sprays of *Francos ramosa* with light trails of foliage produced the chief effects. The second prize for fruit was awarded to Mr. Kidd, gardener to Lord Elphinstone, Carberry Tower, Musselburgh, with fruit that gained 90½ points, and first for decoration with 25 points. The third prize for fruit was secured by Mr. Smith, gardener to Earl of Stair, Oxenford Castle, Larkhall, with 80½ points, and second for decoration with 21½ points.

For a collection of ten dishes of fruit, Mr. Goodacre was the only exhibitor, and to him the first prize was awarded. For a collection of ten dishes of hardy fruits produced in Scotland, Mr. Day, gardener to the Earl of Galloway, Galloway House, was the sole exhibitor, staging a very nice lot and securing the first prize.

For a collection of twelve dishes of fruit grown in an orchard house, Mr. Goodacre was first, staging magnificent examples of Peaches, Nectarines, and Peaches, as well as smaller fruits; Mr. H. Greenlaw, gardener to Mr. Younger, Benmore, Argyllshire, was a very good second, showing fruit equal to Mr. Goodacre in not a few sorts.

The Grapes, as already stated, were staged less largely than usual, but in many instances the competition was not without that keenness that lends zest, not alone to the competitors, but also the appreciative onlooker. Mr. Goodacre did not stage in the six-bunch class, Messrs. D. and W. Buchanan, Kippen, securing first in a very good competition with specially fine clusters; Mr. Belsant, gardener at Castle Huntly, Perthshire, came in a most creditable second, his specimens of Madresfield Court being particularly fine samples of that good Grape; Mr. W. Green, gardener to Sir Charles M. Palmer, M.P., Loftus, also staging well for third place.

Well-finished clusters of Muscat of Alexandria secured the prize in the class for two bunches, Mr. Hughes, Peebles, being first, Mr. Goodacre second, and Mr. Day third. In the one-bunch class Mr. Goodacre changed places with Mr. Day; Mr. J. A. Wann, gardener to Lord Balfour of Burleigh, Kennet Allon, being third.

For two bunches Black Hamburgh, a class well filled with good Grapes, Mr. Goodacre secured first; Mr. A. Grieve, Kirkcaldy, second, and Mr. Kidd third. In the one bunch class, Mr. Grieve was first with a nice cluster; Mr. Stuart, gardener to Earl of Lauderdale, Thirlstane Castle, second; and Mr. Galloway, gardener to Earl of Wemyss, Gosford, third.

There were also good examples of other varieties staged, notably Madresfield Court from Mr. Belsant; Alicante from Mr. Sutherland, Polmont Station; and Buckland Sweetwater from Mr. Mathieson, gardener to Lord Kinross, Gorseburgh, North Berwick.

Of other fruits special mention may be made of Peaches, Mr. Wilson, Rugby, staging excellent Sea Eagle, and the large quantities of Apples in single dishes as well as in collections. Of the latter the Dunn Memorial Prize of a medal with a money consideration added, brought out a strong competition, but, unfortunately, the fruit was in many instances of inferior quality. The prize was secured by Mr. Sinclair, Congalton Gardens, Drem, with clean, well finished fruit; Mr. Day securing second, and Mr. Murray, gardener to Earl of Ailes, Culzean Castle, Maybole, third.

For a collection of six sorts there was again a strong competition, Mr. Smith, The Convent, Roehampton, being slightly ahead of the others; Mr. Caddick, Caradoc, Ross, second; Mr. Gibson, Kingston-on-Thames, third.

A class for seedling Apples brought together a number of varieties, the first prize being awarded to Mr. B. Lawrie, Perthwick, Ayr; Mr. Murray, Culzean, second; Mr. Findlay, gardener to Count Munster, Maresfield, Sussex, third.

In the single dish classes were numerous examples of good Apples, but almost without exception unripe, such well-known sorts as Lord Derby, Lane's Prince Albert, Lord Grosvenor, Lord Suffield, Lady Sudeley, James Grieve, and Beisham Orange being well shown.

The collection of Pears in twelve varieties brought two lots only, but both good, Mr. Findlay being first, and Mr. G. Mackinlay, gardener to Earl Cowper, Wreat Park, second.

A collection of six varieties, confined to Scotland, was not so keenly competed for, Mr. Greenlaw, Benmore, having nearly good fruits, and Mr. Galloway, gardener to Earl of Wemyss, Gosford, Longliddry, second. In the single classes notable examples of Williams' Plumetree Duchesse, Beurre d'Amal and Duchesse d'Angoulême occurred.

PLANTS

In plants there was nothing very special, Mr. Wood, gardener to J. Buchanan, Esq., Oswald House, Edinburgh, being the sole exhibitor in the group class, and securing first prize. A few good Orchids were staged, Mr. Sharp, Forganendy, securing all the firsts. The four exotic Ferns from Mr. Bruce, gardener to P. Neil Fraser, Esq., Rockville, were also noteworthy, and in addition there were the usual foliage plants, besides other flowering and foliage subjects.

CUT FLOWERS

These formed a remarkable display, twelve and six Gladioli were much superior to those usually seen. Mr. Bennet, Serwick; Mr. B. Lawrie, Prestwick; and Mr. Brydon, Inneslathen, taking the prizes in the order named.

Double Begonias from Mr. Johnston, Prestonkirk, were also very fine. Sweet Peas brought many competitors, Mr. Malcolm, Duns, being first for twelve sorts, and Mr. I. Prosser, Corstorphine, in the same position for six sorts, the latter being remarkably fine alike in size and colour of bloom.

Roses, though small, were fresh and clean. Mr. Bennet, Helensburgh; Mr. Farlane, Roselea; and Mr. Whyte, Helensburgh, securing the chief prizes. Carnations shown in vases constituted another good feature. Many of the blooms were somewhat small, but in the leading lots this was not the case. Mr. Brydon, Inneslathen, easily attaining first place for these and for Picotees. The twelve bunches of herbaceous flowers from the same exhibitor were also noteworthy, and in addition Asters, Chrysanthemums, and Dahlias were staged in large numbers. The prizes for a decorated table were secured respectively by Miss J. Macintosh, Mrs. Duncan, Fogo, and Miss Jane T. Campbell.

VEGETABLES

were abundantly shown, the collections, though limited in number, evincing evidence of superior cultural skill. Mr. J. Gibson, gardener to B. W. Hudson, Esq., Dunsfield, Marlow, Bucks, secured first place with 61 points; Mr. W. Harper, Tullibolton, Bankfoot, second, with 54½ points, and Mr. Rae, gardener to Captain Scott Kerr, Sunlawn, Kelso,

third, with 52½ points. Of single dishes mention may be made of Cauliflowers, Cucumbers, Peas, Leeks, Celery, and Carrots, as being good examples of high cultivation.

NURSERYMEN

In the classes devoted to nurserymen the strongest competition occurred in the Rose classes. The blooms, though not so large as summer productions, were characterised by wonderful freshness and good colour, the Aberdeen Roses of Messrs. James Cocker and Sons being the best as a whole of those staged, this firm securing firsts for thirty-six, eighteen, and twelve blooms of pink Roses and for a collection which contained some grand examples of the various sections. Other eminent growers were Mr. Hugh Dickson, Belfast, and Messrs. D. and W. Croll, Dundee, who secured first in the Tea class, as also for twelve scarlet Roses.

Messrs. Cocker and Sons, Aberdeen, were the only exhibitors in the class for 100 bunches of hardy flowers, staging a grand lot of the best flowers of autumn. Dahlias were shown well by Mr. Hamill, The Vineyard, Birmingham, and by Mr. Smellie, Banbury, and Messrs. Campbell and Sons, High Blantyre. Messrs. George Mair and Son, Prestwick, alone staged Gladioli, but these were remarkably fine. Mr. Whitehead, Selkirk, had the best Carnations staged in vases, and Messrs. Campbell and Sons the finest Picotees.

NON-COMPETITIVE EXHIBITS

To these was due not a little of the success of the show. They formed a very large proportion of the exhibits. It is impossible to detail all, but mention must be made of the following: Messrs. Dobbie and Co., Rothesay, set up a better than usual group of Dahlias, chiefly of the Cactus section, and including other flowers. Gold medal.

Messrs. Storrie and Storrie, Dundee, furnished a large table with material remarkable for its excellent quality, e.g., cut Begonias, Streptocarpus, and plants of Coleoides, with tall fruiting Apples in pots. Silver-gilt medal.

Messrs. A. Lister and Sons, Rothesay, staged specimen blooms of florist's flowers, including Panicle, Carnations, Picotees, and Cactus Dahlias.

Mr. Henry Eckford, Wem, exhibited his usual table of Sweet Peas, and Mr. A. F. Dutton staged a few varieties of Carnations, including Royalty and Mrs. Lawson, grown with long stems and neatly arranged. Silver medal.

Messrs. Blackmore and Langdon, Bath, staged a collection of double Begonias in pots, including the newest forms, such as Rosie, Lady Wilmot, &c., and Mr. Jannock, Dersingham, had Lily of the Valley and Lilacs. Silver medal.

Messrs. Cunningham, Fraser and Co., Comely Bank, forwarded an extensive group of hardy shrubs, conifers, and hardy flowers (gold medal); and Messrs. J. Grieve and Sons, Redbraes, showed the last-named also. Silver medal.

Mr. John Forbes, Hawick, presented his usual autumn display of Phloxes, Carnations, Pentstemons, &c., with a group of East-Lothian Stocks and Hollyhock spikes. Silver medal.

The very attractive Chrysanthemum maximum, King Edward, was staged by Mr. W. Angus, Penicuik, to which an award of merit was given.

Carnations were shown by Messrs. Kent and Brydon, Darlington (bronze medal); by Messrs. Dickson and Sons, Edinburgh (silver-gilt medal); and by Messrs. Laing and Mather, Kelso, who made a very effective display of these popular flowers (gold medal).

A small but well-furnished table of flowering Orchids was arranged from the establishment of Messrs. Sander and Sons, St. Albans, and a very large table of miscellaneous plants by Mr. John Downie, 144, Princes Street, Edinburgh. Silver-gilt medal.

Extensive groups of plants were arranged on the floor of the building by some of the large trade firms, Messrs. Dickson and Co., Waterloo Place, having a massive arrangement, in which their novel dwarf salmon-coloured double Geranium Coronation Gem was prominently beautiful. Silver-gilt medal.

Messrs. B. B. Laird and Sons, Limited, occupied a large amount of space with one of their artistically arranged groups, in which many Dracenas, standard Crotons, Lilliums, retarded Azalea mollis, and handsome Palms and Cycads were employed with good effect. Gold medal.

Another extensive group was arranged by Messrs. T. Methven and Sons, 15, Princes Street. This was perhaps the finest arrangement and the most generally effective in the exhibition. Little groups of Lillium lancifolium in variety, with Chrysanthemums, entered largely into its composition, which was at once a little bit formal, and at the same time just sufficiently bold to produce no effect of over-trimness. Gold medal.

Another feature of a different kind was the collection of bouquets, wreaths, crosses, and other floral arrangements produced by Messrs. Todd and Co., florists, Edinburgh. Roses entered largely into the composition of the whole of these, the excellency of which may be estimated by the gold medal which was awarded to the exhibitors.

In addition to the above, a silver medal was awarded to Mr. B. Lawrie, Roselea, Prestwick, for Apple trees in pots; to Messrs. William Thomson and Sons, Clovenfords, a silver-gilt medal for fruit; to the Ransleigh Nursery Company, a bronze medal for an exhibit of Asparagus myriocladus; and to Mr. J. Rowal a bronze medal for Pentstemons.

NEW PLANTS

A more than ordinary number of products was before the committees of the society for awards. The following are those that were considered worthy of distinction:—

Carnation *Francis Samuelson*, soft apricot, from Mr. G. F. Brotherton, gardener to F. Samuelson, Esq., Breckenburgh Hall, Thirsk, a first-class certificate.

Awards of merit were conferred respectively on *Cactus Dahlia Lucifer* and *Fancy Dahlia William Skeldon*, from Messrs. Dobbie and Co., Rothesay; a sport from Chrysanthemum R. Curtis named Janet H. Grieve, with pure white flowers, and on C. J. Cutler Grieve, a bronzy brown sport from Casimir-Perier, both from Messrs. J. Grieve and Sons, Redbraes Piffry, Edinburgh. Also to a red-flowered Fuchsia of the fulgens type, named Rev. H. Hennel, from Messrs. Dobbie and Co., Rothesay.

EAST ANGLIAN HORTICULTURAL CLUB

THE chief feature at the September meeting of this club, held in Norwich a few days ago, was an essay competition for prizes generously offered by Messrs. Daniels Bros., Limited, upon "Fruit Growing for Cottagers and those with small holdings, giving the best sorts to grow." It was rather to be deplored that out of such a large number of members only two of the "craft" should send in papers. These were both practical papers, and were listened to with marked attention. Some good points were raised in the discussion which followed, especially that of the grower for market in not taking the trouble to grade and pack his fruit and combine to find the best market, in the same manner that the foreigner does. The paper sent in by Mr. H. B. Dobbie, Pinebanks, Thorpe, was awarded first prize, and the second to Mr. F. Palmer, Fernhill Gardens, Thorpe.

Another notable feature of the evening was a varied collection of edible and poisonous fungi, set up by Mr. H. B. Dobbie, who also read a short paper upon them and their uses. Other non-competitive exhibits comprised a grand collection of single Begonia blooms from Mr. T. Nottley, Thorpe St. Andrew; some Bean pods of an African variety, 2 feet 8 inches long, brought up by Mr. Robert Holmes, Tuckwood Farm, Norwich; and a stand of choice Cactus Dahlias from the school garden of the Nelson Street Boys' Board School, of which Mr. C. Hubbard—himself an enthusiastic horticulturist and botanist—is head master.

In the third and final competition for two challenge bowls, Mr. C. Hines, gardener to Garrett Taylor, Esq., Trowse, secured both, a very creditable performance. For the one presented by Mrs. Louis Tillett, he had set up a good collection of fruit. For that presented by Mrs. E. T. Boardman he had to exhibit six bunches of herbaceous flowers, and here he was closely followed by Mr. F. Carrington, an amateur, who only lost in the aggregate by 8 points. The monthly exhibition of cut flowers and vegetables was held, Cactus Dahlias and French Beans being well shown. Among those present supporting the chairman, Mr. J. Powley, were Messrs. T. B. Field, J. W. Church, G. Davison, J. E. Barnes, R. Holmes, E. Peake, J. E. Clayton, C. Hubbard, and George Daniels.

MANCHESTER DAHLIA SHOW

THE northern show of the National Dahlia Society was held in the exhibition house, in combination with the Manchester Royal Botanical and Horticultural Society, on the 11th and 12th inst. It proved a decided success, but, unfortunately, was not patronised by visitors to the extent it deserved. All the arrangements were carried out under the supervision of Mr. P. Weathers.

Thirty-six blooms, show and fancy, distinct: Mr. Charles Turner, Slough, gained the position of honour with a very fine stand of Duchesse of Albany, Mand Fellows, Arthur Rawlings, Daniel Cornish, P. T. Rawlings, Arthur Cook, Mrs. C. Noyes, and others; Mr. S. Mortimer, Farnham, second, with a good lot; and Mr. J. Smellie, Bury, third.

Twenty-four blooms, show and fancy Mr. M. V. Seale, Sevenoaks, gained the premier position, having good blooms of Daniel Cornish, Harry Keith, Merlin, Henry Walton, Diadem, J. T. West, A. Rawling, T. Pearce, Reliance, and others.

Twelve varieties, distinct: Messrs. J. Cheal and Sons led with a good stand, Mr. Thomas Jones, Ruabon, being second.

Twelve Cactus varieties in bunches of six blooms each: Mr. James Stredwick, St. Leonards-on-Sea, was first with Mrs. Wawley, Oliver Twist, H. J. Jones, Ella Kraemer, Mrs. J. W. Wilkinson, Falcon, Rainbow, &c.; Messrs. Keynes, Williams and Co., Salisbury, were second with a good stand, including Imperator, Winsome, &c.; Messrs. J. Cheal and Sons third.

Twenty-four blooms, Cactus varieties, distinct: First, Messrs. Keynes, Williams and Co., with good blooms of Minnie West, J. H. Jackson, J. W. Wilkinson, Phineas, Karki, Mrs. J. Crowe, and others; Mr. J. Smellie was second with some fine flowers; and Mr. W. Treseder, Cardiff, third.

Twelve Cactus varieties, six blooms of each, arranged in vases with any foliage, grasses, or berries: First, Mr. M. V. Seale, with a very fine lot tastefully arranged with long stems; Messrs. Keynes, Williams and Co. were second, and Mr. W. Treseder third.

Twelve varieties Pompons, ten blooms of each: First, Mr. Charles Turner, Slough, with beautiful flowers of Bacchus, Emily Hopper, Nellie Broomhead, Daisy, Silvia, Queen of Whites, Darkest of All, San Toy, and others; Messrs. M. V. Seale and Keynes, Williams and Co. took second and third respectively.

Twelve single varieties, in bunches of ten, brought a brilliant display, in which Messrs. J. Cheal and Sons won with beautiful types of Vesuvius, Mr. Amos Perry, Tommy, Princess of Wales, Hilda, and Victoria; Mr. M. V. Seale was an excellent second.

AMATEURS

Eighteen varieties, show and fancy: Mr. T. Jones, Ruabon, had the best; second, Mr. E. T. Mathews, Derby; third, Mr. T. Shawcross, Stratford. Twelve blooms: The first prize taker was Mr. J. Pilling, Hyde.

Twelve blooms, Cactus varieties, distinct: Messrs. E. T. Mathews, J. Pilling, and T. Shawcross were first, second, and third respectively. For six varieties, Mr. F. H. McGrath, Huddersfield, was first. For three vases, six blooms of each, Mr. T. Jones was the winner.

Six varieties, Pompons, in bunches of six blooms: First and second were Messrs. T. Shawcross and Herbert Massey, Didbury. Vase of twelve, arranged for effect: Mr. T. Jones secured the chief award.

LOCAL CLASSES

Twelve show and fancy: First, Mr. E. Potts, Handforth; second, Mr. Herbert Massey; third, Mr. T. Shawcross. Six show or fancy: First, Mr. J. Pilling.

Six Pompons, six in each bunch: The winners were Messrs. E. Potts, H. Massey, and Lady Annette de Trafford.

Twenty-four Cactus varieties: First, Mr. T. Shawcross; second, Lady Annette de Trafford. For twelve varieties, Mr. E. Potts and Mr. Herbert Massey were placed as named.

NEW DAHLIAS.

Certificates were awarded to Mr. W. Treseder for *Mary* and to Messrs. J. Stredwick and Son for *George Gordon*, *Rainbow*, *Hereford*, and *Comet*.

NON-COMPETITIVE EXHIBITS.

These, as usual, occupied a prominent position and added much to the interest of the exhibition. Large gold medals were awarded to Messrs. Hobbies, Limited, Dereham, for a very attractive display of Dahlias in great variety; and to Messrs. Dickson and Robinson, Manchester, for an exhibit of some seventy varieties of Lettuce and a pleasing display of cut Dahlias.

Gold medals were given to Messrs. Dickson, Brown, and Tait, Manchester, for a grand display of Tomatoes in about seventy varieties (red, yellow, and white); and to Mr. J. H. White for a fine collection of hardy cut flowers, Montbretias, Gladioli, Liliums, Phloxes, &c., being most effective. Stems of Tomato White's Majestic carried seven good fruits to the bunch.

Silver-gilt medals were awarded to Mr. A. J. A. Bruce, Didbury, for an excellent display of Chrysanthemums, hardy cut flowers, &c.; Mr. J. Robson, for a large display of Dahlias; and to Messrs. Dobbie and Co., Rothesay, for an exhibit of Dahlias, well arranged.

A silver medal was given to Mr. W. L. Pattison, Shrewsbury, for a collection of Fancies and Violas. Mr. Charles Turner staged a selection of his new Dahlias. Messrs. Dicksons, Chester, had an exhibit of stove and greenhouse plants and cut Dahlias.

Mr. J. Robson, Altrincham, secured the gold medal in the open competition for hardy herbaceous cut flowers with a very fine display, that included a large number of Liliums.

MOFFAT AND UPPER ANNANDALE.

THIS show, held in connexion with the large agricultural show at the popular summer resort of Moffat, Dumfriesshire, on the 11th inst., was, as a whole, of equal quality to those of former years, the number of entries showing a slight increase.

Interest in the gardeners' class centred chiefly in the 8 feet by 4 feet table competition, in which a fine arrangement from Ericstane greenhouses (gardener, Mr. Ewen Cameron) was first; Mr. William Murray, Ardenholm, being a good second. Mr. Luke Fraser, Craiglands, was first for stove and greenhouse plants in flower, and Mr. Cameron was second, while for foliage plants the positions were reversed. Mr. Adam Rankine, Vicalands, who carried off the Lilium prize, was second for Fuchsias, being beaten by Mr. John Hamilton, Heywood.

Other awards for pot plants which made a capital show were as follows:—Early Chrysanthemums: First, John Hamilton; second, W. Murray. Stove or greenhouse plants: First, Ewen Cameron; second, Luke Fraser. Hardy Ferns: First, Ewen Cameron; second, W. Murray. Exotic Ferns: First, W. Murray; second, L. Fraser. Coleus: First, L. Fraser; second, W. Murray. Begonias: First, W. Murray; second, L. Fraser. Zonal Geraniums: First, J. Hamilton; second, E. Cameron. Plants for table decoration: First, L. Fraser; second, James Allen, Arundel House, Dumfries. Mr. Cameron was awarded the silver medal for the most meritorious plant in this class.

Cut flowers also were very creditable, especially flat petalled Asters, for which Mr. A. Taylor, Alfred Cottage, was first, and Mr. B. Richardson, Moffat, second. For hardy herbaceous plants, Mr. Cameron was first, and Mr. Murray second; for Roses, Mr. Fraser first and Mr. Allan second; for Dahlias, Mr. James Raphael, Langshaw, first, and Mr. James Purves, Marchbankwood, second; for Sweet Peas, Mr. W. Murray first, and Mr. J. McAllister, Drumcreeff, second; for hand bouquet, Mr. J. McGillivray, Craigleburn, first, and Mr. E. Cameron, second; for wedding bouquet, Mr. J. McGillivray first, and Mr. L. Fraser second.

Fruit and vegetables were not so good as usual, but nevertheless some excellent exhibits were forward. The Grape prizes were won as follows:—Black Grapes (Hamburghs): First, D. Anderson, Sunnybrae; second, E. Cameron. Grapes (Hamburghs excluded): First, D. Anderson; second, E. Cameron. White Grapes: First, James Allen. Finest flavoured Grapes: First, J. Allen; second, D. Anderson. Finest bloom: First, E. Cameron; second, J. Allen.

Messrs. Palmer and Son, Annan, had on exhibition a fine stand of Roses.

ROYAL HORTICULTURAL SOCIETY.

CHISWICK, SEPTEMBER 11.

A MEETING of the fruit and vegetable committee was held on the above date, Mr. H. Balderson presiding. Also present were Messrs. O. Thomas, G. Kelf, W. Bates, G. Woodward, H. Ealing, J. Jacques, H. J. Wright, J. Smith, and A. Dean, thus forming a full quorum. The attention of the committee was first given to Potatoes, of which a large collection of old and new varieties had been grown. Generally leafage had disappeared; only in a few cases was it still green, and these varieties had to be omitted. Some gave splendid crops of tubers; others very poor ones. Disease was very little in evidence. Eight varieties were selected for the cooking test, all being very good croppers. The cooking of the tubers is in their coats, and is always remarkably well done.

Of these, when tested, two varieties out of several sent by Lord Carew from Ireland obtained awards. To Lim Gray, a very fine cropper, tubers oval, round, and a nice even sample, was given a first-class certificate, as it cooked so admirably.

An award of merit was given to Maid of Coll, also a fine cropper, with handsome white, roundish tubers.

An award of merit was also given to Dalmeny Beauty (J. Smith), a very heavy cropper, tubers longish, round, and white; and to H. Fincham (Fincham, Kent), also white, and

a heavy cropper. An old variety, Daniels' Special, certificated in 1894, was found excellent and a heavy cropper.

A large collection of Tomatoes in pots under glass was seen, but none were regarded as worthy of any award. Nearly all the varieties grown were excellent croppers, and generally were very even in appearance.

A fine mid-season Cauliflower, head solid, white, and compact-headed, named Daumman's Eclipse, secured an award of merit. A quantity of coarse Kale and Cabbages also were seen, but none of them were suited for garden culture.

DRILL HALL.

THE meeting on Tuesday last was of an exceptionally interesting character, both on account of the diversity of the exhibits and of the nature of these. Hardy flowers, Orchids, miscellaneous flowering and foliage plants, fruit and vegetables were all unusually well shown; and there was in addition an exhibition of fungi, both edible and poisonous. Everyone seemed interested in these, most of which possessed a further attraction in that they were labelled either poisonous or edible. The tables upon which they were displayed were thronged with people during the afternoon, and the lecture given by Dr. M. C. Cooke upon edible fungi was very largely attended.

It is not often that three gold medals are awarded at a Drill Hall meeting, but this was the case on Tuesday last, the recipients being Messrs. Charlesworth and Co., Heaton, Bradford, for a display of Orchids that was spoken of as one of the choicest collections ever seen at the Drill Hall; Messrs. Dickson and Robinson, Manchester, for an exhibit of Lettuces containing no less than sixty-eight varieties; and Messrs. James Veitch, Limited, for a grand exhibit of Nepenthes.

ORCHID COMMITTEE.

Present: Messrs. Harry J. Veitch (chairman), James O'Brien, de B. Crawshaw, W. Boxall, J. W. Odell, H. Little, Jeremiah Colman, H. A. Tracy, W. H. Young, J. Wilson Potter, W. H. White, F. W. Ashton, A. McBean, F. J. Thorne, G. F. Moore, Francis Wilesley, H. Ballantine, and J. G. Fowler.

Messrs. Charlesworth and Co., Heaton, Bradford, Yorks, had an admirable display of Orchids, among which were many fine hybrids, most of which have at one time or another received first-class certificates or awards of merit. Some of the most remarkable were *Brasso-Cattleya gigas-digbyana*, *Cattleya Mrs. J. W. Whiteley*, *C. fulvescens* (with rich orange-yellow throat and pink-edged lip), *C. Mrs. Pitt*, *C. Harrisonae* var. *Alexandria* (a lovely flower of purest white, except for a green tinge on the lip), *C. Iris* (bicolor x aurea), *C. Germana* (scholfieldiana x hardyana), *Brasso-Lælia purpurato-digbyana* var. *marginata* (a lovely flower, the large lip a soft rich purple and the throat white), *L.-C. Callistoglossa*, *Sophro-Cattleya Heatonensis* (saby-red), *L.-C. Clive*, and others. Gold medal.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, exhibited a good group of Orchids that contained *Odontoglossum crispum* varieties, *Bulbophyllum Lobbi*, *Oncidium carthagenense*, *Cypripedium Olivia*, *Vanda Hookeri*, *Cattleya gaskelliana* alba, *C. lawrenceanum hycanum* Vanner's variety (a darker green than usual), *C. Mrs. George Trudault*, and some *Oncidiums*. Silver Flora medal.

H. T. Pitt, Esq., Stamford Hill, N. (gardener, Mr. F. W. Thurgood), showed a group of Orchids that included *Cattleya gaskelliana* alba, *C. armavillieriensis* (gigas x Mendell), a handsome form; *Miltonia Blunif* variety, *Cypripedium Felleity*, *Eulophia guineensis*, *Odontoglossum bictoniense* album, *Vanda coerulesa*, and others. Silver Flora medal.

Messrs. Sander and Sons, St. Albans, exhibited some very good hybrid *Lælia* and *Cattleya*. We noticed *Cattleya Lord Rothschild* (*gaskelliana* x *dowiana* var. *aurea*), *C. Mastersoni* (*Loddigesii* x *labiata*), *L.-C. canhamiana* var., *L.-C. Alalanta* (*C. Warscewiczii* x *L.-C. elegans*), *L.-C. Herga* (*L.-C. elegans* var. *Turneri* x *C. gaskelliana*), *Cypripedium Transvaal* (*chamberlainianum* x *rothschildianum*), *C. purpurato-Veitchii* (*purpuratum* x *Veitchii*), and other Orchids were included. Silver Flora medal.

Messrs. James Veitch and Sons, Limited, Chelsea, showed several good hybrid Orchids—for instance, *Cattleya Cyane* (*C. Mossiae* x *guttata* Leopoldi), *C. pittiana* (*C. dowiana* aurea x *granulosa* scholfieldiana), *L.-C. haroldiana* (*L. tenebrosa* x *C. hardyana*), and *L.-C. Eunomia* (*L. pumila* var. *dayana* x *C. gaskelliana*).

Mr. Timmis, Stone Hall, Oxted, Surrey, showed a plant of *Cattleya Loddigesii*, bearing four fine racemes of flowers. Cultural commendation.

T. M. Crook, Esq., Hoxhton, near Preston (gardener, Mr. W. J. Perks), showed several Orchids, two of which obtained award of merit.

Sir Trevor Lawrence, Bart., Burford, Dorking (Orchid grower, Mr. White), showed *Polystachya buchaniana* var. *viride* (botanical certificate); *L. C. Prosperina* (*L. dayana* x *C. velutina*); *L. C. purpurato-chilensis*, *Oncidium boothiana*, bearing a profusion of small yellow and brown flowers; *Miltonia bleuana*, *Bulbophyllum Micholitzii*, *Dias grandiflora*, with twenty-four blooms on a raceme; and *Pholidota chinensis*. Silver Banksian medal.

C. H. Felling, Esq., (gardener, Mr. C. Stocking), showed some hybrid *Cypripediums*, for instance, *Cypripedium Elise* (*Pallas* x *rothschildianum*); *C. massianum* (*superciliare* x *rothschildianum*), and *lawrenceanum* x *rothschildianum*. The plants were very vigorous and bearing fine scapes of flowers. Vote of thanks.

NEW ORCHIDS.

A first-class certificate was given to *Zygopetalum rabbinianum*.—A hybrid between *Z. rostratum* and *Gautieri*. It is a striking flower, and a valuable addition to hybrid *Zygopetalums*. The lip is richly coloured, being heavily splashed with purplish rose, deepening to purple towards the top. The sepals and petals are brown, with a wide border of rich green, making an effective contrast with the brightly coloured lip. This plant was shown by C. G. Roebing, Esq., U.S.A. (through Messrs. Sander and Sons, St. Albans). It was to be offered for sale at Messrs. Protheroe and Morrie's rooms yesterday (Friday), and the

proceeds given to the Royal Horticultural Society's building fund.

Awards of merit were given to

Cypripedium raffartianum.—*C. lathamianum* and *C. Charlesworthii* are the parents of this hybrid. The large, broad dorsal sepal is pale rosy purple, and the sepals and petals are purplish brown. From T. M. Crook, Esq., Hoxhton, near Preston.

Cypripedium lawrenceanum gratianum.—This was also shown by T. M. Crook, Esq.

FRUIT AND VEGETABLE COMMITTEE.

Present: Messrs. George Bunyard (chairman), H. Balderson, Henry Ealing, T. W. Bates, S. Mortimer, Alex. Dean, George Kelf, J. Jacques, H. Markham, Owen Thomas, G. E. Maycock, J. Willard, James H. Veitch, A. H. Pearson, H. Somers Rivers, W. Poupart, E. Molyneux, Edwin Beckett, and J. Cheal.

Messrs. S. Spooner and Sons, Hounslow Nurseries, Middlesex, exhibited baskets of Apples in excellent condition, and making altogether a fine display. *Duchess Favourite* was brilliantly coloured, and *Williams' Favourite*, *Carlisle Castle*, *Peargood's Nonsuch*, *Okra* (beautifully coloured), *Castle Major*, *Goodenough's Nonsuch*, *The Queen*, *Wealthy*, *Grenadier*, and *Red Quarrenden* were all very good dishes. Silver-gilt Knightian medal.

Several Melons were exhibited from various sources, but no awards were made, the flavour in all cases being inferior.

Mr. W. J. Godfrey, Exmouth, Devon, showed a dish of Apples, and Mr. Charles Ross, Welford Park Garden, Newbury, showed a new Apple *Ruddy*, very richly coloured (*Ecklinville Seedling* x *Mère du Ménage*).

Mr. F. W. Rich, Royal Nurseries, Sandford, Churchill, sent Apple *Rich's Favourite*.

Messrs. Dickson and Robinson, Manchester, were awarded a gold medal for a splendid exhibit of Lettuce, comprising sixty-eight varieties, really a remarkable display. Among the new ones were *Little Gem*, a miniature *Cos* variety; *Lord Kitchener*, Cabbage, very large and tender; *Summer Staghorn*, much resembling *Endive*, a very pretty form; *Delicitation*, a fine large Cabbage variety. Other good ones were *Verdant Green*, the darkest coloured of any; *Giant*, *Champion White*, both *Cos* varieties; *Early Ohio*, *Marquis*, *Cazard*, *Golden Spotted*, beautifully marked with red; *Yearend*, *Iceberg*, *Hartwell*, *Rudolph's Favourite* of Cornwall, *Supreme*, *Immensa*, large brown *head*, *Buttercup*, a small yellow variety; *Large*, *Stubburnhead*, and *Unrivalled*. Of red ones, *Matador*, *Marvel*, *Continuity*, *Firstling*, and *Epicure* the best.

Mr. F. H. Randall, gardener to J. Watt Perkins, Biddisbury Lodge, Edgware, showed a new Runner Bean *Black Prince*, a cross between *Sutton's Tender* and *True and Carter's White Ear*, and although it appeared to be valuable no award was made.

Mr. G. Bow, gardener to the Dowager Countess of Harroby, High Ashurst, Dorking, showed a new seedling garden Pea called *Beau Ideal*.

Potato *Recompense* (a hybrid between *Beauty of Heaton* and *Champion* of Scotland, both good disease-resisting varieties) and *King's Autocrat* Pea were well shown by Mr. George King, East Hornden, Essex.

FUNGUS.

There were numerous exhibits of poisonous and edible fungi, but some of the cards were displaced, so that it was not possible in some cases to know who were the exhibitors.

A. Seth Smith, Esq., Silvermere, Cobham, Surrey (gardener, Mr. Quarterman), showed a collection of fungi both edible and poisonous. Among the former were *Fistulina hepatica*, small orange-red; *Amanita rubescens*, large pale brown; *Cantharellus cibarius*, yellow; *Paxillus involutus*, large dark brown; and others. Of poisonous fungi there were *Amanita nappa*, almost white; *Russula emetica*, bright red; and many others unnamed. The largest of all was *Polyporus betulinus*.

Mr. Willard, Holly Lodge, showed *Fomes australis*, a huge and extremely hard fungus from South America.

The collection shown by A. Clarke, Esq., and C. Croeland, Esq., F.L.S., secretary of the Mycological Society, Halifax, Yorks, comprised both edible and poisonous fungi in great variety of form and colouring.

Dr. H. Franklin Parsons, Oakhurst, 4, Park Hill Road, Croydon, and J. H. Holland, Esq., Dean House, Isle of Wight, included in their exhibits of fungi *Lactarius virescens* (almost black above and white below), *Agaricus elevatus* (large, dark brown), *Amanita rubescens* (purplish brown, large, chocolate colour beneath), *Paxillus atroventosus* (velvety brown above, yellowish brown beneath, large), *Fistulina hepatica* (the Vegetable Beef Steak, so called from its resemblance to that article of food), *Cantharellus cibarius* (of curious distorted growth, rich yellow), and numerous others. The great Puff Ball (*Lycoperdon bovista*), which is edible, is of huge size, white, marked with brown; the Horse Mushroom (*Agaricus arvensis*), a very large Mushroom; and *Leptota rachodes* (edible), of very elegant form, were other remarkable ones.

Carlton Rea, Esq., Worcester, also exhibited a collection of fungi, among them being *Russula cyanoxantha*, deep ruby-red, a delicious esculent, as well as many of those already mentioned.

J. F. Rayner, Esq., Highfield, Southampton; Thomas Bristow, Esq., Manfield Cottage, Primrose Hill, Tonbridge; and the Essex Field Club also showed collections of fungi.

FLORAL COMMITTEE.

Present: Messrs. W. Marshall (chairman), R. Dean, John Green, H. B. May, James Walker, Amos Perry, J. F. McLeod, W. Howe, G. Reuther, Charles Dixon, C. J. Satter, Charles Jeffries, K. W. Wallace, J. W. Barr, W. F. Thomas, K. H. Jenkins, W. J. James, Charles Blick, George Paul, H. J. Cutbush, George Gordon, Charles E. Pearson, and the Rev. F. Page Roberts.

From Messrs. William Bull and Sons, Chelsea, came many good things of stove plants and the like, and among them

Dracena Victoria, of which some half a dozen plants were shown, were extremely good. *Habenaria carnea* was very pretty, with pale flesh flowers above a dotted leafage. *Ceropegia Woodii* as a basket trailer was noteworthy, and, apart from these, *Palma*, *Ferns*, *Crotons*, and other such things were freely represented. Silver Flora medal.

The Fern group from Messrs. J. Hill and Son, Edmonton, was largely made up of *Gleichenias*, mostly well-grown examples. We noted *G. flabellata*, *G. semivestita*, *G. dicarpa*, *G. Spelunca*, and others. Several *Davallias* were shown, and the pretty *Asplenium cicutarium* was in fine form. Silver Flora medal.

Messrs. T. S. Ware, Limited, Feltham, showed a good lot of hardy things in many popular kinds. *Phloxes*, *Gladioli*, *Anaryllis Belladonna*, *Helianthi*, *Delphiniums*, *Sedum spectabile*, early *Asters*, *Lilium speciosum* in variety, and others were in great array; indeed, the group was a good one, and included the best in each set. *Romneya Coulteri* and *Iris hexagona* were notable plants, as also the herbaceous *Lobelia*. Silver-gilt Banksian medal.

Messrs. W. Wells and Co., Limited, Redhill, set up a group of early *Chrysanthemums* of good sorts. We noted *Carrie*, yellow; *Nellie*, yellow; *Parisiana*, *Esperana*, and *Mytchett Gem*, white; also *Champ de Neige*, *Polly*, bronze, with *Goucher's Crimson* being among the best. A large and valuable exhibit. Silver Banksian medal.

Mr. H. B. May, Edmonton, put up a fine batch of *Adiantum farleyense*, the plants ranging from small ones in 4-inch pots to large examples in 9-inch and 10-inch pots. Nicely set out, the plants displayed their full worth. Silver Banksian medal.

A group of *Nerines* in pots was shown by Baron H. Schröder, Englefield Green (gardener, Mr. H. Balaustine). The colour is most brilliant, and in the mass as shown the plants were extremely effective. Silver Flora medal.

The group of *Cannas* from Messrs. Cannell and Sons, Swanley, was certainly one of the finest exhibits on this occasion, the plants well grown and displaying large heads of bloom. It is not possible to enumerate so large a lot of sorts, but Mrs. Dreer, Miss B. Brunner, J. Van der School, Blazing Torch, and President Meyer appealed to us as very fine. Oscar Dennecker, a bronze-yellow, is very effective. Silver-gilt Banksian medal.

Messrs. Gunn and Sons, Market Hall, Birmingham, showed a large collection of cut *Phloxes*. *Etna*, *Syphilde*, *La Vogue*, pink; *Louis Mangir* and *Iris* being among the most distinct.

Messrs. Paul and Son, Cheshunt, showed *Anemones*, *Helianthus*, *Tritoma nobilis*, *Gaillardias*, and *Sanguisorba canadensis*; *Statice latifolia* was also good, and *Aster Mrs. Peters* is a pretty white Daisy.

Messrs. J. Cheal and Sons, Crawley, Sussex, showed *Cactus*, *Pompon*, and single *Dahlias* many fine forms were in the *Cactus* varieties: *Lord Roberts*, cream; *Uncle Tom*, maroon; *Vesta*, pink; *William Jowitt*, scarlet; *Richard Dean*, P. W. Tullock, salmon-red, bronze shaded, very fine; and *Columbine* were all good. The singles were charming. Silver-gilt Banksian medal.

Messrs. William Cutbush and Sons, Highgate, showed a fine bank of hardy things, such as *Phloxes*, *Tritomas*, *Eryngiums*, *Delphinium Belladonna*, *Montbretias*, *Aster ilicifolius*, *Pentstemon*, *Senecio pulcher*, *Cytisus Carleri*, early *Chrysanthemums*, *Eupatorium purpureum*, *Chelone obliqua*, *Polygonum amplexicaule*, *Phytolacca decandra*, being all noticeable. A very large and showy lot. *Hardy Heath* made a very pretty margin. Silver-gilt Banksian medal.

Above a groundwork of *Maidenhair Ferns* Messrs. Veitch and Sons, Limited, Chelsea, showed a very fine lot of *Nepenthes* or *Pitcher* plants, the greater portion superb specimens of these plants. The following were among those shown:

N. wrightiana, spotted; *N. mastersiana*, red pitchers; *N. Tivey*, very large pitchers, with broad green margin; *N. sanguinea*, *N. ventricosa*, with pitchers constricted in the middle; *N. Sir W. T. Threlton Dyer*, immense pitchers; *N. mixta*, *N. balfovia*, *N. picturata*, very handsome; *N. cylindrica*, small green pitchers; *N. Burkel*, *N. dicksoniana*, *N. formosa*, very freely pitchered; and *N. Curtisii* *Superba*, a very dark sort.

N. ampullaria vittata is a very small one; a most valuable and interesting lot. Gold medal.

Messrs. Veitch also showed some valuable *Climbers*, *Actinidia chinensis* and *Smilax aspera sagittifolia*.

Dahlias in variety were shown by Mr. Stredwick, St. Leonards-on-Sea, and by Mr. Chas. Turner, Slough. Mr. Shoemith also contributed to this group of popular plants.

NEW PLANTS.

The following received an award of merit:

Smilax (aspera) sagittifolia.—One of the most beautiful of the true *Smilax*. The glossy leaves are in the form of the old flint arrow-head, yet more bluntly pointed. It will prove a valuable plant for rustic poles, pergolas, and similar work. The exhibited example was some 8 feet high. Shown by Messrs. Veitch and Sons, Chelsea.

Senecio tanguticus.—To the few species now grown in gardens for their ornamental foliage rather than for any merit in flowering this Japanese plant will prove a valuable addition. The small, yellow, starry-shaped blossoms are abundantly produced in large pyramidal panicles on stems about 5 feet high. The foliage is exceedingly ornamental, the divisions of the palmately-lobed leaves deeply cut into segments, thus producing a very elegant effect. In the border or in good isolated positions on the lawn this will prove a most useful subject. Shown by Messrs. Veitch and Sons, Limited, Chelsea.

Sidalcea Rosey Gem.—It is highly probable this is of hybrid origin, the flowers shown not being in agreement with the typical examples known. The chief value of the plant is the deep rose-coloured flowers. These are as large as a florin, and profusely borne on stems 3½ feet high. Quite a choice autumn-flowering perennial. Shown by Messrs. T. S. Ware, Limited, Feltham.

The following *Dahlias* also received awards of merit: *Rose Bank Scarlet* (Single).—A shapely flower of a rather intense deep scarlet shade. Shown by Mr. Edward Mawley, Berkhamstead.

Darkness (Single).—A finely-formed flower of rich crimson-maroon. Shown by Messrs. J. Cheal and Sons, Crawley.

Princess of Wales (Single).—This is an exceptionally choice, well-formed flower; indeed, a perfect circle, the well-moulded petals being of a rosy mauve shade, and very attractive. From Messrs. J. Cheal and Sons, Crawley.

Dainty (Cactus).—A pink-shaded variety, the base of the florets of a yellow tinge.

Sweet Nell (Cactus).—Rose-pink, with mauve shading and rather white centre. Both from Messrs. Green and Co., Limited, Dereham.

Mrs. H. L. Broussan (Cactus).—Pale orange, the florets very long and shapely.

Geo. Gordon (Cactus).—Yellow and fawn.

Miss F. M. Stredwick.—A large creamy white flower. The above trio were from Messrs. J. Stredwick and Son, St. Leonards-on-Sea.

Queen of Whites (Pompon).—A neat, attractive flower of snowy whiteness. From Mr. Chas. Turner, Royal Nurseries, Slough.

San Toy (Pompon).—A medium-sized flower, the tips of the florets of a purplish magenta, and the base white. From Mr. Chas. Turner, Royal Nurseries, Slough.

LECTURE ON EDIBLE FUNGI.

Dr. M. C. Cooke, M.A., V.M.H., gave a lecture upon this subject to an exceptionally large and appreciative audience. Most people, said Dr. Cooke, seem to think there are but three edible fungi, the *Agarics*, *Truffles*, and *Puff Balls*, but these he regarded as types of edible fungi. There were numerous ones belonging to the true Mushroom tribe. Most important is the common Mushroom. This is the only fungus whose spores can be made to germinate under artificial conditions. There is no known method of culture that will succeed except in the case of the common Mushroom. If we only knew how the spores of the various edible fungi germinated we might cultivate many others besides the common Mushroom. Dr. Cooke said he had eaten some eighty species of edible fungi, but the number of species growing wild in this country that would be worth the trouble of culture is comparatively small. The common Mushroom is found almost all over the world; in North-West India it is regarded as a good article of food by the tribes. The question as to whether the wild or the cultivated Mushroom is better flavoured is debatable. Dr. Cooke thought that often Mushrooms were spoiled by bad cooking. The sooner they are cooked after being gathered the better. The common Mushroom varies a lot; there is a variety called *Pratense*, with pink gills, this and another are regarded as species in Italy, where they are indigenous. Two other varieties were mentioned, one of which is usually, if not solely, found growing in coal.

The *Horse Mushroom* (*Agaricus arvensis*) the lecturer found to be delicious. It came up in his London garden for three years in succession, but then disappeared. It differs from the common Mushroom in having gills of a dirty white colour; it is also larger, often 10 inches across. It is found in meadows, and in the country is collected for making ketchup. For this purpose it is superior to the common Mushroom.

The *Bleeding Mushroom*, a dirty clay colour with rosy purple gills, and *St. George's Mushroom* (so called because of its appearance about that day), with white gills and no ring on the stem, were also mentioned. The latter is valuable by reason of its appearing at a time when Mushrooms are scarce. The *Blewits* resemble *St. George's* Mushroom, but have a violet-blue tinge. They are found in pastures.

The *Blue Caps* are found on dead leaves and also on rubbish heaps. When young they are of a violet-blue colour. They are some 3 inches or 4 inches wide, and found in summer and early autumn. The *Dusky Caps* are found also on dead leaves. They are sometimes 5 inches or 6 inches across, usually 3 inches or 4 inches, and of a grey colour. The flesh is thick and firm. The *Parasol Mushroom* is of a dirty white colour. The stem is from 8 inches to 12 inches high, and about half an inch thick, larger at the base. Its general appearance suggests the popular name. The *Shaggy Caps* are black-spored *Agarics*, few of which are edible. They are found in waste places, and should be eaten as soon as gathered. Sometimes they are found among bricks and mortar.

The *Chantarelle*, a small bright yellow fungus, some 2 inches across, has been overrated. It has a strong odour of ripe apricots. Found in woods in September and October. It is eaten regularly on the Continent. The *Champignon*, though small, has a great reputation, though it does not rival the common Mushroom. It is about 1 inch across, convex at first, becoming flat later, with broad creamy white gills. It is common in pastures. When dried it is used for flavouring, and then has no equal.

The edible *Boletus* has the external form of the *Agaric*, but underneath is a mass of long slender tubes instead of gills. These tubes contain the spores. It is not appreciated at home as an esculent. It is orange-brown above and greenish beneath. Abroad, and also in Soho, it is, when dried, used for flavouring soup.

The *Morel*, which on the Continent is dried and may be bought per pound, was next mentioned. The *Tree Cap* *Morel* which is smaller, and Smith's *Morel*, that grows 1 foot high and is only found in Britain, are others. *Helvella*, used as a substitute for the *Morel*, can be preserved for winter use. It is, however, scarce. The *Great Puff Ball*, often as large as a man's head, has no gills; the interior is spore-bearing. It changes colour gradually from white to snuff-brown. It should be eaten when young, before it begins to change colour. In conclusion, Dr. Cooke said that in judging edible fungi the common Mushroom must not be taken as a type of flavour; others have a flavour that is quite peculiar.

Several questions were asked by members of the audience, and in reply to one enquiry Dr. Cooke said that Mushrooms, if not eaten as soon as gathered, may become poisonous, especially to some persons. Certain people are much more easily affected than others. One visitor expressed the hope that when the lecture appeared in the *Society's Journal* the diagrams (of which many excellent ones were on view) would be reproduced also, and in colour. Dr. Cooke was accorded a hearty vote of thanks.

LONDON DAHLIA UNION.

THE annual exhibition was held on Wednesday and Thursday last in the Prince's Hall, Earl's Court, and, despite the recent storm, that had played havoc with many growers' plants, an excellent display resulted. Mr. R. Dean had

IN THE CONSERVATORY IN BARON ROTHSCHILD'S GARDEN AT VIENNA.

Roses from Messrs. Jeffries and Son, Cirencester, were superb, and some half-dozen boxes were staged. Some of the best were *Comte de Rainbaud*, *Ulrich Brunner*, *Maman Cochet*, *A. K. Williams*, *Killarney*, *The Bride*, *Marie Verdier*, *Medes*, &c. As a batch of outdoor Roses these were very fine. Silver-gilt Flora medal.

Messrs. Dobbie and Co., Rothesay, showed a remarkable collection of *Fuchsias* in the cut state. Single and double ones were fully represented, and in all the leading sorts.

Messrs. Wallace and Co., Colchester, showed *Colchicums*, *Gladioli*, *Kniphofias*, *Lilium speciosum* *Kretzeri*, *L. auratum* *vitatum*, *Pentstemons*, *Montbretias*, and *Lilium Henryi*. *Sternbergia lutea* major was very fine, and possibly the finest plant shown was *Gladiolus Princeps*, very large and brilliant in colour. *Lilium tigrinum* in variety and a grand form of *L. speciosum cruentum* were also in the group. Silver-gilt Banksian medal.

Mr. A. L. Gwillim, Eltham, Kent, staged a very showy lot of *Begonias*, single and double, in many shades of colour. The crimson and red shades were especially good, while those of salmon hue were among the largest we have seen. Soine a lot fully demonstrates the value of a high-class strain of seedlings. Silver Flora medal.

Messrs. Barr and Sons, Covent Garden, showed hardy flowers and early bulbs, as *Colchicums* &c. *Japan Anemones* and *Kniphofia Corallina* and *Superba* were also in this group. A few *Water Lilies* in the cut state were noted, but these were not fully open. *Actaea alba* was interesting in fruit. *Montbretias* and *Scabiosa caucasica* were also in good form. Bronze Flora medal.

Mr. B. Ladhams, Shirley, had a good group of showy perennials, *Gladiolus Genuis*, *Zanzelsenia*, *Aster Amellus*, *Ceropegia*, *Acanthus*, and a few early *Michaelmas Daisies*. *Gaillardias* were in grand array and very finely shown. Bronze Flora medal.

arranged for the sides of the hall to be partially draped, and the effect of the display was much enhanced on that account.

Mr. M. V. Seale, Vine Nurseries, Sevenoaks, was first for the best display of Cactus Dahlias upon a table with a handsome exhibit. There were no more entries.

Mr. Stephen Walker, Thame, Oxon, was first for three vases of Cactus Dahlias; Messrs. J. Burrell and Co., Cambridge, second; and Messrs. Keynes, Williams, and Co., Salisbury, third.

Messrs. Keynes, Williams, and Co., Salisbury, were first for six bunches of Pompon Cactus Dahlias, with some very pretty miniature flowers; Mr. Seale, Sevenoaks, second; and Messrs. Burrell and Co. third.

SHOW AND FANCY.

Twenty-four blooms, distinct (open): Mr. Walker, Thame, Oxon, was first with a remarkably bright collection of good blooms; Mr. Charles Turner was a very close second; and Mr. S. Mortimer, Farnham, third. There were several more entries.

Twelve blooms, distinct (open): First, Messrs. J. Cheal and Sons, Crawley, who showed a very bright lot; second, Mr. J. R. Tranter, Henley-on-Thames; third, Messrs. J. Taylor and Sons, Chipping Norton.

Twelve blooms, distinct (amateurs): First, Mr. T. Anstiss, Brill, Thame; Mr. W. Peters, gardener to Miss Penrhyn, Hothamstead, St. Leonards, was second, with uneven, badly staged flowers.

Six blooms, distinct (amateurs): First, Mr. E. West, Junior, The Laurels, Frieth, Henley, with excellent flowers; second, Mr. J. Findley, Kingham, Oxon; third, Mr. W. Wheeler, 14, Hop Gardens, Henley-on-Thames.

CACTUS DAHLIAS.

Twelve varieties in bunches of six blooms (open): First, Messrs. J. Stredwick and Son, Silverhill Park, St. Leonards, with a lovely lot. Mrs. Mawley, yellow, Pearl, rich pink, and Ivanhoe, old gold, were perhaps the very best. Second, Messrs. J. Burrell and Co., Cambridge, also with an excellent display. Violette, rich glowing rose-purple, and J. W. Wilkinson were splendid. Mr. J. Walker, Thame, Oxon, was third, and Messrs. Cheal and Sons, Crawley, fourth. This was a very good class.

Twenty-four blooms, distinct (on boards, open): First, Messrs. J. Burrell and Co., Cambridge, with a very even exhibit of good quality—a beautiful lot; second, Messrs. J. Stredwick and Son, St. Leonards; third, Messrs. Keynes, Williams, and Co., Salisbury. There were several more competitors.

Twelve blooms, distinct (on boards, open): First, Mr. M. V. Seale, Sevenoaks, with a very pretty stand; second, Messrs. J. Stredwick and Son, St. Leonards; third, Messrs. Keynes, Williams, and Co., Salisbury.

Nine varieties in bunches of three blooms (amateurs). The Hobbies Challenge Cup is given with the first prize. Mr. H. A. Needs, Heath View, Horsell, Woking, was first. Lady Colin Campbell (new seedling, light yellow) was perhaps the best of a good lot. Mr. W. Peters, gardener to Miss Penrhyn, Hothamstead, St. Leonards, was second, and also showed very well.

Six varieties (in bunches, amateurs): First, Mr. M. H. Brown, Luton, Beds; second, Mr. Edward Mawley, Berkhamsted; third, Mr. W. C. Pagram, gardener to J. Courtney, Esq., The Whim, Weybridge.

Twelve blooms, distinct (on boards, amateurs): First, Mr. H. A. Needs, Horsell, with some characteristic flowers; second, Mr. William Stephens, Spring Grove, Isleworth; third, Mr. H. Brown, Luton.

Six blooms, distinct (on boards, amateurs): First, Mr. E. West, Jun., Frieth; second, Mr. Edward Mawley; third, Mr. W. C. Pagram, The Whim Gardens, Weybridge.

Mr. H. A. Needs was first for one vase of twelve blooms of Cactus Dahlias, and Mr. M. V. Seale won for three vases, both open classes.

In the open class for six blooms of one Cactus variety, Mr. Walker, Thame, Oxon, was first, with a grand exhibit of Mrs. E. Mawley; Messrs. Keynes, Williams, and Co., Salisbury, were second, showing a seedling called J. Bryant; Mr. H. Shoosmith, Westfield, Woking, was third, with Nelly.

POMPON VARIETIES.

Twelve varieties in bunches of sixteen blooms (open): First, Mr. Charles Turner, with a delightful exhibit. Minnie, apricot-orange; Darkest of All, almost black; Nerissa, rose pink; San Toy, the white petals heavily tipped with crimson-purple, were very choice. Mr. Walker, Thame, was second, and Messrs. Burrell and Co., Cambridge, were third.

Six varieties in bunches of six blooms (amateurs): First, Mr. J. F. Hudson, Gunnersbury House, Acton; second, Mr. M. H. Brown, Luton; third, Mr. W. C. Pagram.

SINGLE DAHLIAS.

Twelve varieties in bunches of six blooms (open): First, Messrs. J. Cheal and Sons, Crawley, with a splendid exhibit, the blooms most brilliantly coloured. Miss Morland, deep red, and Hilda, blush and yellow, were of the best. Second, Mr. M. V. Seale, Sevenoaks; third, Mr. Stephen Walker, Thame, Oxon.

NON-COMPETITIVE EXHIBITS.

Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, made a wonderful display with spikes of Gladioli, filling half one side of the hall.

Hobbies, Limited, Dereham, filled the other half with a grand display of Cactus Dahlias and Roses.

Messrs. S. Spooner and Sons, Hounslow, showed a table of hardy fruit, Apples chiefly, and these were in the best condition.

Messrs. W. Cutbush and Son, Highgate, N., had an attractive exhibit of Cactus Dahlias.

Mr. Eric Such, Maidenhead, showed hardy flowers in variety.

Messrs. T. S. Ware, Limited, Feltham, exhibited an excellent display of Cactus Dahlias that included several promising new ones.

Messrs. H. Cannell and Sons, Swanley, Kent, showed a large number of Cactus Dahlias in bunches.

Messrs. Dobbie and Co. also sent an extensive display of Dahlias, Cactus, Pompon, and single varieties, from their Rothsay nursery.

NEW DAHLIAS.

Certificates of merit were given to

CACTUS VARIETIES.

From Messrs. J. Stredwick and Son.—Mrs. H. L. Brousson, Ella Kraemar, and Pearl.

From Messrs. J. Burrell and Co.—Premier, Lauretta.

From L. McKenna, Esq., The Honeys, Waltham St. Lawrence, Berks.—Dorothy.

From Mr. W. Baxter, Woking.—Lady Colin Campbell.

From Hobbies, Limited.—Dainty and Sweet Nell.

SINGLES.

From Mr. M. V. Seale.—Bessie.

From Messrs. J. Cheal and Sons.—Darkness and Princess of Wales.

POMPONS.

From Mr. Charles Turner, Slough.—San Toy, Silvia, and Queen of Whites.

SHOW.

From Mr. S. Mortimer, Farnham, Surrey.—Bloodhound.

Messrs. Burrell of Cambridge were given certificates of merit for Gladioli Kathleen Grahame and Jessie Dean, and Mr. W. Seward, Hanwell, for Tomato Hanwell Victory.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last. Mr. Charles H. Curtis in the chair. Four new members were elected, and four members were reported on the sick fund.

OBITUARY.

FREDERICK LAW OLMSTED.

THE death is reported from Boston of Mr. Frederick Law Olmsted, the eminent landscape architect of America. Mr. Olmsted was born in Hartford, Connecticut, on April 22, 1822. He received his education from the ministers of successive parishes, into whose houses he was taken for months at a time. From his earliest years he was a wanderer. He first settled down upon a farm with rough surroundings at Saybrook, New York, on Long Island Sound. However, he soon removed to better land on Slater Island, where he came into contact with Calvert Vaux, a young English architect, with whom, in later days, he formed a business partnership. In 1851 he made a trip to England, which brought forth his first book, "Walks and Talks of an American Farmer in England." By this time, somewhat late in life, he had begun to give attention to landscape work. He took a tour through the older states of the South, and wrote a series of letters which, when published in book form as "A Journey in the Seaboard Slave States," was recognised as the fairest description of the conditions surrounding slavery that had then appeared. This was followed by "A Journey through Texas," and "A Journey in the Back Country." In 1856, by a happy chance, he met one of the commissioners of the new Central Park in New York, then just authorised by the Legislature. He was chosen superintendent, and in conjunction with Mr. Vaux proposed the plan which, in competition with more than thirty others, won the first prize. This was practically the first attempt in America to apply art to the improvement or embellishment of Nature in a public park. The work was done in such a satisfactory way that it was followed by plans for many other parks, and ultimately he was entrusted with the design and development of the landscape features of the Columbian Exhibition at Chicago in 1893. Working actively to the last, Mr. Olmsted was a frequent visitor to England, and recognised his obligations to this country.

ANSWERS TO CORRESPONDENTS.

Names of plants.—L. C. F.—Isoloma hirsutum.—Miss Forster (Penrith).—Dimorphotheca Eeklonia.—W. Silcock.—1, Dactylis glomerata variegata; 2, Picris hieracioides (British); 3, the Rose is Mme. Alfred Carrière; 4, an old Bourbon, Marquise Balbano.

Pond weed (H. M. R.).—Is the weed a scum or one of the numerous side or bottom clinging weeds? In the majority of instances such weeds come in the water and, indeed, are part of it, having their season of growth as all other plants. The only remedy is periodical clearing, especially where the pond is for the most part stagnant water.

Lime trees and salt water (A. RILEY).—We should very much doubt whether Limes would thrive under the conditions described.

Naturalising cottage Tulips (SYBIL).—Yes, it is quite possible to naturalise these if your soil is good and the grass not too rank in growth. Of May-flowering Tulips that we can recommend for this purpose we would name Aximenes, Bouton d'Or, Billietiana and its vars., Cornua, Didieri, elegans, most of the Gesners, Macropsia, Maculata, Sweet Nancy, and La Merveille. All these varieties flower freely from very small bulbs, hence they are more likely to thrive under a certain amount of neglect in cultivation. You could grow most of the Darwins in such places, but their flowers will not be large, and they are not likely to last quite so long as the varieties noted, as they require good cultivation for their full development. You could plant these in a richer soil and stronger-growing Grasses—places not so suitable for the others.

Shrubs for seaside (REV. DENIS KNOX).—Shrubs most likely to succeed under the conditions named are Atriplex Halimulus (Sea Purslane); Barberries of sorts, particularly Aquifolium, Darwini, dulcis, and stenophylla; Cotoneaster arborescens (Bladder Senna); Cotoneasters of sorts; Cytisus (Broom), various, especially albus, praecox, and scoparius, in variety; Eimagnus of sorts; Eucynimus europaeus and the evergreen E. japonicus; Hammodendron argenteum (Siberian Salt Tree); Hippophae rhamnoides (Sea Buckthorn); Lychnis barbarum and L. europaeum (Box Thorn); Rosa, many members of the Rose family, particularly Rosa rubiginosa (Sweet Briar) and the Japanese Rosa rugosa; Rubus (Ramble), the double-flowered and cut-leaved forms are very ornamental. Salix (Willow) of sorts; Spartium juncaceum (Spanish Broom); Tamarix gallica and T. tetraedra; Ulex (Furze) of sorts. All the above will grow in ordinary soil, hence it is not necessary to mix up artificial compost for them provided the natural soil is fairly good. It should be well dug, and the shrubs planted firmly therein, securing them if necessary to a stake, as plants that sway about with the wind will never flourish.

Peach trees not fruiting (G. N.).—Our correspondent has recently succeeded to the charge of some young Peach trees planted in a cold house, which have grown strongly and freely, but have as yet borne no fruit. Under these circumstances his efforts have been directed to the sensible and correct practice of thinning out the lateral and all useless growth, with the object of exposing the fruit-bearing shoots to the greater influence of heat, light, and air. Added to this our correspondent proposes to lift and root prune the trees this autumn, in order by this means to check their over luxuriance of growth next year, thereby bringing about more fruitful conditions. So far we think our correspondent's efforts have been directed on sound lines. Now a trifling "large and varied experience" steps in and advises our correspondent to submit his trees to a sort of roasting treatment, by advising that the house should be closed at 10 a.m., and no air admitted until the evening, let the weather be as hot as it may. This is a new departure in our experience of ripening the wood of fruit trees. Warmth, of course, is essential, and this should be secured by all means while the trees are in active growth, but a free current of air both by day and by night is quite as important, and by the exercise of judgment and care in the matter of ventilation the benefits of both may be secured, and therefore we advise that the friend's advice be disregarded, and the influence of both heat and a free circulation of air be taken advantage of. In root pruning we advise that the tap and other strong roots should be laid down horizontally, nearly their full length, with the points pointing upwards, instead of cutting them back too severely. By adopting this method more fibrous roots are formed near the surface, and far better results obtained. Immature wood is always more or less weak and the flowers short of pollen, as well as sparsely produced, therefore special attention must be given to fertilising the flowers in spring.

TRADE NOTE.

A PUMICE-STONE SOAP.

THOSE who have anything to do with gathering, preserving, or, in fact, handling fruit in any way, know well how difficult it is sometimes to remove the stains from the hands. One may scrub with ordinary soap until one is tired without effectually removing fruit stains, and many object to using pumice-stone and the old-fashioned sand-balls. The advent of the Pumice-stone Soap will, therefore, be hailed with delight. Messrs. Osborne, Bauer and Cheeseman, 19, Golden Square, Regent Street, London, are the manufacturers of this new soap, and we can testify to its usefulness for removing fruit and other stains from the skin. While perfectly agreeable to use, and free from harshness, it removes the stains most effectually.

CATALOGUES RECEIVED.

Carnations.—Messrs. Chibran, Altrincham, and W. Watson and Sons, Clontarf Nurseries, Dublin.

Daffodils.—Messrs. Barr and Sons, King Street, Covent Garden, W.C.

Our Bulb Number.—The next issue of THE GARDEN, dated September 26, will be largely devoted to the reasonable subject of bulbs and bulb culture. The monograph of the Tulips will be concluded, and there will be articles upon "Hyacinth Culture in England," "Some Greenhouse Bulbs," "Transplanting Narcissi," "Autumn Crocuses," &c., and Mr. Melville will write about Snowdrops.

* * * The Yearly Subscription to THE GARDEN is: *Island*, 15s.; *Foreign*, 17s. 6d.

THE GARDEN

No. 1662.—VOL. LXIV.]

[SEPTEMBER 26, 1903.]

GARDENING IN TOWN AND CITY TENEMENTS.

As a means to the amelioration and improvement of the moral, physical, and general well-being of the industrial poor of England, the value of the garden has, we think, been long unrecognised by those in authority. Gardening is capable of lending as powerful assistance in this direction as any agency a reformer can summon to his help. As education and civilisation have advanced, gardening in one form or another has ministered to the elevation and the highest enjoyment of all who have been able to indulge in it. In no country in the world has advantage been taken more liberally of the potentialities of gardening in this way than in England. Take away the gardens of the rich in this country and they would be deprived of a valued enjoyment. It is the same with our business men and women living in the suburbs of large towns and cities. A house without a garden surrounding it is hardly to be seen. Indeed, it would be impossible to find a tenant for a house not so adorned. It is good to witness the interest taken by business men in the small gardens surrounding their homes. Many of these are at the present time aglow with the rich autumn colouring of creepers and hardy border flowers. What gives real interest and pleasure to the possessors of these gardens above all other things is the fact that in most cases the work of planting and tending has been a labour of love undertaken by the householders and their families. Take away their gardens, and one of the chief pleasures of life will be extinguished in thousands of homes in England.

Seeing then that the garden is capable of bringing so much solace and joy to the hearts of the rich and well to do, may we not conclude that it is equally potent in helping in a proportionate degree to elevate the lives and pleasures of the poor when they are brought under its influence? The poor, living in our congested courts and flats, are totally shut out from sharing in this the purest of human pleasures. May it not be said that the absence of flowers among so much that is repellent and gloomy is responsible in some measure at least for the misery, squalor, and despair with which the lives of the poor are often blighted. Our great municipalities of late years have been generous in providing public parks and gardens, and in planting and making them

beautiful, but these are enjoyed chiefly by the well to do and better class artisan. Moreover, the pleasure of seeing a garden planted and tended by other hands is infinitely less than is that experienced from one's own garden, however small or humble it may be. Much has no doubt been done of late years in improving the home surroundings of our workers by building cottages and gardens in the country, and by providing cheap and expeditious means of travel, but after all that has been done or can be done in the future, millions of the industrial poor will be compelled by the nature of their duties to inhabit city tenements. It will naturally be asked what can gardening do to help to brighten and interest the lives of men and women living under such conditions, where the atmosphere is so charged with impurities, and where the light of the sun scarcely ever penetrates.

Great things in the way of gardening cannot, of course, be done, but hundreds of beautiful flowers may be grown in the many nooks and corners of such homes. It would take too long to enumerate now the many plants suitable to this purpose. We are content with drawing attention to a subject so fraught with possibilities for good to our working poor, and were such a project once started and a committee organised to carry it out, we doubt not many of our readers would render willing help in pointing out suitable plants for such positions, and even help by the gift of surplus ones. Once secure the interest of the workers in the culture of flowers at their homes, the influence would soon spread, and become before long a powerful instrument for good in weaning the workers and their families away from other undesirable and often debasing recreation.

THE EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

A NEW GEUM.

I herewith send you a few flowers of my new Geum Heldreichi superba. This is one of the best new hardy plants introduced during the last two

or three years. It is now in full flower with me, and will remain so until the frost sets in. It has been flowering since the first week in May, and is of a pretty, neat habit, with flower-stems well thrown up above the foliage and lasting some time cut, and its delightful colour will make it a very popular plant.

Aster Perry's White is probably the finest white Aster up to date. It is quite distinct with its pretty loose petals, reminding one of a Japanese Chrysanthemum. It is of a pretty, neat, erect habit.

Aster Elsie Perry is a charming pink variety. It is a seedling I raised here some three or four years ago, and which received an award of merit at a meeting of the Royal Horticultural Society last year. The flower is a clear rosy pink, far ahead of anything yet introduced. I also enclose a few flowers of my new double pink Aster.—AMOS PERRY, Winchmore Hill.

HARDY FLOWERS FROM MAIDSTONE.

Mr. George Bunyard has sent a gathering of hardy flowers in great variety from his Maidstone nurseries. They serve to show what a wealth of material is within reach of the gardener, and how much better off he is now than a few years ago. There would seem to be little excuse for not having a bright border of hardy flowers with so many good things to select from. Among the collection sent by Mr. Bunyard were *Clematis Ville de Lyon*, *Montbretia elegans*, *Rudbeckia Autumn Glory*, *R. Golden Glow*, hardy *Fuchsia* *Mme. Comelison*, *Helianthus mollis*, *H. Bouquet d'Or*, *Anemone japonica Reine Charlotte*, *A. elegantissima*, *Aster Edna Mercia*, *A. Daisy Peters*, *Eupatorium ageratoides*, *Senecio pulcher*, *Clethra tomentosa*, *Spiraea canadensis*, *Clematis davidiana*, *Tritoma H. Cannell*, *T. nobilis*, *T. Pfitzeri*, *T. Leda*, *Delphinium Faust*, *Harpalum rigidum Miss Mellish*, *Ceanothus Gloire de Versailles*, *Clethra paniculata*, *Spiraea Reevesii*, *S. callosa nana rubra*, *Hypericum oblongifolium*, and *Cistus nigrescens*.

KEW NOTES.

INTERESTING PLANTS IN FLOWER.

Temperate House.

ACACIA LINEARIS, *A. spadicigera*, *Chironia linoides*, *Grevillea thelemanniana*, *Hedychium gardnerianum*, *Hibiscus Huegelii*, and *Pitcairnia ferruginea*.

Water Lily House.

Clerodendron speciosum, *Sanchezia nobilis*. Among the ornamental Gourds in fruit the following are the most conspicuous: *Lagenaria enormis*, *L. leucantha* var. *longis*, *L. longissima*, *L. vulgaris*, *Momordica cochinchinensis*, *Trichosanthes Anguina*, and *T. subvelutina*.

Orchid Houses.

Calanthe madagascariensis, *Coryanthes macrantha*, *Cypripedium Charlesworthii*, *C. croesianum*, *C. spicerianum*, *Dendrobium cassiope*, *D. formosum* var. *giganteum*, *D. Phalenopsis*, *D. thyrsiflorum*, *Dipodium pictum*, *Epidendrum inversum*, *E. vitellinum majus*, *Eria aridostachya*, *Habenaria carnea*, *Laelia elegans*, *L. pumila* var. *praestans*, *Masdevallia Chimera*, *M. nidifica*, *Miltonia*

Clowesii, M. cuneata, M. Regnelli, Neobenthamia gracilis, Odontoglossum grande, Oncidium Forbesii, Polystachya odorata, Selenipedium calurum, Stanhopea Wardii, Stelis discolor, Stenoglottis longifolia, Vanda cœrulea, and Zygopetalum cochleare.

T Range.

Allamanda violacea, Clerodendron splendens, Kleinia Galpini, Lindenbergia grandiflora, Meme-cylon floribundum, Nerine Fothergilli var. major, and Pavetta cafra.

Greenhouse.

Among other things the following are conspicuous: Abutilon Golden Fleece, Begonia evansiana, Bouvardias in variety, Cannas in variety, Fuchsia simplicicaulis, Lantana salvifolia, Salvia splendens, and Tibouchina macrantha.

Herbaceous Borders.

Asters, Sunflowers, and Solidagos in variety, Kniphofia breviflora, K. comosa, K. Tysoni, and others, Lilium sulphureum, and numerous other things.

Water Lily Pond.

Zizania aquatica.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

September 29.—Royal Horticultural Society's Fruit and Vegetable Show at Chiswick (three days); Gardeners' Dinner, Holborn Restaurant. Reception, 6.30. Dinner, 7.

October 6.—National Chrysanthemum Society's Exhibition (three days).

October 13.—Royal Horticultural Society's Drill Hall Meeting.

October 14.—East Anglian Horticultural Club Meeting.

October 27.—Royal Horticultural Society's Drill Hall Meeting.

The gardeners' dinner committee. With this issue of THE GARDEN is published a supplement containing portraits of members of the committee responsible for the arrangements in connexion with the great reception and dinner to be offered to between 400 and 500 British gardeners on Tuesday next, September 29, at the Holborn Restaurant, London. A melancholy interest attaches to the publication of this supplement, for while it is being prepared comes the news of the death of Mr. James Smith, head gardener to Lord Rosebery at Mentmore, a member of the committee. Mr. Smith was one of the best known and most widely respected of British gardeners.

Royal Horticultural Society.—**Fruit and vegetable show at Chiswick.**—The Royal Horticultural Society will hold an exhibition of British-grown fruits and vegetables in their gardens at Chiswick on September 29, 30, and October 1. A conference on Vegetables will be held on Tuesday next, 29th inst., at 2.30 p.m., Mr. George Bunyard, V.M.H., in the chair. The following gentlemen have been asked to read papers: 1. "On Cooking Vegetables," Dr. Bonavia and Mr. James Hudson, V.M.H.; 2. "On Vegetables all the Year Round for a Private Family," Mr. W. H. Divers; 3. "On Vegetables for Exhibition," Mr. Edwin Beckett; 4. "On Vegetables for Market," Mr. W. Poupart. The exhibition will open at 12 noon on the 29th inst., and at 10 a.m. on the two following days, closing at 6 p.m. Fellows of the society, on showing their tickets at the entrance, will be admitted free, and the public on payment of 2s.6d. on the first day, and 1s. on the second and third days. At a general meeting of the Royal Horticultural Society, held on Tuesday, the 15th inst., twenty-four new Fellows were elected, making a total of 1,141 elected since the beginning of the present year.

The gardeners' reception and dinner.—Please permit me to use your generous columns just once more to mention a few things of interest. Seats at the dinner will not be according to the numbers on the tickets. All speakers and distinguished visitors will be seated at the long table, with a chairman or with a vice-chairman

at the ends of the nine other tables, and those specially asking for places will, so far as is practicable, have them allotted. A large plan of the tables with these names will be found in the reception room—one of great dimensions. There friends can meet and make up their own parties to sit together. The smaller the parties the more readily will they find seats. There are large cloak rooms near the entrance, and every holder of a ticket will at once pass up into the reception room, handing in his name card at the door. All should come with these cards legibly filled in, as it is desired to preserve them. The dinner entrance to the Holborn Restaurant is in Newton Street, a little way down from Holborn on the left hand. Newton Street is exactly opposite the British Museum Station of the Tube railway. Mr. Jacques, Pound Street, Wendover, is chairman of the dinner or seating committee. All speakers to the respective toasts are respectfully asked to be very short in their remarks. The programme is a long one, but if speeches be brief can be well got through in good time. Only paid tickets can admit. All ticket remittances should be immediate to prevent disappointment. It is hoped that everyone will preserve their programmes as pleasant souvenirs of a delightful social gathering.—A. DEAN.

Grapes at the Edinburgh show.—"Competitor in the six bunch class," writes: "In your report of the Grape classes at the recent Edinburgh show you say that Mr. Goodacre did not stage in the six bunch class—the principal one. This is an error, as he did. He did not get placed, however, and this perhaps may have led your reporter to overlook his exhibit. It is only fair to us and the other competitors in this class to make this known, seeing that a Shrewsbury champion is not an ordinary competitor."

Mr. W. B. Latham.—With reference to the testimonial and complimentary dinner to Mr. Latham upon his retirement from the Birmingham Botanic Gardens, Mr. J. Hughes, who is acting as honorary secretary, writes: "At a general meeting of subscribers held at the Athletic Institute, John Bright Street, Birmingham, on Monday evening, September 14, after much consideration it was decided that it was advisable to postpone the dinner from September 24 (as originally fixed) to October 22, in order that his many friends at a distance may have an opportunity of showing their appreciation of his many kindnesses and life-long service to horticulture. Mr. Owen Thomas, 25, Waldeck Road, West Ealing, W., who has kindly promised to preside at the dinner and present the testimonial, will be glad to receive subscriptions, or they may be sent direct to the secretary."

Chrysanthemum feast at Tamworth.—This takes place to-day (Saturday, September 26), and owing to the fine condition of the plants this season it promises to be of more than ordinary interest. There is to be a display of early-flowering Chrysanthemums in competition for a handsome silver vase, and several medals of varying degrees of merit are also to be competed for. Mr. William Sydenham has generously proposed to throw open his grounds at Bolehall House for this purpose, making a slight charge for the benefit of certain charities. His extensive trial of early-flowering Chrysanthemums, which embrace varieties collected from every conceivable source, and which include all the newer as well as the older varieties in commerce, will be open for inspection. From recently acquired information it is understood this collection of plants is now in fine form and condition, and well worth a visit. The grounds are within eight minutes of the Tamworth Station of the London and North-Western and Midland Railways. During the afternoon Mr. D. B. Crane has consented to read a paper on the subject of "Early-flowering Chrysanthemums."

A new Hybrid Tea Rose (Earl of Warwick).—One occasionally comes across something exceptionally good, and when one does it is well to make a note of it, even if, as in this particular instance, it cannot at the moment be obtained. This new Rose is not yet in commerce, but it will when introduced be much sought after

and appreciated. It has all the good points the Rose should have. It is free-flowering, delicately scented, of vigorous growth, with a fine constitution and an excellent habit, producing its flowers well up above its foliage. The flowers can be described as true salmon-pink, very even in colour, centre slightly shaded with carmine. They are large and full, of globular shape, with numerous petals. Altogether a beautiful Rose, quite distinct from any other variety in cultivation. The Rose is the result of a cross between the Queen of Belle Siebrecht (both Roses, curiously and commonly known under other names, Scotch S. A. Prince and Mrs. W. J. Grant), and raised at their Waltham Cross nurseries by Mr. William Paul and Son. This variety being that class of Rose we want more of, decent and at the same time, with proper culture, an exhibitor's Rose. Messrs. William Paul and Son, Waltham Cross (not Cheesnut, as I was misled by in a recent article on decorative Roses) have a record in the Rose world that stands very high, and the subject of this note, their latest production, will enhance their reputation.—H. MOLYNEUX.

North British railway stations and gardens.—Passengers by the Scottish railways have observed a steady improvement in the appearance of the stations on some of the lines, greatly by the practice of the companies in giving premiums for the best-kept station gardens and their systems. Among these may be mentioned the North British Railway Company, which year has given no less than £400 in prizes for its gardens. Under the system recently adopted, which also provides for a temporary exhibition of those winning for some years together in the same class, there are four classes of prizes, respectively being awarded £4, £3, £2, and £1. There are twenty in the first class, forty in the second, sixty in the third, and eighty in the fourth. It is impossible, for reasons of space, to give names of the winners of even the first class, but it may be said that they are well distributed over the system of the company. Some of the stations are admirably kept, and the appearance in summer is often surprisingly good in circumstances where flowers and plants are many difficulties to contend with.

Edmonton and District Gardeners' Society.—It is proposed to form a mutual improvement society, and a meeting for this purpose will be held on Monday, September 28th inst., in the garden library, Pymmes Park, Edmonton, at 8 p.m. The gardeners of Pymmes Park and the surrounding district are invited to attend this preliminary meeting with a view to settling the details. The Middlesex Education Committee have kindly placed the garden library at Pymmes Park at the disposal of the proposed society, and the collection of gardening and botanical books will also be utilised for the purposes of the society. Meetings will be held once a week, at which dealing with some branch of gardening will be discussed. Gardeners in the neighbourhood who are willing to join the society or to contribute papers are invited to communicate with Mr. Weathers, Pymmes Park, Edmonton.—E. W.

A good September Neapolitan.—When so many trees have failed to produce this season those that have given any result are doubly valuable, and Spenser is one of the best. It gave a fair crop. This is a handsome tree, large, and of good quality. Grown on a wall our first fruits were ripe on September 15th, and the crop not being a heavy one was of unusual quality. What makes this variety more valuable is that it colours so grandly, and the fruit is delicious. Spenser is one of the largest I have grown, and a very heavy fruit, a free set of light green flesh; it can be kept until October in a cool place. It is one of the best cool orchard house fruits grown. This was one of many seedlings raised at Sawbridgeworth by Messrs. Rivers. I have not forced Spenser, but for an unheated house or for a cold frame it is most valuable. In the open the tree is a grower, a most valuable variety for late autumn and a splendid exhibition fruit.—G. W.

lotus Dahlia Mrs. D. B. Crane. is the most recent addition to the list of Dahlias, and promises completely to eclipse other white sorts at present in cultivation. Most of the white varieties this flower is true to type, without any of those stiff and irritable characteristics that belong to the city of the white sorts. It is truly a flower of grace and refinement, having long florets of a fine form, which build a flower of perfect shape. White is the proper description of the flower, each one is borne on a stout, erect footstalk, above the foliage. The plant possesses a good and is distinctly free flowering. To Messrs. E. and Sons, Crawley, belongs the credit of having raised this fine acquisition, and among their and comprehensive collection of the Cactus Dahlias, which were in good order when we were a few days since, the variety under notice is repeatedly highly praised.—C. A. H.

Nerine elegans.—This pretty little bulb is now in flower with me in a narrow bedded border in the open air. It is a small little plant, with its scarlet drooping stalks lightly poised on hair-fine pedicels. The stalks are rather over 20 inches in height, the narrow leaves nearly as long. It has as many as 100 flowers, also coming into flower, the same border Zephyranthes candida and amaryllis are now in bloom; and Z. Ander- yellow), and one I received under the name of Z. grandiflora, said to bear red flowers, owing, but show no signs of bloom. Nerine angustifolia major is just opening, Cypella plumbea ready flowered, and C. Herbertii is throwing long spikes. Tecophilaea cyanocrocus has been in the border for the past two years.—Fitzherbert, South Devon.

Good record.—Though it has been one of the best seasons on record for outdoor gardening, it is wonderful what can be done with care and skill. At the very successful show just held at Hall, open to the county of Inverness, the Scotch Gardens won no less than twenty-six and ten seconds, and at Keppoch no glass of gold, except a few cold frames, is allowed, the being that only the old-fashioned hardy plants and plants will be kept. Another interesting feature in this garden is that, though collections of the best bulbs and herbaceous plants, nothing is grown merely because it is new and interesting. Open only to the where it looks out on the great Ben Nevis with grass paths and sweeping banks, the garden is unique and quite exceptional.—JOHN WALD, Keppoch, Roy Bridge, N.B.

SOME GREENHOUSE BULBS.

GREENHOUSE bulbs may, generally speaking, be divided into two classes—firstly, those that are hardy, and yet are largely employed for the ornamentation of the greenhouse, particularly in the early months of the year. Being forced to a greater or lesser extent (a mode of treatment which they readily conform) these bulbs flower earlier than they would if left out of doors, and on that account much appreciated. The popular members of this class are the Hyacinths, and Narcissus. Those belonging to the second section of greenhouse bulbs are the most part natives of warmer climates than the members of the preceding group, consequently the protection of a greenhouse is necessary to enable them to stand the winter or to protect the tender foliage from harsh cutting winds. In the last group are the following beautiful subjects:

IANA.—This genus, which is nearly related to Ixias and Sparaxis, is, like them, native of Africa. Most of the species grow about a foot high, with grass-like leaves and spikes of large flowers, which are particularly remarkable for their rich, almost metallic, blue of some of them. Well grown the flowers are nearly 2 inches in diameter. The bulbs can be obtained at a cheap price in autumn.

CRINUM.—Many of the Crinums require a stove, while C. capense will grow out of doors in many places. The best for the greenhouse (and these are hardy in particularly favoured spots) are C. Moorei, with large heads of blush-tinted blossoms, usually at their best in August. C. Powellii, a hybrid, has deep pink flowers; of this there is a form with pure white blossoms. Once established in large pots or tubs or planted out in the greenhouse they give but little trouble afterwards.

CYTANTHUS.—A race of, for the most part, small-growing bulbs, for many of them are not much larger than a Snowdrop. The leaves are grass-like, and the flower-stem, which well overtops them, reaches a height of about a foot. The flowers, which are borne in a loose cluster, are of a curved, tubular shape, about 2 inches long, and in angustifolius red; lutescens, yellow; Macowani, crimson; and Mackenii, pure white. Another species, C. obliquus, has a large, solid bulb, and will push up a stem about 3 feet high, bearing an umbel of flowers tubular in shape, about 3 inches long, and curiously marked with red, green, and yellow.

FREESIA.—That form known as Freesia refracta alba is one of the most popular of bulbs for greenhouse decoration, owing its position not only to its great beauty, but also to its delicious fragrance. Great numbers are imported every year from Bermuda, the Channel Islands, and the south of France. They reach here in August, and should be potted without delay. The best way is to put eight bulbs in a pot 5 inches in diameter, or larger masses may be formed if desired. F. Leichtlinii is supposed to have a distinguishing yellow blotch, but these features are very variable; indeed, between this and F. refracta as usually met with there is really little, if any, difference. Two distinct but uncommon kinds are F. aurea, with golden blossoms, and Armstrongi, in which they are pink, but these last two have the drawback of being scentless or nearly so.

HAMANTHUS.—Many of these require stove temperature, but two that will thrive in the greenhouse are albiflorus, with white blossoms, and coccineus, scarlet. This last, which is known as the Blood Flower, requires to be hard baked by the sun in June and July to obtain flowers in August.

HIPPEASTRUM.—Though this name is botanically correct, the different varieties are far more generally known as Amaryllis, and as such they are largely used for decorative purposes in the spring. The forms in cultivation have resulted from the crossing and intercrossing of about half a dozen species, and the state of perfection now arrived at says much for the skill of the hybridist who has attained such marvellous results. Whether kept in a greenhouse or a warmer structure the general cultivation of the Hippeastrum may be thus summed up: Keep dry during the winter, start with a little water in February, soon after which the flower-stems will make their appearance, water till the leaves show signs of ripening off, and keep dry when dormant. After flowering plenty of sunshine is necessary to ripen the bulbs for another year.

IXIA.—These Cape bulbs are largely grown in Holland, the Channel Islands, and other districts. They are about the size of a Crocus, and push up wiry stems to a height of 18 inches or so, the upper half being closely packed with showy flowers over an inch in diameter. The colours vary from white to crimson, and in most of them the centre is of a different colour from the rest of the bloom. One variety stands out quite by itself. This is viridiflora, whose flowers are of a beautiful metallic green, with a black centre. The cultural requirements of the Ixias when grown in pots for greenhouse decoration are not at all exacting, and apply equally to the Babianas and Sparaxis. Half a dozen bulbs may early in the autumn be put in a 5-inch pot in a mixture of loam, leaf-mould, and sand. Give but little water till the shoots appear above ground, and plenty of light and air whenever possible.

LACHENALIA.—A class of bulbous plants that have made great strides in popular favour within the last few years. Potted in September in a mixture of loam and leaf-mould, with the addition

of a little well-decayed cow manure and sand, these when in flower (during the early months of the year) delight everyone. From the semi-pendulous nature of the flower-spikes they are seen to great advantage when grown in suspended baskets, or, if preferred, they may be grown in pots and secured to slender sticks. Among the best are aurea, luteola, Nelsoni, pendula, quadricolor, and tricolor.

LILIUM.—A Lily that is essentially grown for greenhouse decoration is Liliun Harrisii, of which great numbers are sent here from Bermuda every year, arriving usually in the month of August. They should be potted without delay, and grown in a light and airy structure, taking care that aphides do not attack the points of the growing shoots. They may be had in flower early in the year, and up to a recent period they were greatly valued in January and February, but within the last few years there has been quite a revolution in Lily culture under glass. This is brought about by the system of retarding bulbs in refrigerators, so that it is possible to have several sorts in bloom at almost any period of the year, though L. longiflorum and L. speciosum best lend themselves to this method of treatment. They will flower in from fifteen to twenty weeks after potting.

NERINE.—An autumn-flowering class of bulbous plants that bear for the most part brilliantly-coloured blossoms. Though so showy they are not so popular as they should be, perhaps owing to the fact that some fail to flower them properly. They need a soil composed principally of good yellow loam, lightened by a little well-decayed manure and rough silver sand. Once established they will stand in the same pot for years and flower well; indeed, they should not be disturbed at the roots more than is absolutely necessary. As above stated, they flower in the autumn; after then the young leaves are pushed and growth goes on through the winter and spring, during which period a good light position in the greenhouse must be assigned them. As the leaves die off, usually in early summer, no more water should be given, and the plants must be stood on a sunny shelf in the greenhouse, or in some similar position, as without a good baking they will not flower freely. There is a long list of varieties, but those old forms Fothergilli, cornuta major, and sarniensis are still among the best, while Manessii is remarkable for its late flowering qualities. Some of the newer forms, however, are very beautiful.

POLIANTHES TUBEROSA (the Tuberose).—This is a universal favourite, though not always grown successfully. It is useless to attempt the growing of good flowering bulbs in this country, hence all that we require are imported either from the United States of America or from South Africa. The last usually reach here in October, while the Americans, of which The Pearl is the best, do not come till December. They may without injury be kept dry for a time, and in order to maintain a succession should not be potted all at once.

SPARAXIS.—Closely allied to the Ixias, but as a rule of somewhat dwarfier growth. The variety Fire King, scarlet and yellow, has attracted a good deal of attention within the last year or two, being particularly noticeable at the Holland House show this season.

SPEKELIA FORMOSISSIMA (Jacobaea Lily).—This, known also as Amaryllis formosissima, produces a solid bulb, which can be purchased cheaply in the winter. If potted early in the year it will in the greenhouse flower about June. The stem reaches a height of about 1 foot, and the flowers, which are of a somewhat peculiar shape, have intense blood-red coloured petals, on which account they are particularly striking.

URCEOLINA AUREA or PENDULA.—A bulbous plant from the Andean regions of South America, with dark green, heart-shaped leaves, and curious, drooping, urn-shaped blossoms. They are borne in an umbel on a stem about 18 inches high. The individual blossoms are 2 inches long, distinctly marked with yellow and green, and of a thick wax-like texture. Autumn is its season of flowering.

VALLOTA PURPUREA (Scarborough Lily).—A very old inhabitant of our greenhouses, whose showy flowers are borne usually in early autumn. Like

many other bulbous plants, it should not be disturbed at the roots more than is absolutely necessary. It is evergreen in character, and should not be dried off at any time, though overwatering must at all seasons be strictly guarded against.

WATSONIA.—The genus *Watsonia* consists of *Gladiolus*-like bulbous plants, all of which are natives of South Africa. One, *W. iridifolia* *Ardernei* or *O'Brieni*, has made great strides in popular favour within the last few years. In this the blossoms are of the purest white. Other desirable species include *W. angusta*, orange-scarlet, and *W. humilis*, pink.

BULBS FOR FORCING.

The different bulbous plants that, though thoroughly hardy, are largely forced for decorative purposes in the early months of the year are for the most part grown in Holland, from which country immense numbers are sent every year. *Narcissi* are, however, grown in considerable numbers in England, and there is no reason why we should not produce a great many more of the bulbs required for home consumption than we do. The idea that it would be useless to compete with the Dutch in the cultivation of bulbs is now generally proved to be erroneous, for among other places they are largely grown at Kew. On this point there is a short note in the "Hand List of Herbaceous Plants," as follows:—

"Mention must be made of the Kew collection of bulbs. These, though largely used to produce a decorative effect in the spring, are in great measure of botanical interest. They have for the most part been grown at Kew since 1886, from a small original stock, by the same methods as are employed in Holland. At the beginning of summer they are lifted, harvested, and planted out again the following autumn."

At Kew, I believe, a greater measure of success is attained with Tulips than Hyacinths, and Messrs. Veitch, in their bulb catalogue, show photographs of flowers from home-grown and imported bulbs, in which the advantage rests with the native production. The principal hardy bulbs employed for forcing are:—

HYACINTHS.—The chief consideration in the early forcing of Hyacinths is to see that the bulbs are well rooted before taking them into heat; indeed, it is the golden rule towards their successful culture. The month of October is a good time to pot the bulbs, and, unless there are special reasons to the contrary, one bulb should be put in a 5-inch pot. After potting stand on a good bed of coal ashes to prevent the ingress of worms, and cover about 3 inches deep with ashes, or, better still, cocoanut refuse. In making a selection for early forcing, very few, if any, double-flowered varieties should be included, as at first they do not develop so well as the single ones, though later on they make a grand display. A temperature of 50° to 60° is quite high enough for even hard forcing of Hyacinths, as if hotter than that the whole plant is so weakened that a great deal of its beauty is lost. Though they can be obtained by the new year, Hyacinths under glass are seen at their best in the month of March.

The little Roman Hyacinths which reach here in a dormant state by the end of July may be had in flower long before Christmas.

TULIPS.—The cultural requirements of Tulips for flowering under glass are much the same as Hyacinths, except that in the case of Tulips from three to five bulbs may be put in a pot. The earliest to flower are the different members of the Duc Van Thol section, represented at one time only by the common red and yellow form. Now, in addition, we have varieties with crimson, orange, rose, scarlet, white, and yellow flowers respectively. A little later than these we have a great choice of many beautiful varieties.

NARCISSUS.—The different members of the *Polyanthus* *Narcissus* group have been long employed for forcing into bloom, particularly the double Roman and Paper White, but of late years many of the Daffodils have been largely treated in the same way, so much so, indeed, that in some large establishments they are grown in immense numbers for the purpose. The principal thing is to get

the bulbs well rooted and avoid hard forcing. The Chinese Sacred *Narcissus* will develop its highly fragrant blossoms if the bulbs are simply placed in a bowl of water with a few stones around to keep them in place.

GLADIOLUS.—The only section of *Gladiolus* generally grown in pots for greenhouse decoration is that known as early flowering, and one variety in particular, viz., *Colvillei albus* or *The Bride* is often grown by thousands. Other beautiful sorts are *Delicatissimus*, *Duke of Albany*, *Emperor William*, *Fire King*, *Prince Albert*, and *Rosy Gem*. These *Gladiolus* bulbs should be put several in a pot, as in this way effective little masses are produced. They need plenty of light and air when growing, otherwise they run up thin and weak.

Besides the different subjects above mentioned there are many others that naturally flower early, even in the open ground, and are of great value for greenhouse decoration even before their natural period of blooming. They include *Allium neapolitanum*, *Chionodoxas*, *Crocus*, *Scillas*, *Snowdrops*, and *Muscari*. T.

THE TRANSPLANTING OF NARCISSI.

THE advice of an old Daffodil grower to transplant when the clumps become "more leafy than flowery" is good as far as it goes, but it is certainly better not to wait until the stage of deterioration is reached. In this matter, as in pretty well all things relating to gardening, no hard and fast rule can be laid down, much, I might perhaps say, depending on climate, the nature of the soil, and the variety. In some soils it is impossible to keep such sorts as *cernuus*, *moschatus*, and that grand old double Silver *Phoenix* in good health without annual lifting, this being especially the case when the average annual rainfall is great. It is the same with such delicate varieties as with Tulips. They seem to need a change into fresh, well-sweetened ground every year, and it is possible that the lifting and drying off helps to mature the bulbs. Those who grow *Narcissi* for sale must lift the bulbs annually, and some market growers and amateurs do the same, believing that in this way they get flowers of superior quality. In some soils and localities this may be the case, but I am quite certain that this practice need not be generally followed; in fact, in many places I feel sure that the full beauty of many *Narcissi* is not realised unless the bulbs remain several years undisturbed. This is the case with me. Buying bulbs from time to time I find that, although I get them from specialists and plant in good time, I do not get the size of bloom and vigour that distinguishes them in the second and third year from planting. I have never seen that grand old variety *princeps* in such fine form as in the late Mr. Wilson's Wisley garden. Each clump carried about twenty blooms, and so fine were they both in the matter of size and colour that at first sight I did not recognise the variety. I once had some clumps of *cernuus* which in their way were as remarkable. Each clump carried about thirty blooms, exceptionally fine in form and colour. These clumps were the produce of about a dozen bulbs, which, never having been in any way disturbed from time of planting, in the course of five or six years increased in that manner. In the end I broke these clumps up and planted the bulbs in another place, but they never did so well. I could never get them to yield flowers of such fine quality. Probably there was something a little different in the soil or the position was more favourable where I first put them.

In the case of the albino and more delicate varieties generally it is better when one has several bulbs to try them in different situations, for in all probability there is just one place where they will do best. In gardens of considerable dimensions the soil will frequently vary considerably, and even in small gardens there is often more variety than one would think possible. It is wisest to leave well alone, and in lifting choice sorts that have done

well it is safest to return them to their old quarters, first thoroughly sweetening the soil and adding some decomposed leaf-soil. It will soon be seen whether certain varieties are likely to do on the let alone-principle, the growth and colour of the foliage surely indicate how they are likely to fare in the long run. The first season bulbs obtained from a reliable source are pretty certain to give satisfaction; it is in the second season that one is able to see if local conditions are favourable to perennial vigour. Should there be any signs of decline the annual lifting system must be adopted. In some soils and localities it seems absolutely necessary that the more delicate rooting kinds should get an annual change into soil that has been exposed to the sweetening influences of summer. In northern districts, or where the average rainfall is great, it will scarcely be possible to grow such as *moschatus* and the albino kinds in any other way. The mere lifting and drying off for some weeks in a dry place as it hardens and rests the bulbs in a more favourable manner than if left in the ground. The second season, for instance, the ground has been thoroughly warmed and dried from the foliage died off. In taking up some *cernuus*, *princeps* and others, I found that of the old roots were in a semi-active condition had I not lifted them I do not see how they could have got thoroughly rested. This, of course, is an exceptional summer; but in a general way one need not think of lifting such free-growing sorts as *Horsfieldi*, *princeps*, *Empress*, &c., unless more before stated. I feel sure that the bulbs will be more effective and in every way finer when placed several years.

The Daffodil grower will have to be guided by his experience. In the course of two or three years he will be able to form a tolerably correct opinion of the suitability of his soil for varieties of more or less uncertain in their behaviour. A fine old kind *Silver Phoenix* will only do well in many places when lifted, dried off, and annually in sweetened ground. With me, if allowed to remain two or three years undisturbed, but I am blessed with a soil in which albino varieties do very well. It is a very trying time to deal with in a time of drought in which bulbous flowers generally suffer, especially because they get well ripened. One of the old double white, is a complete failure in the ground. Good bulbs will bloom well the first year, the second year they do not bloom or fail to expand their buds. One has been frequently made in this case in gardening papers of the non-expanding flower-buds, which when about half-developed melt away instead of opening. This is a very annoying, and when, as is often the case, every season, the grower consigns the bulbs to a rubbish heap. The failures are most frequent in light soils, and are undoubtedly due to lack of nutrition at some period of the growth. Lifting is, so far as I am aware, the only remedy, and if you want really good blooms, to be both by sound, perfectly finished off bulbs the following year, they must get an annual change of ground, and a certain amount of manure applied in some manner. Well-rotted manure, dug in at the time of planting 6 inches deep, so that it does not come into contact with the roots or crushed bones may be worked into the ground at planting time. Give the bulbs a change into sweet, deeply stirred ground, with plenty of nourishment when the buds are forming, and you will get good blooms and a vigorous growth. As regards the disease, which in some places is troublesome, I feel convinced that in most cases it is induced by falling vigour. A very hot, dry season, which lowers vitality, will bring it on, and a very wet one, in which the bulbs cannot mature properly, will have the same effect. So far as my experience goes, only the more delicate kinds are affected. I have never known such robust varieties as *princeps*, *rugilobus*, *Leedsii*, &c., to be affected. When it is seen that a variety has not made good growth and that the foliage has a tinge of yellow, do not delay lifting. Get them out of the ground as soon as the leaves die off. Clean every bulb

and keep them in a cool, airy place until the beginning of September. Do this annually and there will be but little loss from disease.
Byfleet. J. CORNHILL.

THE DAFFODIL IN 1903.

Those who have not closely followed the fortunes of the Daffodil of late years would scarcely credit the wonderful developments in its form, and colouring which have taken place. Nor have these improvements been confined to one division alone—although, of course, in some a greater perfection has been

coloured, are proceeding apace. Formerly the range of colouring was restricted to only a few colours; now all is changed, and so many lovely new shades have appeared that the popularity of these hardy spring flowers seems likely to become still further enhanced in consequence. This year the most striking feature has been

THE ADVANCE OF THE WHITE AJAX.

Last season this section received some remarkable additions, but this year most of these were surpassed in beauty by five of the most glorious white varieties. Four of them created a perfect sensation at the show of the Midland

Daffodil Society—these being *Francesca*, Mrs. Robert Sydenham, Mrs. George Barr, and *Loveliness*. The first two came from Messrs. de Graaff Bros. of Leyden, and the two latter from Messrs. Barr and Sons, and in each case the seed-bearing parent was Mme. de Graaff. Decidedly the loveliest flower of the set was

Francesca, which was selected by the judges as the finest new trumpet seedling in the show. It was recognised on all sides as the forerunner of an entirely new type. The mouth of the trumpet is fringed, and extremely revolute in character, so much so that it presents a very shortened appearance in consequence. The pointed perianth segments are very broad, overlapping, and of great substance. Both trumpet and perianth are of exquisite purity, and the plant, I learn, is of vigorous constitution. The pollen parent was the white Ajax Cecilia de Graaff.

Mrs. Robert Sydenham, which gained an award of merit, has a broad pure white perianth, slightly campanulate, and a straight white trumpet elegantly

rolled back at the mouth. I am told that it grows about 16 inches in height, and flowers just in front of Mme. de Graaff.

Mrs. George Barr, which gained an award of merit from the Royal Horticultural Society, as well as at Birmingham, has a very large, bold, stiff perianth broadly imbricated at the base. The trumpet, which is very elegantly crimped and expanded at the mouth, measures 1½ inches across, and is tinged with palest lemon. The segments are of great purity, and on the exterior are heavily splashed with green at the base.

Loveliness has a pale lemon trumpet tinged with a deeper shade of lemon at the base, and is in consequence not quite so chaste in appearance as the previous varieties. The pollen parent in this case was *Empress*, and the creamy lemon perianth segments resemble this variety in character, and are 1½ inches in length. Mr. P. R. Barr kindly tells me that Mrs. G. Barr grows to exactly the same height as Mme. de Graaff, while *Loveliness* grows about 1 inch taller, and both flower somewhat earlier than Mme. de Graaff. Several other white trumpets made their first appearance in public this year, but only one of these could rank in the same class as those just described.

Henri Vilmorin.—The variety I refer to, is an extremely large and refined flower. It was exhibited at Truro for the first time this year, being greatly admired by all who saw it. The pale lemon trumpet closely resembles that of Peter Barr, but is neither so chaste nor so large, while, instead of the twisted perianth segments of the latter, it has splendid stiff lanceolate segments of extreme purity. As exhibited at Truro, the flower measured over 4 inches across. It is a significant fact that nearly all the most notable of our white trumpets owe their origin to Mme. de Graaff, and this in its turn to the little wild *N. moschatatus*. Among the

SELF YELLOW TRUMPETS.

four noteworthy additions have appeared. *Cleopatra* has Monarch for one of its parents, and is really an improvement on that variety. *Royal* is absolutely the largest trumpet Daffodil yet exhibited, surpassing even Van Waveren's Giant in size, and is also of much better form. *King's Norton* is an enormous Emperor, from which it is a chance seedling. This is a variety of great substance, and the flowers last in good condition for a month. *Ducat* is a dainty little golden Daffodil which might have had Golden Spur and the Tenby Daffodil for its parents.

THE JOHNSTONI SECTION.

Here Mr. Engleheart has achieved the most striking of all his gains, and I do not think I shall be far wrong in saying that some of these new artificially-produced *N. Johnstoni* forms are the loveliest of all the race. Very few varieties leaped into popularity as quickly as the graceful little Queen of Spain, with its exquisite shape and colour and lasting qualities. None of these new creations are as yet in commerce, and the thanks of all Daffodil lovers are due to Miss Willmott for placing them before the public in such superb form, both at the Drill Hall and at the great Birmingham Show, during the past few years.

Narcissus odoratus rugulosus maximus.—Under this name Messrs. de Graaff exhibited some flowers at the Midland Show about twice the size of the old Campenelle. This new variety originally emanated from America, and, as it has so far only produced one flower on a stem, I hesitate to say whether it is likely to be an improvement or not. Messrs. de Graaff's new sport, Apricot Phoenix, is a great addition to the doubles, and a most distinct novelty.

THE ENGLEHEARTII SECTION.

During the last few years such a number of extraordinary gradations of form have been produced by Mr. Engleheart, many of them which do not conform to the regulations of the present classification, that sooner or later an alteration will be absolutely imperative. Two schemes were put forward for discussion at the Birmingham Conference this year; one by Professor Hillhouse, and the other jointly by Messrs. F. W. Burbidge and P. R. Barr. Although neither of these was deemed work-

NARCISSUS BROADWING.

(Flowers 3½ inches across; it belongs to the Engleheartii section.)

strained than in others—for there is scarcely a single section which has not been considerably enriched by the addition of many delightful new forms. In the whole history of florists' flowers there is none which appears quite so fruitful of interest as that which pertains to the Daffodil. The far-reaching work commenced by Herbert, Backhouse, Leeds and Nelson has been steadily pursued by Mr. Engleheart, Messrs. Barr, Messrs. de Graaff, and others to the present day, with the result that each year we get more and more beautiful flowers, and exquisite gains, especially in

able at the time, as a result of the discussion no doubt a good scheme will be evolved in time for next season. There was one point in which both these schemes were in complete agreement, and that was the proposal to name the shallow or flat crowned group of Parvi-Coronati varieties (now classed as Burbidgei), after Mr. Engleheart, who has been successful in raising them, and who has made them so peculiarly his own. Most of these are crosses between the poeticus varieties and the white wide-crowned incomparabilis sorts. This proposal has met with very general approval, and is certain to be embodied in any scheme of re-classification which is adopted. Perhaps the most striking flower in this section is *Incognita*, which was exhibited in grand condition at Truro, and also at Birmingham, where it won the silver medal for the best Parvi in the show. The rich citron-orange crown is quite an inch across, and is in exquisite contrast to the noble pure white segments. *Egret*, so much admired last year, is another premier flower in this section, and has proved an extremely free bloomer. *Astradente*, which was the premier Parvi variety at Birmingham last year, and received an award of merit from the Royal Horticultural Society in May last, is another very remarkable flower belonging to this same section. This year saw the section still further increased in importance by the addition of such exquisite kinds as Broadwing, White Ensign, Cyclops, Hyacinth, Gold Eye, and Red Disc.

Broadwing was the most beautiful flower in Mr. Engleheart's unique exhibit at the Midland show, and the whole of the stock was disposed of some time before the judges had singled it out for an award of merit. The singular beauty of the glistening white perianth is set off by the disc-like crown, which is of a light orange-yellow edged with deep orange. The individual flowers measured a little over $3\frac{1}{2}$ inches across. It will most probably be exhibited before the Narcissus Committee next year, so that those who have not yet seen it will be afforded an opportunity of doing so. *White Ensign* closely resembles the last, but is scarcely so refined, while *Cyclops*, which has a large, flat, bright yellow crown and rather pointed overlapping segments, reminds me very much of *Egret*. *Hyacinth*, which gained an unanimous award of merit at Birmingham, is quite a new departure, and as I see that it has now been placed in commerce at a most reasonable price, should be made a note of by all those who wish to keep their collections up to date. The flowers possess the unusual merit of being sweet-scented, resembling, in fact, a delicate Hyacinth-like odour, hence its name. It is a beautiful starry flower with a pure white perianth of very lasting character, and a large flat yellow and saffron crown. *Florin* is another flower of great elegance, and very symmetrical. In this the flat cup is three-quarters of an inch across, and of a distinct citron lemon shade with an orange edge.

THE BURBIDGEI SECTION

already contains so many flowers with glowing cups that it is becoming increasingly difficult — where all are attractive — to distinguish between them. Some of the varieties, however, have very weak perianths, and it is here that we must look for considerable improvement. *Firebrand*, which was magnificent at Truro, still holds the lead as being the brightest.

Salmonetta is a delightful break in colour, and *Vermeil*, in which a good deal of Poetarum influence is clearly visible, is another pleasing flower. In

THE POETICUS SECTION

Laureate and *Valeria* are both grand flowers. *Horace* is an exquisite form, though scarcely so large or so vigorous as *Homer*. *Epic*, *Virgil*, *Glory*, *Comus*, *Chaucer*, *Dante*, *Ben Jonson*, *Sidney*, *Sonnet*, and *Carol* are all of great beauty, with vivid crowns and pure white perianths. *White Elephant* is described as a poeticus, outstripping everything yet raised in size of plant and flower, and when well cultivated reaches an enormous size.

THE INCOMPARABILIS AND BARRI SECTIONS have made great strides, and the only difficulty now, as Professor Hillhouse remarked at the last Midland Daffodil conference, is that the difference between the two sections is undefinable. Miss Willmott's *Lemon Queen* is a very distinct canary yellow flower with an elegant drooping habit. *Occident*, which was seen in Mr. Engleheart's exhibit at Birmingham last year and received an award of merit at the Drill Hall this spring, has an intense glowing chalice and fine lemon segments. *Homespun* is an unique yellow flower of splendid texture, and was exhibited at

HYACINTH BULBS: SHOWING METHOD OF PROPAGATION.

Truro, almost 4 inches across. *Symmetry*, with a rather flat, bright yellow, orange-tipped crown and creamy perianth; *Retainer*, a well-formed flower with a deep yellow crown and lemon yellow segments; *Bodyguard*, with stiff, overlapping, creamy perianth segments and short spreading crown of bright lemon, are all incomparabilis varieties of high merit. *Zingara*, from Mrs. R. O. Backhouse, which gained an award of merit at the Drill Hall on April 7, is a large, strong-growing variety with stiff, white, reflexing perianth and broad spreading cup of bright orange red. *Castile*, an exceptionally fine Barri, won much admiration at Birmingham, and received an award of merit. Here the great charm lies in the rich orange suffusion in the wide crown and the shapely cream-tinted segments.

Each year sees the standard of quality raised, and sooner or later all flowers with weak or poor perianths—such, for instance, as *Will Scarlett* and *Torch*—will no doubt have to give place to varieties in which this fault is remedied. Those who watch over the destiny of these hardy spring flowers know that there is no finality, and that much still remains to be accomplished. Year by year the popular taste for these flowers grows stronger, and, as many of these exquisite new forms become plentiful, our gardens will be beautified with their endless diversity of colour.

Worcestershire.

ARTHUR R. GOODWIN.

PROPAGATING HYACINTHS IN ENGLAND.

THE accompanying illustration shows the method of propagating Hyacinths which is adopted in England in order to increase a given variety. The base of the bulb is scooped out and then laid to dry, and in a few weeks the small bulblets appear between the axils of the scales of the bulb. The whole is planted, and during the winter and spring even if no top growth appears, the bulblets increase in size by taking the nourishment from the parent, the latter remaining nothing more than a few dried-up leaves. The small bulbs are then transplanted several years in succession until they are of saleable size.

W. J. BELDERSON.

THE TULIPAS.

(Continued from page 166.)

IV.—EARLY-FLOWERING, BEDDING, AND FORCING TULIPS.

THESE are so well known that detailed descriptions are quite unnecessary. There are many varieties, and new plants are constantly being added to an already large group, so that one can well dispense with quite half of the older ones possessing some glaring defect from the gardener's point of view. A standard bedding and forcing Tulip should have rigid stems; bold, wide expanding flowers, with broad petals, so that the closed flower is cone-shaped; and clear, well-defined colouring that will be close inspection, and which will prove effective at a distance. Double Tulips of the type of *Lady Grandisson* make good bedding Tulips, but those of which *Yellow Rose* may be accepted as a type are no more suited for bedding than a Lombardy Poplar. Their stems are weak, twisting and drooping under their heavy load of inflorescence, and after the first rainfall the petals decay, become soil-stained, and badly bleached. The following appear to be good bedding Tulips from the all-desirable characters of withstanding bad weather, and the colouring height of growth, and season of flowering given will help the planter to arrange displays uniformly and in sequence of flowering.

The *Duc Van Thols* are the heralds of the race. They are all forms of the sweetly scented *T. suaveolens*, numbering about twelve. Their short stems are a defect, though a common one with early-flowering plants. Nevertheless, we could not dispense with them—all are good.

Of second earlies, *Brunhilde*, a magnificent broad-petalled white flower flushed with yellow, growing 15 inches high; *Canary Bird*, pure yellow, 1 foot high; *Keizer's Kroon*, 14 inches high, scarlet, edged yellow; the *Pottabakker*, 14 inches high, in white, scarlet, and yellow distinct colourings; *Proserpine*, a grand rose carmine flower, 1 foot high; and *Vermilion*, another grand Tulip, coloured scarlet-vermilion, about 1 foot high, are among the most distinct—free, also, from any bad traits.

The next group, holding a third place in sequence of flowering, embraces as good representatives: *Artus*, rich dark scarlet, 9 inches high; *Chrysolora*, pure yellow, paler than *Canary Bird*, 12 inches high; *Coleur Ponceau*, 1 foot high, coloured cerise, flushed and feathered white externally; *Cottage Maid*,

under 1 foot high, choice little flower, white, with rosy edging; *Crimson King*, crimson-carlet, 10 inches high; *Van Vondel*, 1 foot high, pure white, a very striking flower and a good white bedder—cannot be too freely used to break up clashing colours; *Yellow Prince*, very fragrant yellow Tulip shading to orange with age, under 1 foot high.

The last to flower, and which are succeeded by the May-flowering Tulips, embrace as admirable representatives: *Coeur Cardinal*, a massive scarlet flower with crimson shading, 1 foot high; *Duchesse de Parma*, 1 foot high, orange-scarlet, flushed and edged old gold; *Lea Mundi*, 1 foot high, pink, with rosy shading and flushed with white; *Rose Gris de la*, 1 foot high, rich rose, flushed with white; *Thomas Moore*, 18 inches high, large flower coloured orange, shaded terra-cotta, and flushed golden yellow.

Of double early-flowering Tulips one can recommend as a good representative half-dozen: *Imperator Rubrorum*, scarlet, 12 inches high; *La Candeur*, white, with pink tips later, 12 inches high, very late; *Lady Grandisson*, crimson-scarlet, of Duc Van Thol habit, very dwarf and brilliant, but few petalled; *La Grandesse*, rose, tinted white, 10 inches high; *Innocence*, snow white, very choice and full flower; *Vuurbaak*, orange-scarlet, possessing the brilliancy of T. Greig, comes best on poor soils.

Double Tulips should not be watered overhead, their petals quickly decay, and in forcing them a dry buoyant atmosphere should be maintained. *Yellow Rose*, a fine double Tulip and sweetly scented, coloured yellow, with olive petal tips, should be grown for its flowers, though its lax habit leaves much to be desired.

Variegated-leaved Tulips make excellent bedding plants, either solely or in association with their plain-leaved brethren, but one cannot recommend a free use of them, for their floral colouring is not vivid, and those white and pale coloured varieties are seen to disadvantage in competition with their leafage. *Cottage Maid* has leaves bordered with creamy yellow and edged with rose. Its flowers are white edged with rose. *La Belle Alliance* (Waterloo) has silvery white leaf-margins and crimson-scarlet flowers. *La Candeur* has white flowers and leaves margined with cream. *Lac Van Allyn* has rosy violet flowers of rather dull colouring and silvery margined foliage. *Royal Standard* is generally grown; its flowers are white streaked with cerise, and the foliage is broadly margined creamy white. *Yellow Prince* is exceedingly pretty, flowers yellow, foliage variegated and edged creamy yellow on a milk-white ground colouring.

V.—PARROT TULIPS.

A singular-looking race of garden origin, at one time despised as fantastic, gaudy, and weird. They are that now, but their singular shape and colouring is welcomed by many, though the old prejudice dies hard. Their weak stems, though adding to their grotesqueness, are undesirable features in a garden plant, and it is very necessary to carpet the soil beneath them with some low-growing herb that would protect the flowers from mud splashes and give the stems some support. For this purpose, the common Rock Cress or its double form is excellent; it gives the needful white, always lacking in Tulip beds, and most desirable in the case of the gorgeous Parrot Tulips. Their bulbs cannot be depended upon to flower every year; a few out of each planting will bear no flowers, and this is not a matter for surprise when one considers the great

tax a massive Parrot Tulip flower places upon its bulb. Not only is it unusually large for a Tulip, but the hosts of petaloid processes that issue from the surfaces of the petals are in themselves robbers of tissue derived from the bulb. Those who care to weigh the flowers of a Parrot Tulip and that of a Gesner of the same dimensions will find the Parrot weighs nearly twice as much as the Gesner. There are six varieties one can describe as distinct, and though each variety has several names, and may perchance be known to some under one or other of them, the names here given are those in general use, and, where possible to learn, those given them by their raisers. *Admiral Constantinople* is coloured scarlet and variously splashed orange. *Coeur Café* has brownish red flowers spangled with minute dots of chocolate, giving the flower a bright bronzy sheen. *Cramoisie Brilliant*, rich crimson, flecked and splashed with chocolate, blue, and black. *Lutea major*, shades of yellow, with olive tints showing here and there. *Maark Graaf* [von Baden], yellow with orange flecks, splashed and striped externally with scarlet. *Perfecta*, yellow, heavily striped scarlet; the petals are remarkable for a series of horn-like processes pointing in all directions that often occur on their surfaces. Intermediate forms are legion. All flower in May.

GEO. B. MALLETT.

[The monographs of various genera published in THE GARDEN appear to have been much appreciated. We have, therefore, arranged for the publication of others. Lilies will next be described.—ED.]

TREES AND SHRUBS.

A CLIMBING HYDRANGEA.

FOR many years this plant, now generally known as *Hydrangea scandens*, and to which the specific names of *petiolaris*, *cordifolia*, and *volubilis* have also been applied, was thought to be identical with *Schizophragma hydrangeoides*. Both plants were introduced from Japan in 1879, both are self-clinging climbers like the Ivy, and both bear flat flower-heads, in which the fertile blossoms, which are inconspicuous, far outnumber the large sterile blooms. However, a Kew authority writing in THE GARDEN in August, 1896, says: "In foliage and mode of growth this species resembles *Schizophragma hydrangeoides*, and is frequently grown under that name. The two are quite distinct." This, coming from Kew, is doubtless correct, though I confess that, personally, I am unaware in what the difference consists. In several gardens that I know *Hydrangea scandens* is grown as *Schizophragma hydrangeoides*. It is a deciduous climber and quite hardy, at least

HYDRANGEA SCANDENS (THE CLIMBING HYDRANGEA) IN THE GARDEN OF MR. RASHLEIGH AT MENABILLY, CORNWALL.

in the south-west. Its deeply serrated, somewhat heart-shaped leaves are about 4 inches in length and 3 inches in breadth, and are of a very pleasant green. The large, flat corymbs, often 10 inches across, are composed mainly of small, fertile blossoms that detract somewhat from the decorative effect of the plant, the white, sterile blooms being few. On this account it is not to be recommended as a wall climber, for which purpose it is often used in the south-west, as in that favoured climate there are many beautiful half-hardy flowering subjects, such as *Sollya heterophylla*, *Bignonia*s, *Tacsonia*s, *Cassia corymbosa*, *Manettia bicolor*, and numerous others that do well on open walls and are far more ornamental. As a tree climber, for clothing the great bare trunks with foliage and flower, however, the climbing *Hydrangea* stands unsurpassed, for here its effect is striking and unique. Clinging to the bole with rootlets thrown out from its lengthening growths it requires no adventitious aid in the shape of wire or tarred string to ascend the trunk, but when once planted makes its way upward year by year until it has enveloped the whole of the tall shaft with its twining shoots.

The specimen portrayed in the accompanying illustration is growing in the famous garden of Menabilly, Cornwall, the property of Mr. Jonathan Rashleigh, which contains a collection of rare and tender plants unsurpassed on the mainland of England. This *Hydrangea*.

was planted at the foot of a tall Turkey Oak about thirteen years ago, and has now ascended the trunk to a height of over 40 feet. The climbing Hydrangea is very easily propagated, for if the creeping stems are laid along the ground and held in position by pegs roots will be freely produced and shoots will start from the joints. When sufficient root growth has been made the pegged-down stem may be cut into lengths, each one of which will form a plant. The greatest fault of this Hydrangea is that its flower-heads, by reason of the few sterile blossoms they contain, are not sufficiently showy. If any hybridiser were to take the plant in hand and eventually succeed in eliminating the fertile blossoms and producing sterile ones in their place we should have a far more ornamental plant, and one that would always command admiration, whether used as a wall climber or for covering tree trunks.

S. W. FITZHERBERT.

SPIRÆA AITCHISONI.

THIS plant is not very well known as yet, as it has only been introduced some five or six years; but when it is better known it will become popular, as it is a handsome and graceful shrub, somewhat resembling *S. lindleyana*. The stems are smooth and slender, reddish in colour, and are clothed with alternate, pinnate leaves. Each leaf consists of from fifteen to twenty narrow deeply serrated leaflets from 1½ inches to 2 inches in length, and of a soft, deep green colour. The pure white flowers are freely produced in terminal panicles, and open about the middle or end of August. *S. Aitchisoni* requires practically the same treatment as *S. lindleyana*, and with age attains to nearly the same size. Propagation is effected by seeds, layers, or suckers; the latter, however, are sparingly produced.

Bagshot, Surrey.

J. CLARK.

SOME LESSER-KNOWN JAPAN TREES AND SHRUBS.

(Continued from page 200.)

As a striking pillar plant *Polygonum multiflorum*, which makes 20 feet to 25 feet of growth in one season, is invaluable, and the long undistinguished *Vitis Thunbergi* has proved superior

from a gardening standpoint to *V. Coignetiae*, which in general aspect it resembles. It may be distinguished by its leaves being hairy beneath, of thicker texture, and assuming a richer hue in the autumn.

Nearly allied to the Japanese Hollies, of which the most beautiful is *Ilex latifolia*, is *Hovenia dulcis*, introduced to European gardens some ninety years since. In England it has attained a height of 20 feet, but in its native habitat, extending from the Himalayas to Japan, it attains nearly double these proportions, as it does under cultivation in Australia, where it forms a symmetrical if not ornamental specimen. The thickened flower-stalks, somewhat insipid, but not unlike a Pear in flavour, are said to have medicinal properties.

Among evergreen shrubs there should not be overlooked *Photinia serrulata*, the *Linderas*, and *Daphniphyllum glaucescens*. *Photinia serrulata* (figured in the *Botanical Magazine* as *Cratægus glabra*) is one of the best of our seaside shrubs, individual specimens attaining a great diameter.

Not less than twenty species of *Lindera* are found in the Far East, by far the handsomest being *L. obtusiloba*, attaining in Japan a height of 20 feet to 30 feet. In Surrey a promising specimen is already 12 feet in height, its foliage assuming annually the characteristic clear yellow autumn tint. *L. sericea*, found further north than is *L. obtusiloba*, is equally hardy. *Daphniphyllum glaucescens* is a singularly handsome shrub, far too little known. In this country the female plant grows luxuriantly and seeds profusely, the seed germinating freely, unlike consignments received from the native forests, probably due to their passage through the tropics. Professor Sargent states it is of Malayan origin, though apparently acclimatised in Japan.

JAMES H. VEITCH, F.L.S.

[Reproduced, by permission, from the *Journal of the Royal Horticultural Society*.]

NATURALISING SPRING-FLOWERING BULBS AND PLANTS.

WITHIN the last few years this phase of gardening has become so popular that there

are few gardens that have not some spring-flowering bulbs planted in the grass, under the trees about the pleasure grounds, in the orchard, or in the meadow land adjoining the garden, but how seldom one sees an effective group planted in a natural way. Too often the bulbs are set out in lines or circles, or dotted about in small clumps, without any attempt at natural effect. I have even seen Daffodils planted on parts of the lawn which are mown by the machine, where they are quite out of place.

It is not everyone who can make a really natural group, but it is at least easy to avoid set patterns or dotting at even distances and the indiscriminate mixing of colours.

What I write in these articles is the result of my own experience, which has been gained from several years of planting, and the illustrations reproduced are from negatives I have taken from the results of such planting. They will, I trust, help to show what a pleasing and interesting picture the natural spring garden can be made, quite apart from the flower garden, generally so called, where such things as Daffodils sadly interfere with the early bedding out, that is, if they are allowed to remain until their leaves have died down, which is so necessary to the well-being of the bulbs, for on this depends the flowering for another season. How untidy, too, a bed of half-withered Daffodil foliage looks, whereas if they are in the grass they can be allowed to remain undisturbed, and the withering foliage will not be noticed amongst surroundings which so closely resemble them.

The plants I name are obviously only a few of the many that are suitable for the wild garden. I have, however, selected those with which I have had some success, and after the name of each of the varieties of Daffodils I have put the date when the first bloom opened here (North Wales) last spring, but I may say that most of them were about three weeks earlier this year than in 1902. I will begin with

Daffodils, as they are the best of all the spring-flowering bulbs for our purpose. There are few of this family that will not flourish in the grass; the Polyanthus varieties are the only ones that have failed here. Some varieties, such as *Moschatus* (March 25), a charming little white gem which seeds freely; the English Lent Lily, *Pallidus Præcox* (February 19); and *Cernuum* (March 25), a pretty silvery white flower of medium size, rather expensive (about 5s. 6d. per dozen), but well worth having, are all quite at home under a cool covering of turf, although they will not flourish in the richer garden soil. The old double yellow Daffodil (*Telamonius plenus*) is a grand one for massing, and is as effective as any when planted freely.

As to the trumpet varieties, in naming the following I have selected, as far as possible, those which produce seed, and are therefore more likely to become established and spread. The best of the early ones are: *Obvallaris* (February 18), or the Tenby Daffodil, of uniform clear yellow, perfect in form, and of medium size; *Golden Spur* (March 8), large deep yellow, with trumpet lobed; *Spurius* (March 4), soft clear yellow; and *Pallidus Præcox*, already mentioned, a lovely pale straw-

NARCISSUS TELAMONIUS PLENUS AT ST. ASAPH.

coloured flower. And if you have a mossy bank where the grass does not grow too long you should try such varieties as *Minimus*, a tiny little gem, which was in bloom here this year before the end of January, and *Cyclamineus* (February 18), a very distinct and dainty little flower of rich golden yellow, with reflexed perianth, which seeds freely, so should soon become established.

These are the best of the early varieties. There are a great number of later-blooming ones which can be used, and the best of them, which are not too expensive to procure in quantity, are *Princeps* (March 20), a bicolor with sulphur white perianth and yellow trumpet; *Rugilobus* (March 21), a very sturdy flower, like a small Emperor, but earlier; *Horsfieldii* (March 20), a bicolor with white perianth and yellow trumpet. This very nearly resembles *Empress*, but as it is earlier I name it in preference; *Queen of Spain* (March 27), a great beauty, clear yellow throughout, with slightly reflexed perianth, of medium size. Although not a seeder it cannot be left out; *Maximus* (March 20), a large, deep golden yellow flower of very graceful form; *Emperor* (March 30), a bold, strong - growing yellow flower with perianth slightly paler than the trumpet, a very good seeder; and *Grandis* (April 9), a very good late bicolor.

Then there are the *Incomparabilis* or chalice-cupped varieties. Of these the best is the giant *Sir Watkin* (March 20), a grand flower of rich sulphur yellow with yellow cup. It, however, produces practically no seed. Other suitable varieties of this section are *Stella* (March 21), with white perianth and yellow cup, which seeds fairly well; *Cynosure* (March 31), primrose, with a tinge of orange in the cup. Produces very little seed; *Frank Miles* (April 1), a very beautiful clear yellow flower with prettily-twisted perianth, a very poor seeder; *Queen Bess* (March 16), perianth white, with widely-expanded pale yellow cup, the earliest to bloom of the *Incomparabilis* section. The double *Incomparabilis* I have found to succeed in the grass, and their large heavy heads do not get splashed in the grass as they do in the border.

The three best are *Butter and Eggs*, large, full double flowers of clear yellow with touches of orange in the centre; *Eggs and Bacon*, white, with orange red in the centre; and *Codlings and Cream*, white, with pale yellow in the centre. They commenced to bloom together this year on March 26; none of them produce seed.

Of the *Leedsii* varieties, which are similar in shape to the *Incomparabilis*, the best are *Amabilis* (March 28), a beautiful silver white flower with long cup, producing no seed; *Leedsii* type (March 26), a small star-like silvery white flower and a fairly good seeder; and *Minnie Hume* (March 27), with white perianth and broad expanding lemon cup, changing to white, a very choice variety, seeding fairly well.

Then there is the gorgeous *Barrii Conspicuus* (March 31), with large rich yellow perianth and cup short and spreading, of the same colour, tinged on the margin with brilliant orange scarlet. It is one of the most striking of all, and although it does not produce seed it must not be omitted. *Odnus Rugulosus* (March 26) of the *Jonquil* class, rich yellow and sweet scented. *Burbidgei* type is very early and effective, and produces seed fairly well. *John Bain* (March 26), a lovely white with pale lemon cup, quite a distinct variety; no seed. *Poeticus Ornatus* (April 3), with its pure white flat broad perianth, and cup tinged with scarlet, is a free seeder and an excellent

Duchess of Westminster (April 5), but as there are so many good varieties without these it would be as well perhaps, unless money is of no object, to wait until they come down in price.

I think I have now mentioned the best varieties of *Daffodils* for naturalising, so I will just say a word or two as to the grouping and best situation for planting.

For *Daffodils* and most other spring-flowering bulbs a position should be selected where the ground is shaded by deciduous trees from the hot sun in summer. This will keep the bulbs cool during their season of rest, and the overhanging branches, though bare of leaves during

the time when the bulbs are in bloom, will act as a slight screen to save the flowers from being shrivelled up by the sun, and so be a means of preserving them in perfection for a much longer time than would be the case if they were without such shade.

A grassy slope facing north, with a screen of trees to the south, or, better still, if sheltered on all sides, is a position I would select in preference to all others, though in such a place the blooms will be slightly later in opening, the lengthened time that they will last will, I think, make full compensation for this.

W. A. WATTS.
Bronwyfya, St. Asaph.
(To be continued.)

POLYANTHUSES BY WOODLAND AT ST. ASAPH.

NOTES ON HARDY PLANTS.

DIANTHUS GALLICUS.

BY no means a common plant in English gardens is the true *Dianthus gallicus* (Persoon), the name being far more common than the reality. This is partly owing to the readiness with which flowers of *Alpine Pinks* cross with one another, so that seed saved in English gardens often comes untrue, but it is due still more to a confusion of names, *D. gallicus* having been named *D. arenarius* by De Candolle and Thory, and in this way having been thought identical with *D. arenarius* of Linnaeus (*Botanical Magazine*, tab. 2038), a native of Russia and Northern Europe, and having white flowers with a brown eye. *D. gallicus* is native only on the west coast of France, Northern Spain, as far as the Bay of Biscay reaches, and one or two spots on the coast of Portugal, being a sand-loving maritime species, never reaching far inland. The only good portrait of it I have seen is in "*Wooster's Alpine Plants*," Series I., page 113, the flower for that work having been furnished by Backhouse's York nursery. My first acquaintance with it was made nearly thirty years ago, when the late Mr. Harpur Crewe, sent me cuttings from Biarritz, which I reared to flowering, but soon lost. Since that time I have more than once brought it home from Biarritz, where it is very abundant close to the sea, growing in deep sea sand, and extending some distance into the woods of *Pinus Pinaster* which grow on the sandhills there.

The flower is uniform pale pink, very deeply incised, the height of the rather stout stalk is 9 inches to 12 inches. The grass is stiff and rather

variety for naturalising. The *Pheasant's Eye* *Poeticus*, with its slightly reflexed perianth, which blooms considerably later than *Ornatus*, is also good, and they are both cheap. *Biflorus* (April 15), as its name infers, bears two blooms on a stalk, with white perianth and yellow crown, and the double *Poeticus*, with its large *Gardenia*-like flowers, very sweet scented, which is one of the last to bloom, and likes a cool, rather damp soil.

There are amongst the newer varieties, which are more expensive, many that are excellent for naturalising, such as the splendid bicolor *Victoria* (March 21), the white trumpet *Mme. de Graaf* (April 8), and *Leedsii*

substantial for the size of the plant. In my cold garden it has seldom flowered till September, and has rarely lived more than two years. I am now growing it on a mound of finely riddled stone, where it seems happier than it has been before, though I once made a site for it under a south wall 2 feet deep in sand. It is rather tender, and a favourite food of slugs. C. WOLLEY DOD.

Edge Hall, Malpas.

HELIOPSIS SCABRA B. LADHAMS.

I WOULD strongly advise Mr. Arnott to grow this variety of *Heliopsis* in preference to *pitcheriana*; it is such an improvement in every way. The flowers are larger, the florets slightly recurve at the tips and give grace to the flower, whereas in *pitcheriana* they are rigidly erect. In colour, too, *B. Ladhams* is deeper in its orange tint, and is altogether a much better plant. In growth *pitcheriana* is a trifle taller. E. MOLYNEUX.

ANEMONE ALPINA AND A. SULPHUREA.

PERHAPS others besides myself have failed in their attempts to raise these two *Anemones* from seed. I wrote to Herr Otto Froebel on the subject, and he kindly gave me the hints appended and permission to offer them to any interested in the subject. His words are as follow: "The seeds of *Anemone alpina* and *A. alp. sulphurea* can be sown as well when just ripe, or later in autumn or early in spring. The seeds will shoot if the soil is always moist and kept in darkness. I should advise you to sow in boxes, on which you put another box of the same size, the second box also full of soil and kept always moist, so that it is impossible for the box containing the seeds to get dry and to receive any light." With this assistance I hope to be able to raise plants of *A. alpina*. I should be glad to receive seeds (fresh) of *A. alp. sulphurea* from any nurseryman who has them for sale. A. C. BARTHOLOMEW.

Park House, Reading.

SILENE ARENARIA.

OWING to the excessive rainfall of the present season results in the flower garden have not altogether been satisfactory, in fact, in many cases very disappointing. An occasional bright

sunny day encourages flower-buds to burst forth in full splendour, only too often to be disfigured, and sometimes completely spoilt a few hours afterwards by a heavy downpour of rain. Under these circumstances some things have done well, amongst them that showy little annual *Silene arenaria*, flowering, as it were, in defiance of the inclement weather, which has had such ruinous effects upon many of its neighbours. Its dwarf habit and pleasing pink flowers, so abundantly produced, make it a most desirable plant for bedding, edging, and for the rockery. When cut and tastefully arranged in small vases it is very effective, lasting for fully a week. T. B. F.

Buxted Park Gardens.

GENTIANA ACAULIS.

THERE is no more beautiful flowering plant in our gardens in early summer than the *Gentianella*. Its comparative rarity may be due to many causes, as the plant is fickle. Year by year in spring it is one of those things that are invariably offered for sale in many a market throughout the length and breadth of the land. Such plants are eagerly bought for a few pence and taken home to die. It is perplexing that one cannot lay down any hard and fast rule as to culture. Looking back over an extensive practice among hardy plants, not always confined to one locality, the great thing that stands out so prominently is that on a light or a well-drained soil, or a soil overlying the red sandstone, this fine plant has been a complete success. On the other hand, where clay soil exists the plant does not usually grow vigorously, and certainly does not flower freely. In the more heavy soils a dense carpet of small growth is often made, with little or no flower as a result. In all such cases give a perfect drainage for the bed or border, and in this way freedom to the many stoloniferous shoots that are constantly being made. Thus treated I have been most successful with the plant, even in those gardens where there was little but clay. Indeed, in one garden, not merely for such a plant but for all good things and choice bulbs, the beds had to be made throughout, and one of the preliminary items in the making was a drainage of brickbats of not less than 6 inches below the beds. Here with much else this common yet beautiful *Gentian* gave a picture of colour each year. In other instances one could form a permanent edging

of the plant with the greatest ease by simply digging up the light sandy soil, beating it down hard as though a Box edging were to be laid, and with the small often single bits of *Gentian* in position and another heavy beating with spade or a good treading to place it firmly in position. Firm planting in all the lightest soils is essential, and of the many edgings I have planted and purposely walked upon again and again I have seen no instance of disapproval. In those instances where failure has dominated past efforts I would suggest the trial of an edging to border or walk, taking out the soil and replacing it with old potting material and gravelly sand, making up the edging quite firmly by treading or beating. It is important to plant in September or October, especially October. For planting I prefer quite small pieces, and not more than three or four shoots. Gather these tightly in the left hand, place in position, and make firm at once with soil and treading. Little or no manure is required, and where soil of a light sandy nature exists the growth is rapid and continuous through the winter, as may be seen by many shoots pushing through the soil in spring. E. JENKINS.

SNOWDROPS IN GRASS.

AMONG early flowers the *Snowdrop* is, perhaps, the most welcome. Flowering at a time when gardens, fields, and forests are bare, it is all the more appreciated. It is one of the first hardy flowers to remind us that Nature's forces are at work, and will, in due time, girdle the year with flowers in their respective seasons. During the last quarter of a century the *Snowdrop* has increased very much in public favour; in many of our public parks and in private gardens large masses may be seen naturalised in the grass, where formerly nothing of the kind was attempted. While *Snowdrops* are fairly accommodating in the matter of soil, they do best in light friable loams, resting on gravel, or on a sandy subsoil, which admit of surplus water percolating readily away, and at the same time are not liable to get dust dry in periods of drought. The fact of their doing in many instances so well under deciduous

trees, is probably accounted for by the shade preventing the premature ripening of the bulbs by early drought. Clayey, heavy, wet soils, or subsoils through which water does not pass readily, are perhaps least adapted to the naturalisation of the bulbs in the grass.

In such soils, if it is found they do not increase, and more than hold their own, it is little use planting on an extensive scale. Something may be done, however, by planting in a more moderate way in cultivated ground, where the conditions can be made more suitable by adding light, friable, or sandy material, and mixing with the heavier soil. Where the conditions are found suitable as to soil and position for planting large masses in the grass for effect, the turf, if good enough to keep, should be lifted and laid aside. If the soil requires any addition in the way of leaf-mould, wood ashes, or other material, it should be spread over the surface and incorporated with the soil with a spade, or steel fork, levelling the ground afterwards to the desired form. The bulbs should then be sown liberally, and forked in to a depth of 2 inches or 3 inches, the surface being again raked over, the turf replaced, and the work finished by passing a roller over it. September or October is the best time

A WOODLAND OF SNOWDROPS.

for this work. Anything in the nature of fancy designs, straight lines, or circles, should be avoided in seeking after true natural effects when establishing masses in the grass.

The best Snowdrop for planting extensively is the old *Galanthus nivalis*, which does well and increases freely where some of the newer ones make little headway. The double-flowered variety of *G. nivalis* seems to establish itself and succeed as well as the single, though not so effective. *G. nivalis* and its varieties seem to hold their own, and multiply more freely than most of the newer sorts. *G. Imperatii*, *G. Elwesii*, and *G. plicatus* can be had in quantity at a reasonable price, and are well worth trying to establish in the grass in separate masses or clumps. *G. Fosteri* I had great hopes of, as it is a fine strong grower, seeds freely, and for a new sort could be had in considerable quantity; but, unfortunately, it seems to be liable to be decimated by the Snowdrop fungus, and with me has almost disappeared. Another variety which increases freely is the October-flowering Snowdrop, *Galanthus octobrensis*, and when it can be got in sufficient quantity promises to be well worth trying to establish in grass. Opinions differ as to this Snowdrop; I must say I agree with those who consider it a welcome addition, though some think that it is like "snow in summer," altogether out of season. The Straffan Snowdrop, a large variety of caucasus, kindly sent me by Mr. Burbidge, is making itself at home here in the grass. A small patch of it last season had every appearance of establishing itself and increasing. There are others of the newer acquisitions, which may in time be found suitable for naturalising, but at present they are too scarce, and can be better attended to, properly labelled, and increased by growing in beds or spare places in cultivated ground.

Naturalising bulbs in the grass is by no means new. Breadths of Snowdrops and Daffodils may be met with in some old places planted long ago, but still giving annual evidence that flower lovers in the olden time knew how to take a leaf out of Nature's book. One such example exists here at Dunrobin, where among some aged trees near the old castle the ground has been annually carpeted with a sheet of Snowdrops, certainly for more than 100 years, and probably much longer. There is no record or tradition as to when or by whom they were planted, but most likely for one of the Countesses of Sutherland some time in the seventeenth or eighteenth century. This old plantation has been the nucleus or parent of the considerable extensions made here from time to time, and, so far as present appearances go, may continue for generations yet to come.

THE KITCHEN GARDEN.

EXHIBITING VEGETABLES.

I AM glad to notice that at nearly all our most important exhibitions collections of vegetables now form an attractive feature, and will, I feel certain, do more so in the future, but there is yet much to learn not only as to what constitutes quality in the highest degree, but in the preparation of the various specimens and the art of setting up and

WHERE SNOWDROPS THICKLY CLUSTER.

arranging a collection. What I am specially anxious to see more encouraged are mixed collections arranged for effect on a given space, such as the Royal Horticultural Society is asking for at the coming Chiswick show—of course, giving a chance to small as well as large growers in the matter of space to be filled. Everything should be distinct; then all or many of the different types would be represented and brought out, whereas in offering prizes for say six, nine, or twelve kinds only—though I would by no means like to see such classes abandoned—a few of the very choicest kinds are necessarily exhibited. Each variety should be legibly and correctly labelled, and this applies to all vegetables exhibited, either shown as single dishes or otherwise.

One of the most important regulations I should much like to see universally adopted is the number of specimens of each vegetable to be exhibited. At some of our leading shows there is no mention as to this, consequently those living at a distance are much handicapped, as the expenses of transit are considerable, and by limiting the numbers everyone would be placed on the same level as regards this. Each kind should be shown to represent a fair dish and no more. I am, of course, aware that in many places it is so, and I trust the time is not far distant when it will become general, and I feel certain that not only would this meet the wishes of exhibitors generally, but it would also simplify the details of those who are responsible for the staging.

FAILURES AND SUCCESSES WITH POTATOES.

IN a recent article which appeared in *THE GARDEN* I was privileged to discuss the gloomy outlook for Potatoes generally, and having since then been engaged in the important work of lifting the crop I am able to speak now, not of anticipations, but realisation as regards this indispensable vegetable. Lifting Potatoes is not an operation requiring a great amount of skill and experience, but it may be either one of the most fascinating, or, on the other hand, one of the most disappointing garden tasks, just according as the crop turns out. To a man who takes any pride at all in vegetable culture I know of nothing more interesting than Potato digging when the roots compete with each other in the number of well-shaped tubers turned out. The back-aching part of the business is forgotten in the excitement of the moment, but how

different are the sensations of the digger when the crop is scrubby and scanty, and all the best specimens are marred by the presence of disease. Potato lifting then is a depressing task, and one that even an enthusiast fails to take interest or find pleasure in.

My own Potato lifting experience this year has been a peculiar mixture of satisfaction and disappointment, and in course of progress I have been brought face to face with problems that seem to be worthy of discussion with a view to coming at a correct solution. In the first place, no man can take a fork in hand this year to dig Potatoes without thoughts of disease. The grim ogre faces you at every turn, and whether the crop will be affected much or little is a matter of mere conjecture before lifting operations commence. It is a well-known fact that certain varieties are much more liable to disease than others, but why is this? There are various theories. Some people say that the Potatoes most liable to disease are varieties of long standing, the constitutions of which are weakened by continued cultivation and inbreeding. Theoretically there may be something in this, but it does anything except explain why British Queen should be the worst diseased variety in my collection. The Potato in question is one of comparatively modern introduction, and is possessed of vigour almost unsurpassed by any other; yet it was in British Queen that I beheld the first tell-tale blotches on the foliage, and when digging the other day it was a cheerless task, having to throw all the best tubers to the waste heap.

The fact is we have got in the habit of saying that one Potato takes disease badly, while another is possessed of power to resist the plague, and that is about all we know regarding the matter. For instance, I have had growing side by side two well-known Potatoes, namely, Sutton's Ringleader and Sutton's Ninety-fold, both of which gave good crops, but quite one-half of the latter were diseased, while of the former I hardly found a bad tuber. Why should Ninety-fold be diseased to the extent of 60 per cent. and Ringleader escape, though both were grown under exactly the same conditions? This is one of the problems regarding disease that remain unsolved, and though I shall probably grow Ringleader in the future in preference to Ninety-fold, it is quite likely that the experience of other growers will not coincide with my own.

There seems to be an impression in some quarters that vigorous haulm growth is not an indication of a good crop of tubers, but the experience of

THE PLANT SHELTER IN MESSRS. BARR AND SONS' SURBITON NURSERIES (SIDE VIEW).

successive seasons convinces me more than ever that it is impossible to have good Potatoes without strong healthy growth, and the character of the crop can be estimated by the appearance of the haulm during the growing season. By way of illustration I may add that I had a patch of the Sutton Flourball and another of Chiswick Favourite, with several rows of Syon House Prolific in between. From the very outset the growth of the first two was far ahead of the latter, and at the finish Syon House Prolific, which enjoys the reputation of being a good Potato, did not return half a crop, while Flourball and Chiswick Favourite turned out splendidly.

I cannot account for the failure unless something was wrong with the sets, which I obtained from a reliable source, and they were nicely sprouted when planted. Another variety which served me in the same way was the popular Sir John Llewelyn, which is admittedly a fine Potato, and yet for some reason or other it made nothing but spindling growth, ripened off quickly, and returned about half an average crop. If other varieties that I have named have done well, why not Sir John Llewelyn and Syon House Prolific, which are both comparatively modern and possessed of youthful vigour? Quite the best Potato I have grown this year is the Factor, which was the strongest growing variety I had. I venture to predict a future for this Potato, which in every instance that has come before my notice has produced a heavy crop of fine pebble-shaped tubers of perfect shape. Evergood ran the above very close, and in my opinion it is one of the best of the newer Potatoes. Carltonian, Progress, and General Roberts have all done exceedingly well, and in each of the above cases the haulm was strong and vigorous, while in all cases where the growth was weak and ripened off early the crop was unsatisfactory. What is the cause of this spindling haulm growth which has been so prevalent this year? The too familiar blight has apparently nothing to do with it, because before any signs of the well-known disease appeared the leaves showed a tendency to curl, dark rusty spots appeared on them, and the stems became stunted. Is the root of the trouble to be found in the old leaf-curl disease which was known to Potato growers years and years ago, but about which little has been heard of late?

The experience of 1903 supports the contention I have made on different occasions that there is wisdom in keeping abreast of the times in regard

to varieties. Potatoes of long standing, like Beauty of Hebron, Snowdrop, Early Rose, and even Windsor Castle, have suffered severely through blight, and in many cases have cropped lightly, while, generally speaking, it is the vigorous varieties of recent introduction that have successfully repelled disease and returned good crops.

In short, sentiment must play no part in Potato culture. There should be none of that sticking to an old variety because it once did well, because Potatoes, even the best of them, wear out in time, and the grower who sticks to them when that time has come simply for old association's sake is certainly not wise in his generation. Lest I be charged with not mentioning the names of many other good varieties, let me add, in conclusion, that my remarks are confined to Potatoes grown in my own garden this season.

TREE LUPINS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—IN THE GARDEN for August 8, in the article referring to the Tree Lupin, some doubt was expressed as to its being hardy in the North. It succeeds well with us here in the Midlands, 600 feet above the sea, and it is often colder here than some parts of Yorkshire, as I have seen Gloire de Dijon Roses there in full bloom at the end of May, and ours have only just been showing bud. I always prune the Tree Lupins myself about the middle of August after they have finished flowering, and thin out all the old and decayed wood, shortening the branches to a sprig growing outwards, and reducing the bushes to about 4 feet high; then with a circle of thick rope around the branches and securing this to a stout stake, I make them secure against the strong gales we have in our exposed situation. We grow Tree Lupins as a hedge, and this year we have taken out every other old tree (four years old) and shall fill in in the spring with young seedlings, of which plenty come up round the old plants.

Edgbaston, Birmingham.

E. P. K.

A PLEA FOR DECORATIVE DAHLIAS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—As a lover of Dahlias, without being a specialist, I should like to express myself in sympathy with the remarks made in the leading article on "Dahlia Fancies" (page 161) respecting the disappearance of the old decorative Dahlias once so popular in gardens. When everything that can be said in favour of the Cactus Dahlia, it is no argument that the wide-petalled flower should be banished from our midst, because there is room for both, and to grow the former section and discard the latter looks very much like riding a hobby to death. Well do I remember the introduction of some of the varieties mentioned, including Henry Patrick, Lady Penzance, William Pearce, and Fire King, and in my own case they made quite a sensation in a garden in which, prior to their advent, single varieties were almost exclusively grown. Now, in many cases, the wide-petalled decorative Dahlia has gone under, crushed into insignificance by the modern Cactus, but in another sphere the favourite of other days still holds its own. To see the decorative Dahlias grown and appreciated as they deserve to be one should peep into wayside gardens of cottagers and amateurs, and into the domains of those who are not versed in variety names and sections, but love the Dahlia as a good old garden flower and share their affections equally between the new Cactus and the older forms. Suppose a white Dahlia is wanted for cutting or for making a display in the garden, have we anything better now than Henry Patrick? I doubt it, and, as the Editor aptly puts it, "to let this grand type of a good flower fall into disuse is to neglect some of the very best flowers we can have in our gardens."

G. H. H.

THE USELESSNESS OF MALMAISON CARNATIONS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was deeply interested in the notes upon the above by "T." also the reply furnished by Mr. Ellis in defence of the Malmaison. I also note "T.'s" remarks in the issue of the 12th inst., relating to the same subject. "If pug dogs are kept for one to be in the fashion, and not for beauty," I am sure Malmaisons are quite *vice versa*. I should just like to add a few lines with regard to the Malmaison and its culture, criticised by "T."

In the first place, I quite agree with what Mr. Ellis says, and fully endorse his letter of a few weeks ago on the culture of the Malmaison, and I quite agree with "T." when he says that the Malmaison is a lot of trouble, and that a plant in a 6-inch pot carrying only one bloom is not very attractive. That is not the fault of the Malmaison; it is the fault of the cultivator. I can assure "T." that the man who only gets one bloom from a 6-inch pot is not up-to-date. I have seen Malmaisons and grown them myself with from three to six blooms on a plant in a 6-inch pot. That is when you see the beauty of Malmaisons. For my part I think of all flowers the Malmaison ranks second to none if grown well and of good size and good quality. It is without doubt a flower that is thought a great deal of, not for the sake of fashion altogether, but for its beauty and delicious scent, which, unlike that of many more flowers, is most delicate and pleasing. I would just like to add the names of a few of the best, then "T." may give them a trial and alter his harsh opinion concerning the Malmaison, of which I am a great lover. They are Nell Gwynne, Princess of Wales, Thora, Prime Minister, Mr. Trelawny, South, Calypso, Baldwin, Mercia, and Lady Ulrica.

MISCELLANEOUS.

A PLANT SHELTER.

MANY passengers on the London and South-Western Railway have noticed in the Surbiton nurseries of Messrs. Barr and Sons a series of enclosures that are evidently erected for the protection of plants.

Several letters having been received asking for a description and details as to their construction we took photographs of them, from which the accompanying illustrations have been made. Messrs. Barr and Sons have kindly supplied us with the following information concerning these plant shelters. They are termed "shade gates," are made simply by fastening reed mats upon a wooden framework, and may be had in different sizes.

They are erected with the idea of giving necessary shade and shelter to young plants, to protect them from the morning sun in spring and early summer while in a frozen state and the heat of the afternoon sun later in the summer. They allow a free entrance of light and air, and do not draw and soften the plants. They are also valuable for hardening off plants in early summer before bedding out, and should prove very valuable in large private gardens. They are useful for wintering Bamboos and many tender shrubs, for they afford an ideal protection from severe weather. We use them for growing Primulas, raising seedlings, for Trilliums, Cypripediums, and North American shade-loving plants. In private gardens their principal uses would be—hardening off bedding plants, wintering tender shrubs which had been planted out in summer, and planting (in summer) Polyanthus, Primroses, Myosotis, Violets, and such plants which require a certain amount of shade in the hot weather. The shade gates need never be idle. We make use of them also for wintering young Violas, &c.

The reed mats which are used to form these shelters cost only £2 8s. per dozen, full size, and they last for years. During summer they are valuable for shading plants in frames and pits. They roll up, and are of neat appearance, and four or five Archangel mats would be worn out as soon as one reed mat. For protecting plants from frost a similar mat, but the reeds rather more closely placed, is used, and Messrs. Barr find that one mat of this description will keep off as much frost as three or four Archangel mats. These thicker ones are £3 per dozen; they, too, roll up easily, and take up but little space.

GARDENING OF THE WEEK.

INDOOR GARDEN.

LILY OF THE VALLEY.

AS a cut flower this now may be had all the year round, therefore see that a sufficient number of crowns are in stock to introduce every ten days or a fortnight a successional batch. Retarded crowns will be available for some time yet, but at any season of the year crowns start more freely and uniformly if subjected to a low temperature by the refrigerating process for a week or ten days before starting to force them. After crowns are once introduced into the forcing house care must be taken to ensure that the progress be gradual and progressive until the spikes are fully developed and the bells show colour, when, if necessary, they may be retarded.

LILIUM LONGIFLORUM HARRISII.

An early batch of this Liliun should now be potted up. Place a single bulb in a 6-inch or 7-inch

pot, a compost of sound turfy loam pulled into rough pieces, with an equal part of leaf-soil and an addition of sand suits them. Make the pots half full only with the soil, on which place a little sand to rest the bulb upon; fill in around the bulb with soil pressed moderately firm, leaving its apex only uncovered, and unless the soil be very moist a watering will be necessary, after which allow the pots to drain, and, when dry on the surface, place them under a stage in a greenhouse. Cover with cocoanut fibre to a depth of about 4 inches; they may remain there until the bulbs start into growth, when they may be subjected to a gentle forcing process.

TULIPS

for early forcing should now also be boxed up. For this purpose boxes may be used similar to those used for Roman Hyacinths. A light rich soil is necessary, in which place the bulbs 3 inches apart, and only slightly covered with soil made firm by the hand. The boxes may be placed either in a cold frame or under the stages in a cold house, covered to a depth of 4 inches with fibre, and kept quite cold until root action is well advanced. If required for early flowering they must be placed in a temperature of 45° to 50° by night, and exposed to full light by day. As the blooms develop their colour they may be potted up five bulbs in a 5-inch pot, selecting such bulbs as are in an equal stage of growth. The Darwin Tulip is well adapted for pot cultivation, and forms a charming succession to the early blooming varieties, their long tough stems render them peculiarly adapted for cutting purposes, and there is not within the whole range of spring flowering plants anything more gorgeous.

CHRYSANTHEMUMS

for decoration should be under glass by this time, and as abundance of room in early vineries and Peach houses is generally available at this season there is but little excuse for keeping them out of doors. Keep the plants neatly tied up and attend to disbudding as the flower-buds develop, retaining the crown or terminal bud free from injury; the foliage must also be kept clean and healthy by applications of flowers of sulphur wherever mildew shows itself, and by fumigation with XL All Compound to rid the points of the shoots of aphids. Regular supplies of clear liquid manure must be given to the plants, and an occasional light top-dressing of Clay's or Peruvian Guano.

J. JAKES.

Wendover.

FRUIT GARDEN.

HARDY FRUITS.

TAKE advantage of the fine dry days which we are now having for gathering Apples and Pears as they become fit for removal from the trees. Choice Pears that are to be kept for a long time should be handled with the greatest care, and none but those which are of full size and sound should be placed on the shelves where they are intended to remain until fit for use. As

many of the trees, owing to the lightness of the crop, have made strong growth and the ground is now in good order, immediate attention must be directed to root-pruning, otherwise the full advantage which may be derived from the judicious performance of this operation will be lost. Wall trees of all kinds, commencing with Apricots, early Peaches and Nectarines, if

ROOT-PRUNED

with care now will fruit abundantly next year. But amateurs and others who have not seen this operation skilfully performed must not suppose that root-pruning means a general cutting away of all the roots which extend beyond a certain line, and then filling the trench in again. The proper way is to open out a trench at the extremity of the principal roots, and then with a steel fork to work inwards until a number of the strongest roots have been traced to within a reasonable distance below the surface of the border. These will then require slightly cutting back with a sharp knife, and the work of relaying in fresh loam, which must be made very firm by ramming, will follow as the trench is filled in again. If the old compost is really good a small quantity of fresh loam will suffice, and the addition of manure as a mulching only will complete the work. Where the

FORMATION OF ORCHARDS

is contemplated, thorough draining must precede all other operations. Trenching as deep as the soil will allow will then follow, and the time of planting will be regulated by the soil. On free, friable soil it may be done at once, but cold, heavy soils often first require turning over a second time and full exposure to frost. Soils of this description may be greatly improved by the addition of burnt earth or garden refuse, road scrapings, or old lime

ONE OF THE COMPARTMENTS IN THE PLANT SHELTER (END VIEW).

rubble, and in some cases it may be necessary to crop with Potatoes or other vegetables for a year before the trees are permanently planted.

ORCHARD HOUSE.

A few years ago no one thought of disturbing the roots of a fruit tree until it had cast all its leaves, but it is now generally admitted that the best results follow potting immediately after the fruit is gathered. The after treatment is, of course, different, as trees which are potted before they go to rest require the shelter of an orchard house where they can be syringed occasionally until the wood is ripe, when the best place they can occupy is a sheltered situation out of doors. Here they should be placed not too closely together, with the pots fully exposed to the atmosphere until bad weather threatens, when they may be well packed with dry Fern to secure the pots and roots from frost through the winter. Autumn is the best time for pruning, which should always follow the reducing and repotting. Trees of ordinary size which have been kept properly pinched throughout the summer require very little pruning, and on no account should the roots be shortened until the triple buds can be distinguished. If maiden trees for potting have not been selected no time should be lost in looking them out, as first comers generally take the best, but it is not always advisable to take the strongest unless the wood is thoroughly ripe and the young shoots are evenly balanced.

Madresfield Court Gardens.

W. CRUMP.

FLOWER GARDEN.

PRESENT WORK.

THERE is still certain work in the flower garden that must not be neglected because of the lateness of the season and the expectation of early frost. Sometimes frost is delayed until the end of October, and, with the hope of being thus favourably treated, the removal of seed-pods and dying flowers from Sweet Peas, perennial and annual Sunflowers, Gaillardias, and other things may continue, and if there is no frost all back flower-buds now showing will be developed upon a late batch of Cactus and Pompon Dahlias planted with a view to furnishing flowers for late cutting.

EAST LOTHIAN STOCKS.

Frames that have been occupied by Pink and Carnation cuttings that are now planted out should at once be utilised for other things. East Lothian Stock sown in boxes the early part of last month will now be ready to handle, and may be pricked out into these frames 3 inches apart each way. The soil prepared for Pinks and Carnations will do very well for them.

VIOLAS.

These are best struck during the present month. They root readily enough in cold frames in a good gritty soil, but the compost should be raised to within 1 foot of the glass and the surface dressed over with finely-sifted road sand. Choose young, soft pieces for cuttings, make the soil about them quite firm, damp over, shade, and keep close for a few days. Should mildew show itself apply black sulphur.

BEDDING CALCEOLARIAS

may now be propagated and heated in exactly the same way, very little protection during the winter being required. The variety *amplexicaulis* is more tender, and requires to be grown in boxes, which can in severe or very damp weather be brought into a dry and cool but frost-proof house. This charming old plant deserves to be more largely grown than it is at the present time.

THE IVY.

Ivies may be successfully cultivated in a purely ornamental character, but they may also be made distinctly serviceable for forming edges to paths or for covering the soil under tall trees, and much might be done in the way of growing round, bushy plants laden with blossoms and berries, for filling flower-beds, vases, or even massing in prominent parts of the shrubbery. *Hedera Helix* and the variety *H. H. rægnieriana* are capital for this work. Plants trained in this form are easily

raised from cuttings inserted now on a north border. The only point of importance is to be sure that the cuttings taken are from flowering shoots. There is no occasion whatever to graft these varieties to ensure bushy plants that will not extend more than a yard each way for many years. For winter decoration of terraces, verandahs, or beds Ivies in variety may be successfully grown in pots or tubs many years without repotting. An annual top-dressing of rich soil and regular attention with water during the summer will maintain the plants in a healthy condition.

Ashwellthorpe Hall Gardens, Norwich.

CHRYSANTHEMUMS.

THE severe gales we have experienced of late will, I fear, have done a considerable amount of damage to the growth of these plants, especially those which are being cultivated for specimen flowers. Even where every care has been taken to make them secure much injury will have been done, except to those favoured with sheltered positions. Nearly always at this season we are subjected to rough winds more or less, but seldom with such severity as of late.

HOUSING THE PLANTS.

All the plants should now be placed under glass, except those which are being specially cultivated for late flowering, and even these should be so arranged that protection can be afforded them if necessary. Light airy houses should be selected if possible, and the plants so arranged that plenty of light and air reaches them. The pots should be thoroughly cleansed before removing them inside, and all decaying foliage and superfluous growth taken off. Overcrowding should be strictly guarded against. Many are under the impression that after the plants have made their growth in the open it matters but little how they are huddled together in the houses. Early fruit houses are admirable structures for receiving the plants, especially so in the first instance, as these are generally thoroughly ventilated, and the Chrysanthemums will do the fruit trees little or no harm. For the first two or three days and nights also the ventilators should be kept open, or however carefully the plants are managed the foliage will suffer; but immediately they get acclimatised and used to their new quarters thoroughly fumigate two or three nights in succession.

Mildew also will spread on some varieties with alarming rapidity unless checked in its early stages when the plants are removed under cover, but by applying plenty of black sulphur to the under side of the foliage and maintaining a dry buoyant atmosphere this can be kept under control. Watch carefully for rust, and isolate plants so affected. Paraffin used fairly strong, if kept thoroughly mixed and syringed on the under side of the foliage, will keep it in check. Earwigs will also have to be looked for. Endeavour to arrange the plants in batches according to the stage of the bud, so that full control can be had either of retarding or pushing them forward. The Japanese and incurved sections should always, if possible, be kept separate; while the last-named always resent fire-heat, the Japanese and Anemones are benefited by the careful use of it, and judicious airing will to a very great extent prevent damping or scalding of the florets.

WATERING.

This will now have to be performed with extreme care, as the plants will not dry to the same extent as when in the open. Early morning is the best time for this, and on very drying days look over the plants again in the early afternoon. Never attempt to give water unless they are quite ready for it, but when doing so fill up the pots at least three times to ensure every particle of the soil becoming moistened. Feeding should be rather increased than otherwise, and at every other watering manure of some kind or another should be given. I know nothing to supersede that which is made from cow, sheep, and horse manure, which should be collected and put into a large tub; place fresh soot in the proportion of one bushel to every fifty gallons of water in a thin bag and thoroughly stir

before using. The whole form a safe and good stimulant if properly diluted. Weak Peruvian Guano water is also good for a change, but requires to be used only by experienced men.

E. BECKETT.

Aldenham House Gardens, Elstree.

KITCHEN GARDEN.

BEEETROOT.

THIS being a tender vegetable and liable to injury from frosts it should be lifted and stored before other root crops. A digging fork should be used to loosen the roots, for if pulled with the hand there is a risk of breaking the tap-root, thus causing the juices to exude and the full flavour and high colour will be lost. The tops must also be twisted off with the hand and not cut. The roots should be graded, stacking the largest by themselves for ordinary kitchen use and the small ones for salad. No sand or similar material is required for storing the roots in if the floor of the structure be of earth or bricks, but if a boarded floor then the roots should be laid in sand or dry earth to keep them firm. No good purpose will be served by leaving Beetroot in the ground long after this date.

TURNIPS.

It is well known that Turnips thrive best in cool rainy seasons, and the one now rapidly drawing to a close has been exceptionally favourable to quick unchecked growth, which is so essential to this valuable crop. Provided the weather remains open sufficiently long the late sowings will produce some useful roots for autumn, and the remaining ones will become strong enough to pass through the winter for yielding tender and wholesome greens in early spring, when there is often a scarcity of such. Rather severe thinning should be carried out with this batch in order to admit the maximum amount of light to the plants, thus ensuring sturdy growth.

ENDIVE AND LETTUCE.

Large plants of these should be lifted and transplanted in rough frames or pits for late autumn and winter use. The soil in which they are planted must not be too rich, or over-luxuriant growth will be made that will be unable to withstand the rigours of the winter without decaying. Lift with good balls of earth and plant in lines 15 inches apart and 12 inches in the row, and give a good watering to settle the soil, but avoid wetting the foliage in dull weather. Keep the lights off on fine days and admit some air at all times in accordance with the conditions prevailing. Abundance of fresh air is absolutely necessary on all favourable occasions, as is protection from severe frost and snow. Where large numbers are in request and the frame room is not limited it is a good practice to fill them with plants in various stages of growth to ensure an unbroken supply over a long period.

VACANT GROUND

that is not required for cropping this year should now be heavily manured, and either deeply dug or trenched as thought necessary. The rougher the ground is left at this season the better in order to expose as great a surface of the newly-turned-up soil to the action of the weather as possible. It has been abundantly proved that the best vegetables are grown in gardens where deep cultivation is practised, but the nature of the sub-soil must guide the cultivator as to whether it is advisable to trench deeply or to bastard trench.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

AUTUMN GARDENING.

IT requires a good deal of skill and forethought on the part of a gardener to keep a garden bright and interesting for some weeks at a certain period of the year, and particularly so during the autumn. Some owners of gardens wish to have them at their best in spring, some again in summer, while yet others prefer them to wear their brightest apparel in the autumn months, the most difficult season of all to have a garden gay, for the selection of plants that

flower naturally in the autumn is limited. It becomes necessary, therefore, to requisition the services of those that in the usual course of things would flower during summer. For a small garden perhaps there would not be much difficulty in having a fair quantity of plants in flower in the autumn, for Dahlias, Chrysanthemums, some of the Sunflowers, Golden Rods, and Michaelmas Daisies might suffice. If, however, autumn gardening is taken up seriously, and one wishes to have the garden at its best then, one must make use of many plants that, strictly speaking, are not autumn blooming at all, and as the charm of a garden to a large extent lies in its variety, the greater number of plants one can induce to be accommodating, the more decided will be the success, the more bright and interesting the autumn garden. Those who are content with the second flowering of plants for an autumn display never know what it is to have a real garden of autumn flowers; there is no comparison whatever between results obtained by a systematic and painstaking method and the casual and doubtful second harvest of what are really summer-blooming plants.

A valuable aid to the successful planting of a garden of autumn flowers lies in taking advantage of the fact that some perennials are so accommodating as to succeed equally as well when treated as annuals, and, instead of flowering during their normal season—the summer months—they show none or few signs of blooming until the autumn, and, if they should, it is a simple plan to pick off the flower-buds. By adopting this method and also by making late sowings of annuals one at once brings into the domain of autumn flowers a quantity of those that are never or but rarely seen at that time. The gardener, too, who values a good supply of cut flowers at a season when in the natural course of things hardy flowers are fast waning, should take advantage of these accommodating plants. The garden at Hewell Grange, Lord Windsor's Worcestershire residence, is essentially an autumn garden, at its best during September and October, and Mr. Pettigrew therefore so cultivates his plants that they shall be at their best during these months. The plants he grows and the methods of culture will doubtless prove of interest to those of your readers who value beauty and brightness in their gardens in autumn.

It goes without saying that Chrysanthemums and Michaelmas Daisies of sorts (of the latter are grown Aster Amellus, acris, horizontalis, cordifolius, and varieties of Novæ Angliæ and Novi-Belgi) are extensively made use of. Sedum spectabile, too, is found to be indispensable, and also Helianthus rigidus, H. Miss Mellish, H. mollis, Cactus Dahlias, Montbretias, Gladiolus gandavensis and G. brenchleyensis, Verbena venosa, Phloxes, Erigeron mucronatus, Salvia splendens, Tea Roses, Heleniums, Rudbeckias, Hollyhocks, Lilium tigrinum, L. speciosum, Hydrangea paniculata, autumn Crocuses, and the Belladonna Lily. There is not much difficulty in obtaining all these in flower during the two months named. Verbena venosa, however, when sown outside in spring is too late altogether, so it needs to be treated as a half-hardy annual and the roots preserved during the winter. Lantanas and Pentstemons if propagated in spring come in splendidly for autumn flowering, whereas if cuttings are taken in the autumn in the usual way they will bloom in summer. Marguerite Carnations, Gaillardias, Hollyhocks, and Delphiniums (especially Queen of the Blues and D. nudicaule) may be sown in spring for autumn blooming.

The following annuals also, if propagated fairly late, are valuable in the autumn garden: Mignonette, Alonsoa Warscewiczii, Tagetes pumila signata, Brachycome iberidifolia (the Swan River Daisy), of Everlastings, Rhodanthus, Ammobium alatum grandiflorum, Helichrysum and Acroclonium, Sweet Peas and Lavatera rosea; Ipomœa rubro-cœrulea, and Torenia (sown in March and the flowers picked off), and Abutilon Boule d'Or, with handsome leaves splashed and marked with green, yellow, and cream colour, are always admired in the greenhouse or for house decoration. Vases filled with plants often add much to the variety and interest of a garden in autumn, and suitable for this purpose are Ivy-leaved and zonal Pelargoniums, Chrysanthemums, sweet-scented Geraniums, Fuchsias, Salvia splendens, Lilium speciosum and tigrinum, Hydrangea paniculata, Marguerite Carnations, and Lobelia Erinus varieties. A. P. H.

THE FRUIT GARDEN.

APPLE CELLINI PIPPIN.

WHILE I do not go the length of saying that this variety has borne well generally, I have heard many growers of Apples say that it has given them a good crop. It is the only Apple that has given me a crop this season, an old tree and several young ones have yielded a profuse crop, and in the case of the former quite profusely on the young wood of the previous summer. I am not to be understood as advocating the general planting of this variety, though it is acknowledged to be a culinary Apple of the first quality. Dr. Hogg fancied it had been raised from the old Nonesuch, because of its resemblance to it. The raiser was a Mr. Leonard Phillips of Vauxhall, probably during the last sixty years, as no mention is made of it by George Lindley in his "Orchard and Kitchen Garden." It would be interesting to know why the name of Cellini Pippin was given to this Apple. R. DEAN.

THE LOGANBERRY.

MM. CAYEUX and LE CLERC showed at the Société Nationale d'Horticulture on July 9 last a fruit-bearing branch of the Loganberry. This is the first time that this bush, which has been known for some years past in America and England, has made its appearance in Paris.

The name, which is of American origin, signifies the berry of Mr. Logan. "Berry" is the generic name in English for a number of small fruits, as the Strawberry, Raspberry, Blackberry, Gooseberry, &c. Judge Logan, the Californian nurseryman, having produced a new fruit, has created a new name for it, which he has formed from his own.

The Loganberry is a hybrid between the Raspberry and the Blackberry, and has met with considerable appreciation in the English-speaking countries to which it has spread. In 1894 Mr. E. J. Wickman, of the experimental station of California, wrote that this shrub had given proof of robust growth, and that it produced large and beautiful fruit, endowed with a remarkable flavour, partaking of the nature of the Raspberry and Blackberry. In 1897 Professor Kinney dedicated a small special bulletin to the Loganberry, and came to the conclusion that it was the new "small fruit" shrub which gave the best promise among those which had been cultivated at the station. He also mentions—and this is an interesting point to note—that they had been successful in propagating the Loganberry from seed, but that the produce thus obtained was relatively inferior.

The specimen shown at the Société Nationale d'Horticulture by MM. Cayeux and Le Clerc corresponds to the description just given. So far as could be judged the growth appeared to be

very robust. The berries were of large size, larger than the Raspberry and the Blackberry. This, no doubt, is explained by the fact that in the United States there are varieties of Blackberries which have very big berries. The greater part of those shown were not quite ripe, and had a colour similar to that of the Raspberry in the same state. One fruit which had arrived at maturity was of a very deep brown-red; it was a little crushed, which enabled us to certify that it exhaled a very appetising odour.

How should the cultivation of the Loganberry be conducted? On this point we have the evidence of different cultivators, who have given an account of their observations in several English and American publications. The following is a summary of these observations:—

"The Loganberry produces vigorous offshoots which often attain a length of 3 metres. The best system of cultivation is to train these offshoots along a wall upon wire or trellis work, leaving a space between them of from 20 centimetres to 25 centimetres. They bear fruit the second year, then wither and die. Messrs. Fell and Co., who were the first to introduce the plant into England, say that it is not even necessary to cut off the old wood after it has produced fruit. As soon as the crop is over the branches are detached and fall to the ground, and in their place the year's shoots are trained. Five or six shoots may be left to each tuft; if the tuft is very strong as many even as eight or ten may be left.

"It is well to give several waterings of liquid manure during growth, for the Loganberry, like the Raspberry, quickly exhausts the soil."

According to the American authors the shrub will never be absolutely hardy throughout the United States; the severe frosts would be prejudicial to it. But it must be remembered that the winters of a great part of the United States are more severe than ours; and it may be admitted that the Loganberry will have nothing to fear from the cold of our climate, especially if it is trained against a wall.

A similar cross to that which gave birth to the Loganberry was reproduced in England some years ago by Messrs. Veitch of Chelsea. The hybrid which they obtained was between the Raspberry (Belle de Fontenay) and a Blackberry (Rubus fruticosus), and which they named the Mahdi. It would therefore, botanically, be a variety of Loganberry. It was shown to the Royal Horticultural Society of London in 1897 and after, and since then has been placed upon the market.

The great interest in these crossings lies in obtaining a shrub which will give fruit as delicate as that of the Raspberry, and yet will continue to bear successional crops for as long a time as the Blackberry. A selection will, no doubt, permit this result to be obtained eventually. In any case, the Loganberry appears already to be a valuable acquisition, and is the most important which has yet sprung from the crossings of small fruit shrubs so far attempted, especially in the United States.—*Revue Horticole*.

THE INDOOR GARDEN.

MIGNONETTE.

FOR early spring flowering seed should be sown at once. It may be sown in the pots that it is to flower in, or it may be sown in pans and pricked off later on. The latter is, perhaps, the best method, as it can be placed on a shelf close to the glass. To get short, sturdy plants it is most essential to expose them to all the sun and daylight possible. When sown in pans for pricking off any light compost may be used, and it should not be pressed too firm or it will be more difficult to get the seedlings out with good roots. Many of our market growers grow Mignonette singly instead of several in a pot, but for this purpose the seed may be sown early in August, the plants then become strong before we get dark, dull weather. Stopped once or twice they make nice bushy plants. They

may be potted off singly or several in a pot, whichever way it is intended to grow them.

The compost should consist mainly of good fibrous loam, some well raked stable manure may be added, also a good sprinkling of sand, and for winter potting I like some lime rubbish; this helps to keep the soil sweet, and is also beneficial. If the soil is fairly dry it cannot be pressed too firm. Firm potting with good drainage is one of the most essential points in the culture of pot Mignonette. When first pricked off it may require to be kept close, and shade a little for a few days, but as soon as it has rooted into the new soil must be exposed to all the light possible.

Watering requires very careful attention. The slender thread-like roots are easily damaged either by excess of moisture or from drought, but during the winter it is better to keep the soil rather dry than otherwise. Only just sufficient artificial heat should be given to keep out frost. Mignonette may soon be spoilt by keeping it too warm, especially in dull weather. With plenty of sunlight a little more warmth may be given if desirable to force it early. Manure may be used freely as soon as the plants have made a good start, and should be continued, regularly increasing the strength as the plants advance in growth. A good liquid manure is that made from guano and soot, but this should be prepared beforehand and allowed to settle down, so that it can be used in quite a clear state. Soot-water may be used for sprinkling over the foliage if quite clear, and will help to keep off caterpillars, which are sometimes very troublesome in the spring time.

In growing what is termed Tree Mignonette a little more warmth and shade may be given during the early stages of growth; this will draw the stems up a little. Plants should be potted singly in small pots as soon as large enough to handle, and when ready for repotting cut off all the side shoots except the top one, and take out the flower-spikes. When the stem has attained to the required height about three or four of the top shoots should be left, and these may be stopped as soon as they show flower. I have had Tree Mignonette fully 3 feet high with heads over 3 feet in circumference, but it requires a great deal of care to grow such large plants. Those with stems about 9 inches high with from six to twelve spikes of bloom are not so difficult to manage. It often proves difficult to establish Mignonette in the open ground, especially in mixed borders or where there is any shade. The market growers generally sow it in small pots and plant out when well established. If sown about the middle of March it will make nice plants for planting out about the end of May, or in a sheltered sunny position it may be planted out earlier. It may require thinning out. Only about three or four plants should be left in a pot, or planted out singly in good ground they will cover a large space.

There are now many improved varieties. That known as Machet is most generally favoured by those who grow it in pots for market. It is a dwarf variety, with very thick flower-spikes. For out bloom or the garden the one originally known as Parsons' White is the best. This may now be had under various names, but it is not always easy to get the very best type. Mignonette is much inclined to vary, and it is only those who are very careful in selecting the best types for saving seed from who can keep any variety true. I should mention the Hybrid Spiral as being one of the best for Tree Mignonette. A. HEMSLEY.

SOCIETIES.

STROUD HORTICULTURAL SOCIETY.

THE two days show arranged by this society was held on the 26th and 27th ult., in the grounds of Calne Cross House, kindly lent for the occasion by E. S. Godsell, Esq., who, as joint secretary with E. C. Davis, Esq., capably arranged the necessary matters connected with the exhibition. This season the promoters of horticultural exhibitions have had to reckon with the vagaries of the weather, and unfortunately these two dates proved no exception to the rule. The afternoons of both days turned out miserably wet, and undoubtedly damped the ardour of many visitors to the show, the result being a corresponding decrease in the gate

money. It is to be hoped that this show will now prove to be an annual fixture, because of the great aid it renders to horticulturists in the county of Gloucester. Excellent arrangements had been made by the secretaries for the convenience of exhibitors, five large tents being requisitioned for the exhibits, which were numerous and well represented. The committee were fortunate in their selection of judges, who were as follows: flowers and plants, Mr. S. T. Wright, Royal Horticultural Society's Gardens, Chiswick, and Mr. Herbert Cutbush, Highgate Nurseries; fruits and vegetables, Mr. W. Crump, Madresfield, Malvern, and Mr. W. Child, Earl's Croome, Worcester; vegetable classes, Mr. T. Arnold, The Gardens, Cirencester House, and Mr. J. Pitts, Grittleton, near Chippingham. The number of exhibitors was 52, who sent 641 exhibits.

PLANTS.

Group of miscellaneous plants arranged for effect within a space 8 feet deep by 25 feet frontage: First, Messrs. J. Cypher and Son; second, the Right Hon. Sir J. E. Dorrington, Bart., M.P. (gardener, Mr. Saverger); third, Mr. Vause, Leamington.

Group of similar plants within a space 8 feet deep by 15 feet frontage: First, E. S. Godsell, Esq. (gardener, Mr. W. Hammond); second, Mr. Blackwell.

Group of similar plants within a space 8 feet deep by 10 feet frontage: First, J. W. Lane, Esq. (gardener, Mr. A. Powell); second, A. Apperley, Esq.

Six specimen stove or greenhouse plants, three foliage, and three flowering: First, Messrs. Cypher and Son; second, Mr. Vause; third, E. Calcutt, Esq.

Collection of Dahlias arranged on space 6 feet by 4 feet: First, The Vineries, Limited, Birmingham; second, Rev. S. Cornish; third, Mr. A. Edmonds.

Collection of Roses arranged on space 4 feet by 4 feet: First, Messrs. J. Jefferies and Son; second, Mr. A. Edmonds. Twelve Roses, not less than eight varieties: First, Mr. A. Edmonds. Six Roses, not less than six varieties: First, Mr. Charles Hill; second, Mr. Edward Remes.

Hardy flowers arranged on space 6 feet by 4 feet: First, The Vineries, Limited, Birmingham; second, Mr. Charles Hill; third, Mr. A. Edmonds.

Gladioli, any variety, arranged on space 4 feet by 4 feet: First, Messrs. J. Jefferies and Son; second, Mr. A. Edmonds; third, The Vineries, Limited, Birmingham.

Collection of Sweet Peas, thirty varieties, arranged on space 4 feet by 4 feet (prize presented by Messrs. Jefferies and Son): First, Mr. H. Miller. Collection of Sweet Peas, not exceeding fifteen varieties, arranged on space 4 feet by 2 feet: First, Messrs. J. Price and Son; second, Mr. Charles Smith; third, Mr. A. Edmonds.

Collection of annuals, any variety, arranged on space 4 feet by 4 feet: First, Mr. H. Miller; second, Mr. A. Edmonds; third, Mr. Charles Hill.

FRUIT.

Collection of fruit, six varieties: First, E. Calcutt, Esq.; second, Sir J. Dorrington; third, Mrs. G. Holloway.

Collection of fruit, four varieties: First, Gordon W. Canning, Esq.

Four bunches of Grapes, two black and two white: First, E. S. Godsell, Esq.; second, Mrs. Blackwell; third, Mrs. G. Holloway.

Two bunches of white Grapes: First, E. S. Godsell, Esq.; second (equal), Messrs. E. Calcutt and G. W. Canning; third, Mrs. G. Holloway.

Two bunches of black Grapes: First, Sir J. Dorrington; second, E. S. Godsell, Esq.

Peaches, dish of six: First, Sir J. Dorrington; second, Mr. E. Calcutt; third, Mr. G. W. Canning.

Nectarines, dish of six: First, Mr. E. Calcutt; second, Messrs. Price and Son; third, Mr. G. W. Canning.

[This report has been unavoidably held over.]

DERBYSHIRE AGRICULTURAL AND HORTICULTURAL ASSOCIATION.

CONSIDERING the disastrous season the exhibits generally were decidedly good. Flowers, which rank as the chief feature of the department, formed a very attractive class, and in many instances the exhibits bore striking evidence of intelligence and painstaking attention on the part of the cultivators. Although they did not constitute a very big class, Roses were well represented, some exceedingly fine specimens being in evidence. Mr. J. W. Smith of Alveston Hall gained premier honours for the best twelve Roses in the open class, whilst Mr. P. Newbold achieved similar success for twelve distinct blooms in the second division. The first prize in the upper division for twelve Cactus Dahlias was won by Mr. G. Carrington of Derby, who also carried off a similar award for six remarkably fine double Geraniums.

In the fruit section some of the produce bore ample evidence of the adverse growing weather, but a somewhat surprising fact was the large size of some of the Apples. Mr. H. D. Smith, a big prize winner, exhibited three dishes of fine Peas, which easily obtained first place, and Mr. J. H. Goodacre (gardener to the Earl of Harrington) gained premier honours for Grapes, any variety, in the open class. Mr. Hampshire, of Quarndon, showed four bunches of well grown Grapes, black and white, which the judges had no hesitation in deciding to be the best in the second division.

As in former years, a portion of the large circular tent was devoted to groups of foliage and flowering plants, the awards being given to those exhibitors who made the general arrangements for the best effect. Space was provided for seven exhibitions, for which prizes of £20, £10, £12, £8, £6, and £4 were offered for competition. Mr. J. Ward (gardener to Mr. T. H. Oakes of Biddings), who was adjudicated first for his brilliant display last year, did not compete, with the result that the first prize went to his old rival, Mr. J. Thompson (gardener to the late Mr. G. H. Turner of Littleover), for a beautiful collection of Ferns. He was closely followed by Mr. J. Holmes, whilst Mr. G. Woodgate (gardener to Sir Oswald Mosley) was placed third. The tent was rendered all the more beautiful by the exhibits of a number of the best known nurserymen and florists throughout the country.

The society awarded gold medals to Messrs. Hewitt and Co., Edgbaston, Birmingham; J. H. White, Worcester; R. W. Proctor and Sons, Chesterfield; W. B. Child, Worcester; and W. J. Brown of Peterborough. Messrs. J. Cheal and Sons, Crawley, Sussex, obtained an award of merit for a new white Dahlia named Mrs. D. B. Crane. Mr. J. L. Cartwright of Market Place, Derby, whose table decoration was much admired, was awarded a special certificate of merit, in addition to being entitled to a gold medal. The judges were Messrs. N. F. Barnes, Chester; P. Blair, Trentham; W. Speed, Penryn; J. Voss, Kedleston; F. Gilbert, Bonhill; J. Bladen, Derby, and J. Stopps, Derby.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.

THE monthly meeting of this association took place on Tuesday, the 1st inst., at Winchester House, Old Broad Street, London, E.C., Mr. T. W. Sanders, F.L.S., in the chair. A capital audience was present to hear Mr. D. B. Crane's lecture on "Hardy Flowers for Exhibition." The lecturer considered at some length the methods at present in vogue for staging the many and varied kinds of hardy flowers. He said that hardy flowers should be exhibited, such a way that their beauty and usefulness in the hardy border could easily be appreciated. Too often this was the case. At local exhibitions in particular this idea was more often ignored than many were perhaps prepared to admit. Some of our leading shows were also innocent in this respect. Mr. Crane said flowers of tall and stately growth should be cut with long stems with foliage adhering in order that they might be rightly represented and the stately character seen. He emphasised the value of a proper setting-up of the different subjects in vases, and said a spike or spray of blossoms should be inserted unless the individuality, so to say, spoke for themselves. Plant developing large compact trusses of blooms should, he said, be cut with long stems and massed, in this way showing their effect in the hardy border, and contrasting with the plants of stately or elegant growth. Of the numerous plants of dwarf and procumbent growth, which it was almost impossible to set up in bunches, Mr. Crane advocated that being exhibited as growing plants. He was convinced, this was properly carried out, a greater interest would be felt in this type of plant than is now the case. There were many charming plants so well adapted to this purpose the advantage might very well be taken of exhibiting them in pans or baskets, or any other suitable receptacle. Where it was more convenient ordinary nursery beds were recommended in which to plant hardy flowers for exhibition in preference to the generally accepted hardy border. The advantage of nursery beds was the ease with which the plants could be overlooked, their needs supplied, and mulching, watering, and other items of culture attended to. Liberal mulching applied in early summer were highly spoken of, and in the case of the autumn-flowering subjects, such as the Phloxes, Helianthus, &c., a second mulching in late July had many advantages. Copious waterings in dry weather, followed subsequently with an equally copious application of manure-water, was recommended. Thinning out and staking the shoots and the removal of spent blossoms were each dealt with in turn. Deep culture was essential to success, and the free use of well-decayed manure incorporated at the time of digging was also emphasised. A selection of plants to flower in May till October was also given, mention being made of more meritorious varieties in each case. The meeting closed with a hearty vote of thanks to Mr. Crane for his interesting and instructive lecture. The monthly exhibitions continue to be highly successful, and the September meeting was one of the best. Mr. Levi Weybridge, won the gold medal for Cactus Dahlias, Mr. D. B. Crane for hardy flowers, and Mr. B. G. Sinclair, also for hardy flowers, first prizes. Mr. Planner made a charming display with a dinner-table decoration, and Mr. George Hobday, Romford, exhibited fruits and vegetables in superb condition. There were numerous other exhibits.

CROYDON AND DISTRICT HORTICULTURAL SOCIETY.

CRYPTOGAMIC plants, or the lower order of plant life, formed the subject of a lecture delivered before the members of this society at their rooms, Sunflower Temperance Hotel, on Tuesday, the 15th inst. The lecturer, Mr. G. W. T. Shrubshall, alluded to the little attention generally devoted to this race of plants. Yet they in their sphere are as useful to the beautifying of this earth, and some of them in the cellular group contributing food for mankind, as to make them worthy of deeper study and further research. The two divisions of the vegetable kingdom are the phanerogams, or flowering plants, and the cryptogams or flowerless plants, and the latter division was dealt with in this lecture. The principal feature to understand clearly is the reproduction which takes place by spores, or cells, and on this he dwelt at some length. He said it must always be remembered that the cell is the fundamental unit of plant life, and in fructification Nature ordains the division of these cells for propagation, from which emanates the perfect plant. Although the time at his disposal was very limited for such an extensive subject, yet many points were unfolded to his appreciative audience, which called forth at the conclusion a very hearty vote of thanks. The exhibits at the meeting also proved very attractive, and unanimous thanks were freely expressed to the exhibitors. Mr. A. Edwards, Ambleside Gardens, brought a good collection of Apples; Mr. E. Kromer, Bandon Hill Nurseries, bringing a flowering specimen of *Watoniana humilis*; Mr. J. Gregory, a flower of *Cercis triangularis*; Mr. A. C. Roffey, Croydon, Cucumbers, saved for seed purposes; and Mr. M. E. Mills, Coombe House Gardens, who brought varieties of Fern fronds and splendidly grown Dahlia blooms.

The next paper will be read on October 6, when Mr. J. Cheal, Crawley, will take for his subject "Horticulture in America and Canada."

NATIONAL CHRYSANTHEMUM SOCIETY.

Monday evening last, September 21, the executive committee of the above society held its first meeting of the season at Carr's Restaurant, Strand. Mr. Thomas Bevan, was well supported by his brother officers and members. The minutes of the previous meeting and correspondence occupied some considerable portion of the proceedings. It was announced that one of the society's judges, Mr. J. Smith of Mentmore, had died, a vote of condolence with his family was accordingly passed.

T. Tupper, a former member of the committee, having resigned on account of removal to the city, his place was filled by the election of Mr. Castleton to Crystal Palace.

The secretary then read the correspondence with the Crystal Palace Company, and also the agreement entered into by the company for holding the National Chrysanthemum Society's shows there during the coming season. In answer to an enquiry it was stated that the new supplement to the society's jubilee catalogue was now complete, and it was in course of printing. A few days at most would see it before its publication.

Mr. Harman Payne, the foreign secretary, announced that the French National Chrysanthemum Society would this year hold its annual show and congress at Lille on November 1st. An invitation had been received requesting the society to send a deputation from the English society, and Mr. Payne said he should be pleased to receive the names of any members wishing to form part of the deputation. It is also proposed that the French National Chrysanthemum Society shall pay a return visit to the National Chrysanthemum Society's show at Crystal Palace on November 10 being a most convenient time for this purpose.

Reference was also made to the recent publication by the French National Chrysanthemum Society of a coloured book of diseases and insect pests affecting the Chrysanthemum, with remedies suggested. The report of the American Chrysanthemum Society's show at Chicago last November has been now published, reference was also made to that report being of interest to members present. April the committee appointed a small deputation to the Ghent Quinquennial Show, and Mr. Witty gave an account of the visit, and also some particulars relating to the gardens of the King of the Belgians at Laeken. Mr. Witty also formed one of the deputation and who had only visited the Riviera, also interested the committee in his experiences of Mediterranean horticulture. These accounts were greatly appreciated by those present.

The secretary reported on the annual outing, which was held by an unusually large number of members and was socially and financially the day's proceedings proved a great success. Special votes of thanks were passed to Mr. Noble, the proprietress, and Mr. G. Stanton, the man for their kindness; the one in allowing her gardens to be placed to be visited by the party, the other for so kindly arranging the details that tended to the comfort and enjoyment of those who went. Some new members elected, and the election of the Macclesfield Chrysanthemum Society in affiliation concluded the business of the day.

The first meeting of the new season of the floral committee was held on Tuesday last, the 22nd inst., at 4 o'clock in the afternoon. The committee met for the first time in one of the smaller halls of Essex Hall, Essex Street, W.C., Mr. D. B. Crane in the chair. There was a large attendance of members, and on this occasion the election of chairman for the ensuing season of 1903 and 1904 was the chief item for consideration. After the minutes read and confirmed, the only novelties present were fitted for adjudication. The following variety was named:

H. Humphrey.—A large and beautiful Japanese flower useful form, having long recurring florets of medium health, and building a bloom of splendidly pretty curling, and protruding far beyond the petals. Colour soft yellow, pleasingly tinted coral. Late season, far prettier and more attractive. From Mr. W. Walton Leigh Gardens, Addlestone.

The election of chairman of the floral committee was quickly proceeded with. The names of Mr. D. B. Crane and Mr. J. Lyne were nominated for the position, and the result of the election by ballot Mr. Crane was declared elected.

ROYAL HORTICULTURAL SOCIETY.

SCIENTIFIC COMMITTEE.

Dr. Cooke, V.M.H., in the chair; and seven members present.

Posterior species.—Colonel Tillotson showed flowers of a new species from South America. The petals were of a pale green, passing into primrose, the stamens and pistil pink, and protruding far beyond the petals, which almost closed at the apex of the flower. Though not attractive in colour, it was thought it might be useful for seed, on account of the great substance of the petals.

Raspberry, Wineberry, Blackberry Hybrids.—Mr. H. Peerman presented specimens of the foliage (the fruits had fallen off, and not been identified) of three hybrids, Blackberry x Raspberry, Wineberry x Raspberry, and Raspberry x Wineberry. These were considered most interesting, and he was requested to again next year, each in a separate box, with both seed and foliage.

Formation.—Mr. J. Robson sent "a section from a Sycamore exhibiting the extraordinary facility with which this tree develops wood-buds from the alburnum." He had been budding on the bare space between two buds, and the bud had failed, but from the base of the bud the stock had sent out a growth "where no eye

previously existed. I have twenty-five or more examples of the same thing in Sycamores, but though I have budded many subjects I have never noticed the same thing in any other genus."

Hippeastrum Bistored.—Dr. Bonavia sent some leaves of *Hippeastrum* "covered with something that looks like scale, but which adheres so closely to the epidermis that it is difficult to remove." The scale-like blotches, on examination, proved to be not of insect formation at all, but blisters due probably to defective root-action, itself due to a check of some sort, such as cold or too much wet.

Cryptococcus on Weymouth Pine.—Mr. R. Knight-Bruce sent a specimen of bark literally swarming with the white woolly or waxy *Cryptococcus* which attacks Pines, and which, he says, is rapidly spreading, and killing plantations of the Weymouth Pine. The committee considered the case almost hopeless, but suggested spraying the trees with a paraffin emulsion. Mr. Wilks said he had but little hope in spraying *Cryptococcus*, as, unless the sprayer was peculiarly strong and powerful, the fluid would not penetrate the downy wax with which the insect covers itself over. He had known a case of a Beech tree being saved by hand scrubbing with a brush, using soft soap and paraffin emulsion; but he had never known spraying to be successful.

Discoloured Vine Leaves.—These were received from Mr. Neild, of Holmes Chapel. Dr. Cooke reports: "Vine leaves with broad irregular patches of bright colouration have been known and observed for the past half century. Sometimes the colour is yellow or becoming brown, and sometimes reddish or claret colour. In America it is known as the California Vine disease (see U.S.A. *Reports of the Department of Agriculture*, xx., 1892). This, or a similar disease, is known in Sicily as 'Folletage,' and in Italy as 'Mal Nero.' No satisfactory reason has yet been assigned for this affection, as no trace of fungi has been found, and there is no cause to suspect that fungi of any kind have anything to do with the discolouration. Leaves are constantly being submitted to the scientific committee for report as to the cause or remedy, but none can be given."

Flowering Sweet Pea.—Mr. Hunt sent a flower-stalk of Sweet Pea having seven fine blossoms.

Proliferous Helianthus.—The Rev. C. Wolley Dod, V.M.H., sent flower-heads of this, remarking that one particular plant in his garden always produces them; and that, as a rule, small secondary flowers grow out of the disc.

Campanula lactiflora, linear-leaved.—The Rev. Wolley Dod sent a curious "abnormal" form of *C. lactiflora*, which comes in small percentage from the seed of the typical form, perhaps one in 200. The linear leaves can be recognised early in the seedling stage, and I never saw intermediate forms. Analogous forms with stellate flowers are not uncommon in *Campanula rotundifolia*, and De Candolle in his "Monograph of Campanula" figures and describes one of *Campanula medium*, which he considered unique in the genus.

Silver-leaf disease in Apples and Plums.—Mr. Gaut brought specimens from an orchard of 7 acres in Yorkshire. The soil is warp-land, varying in depth from 1 foot to 3 feet within short distances, and overlying clay. The drainage is good, with drain pipes. Shelter is afforded by the fruit trees in the orchard. The altitude is nearly sea-level. The general culture has been to give a good dressing of farmyard manure every four years and lime every few years. The trees had been planted ten years, and silver leaf appeared three years ago and gets worse every year. The varieties affected are Victoria Plums, of which there are about 500 trees; and Lord Grosvenor Apple grafted on Keswick Codlin stock.

Mr. Gaut remarked that the matter was creating considerable interest in Yorkshire, and the soil had been analysed, with the following result:—

The air-dried soil contains in 100 parts—	
Water	3.10 per cent.
Loss on ignition (organic matter, combined water, &c.) ..	5.00 "
Mineral matter	91.81 "
100.00	

Containing nitrogen	0.151 per cent.
Equal to ammonia	0.183 "

The soil was free from root-fibres or any visible organic material.

It had been said by some experts that silver leaf was due to a lack of nitrogen in the soil, but the analysis seemed to show this could hardly be the case. Dr. Cooke said that the disease was so mysterious, because he could find no spores or mycelium of fungus and no bacteria. He knew of no remedy, but advised cutting out the parts affected the moment the disease was seen and burning them. (See also Royal Horticultural Society's Journal, vol. xxviii., pages 713, cxliii., and cxlix.)

Rose leaves diseased.—Mr. J. W. Scott sent three bundles of Rose leaves diseased. "No. 1. The plants are in good health, and at present there is but very little of the disease on them. No. 2 is taken from small potstuff spring grafted, and seems to develop those spots when grown in a high, moist temperature. No. 3 appears to be like the last, attacking plants that are in a soft growth, and we have it in several houses, in some cases stripping every leaf off the stem, but on taking the lights or glass off the plants recover to a great extent."

Dr. Cooke pronounced the disease in each case to be *Actinonema rose*, called by growers the black mildew. It is a fungus disease very common all over Europe, and though it may be checked by Bordeaux mixture, no actual remedy is known. It was considered to be greatly stimulated and encouraged by growing the plants too closely together without sufficient air and light, or in too humid an atmosphere. It is advised to dry the plants off and let all the leaves fall (which should be collected and burnt), and then induce them to make altogether fresh growth.

CACTUS DAHLIAS AT CHISWICK.

In compliance with a notice from the hon. secretary, Mr. P. W. Tulloch, a meeting of the committee of the National Dahlia Society was, by consent, held at the Royal Horticultural Gardens on the 17th inst. for the purpose of examining the Cactus Dahlias grown there this season for trial. The response, however, was not considerable, as only the president, Mr. K. Mawley; the secretary, Mr. Tulloch; Mr. J. F. Hudson, and Mr. A. Dean were present. Raisers and trade growers, although many of them sent plants to Chiswick for the trial, which was limited to varieties but five years in commerce, yet seem to take little interest in the Cactus Dahlia as a garden decorative flower, but devote their energies chiefly to raising weak-stemmed exhibition varieties, so many of which are useless in gardens. That is most undoubtedly a mistake, as for one grower of these Dahlias for exhibition there are a score who like to grow them as garden flowers.

The Chiswick trial comprises some 200 or 300 plants, which are grown on a long south border in rows of four plants. All of them were received too late to be got out in good time, and they are rendered later by having had a somewhat severe thinning. Many were not in flower on the 17th inst., and it will, if frost spares them, be the middle of October probably before they are at their best. One object of the meeting was to select the variety held at the time to be the best for garden decoration. A prize of 10s. 6d. being offered for it by Mr. A. Dean, some half dozen were selected for consideration, but the prize was eventually unanimously awarded to Amos Perry (Hobbies and Co.), a bright scarlet flower of good size, standing well up on stiff stems. The variety should be first-class for garden decoration, although the flowers would not now be regarded as of exhibition merit. Other very good varieties were E. Needham, maroon-crimson; Aunt Chloe, mardon; Peach, white; Mr. H. A. Neede, crimson, flushed violet; Winsome, white; Mrs. Spencer Castle, pale peach and primrose, flowers well thrown out, though stems were rather weak.

OBITUARY.

JAMES SMITH.

By the death of Mr. Smith the rank of British gardeners has been rudely broken, and we mourn the loss of one of her oldest and best representatives. We extend to his widow and children our sincere sympathy. It is almost impossible to realise that Mr. Smith of Mentmore is not still with us. It was only on the 11th inst. that he attended the Chiswick trial of Potatoes, when all were pleased to remark how well he looked after his recent indisposition, and he himself said that he never felt better in his life. He was taken ill with a chill while visiting friends in Scotland, and before Mrs. Smith could reach his bedside he passed away on Friday night, the 18th inst. In 1869 Mr. Smith went as gardener to Lord Gainsborough, and was transferred a year or two afterwards to the responsible charge at Mentmore. His career since then is well known to the gardening public by the work he was privileged to carry out, first for Baron Rothschild, and afterwards for the noble employer in whose service he died—Lord Rosebery. As a landscape gardener the improvements effected in the pleasure grounds at Mentmore will bear witness to his skill. In the culture of plants, more especially serviceable decorative ones, he was excelled by few. In the kitchen garden he was one of our soundest and best authorities, and in the important matter of salad culture he had few equals. But probably the fruit department of the garden had the greatest charm and attraction for him, and it is in this connexion that his name will be longest remembered, both as a cultivator and an expert judge. With the help of Lord Rosebery he was the pioneer of orchard planting on a large scale for commercial purposes in England during the past twenty-five years, and the orchards of Apples and Plums at Mentmore will be for many years a testimony to his skill and industry as an orchardist.

On more than one occasion he has read most useful papers at the meetings of the Royal Horticultural Society in London, of which he was a Fellow, as well as an active member of the fruit committee. He was a zealous member of the committee formed to inaugurate the gardeners' dinner to be held on the 29th inst. in association with the great exhibition and congress of fruit and vegetables held by the Royal Horticultural Society at Chiswick Gardens, and was to have been one of the vice-chairmen. This committee was represented at his funeral on Thursday by many members. A beautiful wreath was sent on their

behalf. A portrait of Mr. Smith appears in our supplement.

It is twenty-nine years since Mr. Smith took charge of the gardens and the extensive outlying orchards at Mentmore, and from first to last there has been a gradual improvement in all departments, with the result that few gardens can equal the outcome of his care and skill. At the time of Mr. Smith's appointment I was quite a youth serving in the gardens, but how different was their appearance then.

Mr. Smith undertook his important charge when everything appeared against him, and for a long time I know he had to face many obstacles and disappointments. He, however, was the last man to be daunted, and his perseverance became patent to those he served so well and faithfully. Few men had a better knowledge of hardy fruit, many acres at Mentmore being devoted to Plums, Gages, Apples, Cherries, &c. In each department everything was managed well, and the best results secured. Mr. Smith was devoted to his profession, and his advice was often sought and not in vain. As a judge at the leading exhibitions, both in Scotland—his native land—and England, he was in great request.

For some years past Mr. Smith had not enjoyed robust health, which caused him to lay on one side his ready pen on all horticultural matters, but his notes formerly were read with keen interest and profit by many gardeners, young and old. By myself, his death is much lamented, having known him so intimately for many years, and in common with many others was looking forward to meet him once more at the coming gardeners' dinner.

Mr. Smith leaves a widow and a grown up family, and I am sure all who have the pleasure of knowing them will join me in expressing the greatest sympathy in their loss.

Goodwood.

RICHARD PARKER.

CHARLES MARR.

THIS veteran gardener died on Wednesday, the 16th inst., in his eighty-sixth year, at Bagshot, where he had lived for the past few years on a generous pension given to him by her late Majesty Queen Victoria. He was kitchen garden foreman at the Royal Gardens for fifty-two or fifty-three years, and had served under four head gardeners, namely, Messrs. Ingram, Rose, Jones, and Thomas. Charles Marr was an original and interesting personality, and must be well known to many hundreds of gardeners at home and abroad who have had the privilege of working in the Royal Gardens during some portion of that long time. He was engaged by Mr. Ingram soon after the formation of the Royal Gardens, and nothing used to please him more than to relate his recollections of the frequent visits of her late Majesty and the Prince Consort to the new gardens. It was not till the time came when he could not get about that he gave up his position as kitchen garden foreman. He was then about eighty-two.

Native of Coldstream, in Berwick, he possessed all the characteristics of a sturdy Scotman—large of frame, blunt of speech, but with a kind heart. Few men stuck to their work better than Marr. He never knew a day's illness during his life at Frogmore, and, I think, never took a holiday, with the exception of a day once in two or three years. Thus has passed away full of years and honour a man who served his Queen and generation well, and for whose memory a kindly thought will be expressed by all who have known him.

International Exhibition at Düsseldorf.—The programme of the International Art Exhibition, which is to take place at Düsseldorf in 1904, contains particulars of the department devoted to gardening. It may be obtained post free from the following address: Geschäftsstelle, 28, Schäferstrasse, Düsseldorf.

The Garden City.—We have received the prospectus of the First Garden City, Limited, formed for the object of building an industrial town on an area of 3,800 acres, which has been

purchased for this purpose near Hitchin, thirty-four miles from London. The prospectus is at present only being issued to the shareholders of the Pioneer Company, members of the Garden City Association and those who have shown some interest in the movement. There will be a public issue in a few months, which will be properly advertised. A Press view of the estate will take place on Tuesday, October 6. On October 9 and 10 there will be a public inspection of the site. The Right Hon. Earl Grey will preside at the luncheon on the former date.

Pelargonium Tom Thumb.—If this should meet the eye of anyone possessing this old plant, I should very much esteem the gift of a few cuttings.—T. SMITH, *Daisy Hill Nursery, Newry.*

National Dahlia Society.—The following letter has been addressed to the committee of this society by the honorary secretary, Mr. P. W. Tulloch: "During this my first year as secretary of the National Dahlia Society I have been considerably impressed by the fact that whereas the number of applications for schedules from non-members since January has reached thirty-five, in only four cases have the applicants subsequently joined the society, and in looking through the list of applications received by Mr. J. F. Hudson in 1902 and the preceding years I find the proportion to have been even less than this. The above fact suggests two reflections to my mind—firstly, that these persons are Dahlia growers, and are inclined to become members in order to exhibit at our shows; secondly, that having seen our schedule they do not consider the prizes sufficiently tempting. There is without doubt a large field for recruiting amongst gentlemen's gardeners and amateurs of the industrial and trade class, who grow a limited number of plants; but these will not join unless the prize money offered is sufficient to cover the expense of getting to and returning from the show. I therefore wish to propose at the next meeting of the committee that certain classes at present included in the schedule be abolished, and that the prize money, plus something in addition, which, I think, we shall be warranted in offering, be transferred to other and more popular classes. I much regret being unable to suggest better prizes in the open classes, but am sure that our professional supporters, who have been so generous to the society in the past, will cheerfully forego any additions to prizes in this section at present, if they are of opinion that the above suggestions are in the true interest of the society."

Broughty Ferry Horticultural Society.—Under the auspices of this society a lecture on "Fruit Culture" was delivered at Broughty Ferry, N.B., on September 12, by Mr. William Williamson, horticultural lecturer to the East of Scotland Agricultural College. Mr. Williamson is well known as a practical gardener, and his treatment of the subject was very satisfactory to the good audience which assembled to hear him. There was, in addition, an exhibition of fruit and other horticultural produce sent by the members.

A valuable Orchid.—*Zygopetalum roeblingianum*, sold at Messrs. Protheroe and Morris's rooms on Friday, the 18th inst., as a donation from C. G. Roebing, Esq. to the building fund of the new hall of horticulture, brought fifty guineas, Sir Frederick Wigan, Bart., being the purchaser, and the auctioneers foregoing their commission under the circumstances. This *Zygopetalum* is a new hybrid raised by Mr. H. T. Clinkaberry in the gardens of C. G. Roebing, Esq., of Trenton, New Jersey, U.S.A., and was awarded a first-class certificate by the Royal Horticultural Society's Orchid committee when shown by Messrs. Sander and Sons at the last Drill Hall meeting. The parents are *Zygopetalum rostratum* × *Zygopetalum Gautieri*. This magnificent new and distinct Orchid is the only one of its kind in Europe, and is flowering for the first time in this country.

New park for Glasgow.—It is announced that Mr. A. Cameron Corbett, M.P. for the Tradeston Division of Glasgow, has decided to present that city with the mansion house and a portion of the estate of Thornliebank, where he

has at present his residence, for the purpose of a public park. It is understood that the portion of the estate to be handed over comprises upwards of 140 acres, and that both the mansion house and the land are to be gifted in perpetuity. The cost of the mansion house was £30,000, and the portion of the estate gifted for the park is worth at least £24,000 more, so that the gift is truly a munificent one. The new park will be a great advantage to the rapidly increasing population in the Pollokshaws direction, and, should the tramway be extended to the park, as is proposed, a great boon to many others.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire to know no matter what the branch of gardening may be, and will object will make a special feature of the "Answers to Correspondents" column. All communications should be clear and concisely written on one side of the paper only, addressed to the EDITOR OF THE GARDEN, 20, Tavistock Square, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender required in addition to any designation he may desire to be used in the paper. When more than one query is sent, it should be on a separate piece of paper.

Names of plants.—C. B. M.—Either *Clematis vitalba* or *C. coriacea* odorata of gardens. If the first it is a free-growing climber, whereas *C. coriacea* does though it reaches a height of 6 feet or so, does not climb. Too much shrivelled to say with confidence.—A. B. Numbers were mixed. Plant with succulent leaves of pink flowers is *Sedum spectabile*; red flower is *Red Valerian* (*Centranthus ruber*); variegated about as poor a specimen to say; send flowers. Others next week.

Quick-growing trees (IGNORAMUS).—The rapid-growing trees likely to suit your purpose are *Asplenium platyneuron* (Norway Maple) and its varieties; *Acer platanoides* (Sycamore), of which there are several forms; *Platanus acerifolia* (London Plane); *Populus* (*Poplar*), sorts especially; *Populus alba* (Able); *Populus nigra* (Black Poplar); *Populus fastigiata* (Lombardy Poplar); but, above all, that often met with in nurseries as *P. canadensis*, which is by botanists referred to as *P. deltoides*. These known *P. canadensis* aurea and *P. canadensis* nova are equally in growth. In fact, to furnish a screen of trees as quickly possible there is nothing to equal this last section of *Populus*. The common False Acacia, (*Robinia Pseudacacia*), grows quickly when young, and affords a pleasing variety of the others.

Profitable hedges (E. RICHES).—Where hedges are simply required as wind-breaks in plantations of trees there are many kinds which can be utilised in this way, but with due care can be made to yield crops of saleable value. Filberts, for instance, afford good protection, and when established will often produce valuable supplies of nuts. The best I have tried for the purpose are *Conford*, the *Frizzled Filbert*, the *Lambert Filbert*, and *Pearson's Delia*, all of which are abundant croppers and of suitable vigorous habit. They must, however, be pruned systematically, as they are not adapted for the ordinary method of hedge trimming, and the chief difficulty is to keep them sufficiently dense to serve as adequate wind-breaks and procure fair crops of nuts, for the two conditions are rather opposed. Damsons form useful hedges, especially the *Prunella* or *Shropshire Damson*, which is rather more compact in growth than *Crittenden's* (or *Farleigh*). *Bradley's King* of the Damsons is also adapted for the same purpose. They also are preferably pruned than trimmed with a hedge-saw. By far the best cropping tree for hedges is *River's Early Prolific Plum*, but it needs much attention to keep it dense and compact to the base. Other Plums that can be planted in the same way are *The Carr*, *Diamond*, and the *Kentish bush Plum*. I have not found Cherries so satisfactory for hedges as either Plums or Nuts, but the *Wye Morelle* can be formed into a neat but not very dense hedge. Some varieties of Apples are adapted for the same use, the best I have tested being *Tom Putt*, *Belle Dubois*, *Early Rivers*, *Lord Grosvenor*, and *Gold Medal*. Of *Pears*, *Beurre Hardy*, *Vicar of Winkfield*, and *Vermilion* can also be utilised. The best plan is to start all these as maiden trees in well-drained and fertile soil, which should, if necessary, be enriched with liberal dressings of old manure. The first season after planting they must be cut down low enough to induce the basal buds to start, so that the plants may be well furnished from the bottom. Two feet to 3 feet apart will suffice for the Plums and Damsons; the Nuts, Cherries, Apples, and Pears may be allowed more space, according to the strength of the varieties. It must be remembered in subsequent treatment that the trees grown under such crowded arrangements will need liberal supplies of manure, also that the ground on each side should be kept clean and cultivated to quite 3 feet from the stems.—R. L. C.

GARDENING APPOINTMENT.

MR. W. A. COOK, formerly of Compton Bassett, has been appointed head gardener to Colonel Simpson, Shirley House, Shirley, Croydon, and enters on his duties on October 1.

* * * The Yearly Subscription to THE GARDEN is: *Island*, 15s.; *Foreign*, 17s. 6d.

THE GARDEN

No. 1663.—VOL. LXIV.]

[OCTOBER 3, 1903.]

FRUIT AND VEGETABLE SHOW AND CONFERENCE.

ON another page we have given as full a report as possible of the fruit and vegetable show which was held during the present week in the Chiswick garden of the Royal Horticultural Society.

The show was a surprise and a delight. I anticipated in this year of fruit plenty a miserable and uninteresting display, but quite the reverse happened, thanks to the skill of the British gardener and imposing exhibits from the leading fruit nurserymen. The largeinery was crowded with exhibits—most uncomfortably so, and several tents were filled with produce that for quality has been rarely surpassed.

In the afternoon a conference was held under the chairmanship of Mr. George Bunyard, at which much information was forthcoming on various aspects of vegetable culture, and immediately before, the committees of the society, at the invitation of the council, met together for the last time at Chiswick. It was a parting with the historical garden which has been the scene of many memorable gatherings, and Sir Thomas Hanbury, the owner of the late Mr. Wilson's garden at Wisley, the recipient of the Victoria Medal of Honour, as some recognition of so interesting a gift. Sir Trevor Lawrence gave a brief sketch of the history of the Chiswick Garden, alluding to the great work of the society in its early days, to the Hall approaching completion, and to the new home at Wisley, where the practical work of the society will be continued under better conditions than exist in a London suburb.

Mr. Bateson, F.R.S., congratulated the Fellows on acquiring the garden at Wisley through Sir Thomas Hanbury, and hoped the scientific and experimental aspects of horticulture would not be lost sight of, and with his remarks we heartily concur.

Before the large gathering of horticulturists dispersed Sir Trevor Lawrence presented Mr. Thomas Humphreys, assistant superintendent of the Chiswick Garden and secretary to the Floral Committee, with many gifts, including an illuminated address, as an expression of hearty goodwill from the Floral and Fruit Committees, on his appointment as curator to the Birmingham Botanic Gardens. Mr. Humphreys received many tokens of the esteem in which he is held by all who have

been brought into contact with him in his official duties.

Thus ended an interesting and a never-to-be-forgotten day. It was a fitting close to the history of the Chiswick Garden, which is, in a degree, the history of horticulture in Great Britain. Another page in the society's history is to be opened, and we hope that a great practical and experimental work will begin in that beautiful Surrey retreat which we knew so well as the private garden of one of the strongest supporters of the Royal Horticultural Society in the old days, the late Mr. G. F. Wilson.

A GREAT GARDENERS' DINNER.

THIRTY-SIX years ago a great gathering of gardeners was held in London. It occurred to Mr. A. Dean that a repetition of that dinner would be acceptable to the present generation, and the result at the Holborn Restaurant on Tuesday last was a complete success. The chair, in the regrettable absence through illness of Mr. Leopold de Rothschild, who had kindly consented to preside, was taken by Viscount Duncannon, who was supported by Sir Trevor Lawrence, Bart., and a host of men familiar in the horticultural world, besides, of course, gardeners from all parts of the United Kingdom. There were about twenty speeches, some audible and some otherwise, but in spite of this and a sweltering heat the proceedings were marked by an enthusiasm that astonished those to whom public dinners have little charm. The toast list contained the names of some of the best known of English gardeners, whose exhibits at Chiswick showed their practical skill in the cultivation of fruit and vegetables, and the speeches were marked by a delightful freshness, and in a few instances real eloquence.

The Rev. W. Wilks made a strong appeal to complete the Hall and equip the garden of the Royal Horticultural Society, and Sir Trevor Lawrence received a warm welcome. It was an evening of speeches, which another year, if such an event as that of Tuesday evening is repeated, must be severely reduced. The committee, whose portraits we published last week in a special supplement, have worked hard to bring to a successful issue this gathering together of gardeners to meet old friends and make fresh acquaintances. Mr. Owen Thomas was chairman of the committee and Mr. A. Dean the hon. secretary.

It was, we repeat, a great gathering of gardeners, and taking into consideration the immense attendance in one room, the King's Hall of the Holborn Restaurant, the proceedings passed off pleasantly, and are not likely to be forgotten by those gardeners who were

able to be present. A report will be found on another page.

The Dean of Rochester, whose affection for gardeners and gardening has continued through a long and interesting life, was through illness unable to attend, but he sent a letter to the secretary, which was read at the dinner. We make the following extract:

"I have been anticipating long and anxiously a meeting with a representative body of those men among whom I have found the most genial friendship and happiest enjoyment of my life. Will you tell them that with an old man's blessing and from a brother's heart I pray they may ever cherish and communicate to others that love for a garden which brings health to the body, peace to the mind, and thankful worship to the soul. May the words spoken by my beloved friend, Thomas Rivers of Sawbridgeworth, be as true to them as they have been to me: 'Your delight in the flowers will never leave you.'"

Mr. Leopold de Rothschild wrote a long letter regretting his enforced absence. We take the following words from his communication:

"I cannot refrain from expressing the sympathy I have for your craft. This great gathering of men following the same occupation, coming from all parts of the United Kingdom to meet in friendly intercourse, is a testimony to the value of the early friendships began in the bothy and continued through life. I have noticed how anxious every gardener is that the man whom he has taught should succeed well in life, and how, when he has succeeded, he comes back with feelings of affection and regard to the place where he first received garden education; and then there is that pleasing interchange of knowledge and of new specimens, all of which proves that there is no petty jealousy in men of your occupation. This may be due partly to your studious habits and to your interest in the world of science, but I am inclined to think that it is chiefly due to the softening influence of Nature which brings harmony into your lives as it brings harmony into the gardens that you tend."

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

ERYNGIUM AMETHYSTINUM.

ENCLOSED are two or three stalks of *E. amethystinum*. The colour of the heads is not so deep

and rich as it would have been if the season had been more sunny. It ought to be the rich dark blue of burnished steel. To those who like plants under their true name it is provoking to find how many mongrel Sea Hollies are sold in nurseries as *E. amethystinum*. My experience is that five out of six are wrongly named. The most common substitute is *E. oliverianum*, itself a garden hybrid, according to E. Boissier, though of uncertain parentage. This hybrid occasionally makes a few fertile seeds, which vary from the parent and get different unauthorised names in nurseries; often a Latinised nurseryman's name tacked on to *E. amethystinum*. I wish gardening journals would express disapproval of this reckless naming. I have appealed to some nurserymen in vain, as they often tell me that the name they give was "approved at Kew."—C. WOLLEY DOD, *Edge Hall, Mulpas*.

ASTER WINNIE WEAVER.

The enclosed spray of white seedling Aster may interest you. A small piece like this gives, of course, no idea of its appearance in the garden. As a matter of fact, I find it to be the best looking garden plant of all the white Asters I have tried, except such as *Vimineus*, which is so much later. This seedling I have had for about four years. It grows 3 feet high and no more, consequently is manageable without staking. One thing about it that I like is that the centres do not turn black as so many whites do. This blackness spoils the appearance of the bush—at any rate to my fancy. I call this Aster Winnie Weaver.—T. J. WEAVER.

A beautiful flower, white, except for a faint blush tinge, with rich yellow centre. The blooms are large and very freely produced.

THE WILD HOLLYHOCK.

I do not know whether wild Hollyhocks are common. If not you may perhaps be interested in seeing the enclosed, which I have cut from a plant brought from Syria two years and a half ago. I dug it up in the fields not far from Beirut, and it has flourished even in our northern climate. It was in a pan in the open for the first winter, and then in a border. I have now moved it to the wild garden, where its graceful spikes, about 5 feet long, are beautiful and interesting. My Hollyhock was in flower in April in its native haunts. It flowers in the autumn here.—(Mrs.) E. B. BACKHOUSE, *Hurworth Grange, Croft, Darlington*.

HYDRANGEA PANICULATA.

I am sending you a few blooms of *Hydrangea paniculata*, which is making a very fine show at the present time. Many of the individual plants are carrying from nine to twelve blooms. The panicles incline away from the stem, giving the plants a more graceful appearance.—C. J. ELLIS, *The Warren House Gardens, Stanmore, Middlesex*.

The panicles of bloom were very fine, and showed well the value of this plant for early autumn.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

October 6.—National Chrysanthemum Society's Exhibition (three days).

October 13.—Royal Horticultural Society's Drill Hall Meeting; Horticultural Club, Hotel Windsor, lantern lecture by Mr. Charles E. Pearson on "Bird-nesting in Southern Lapland."

October 14.—East Anglian Horticultural Club Meeting.

October 27.—Royal Horticultural Society's Drill Hall Meeting.

November 11 and 12.—The Liverpool Horticultural Association's Chrysanthemum and Fruit Show.

Argemone grandiflora.—In THE GARDEN of September 12 *Argemone grandiflora* is mentioned as rarely grown. Some of your readers may be interested to hear I grew it in the North Island of New Zealand from seed sown in the open ground.—(Mrs.) F. G. SHIELDS.

Pompon Chrysanthemum Mme. Ed. Lefort.—This is a plant of Continental origin as its name suggests, and is one of the best early-flowering Pompons that the French raisers have ever sent to us. I have never known the plant to fail in any respect; in fact, it may be regarded as one of the most consistent sorts in cultivation. Tried in several positions and in a variety of soils the plant does well, and rewards the grower with a very free and beautiful display of blossom during September and October. The plant should not be disabused, in which case its blossoms, with fimbriated florets, are developed in handsome sprays, the whole plant making a compact mass of flowers. The colour may be described as orange-yellow, tinted and suffused a shade of crimson-red—really an attractive flower. Habit dwarf and sturdy, and constitution robust. Height slightly under 2½ feet.

Pompon Chrysanthemum Anastasio.—This is a very beautiful early-flowering Pompon that has stood the test of time remarkably well. The plant was raised by the late Mr. A. Salter, who also gave us Early Blush and Mrs. Cullingford, the latter being one of the best early October flowering sorts at present in commerce. The variety under notice is a plant of very dwarf habit, its growths being bushy and sturdy, and its constitution most robust. There is no other Pompon sort of a similar colour, soft violet-purple tipped with gold accurately describing the flowers. Their form is perfect, and each blossom is born on a sturdy footstalk, and when the plant is at its best it represents a compact mass of flowers.—D. B. C.

Lonicera chinensis.—Never have I seen this charming Honeysuckle flowering so freely or its fragrance so pronounced as I recently saw it in Lord Battersea's garden at Overstrand. Growing over a stump of a tree in the most luxuriant fashion it was, indeed, a plant to make use of for September. This Japanese Honeysuckle at times goes under the name of *japonica* as well as *chinensis*. In any case its merits well deserve notice, and being practically evergreen it is all the more desirable.—E. M.

Allamanda violacea.—On a recent visit to Kew I was particularly struck with a fine form of this *Allamanda*, which was and had been for some time flowering in the T range there. While all the other members of the genus bear flowers of some shade of yellow, in this they are of a rosy purple hue. It is a native of Brazil, was introduced many years ago, and subsequently lost till reintroduced to Kew through the Botanic Garden, Durban, in 1888. I well remember the first flowers that opened in the autumn of 1889, and the attention they then attracted. While many of the garden varieties of *Allamanda* have afforded ample ground for controversy as to their distinctness or otherwise from each other, there is nothing of the kind about *A. violacea*, for with no other member of the genus can it in any way be confounded, suggesting, as it does at first sight, a *Dipladenia* rather than an *Allamanda*.—H. P.

Arbigland Gardens, Dumfries.—The fine gardens of Arbigland, the property of Colonel C. E. Blackett, are, through the kindness of the proprietor, opened to the public on two Sundays in autumn, when the garden is at its best. This year the number of visitors who took advantage of the privilege was larger than ever before, and it is gratifying to learn that they conducted themselves admirably. The privilege is highly appreciated, and those who visited the gardens were much pleased with the display of flowers and plants.

Rose Pauline Bersez.—It appears to me that this pretty novelty is nearer the Teas than the Hybrid Teas, as the flowers are smaller and the clusters much resemble those of Tea Roses. The colour, too, is so delicately Tea-like in its tint, creamy white, shaded daffodil-yellow. The variety

is very free-flowering, of good, vigorous growth, and it is certainly a novelty worth planting.

Craigielands Estate Cottage Gardens.—Following her laudable practice for several years, Mrs. Smith, of Craigielands, Moffat, again offered prizes for the best kept cottage gardens in the village and estate of Craigielands, Moffat, N.B. Although the season has been a most unfavourable one in the Moffat district, where there has been a very heavy rainfall, the gardens inspected by the judges were, as a whole, highly creditable to the cottagers. The first prize was awarded to Mr. Archibald Steel with an admirably cultivated garden, the other winners being: Second, Mr. Thos. Rankin; third, Mr. F. Johnston; fourth, Mr. Wm. Watson. Mrs. Smith's kindness in giving these prizes has done much to foster gardening in the neighbourhood.

Dundee gardening societies' meetings.—Two Dundee horticultural associations have had very satisfactory annual meetings recently, and their prospects for the coming year are very promising. On the 21st ult. the Lochs Horticultural Society held its meeting in the Union Hall, Dundee, when the treasurer and secretary submitted reports which were considered of a satisfactory character. The attendance of members was large, and augurs well for the future work of the society. Mr. Alexander Jolly was appointed president, Mr. William Robertson secretary, and Mr. Charles Robertson treasurer. On the 21st ult. the Clepington Working Men's Gardens Association, a flourishing organisation which has been in operation for more than twenty years, had its annual meeting in Dundonald Street Hall. Although the annual report showed a small decrease in the funds, it was considered gratifying, seeing that there had been a considerable amount expended on improvements on the gardens. The following office-bearers were appointed: Mr. John Chaplin chairman, Mr. A. H. Rea secretary, and Mr. William Gall, treasurer.

Lotus jacobaeus.—Years ago this was a rather popular plant for greenhouse decoration, but nowadays it is very seldom seen, though it is decidedly pretty and quite distinct from any other occupant of that structure. It forms a much branched but slender growing plant, with light compound, hoary leaves and a profusion of fish-shaped blossoms of a deep purple colour—in fact, almost black. These flowers are borne in clusters towards the points of the shoots. Seeds are readily obtainable, and if sown early in the spring they will yield plants that flower well in the summer and early autumn months, either planted out in a warm border or grown in pots in the greenhouse. When plants are raised from seeds the progeny shows a certain amount of variation, some being a good deal superior to others. In the best forms the flowers are of a rich velvety hue, but in others they are tinged with green, and much less effective. Cuttings are not at all difficult to strike, and this is the method sometimes employed for the increase of the deepest coloured kinds. Spring is the best season for taking the cuttings. This *Lotus* is a native of the Cape de Verde Islands, and has been long known. A second species from Teneriffe is *Lotus peliorhynchus*, whose long, trailing shoots are furnished with scarlet flowers, somewhat suggesting a small bloom of *Clianthus puniceus*. This last-named *Lotus* forms a handsome basket plant for the greenhouse.—T.

Two beautiful Clematises.—One is *Fairy Queen*, with large, well-formed blooms of a lovely pale flesh colour, with pink bars. As this variety partakes a good deal of the patens character, it should be remembered that the flowers are borne on the ripened wood of the previous year, and therefore only the exhausted wood of the previous year should be cut away at the time of pruning in autumn and winter. A red *Clematis* (Jackmanni) is being distributed for the first time by a French firm, and it is said to be a sport from the well-known C. Jackmanni, the flowers being of "a beautiful deep velvet red colour." This will be looked forward to with some interest, though in all probability blue of some shade, whether delicate or deep, will always be the favourite colour in the *Clematis*.—R. DEAN.

A new Carnation.—Messrs. William Watson and Sons, Clontarf Nurseries, Dublin, write: "We note in your report of the Dublin show (page 192) the desire is expressed to know the name of a new seedling Carnation exhibited by us. This is Mrs. Lora Armstrong, which was recommended the certificate of the Royal Horticultural Society of Ireland at that show by the judges. The prize list is slightly misreported. In the class for twenty-four Cactus Dahlias we won the first prize and the gold medal of the society."

Valeriana arizonica.—The heavy rainfall of the past summer appears to have suited the comparatively new *Valeriana arizonica* well, as it is now in bloom for the second time this season. Although not one of the choicest of plants for the front of the border or for the rockery it is pleasing with its pink flowers and its neater habit than that of some of the other *Valeriana*s.

Hellanthus tomentosus.—This fine Sunflower is doing well this season, although it came into bloom later even than last year. It is not appreciated by some, it would appear, but I imagine that they had formed exaggerated ideas of the size of its flowers. Somehow a good many people appear to base their standard of size as regards the Sunflowers upon the huge blooms of some of the annual species, while they despise the smaller but more useful and ornamental flowers of the perennial species. *H. tomentosus* is very fine just now with its rich yellow flowers and its hoary foliage. Associated with some of the perennial *Asters* it is exceedingly ornamental in a border here.—S. ARNOTT, *Carsethorn, by Dumfries, N.B.*

A new Crab Apple (The Langley).—This forms a useful and beautiful ornamental tree; the fruits, though not large, are pleasantly flavoured, and being abundantly produced they are most valuable for decoration. This new Crab originated at Messrs. Veitch's Langley Nursery. It bears grandly, and the fruits remain on the trees till quite late in the year (November), thus making it useful for the shrubbery. In the spring it is very beautiful when in blossom. The bright yellow fruit, as regards their flavour, resemble Apple King of the Pippins. This variety was one of the parents, the other being the well-known ornamental Crab John Downie. The fruits make a delicious preserve, and by many would be liked in a raw state. I have referred to its free bearing; the smallest shoots are studded with fruit, and the trees grow well in poor land; indeed, the Crabs—especially the best sorts—could with advantage be more largely planted for effect.—G. WYTHES.

Irish-grown Peas.—What your correspondent C. H. Howes tells us about the growth of Peas in Ireland naturally leads to the assumption that it must be a sort of Pea Paradise. When he tells us that Gladstone Pea, seldom here exceeding 4 feet in height, grows to such height as from 5 feet 6 inches to 7 feet, it is evident that the climate must suit it admirably. I have wondered whether it may not be possible for Ireland to grow first-class late Peas and send them over here for the English market and find it to be profitable. Our market Pea season is, as a rule, a short one, rarely exceeding from five to six weeks. By September we have begun to tire a little of Kidney Beans, good as they are, and should gladly welcome good Peas then for a change. Besides Gladstone and Autocrat, Sutton's Exhibition Marrow, Sharpe's Queen, Late Queen, and Michaelmas are all good late varieties. But in Ireland, for the purpose named, it may be wisest to sow mid-season varieties, or else to sow these late varieties early in May.—A. D.

Malvastrum munroanum (syn. Sphaeralcea munroana).—This Mallow is apparently even less known than the subject of the preceding note, for no allusion to it is to be found under either name in the last fifty volumes of THE GARDEN. In deep soil its reddish pink flowers, which are smaller than those of *M. lateritia*, are scarcely produced in sufficient quantity to be effective; but in shallow, stony ground it blooms far more freely. It is a rampant grower, except in very poor soil, and quickly

covers all small neighbours with its spreading shoots. A small plant that I put in one spring measured 4 feet each way in the following October. It was introduced from Columbia in 1828, and is said by Nicholson to be hardy. It is as easily raised by cuttings as *M. lateritia*, and passes through the winters in the south-west without the slightest protection. It blooms throughout the entire summer and autumn, and its somewhat downy leaves, which are smaller and much more deeply cut than those of *M. lateritia*, are gracefully formed. Both these plants should have the sunniest spots available in order to induce them to flower freely, and rich soil should be avoided.

Bulbs remaining dormant.—Most of those who have grown Lilies at all extensively must have remarked that occasionally a bulb has remained dormant for an entire year, and the following season has made good growth. I have experienced this in the case of Lilies, but cannot remember to have noticed it with other bulbs until lately, when three instances occurred in my garden. Two years ago I procured a bulb of *Pancratium illyricum* and planted it in light soil in front of a south wall. Not a particle of growth appeared during the whole summer, and I concluded that it was dead. After it had been in the ground for a whole year I determined to see what had happened to it, and on making a search discovered it plump and apparently healthy, but with no sign of roots or top growth. I then potted it in light soil and placed the pot in a frame, covering it with 6 inches of Coconut fibre. Here the bulb remained for six months in precisely the same condition. I then placed it in gentle heat, but for two months no change was apparent. Then it commenced to make root growth, which has continued for the last ten weeks, but no sign of top growth has yet appeared. Thus it has remained without a vestige of foliage for practically two years, yet the bulb appears plump and healthy. Last October I planted some bulbs of *Ornithogalum arabicum*. This year they have shown no sign of growth above ground, and recently, on uncovering them, I found that they were hard and apparently sound, and had put forth a few roots which were from half an inch to 1 inch in length. The third case is somewhat dissimilar, the bulb or tuber being in this instance that of *Tropaeolum pentaphyllum*. This I received from Mr. Archer-Hind late in 1901 and immediately planted. In January, 1902, it commenced to show growths, and although many were badly cut by the frost, it continued to throw up more through the spring, reached a height of over 6 feet during the summer and autumn, and continued flowering until December. This year no sign of growth had shown at midsummer, but on uncovering the tuber I found it perfectly sound. Curiously enough, a tuber given by Mr. Archer-Hind at the same time to a friend resident about 15 miles from here behaved in a precisely similar manner. It made growth early in 1902, and continued in flower until nearly the end of the year, but up till August this season had remained dormant. I am not aware of its behaviour since then, but about the third week in August my tuber commenced to make growths, the longest of which is now 15 inches in length. What the reason is for the bulbs of the *Pancratium* and *Ornithogalum* having remained dormant so long and for the tuber of the *Tropaeolum* having passed through the spring and summer without showing visible signs of growth I am at a loss to conjecture.—S. W. FITZHERBERT, *Kingwear, South Devon*.

Lettuce at the Drill Hall.—The magnificent collection of Lettuces staged by Messrs. Dickson and Robinson, of the Royal Seed Warehouse, Old Mill Gate, Manchester, on the 15th ult. was certainly one of the features of the exhibition, for not only was there a considerable number of distinct varieties, but all were in the pink of condition and splendidly staged. I was informed that the specimens were not specially grown for exhibition, but were simply taken from their trial rows—sown on May 31. Though, of course, in such a large number, many bearing different names, much resembled each other, nevertheless a great many were thoroughly distinct, especially the

Cabbage varieties. The highest award—a gold medal—was unanimously recommended by the committee, and, though this may seem somewhat extravagant to those who did not see them, the exhibit was fully worthy of it, and Messrs. Dickson and Robinson are to be congratulated on making what I fully believe to be the finest exhibit of Lettuce ever seen in London. How interesting if these could have been kept back and shown at the Chiswick show! I append a complete list of the varieties staged. *Cabbage varieties (New)*: Lord Kitchener (fine), Staghorn (very distinct), Distinction (extra good), and Verdant Green. *American Gathering*, Large Yellow Stubbhorn Head, Standwell, Queen of Lettuce (good), Large Brown Stubbhorn Head, All the Year Round, Immensity (very large), Perpignan Improved, Erfurt Thickhead, Ideal, Early Ohio, Duke of Cornwall, Heartwell, Iceberg, Paragon, Giant, Golden Spotted, Favorite, Emperor William, Wonderful, Unrivalled, Neapolitan, Buttercup (very effective), Exquisite, Commodore Nutt, Matador, Supreme, Magnet, Marvel, Perpetual Cabbage, Bismarck, Sugar or Swede, Rudolph's Favourite, Continuity, Fearnought, Marvel of Cazard, Bossin's Giant, Philadelphia, Dutch Butter, Satisfaction, Golden Head, Brown Dutch, Epicure, Giant Summer, Drumhead, Australian Yellow Curled, Firatling, Great Heart, and Red Besson. *Cos varieties (New)*: Giant Market, Little Gem, and Champion White; Prince of Wales, Par Excellence, Dwarf Perfection, Hicks' Hardy White, Express, Bath Cos, Asparagus Lettuce, *Lactuca angustana*, Balloon or Mammoth, Ivory's Nonsuch, Trianon Early White, White Heart, Baldwin's Cos, and Paris Green.—E. BECKETT.

A grass for shaded situations.—*Festuca rubra* (the Red Fescue) is recommended in Bulletin 22 of the New England Association of Park Superintendents as a very good grass for shaded positions, doing well in dry, sandy, and sterile land. Of course, it will suffer and disappear if tramped over continually by great masses of people. The Government astrologist recommends the variously leaved Fescue (*Festuca heterophylla*) for use in densely shaded situations. Often, too, Kentucky blue grass can be used to good advantage if care is taken to keep the land from becoming sour and sodden. This can be done by using care in watering and by occasional applications of lime, with surface cultivation of the soil by means of an iron-toothed rake or similar instrument.

Rose Amateur Teyssier (new H.T.).—I enclose some blooms of Rose Amateur Teyssier (H.T.) which have been cut from two standards in my garden, and which I think you may like to see, as the Rose appears to be little known. One standard was planted in the autumn of 1901, the other last autumn, and both have made good growths and fine heads. The production of blooms on each standard is remarkable, and the recent rains and wind have had little effect on them.—H. J. STOBART, *The Church House, Belbroughton, Stourbridge*. [The blooms received are of lovely form, slightly scented, white, suffused with cream, especially in the centre.—ED.]

The single Hollyhock.—I notice that some of your correspondents look upon the single Hollyhocks as useless and weedy subjects, unworthy of a place as border plants. But it is unnecessary and even unnatural that every lover of flowers should be so conservative as to admire only what might be termed florist's flowers. Freedom of choice and variety are points of particular interest in beautifying gardens of any considerable extent, and hence the impartiality of Nature in providing objects of interest to uncultivated tastes. To make an extensive use of the double Hollyhock upon its Hop-pole habit of growth, studded with it may be pretty, yet formal rosette-like flowers devoid of the natural elegance of the single and semi-double ones, when seen in great variety and well selected colours, would be deplorable. Since reading your correspondents' remarks upon this subject I have carefully examined numerous plants of the single and semi-double varieties, which have been blooming in great profusion considerably over two months, and find from twelve to twenty growths upon each

plant, from 12 feet to 14 feet in length, averaging from thirty to fifty fully-expanded flowers upon each individual growth, and the full height of the plants, and this too after the severe gales and heavy rains experienced. Near these giants of the garden may be seen *Lavateras*, growing and blooming in great profusion and beauty, but in comparison like the garland Oak and the pigmy in a 10-inch pot. My experience is that single *Hollyhocks* are much less subject to disease than are the double varieties.—W. FRYE, *Lockinge*.

Notes from Baden-Baden.—Among *Solidagos*, *S. spectabilis* is very free and pretty. It does not become more than 2½ feet to 3 feet high, and the flower-bunches form regular pyramids, which are very showy and striking. *Scabiosa japonica* well deserves a place in the flower garden. It is a hardy perennial, has pretty deeply-cut foliage, and bears now a multitude of mauve-coloured flowers. *Patrinia scabiosifolia* deserves recommendation; it reaches a height of 3 feet, and has very showy, handsome, bright yellow umbels of a peculiar arrangement which permits a very long succession of blooms. *Clematis tangutica* shows quantities of its deep yellow flowers, and may perhaps be very useful for hybridising.—MAX LEICHTLIN, *Baden-Baden*.

Bulbous plants from seed.—In the leading article in *THE GARDEN* for September 19 mention is made of the ease with which the charming little *Cyrtanthus Mackenii* can be raised from seeds, a remark which applies with equal force to the other two species therein mentioned. A feature that causes these small growing *Cyrtanthi* to stand out markedly from many other bulbous plants is that they will flower in about eighteen months from seed, that is, if it is sown as soon as ripe. Of the bright flowered ones there is a good deal of difference in the depth of colouring between the flowers that open in the winter and in the summer, those of the last-named season being much brighter in tint. Early in life as these *Cyrtanthi* flower they are in this respect eclipsed by another pretty little bulb mentioned in the before-named article, namely, *Anomatheca oruenta*. Having some pans of this the seed ripened and was then scattered about on the soil of the neighbouring plants, with the result that in the following summer young flowering examples cropped up in all directions, in some instances even underneath the stage. Of *Zephyranthes carinata* (which, like the writer, I have found to flower at different seasons of the year), the finest bulbs that have ever come under my notice were sold in one of the London auction rooms some five or six years ago. They were said to have been grown in Bermuda, but probably the price realised, which was very little (though I cannot say the exact amount), did not encourage their continued culture.—H. P.

Maize as an autumn vegetable.—The Maize or Sugar Corn is not a favourite in this country, though it can be grown readily enough and gives variety. My note more concerns the value of Maize as an autumn vegetable, and I notice that the plants this season have made a splendid growth, finer than usual. Doubtless the heavy rains have suited it, though it requires warmth to mature the cobs. I recently saw a fair quantity of cobs for sale in the market and greengrocers' windows, doubtless imported produce, though I have seen quite as good growths at home, even when the plant is only grown for ornament. Given room and a rich root-run it soon makes a grand growth. A few seasons ago I had a dozen distinct varieties sent from America. Some were much earlier and dwarfer than others. They differ greatly as regards size, colour, and flavour. Some of the dwarf ones, even when sown in the open, finish well in the early autumn, but, of course, much depends upon the season. The year I grew the varieties named was hot and most favourable. The plants were in trenches, which were flooded weekly. Many are grown in the States, where the Green Cob is a favourite. They are cooked and served in a variety of ways, but the simplest way is to cook like Asparagus and serve hot. The best plan is to sow in small pots in frames and plant out, but care is necessary that the young seedlings do not get pot-bound in their early stages of growth. In a

warm soil they do well sown late in April or early in May in deep drills or shallow trenches 3 feet apart and thinned to 18 inches between the plants. Why I advise drills or trenches is because more food and moisture can be given the plants during growth. They are rapid growers, and require a rich root-run and ample moisture. The first cobs will be ready in September, and the plants will grow till cut down by frost. An open quarter and deeply-dug soil suit them well. Large growers may with advantage have more space than advised above; 4 feet is not too much, and 3 feet between the plants. They will repay a mulch of rich manure when the plants form their cobs.—G. WYTHES.

The Florists' and Gardeners' Society of Rome have recently issued a schedule of prizes to be offered at their forthcoming autumn exhibition. This exhibition will be held in the Palace of the Fine Arts, and will be devoted to *Chrysanthemums*, foliage plants for decoration of apartments, &c. The prize list is a comprehensive one, and includes five principal divisions. In the first division are forty seven classes for *Chrysanthemums*, both plants in pots and cut flowers. Provision is made for novelties, for varieties of Italian origin, for general collections, for large blooms, and others. The second division is for ornamental foliage plants, of which there are twenty-five classes. In the other divisions various autumn flowers are provided for, plans of gardens and artistic objects relating to the garden having special attention. The prizes offered consist of diplomas of honour, silver-gilt, silver, and bronze medals, and honourable mentions. The secretary is Signor C. Pasquini.

Horticultural Directory.—The editor would remind nurserymen, seedmen, and more particularly head gardeners, that additions and corrections for the 1904 edition of the "Horticultural Directory" must be received at the office, 12, Mitre Court Chambers, Fleet Street, London, not later than the 5th inst. to ensure insertion.

THE ROSE GARDEN.

EXHIBITION ROSES FOR BEGINNERS.

NURSERYMEN will soon issue their new catalogues, and their advent is doubtless being looked forward to by some of your Rose-loving readers who intend next year to blossom out as "new exhibitors." The difficulty one finds in looking through the catalogues is the number of varieties marked "S" (show), and when we come to compare the names of those we have taken a fancy to at some exhibition, the matter of selecting the best growers becomes difficult—at least I found it so when I first started Rose culture. I carefully selected all the varieties marked "S," and thought I was sure to stand a good chance at our local show. I did get a third prize (there were only two other exhibitors). The next autumn my 130 varieties were weeded down to about thirty, and the number of plants increased to six of each sort. I would certainly advise the beginner to start with not more than 200 plants, and join the National Rose Society. The subscription is only 10s. 6d. per annum, and one has only to send his subscription, name, and address to the honorary secretary, Mr. E. Mawley, Rosebank, Berkhamsted, who will be pleased to enrol and forward him the society's interesting and instructive publications, written by some of our greatest rosarians.

Of course a very great deal depends on the soil and situation of the beds as to which are the best varieties to grow. My garden here is situated on the top of a ridge, and is simply swept by the north-east wind; yet both the

Teas and the Hybrid Perpetuals do remarkably well, and as the soil in one part of the garden is a clayey loam, which the H.P.'s seem to revel in, the other part is a sandy loam, which suits the Teas admirably. I am fortunate in that respect, but all soils are not alike, and what are not suitable for the purpose required must be made, or failure is certain, and the National Rose Society's pamphlet will tell how to set about matters. It is a mistake to grow a large number of varieties, or attempt to do too much with a few. The 200 trees which I would start with are as follow:—

HYBRID PERPETUALS.

Mrs. John Laing, 10; Ulrich Brunner, 10; Frau Karl Druschki, 10; Her Majesty, 10; Mrs. Sharman Crawford, 10; Prince Arthur, 10; Captain Hayward, 5; Charles Lefebvre, 5; Robert Scott, 5; Susanne Marie Rodocanachi, 4; and A. K. Williams, 3.

HYBRID TEAS.

Bessie Brown, 10; Caroline Testout, 10; Mrs. W. J. Grant, 10; Marquise Litta, 4; Kaiserin Augusta Victoria, 5; Gladys Harkness, 5; and La France, 5.

TEAS.

Maman Cochet, 12; White Maman Cochet, 12; Mrs. Mawley, 12; Souv. de S. A. Prince, 10; Mme. Hoste, 10; Bridesmaid, 6; and Innocente Pirola, 6.

I have left out of the foregoing list such varieties as Gustave Piganeau, Horace Vernet, Marie Beaumann, and Ulster—they only succeed well when grown as maidens—and Catherine Mermet, Mme. Cusin, and Comtesse de Nadailiac from the Teas, as I find them very difficult to grow. The Teas should all be half-standards about 2 feet high. Obtain your plants from a good firm, and order early. Stipulate that they are to be worked on Briar stocks. Follow the directions given in the National Rose Society's pamphlet, "Hints on Planting Roses," as to the planting, and exhibit next July at the Temple Rose show.

Enfield.

COURTENAY PAGE

SEASONABLE WORK.

No time should now be lost in getting planted a quantity of

ROSE CUTTINGS.

Only those who have watched the development of own-root plants know how excellently they acquire themselves after the second or third year, and they quickly overtake plants of the same varieties budded on the Manetti stock. I should not advise anyone to put in cuttings of all varieties. At this season of the year it is best to confine one's efforts to the Hybrid Perpetuals and some of the Hybrid Teas, especially those of the La France race. Of course, all the Ramblers, Ayrshires, and Penzance Briars strike like Willows, and they come in very useful for various purposes. The kitchen or nursery garden is the best place to form a bed for Rose cuttings. I prefer to employ a piece of land that has been dug some few weeks and that is in fairly good condition. Rather than apply fresh manure it is better to omit altogether. Level the ground, then mark out beds about 4 feet wide. Cut down narrow trenches about 8 inches to 10 inches deep, and in the bottom put 1 inch to 2 inches of sharp sand or road grit. The cuttings should be planted as soon as a few dozen are made. Select firm well-ripened wood of the current season's growth, and, if possible, with a heel. Make the cuttings from 6 inches to 10 inches long. Do not take out the eyes as one would if Manetti or Briar cuttings were being made. If the foliage seems very persistent allow it to remain near the top of the cutting. Now set the

cuttings against the wall of earth, and, of course, the heel resting on the sand, then fill up with the soil removed. The cutting should be buried a little more than three-quarters of its length. If left out of the ground more than this the sharp frosts of winter will force them out of the ground several inches. Even as it is the cuttings will be lifted, so that it becomes necessary to watch them and push them down into the sand when frost has gone. As each row is planted it should be well watered, and the next row commenced about 8 inches or 9 inches apart. Fully 90 per cent. of these cuttings should root and be ready for transplanting in April, 1905.

CLIMBING ROSES ON PERGOLAS.

Pillars and walls should now be overhauled and any worn out wood removed. Lay in the new shoots so that they are not crowded. The air and light they receive from now till November will assist much to mature the wood, a condition that is most essential to good displays of blossom. There are this season numbers of soft growth which will be a trouble to the grower another year. If the points of such are now pinched out it will help matters considerably.

POT ROSES

for spring flowering should now be repotted. Do not give too great a shift. I believe in well overhauling the soil with a pointed stick. This work should be done carefully, as it is of the utmost importance to preserve all the roots possible. A few oyster shells broken up fine and mixed with the crocks are appreciated by the fine rootlets. The compost should consist of two parts good turf, loam, one part spent hot-bed manure, a small quantity of burnt garden refuse, say two or three shovelfuls to a barrowful of soil, and about a pint and a-half of bone-meal to each two bushels of compost, all thoroughly incorporated. A sufficient quantity of compost should be kept to top-dress any plants required to bloom earlier, and also for potting up, in November, standards, half-standards, Ramblers, and other Roses which come in so useful for conservatory decoration, and for special employment in the flower garden and terraces during the summer months. If a supply of

ROSE BUDS

is required during November and December, these can be obtained by introducing now some plants into a very gentle heat. These plants are usually obtainable at the large Rose nurseries, and should consist mainly of the thin Roses of the Isabelle Sprunt and Safrano types. If possible, every large establishment should have at least one house planted of that splendid winter Rose Liberty. Its glorious colour, so well maintained, is of inestimable value during the dull months. I am strongly in favour of planting it out in well-prepared borders, but of course the variety may be grown in 8-inch pots. Do not try to grow Roses with other plants. The Queen of flowers is deserving of a house all to itself, and will repay anyone for so doing. P.

THE FLOWER GARDEN.

CACTUS DAHLIA VESTA.

MESSRS. J. BURRELL & CO. sent out this variety in 1901. It is a charming colour, rich deep pink, with ivory white centre, which is more pronounced as the bloom becomes fully expanded. It is a free and early bloomer, and a good variety for garden decoration, most of the blooms coming well out from the foliage. As an exhibition variety it is variable, doing well on some soils but badly on others, when the blooms have a tendency to come shallow. This fault is, I think, the result of disbudding, and will not be experienced when grown naturally for garden decoration. This Dahlia

CACTUS DAHLIA VESTA. (Pink. Slightly reduced.)

has figured largely at various exhibitions this year, and its distinct attractive colouring has often had much to do with the successes of some exhibitors. P. W. TULLOCH.

FOUR UNCOMMON HERBACEOUS PLANTS.

GAURA LINDHEIMERI.—This is a pretty perennial that may be termed perfectly hardy, as it has come unharmed through over 20° of frost in Scotland. It is, however, but rarely met with in gardens. It attains a height of between 5 feet and 6 feet, and bears long, slender racemes of white flowers rather over 1 inch in diameter, the reverse of the four narrow petals being rose-pink. It was in mid-September in good flower, and its bloom-sprays have a delicate effect arranged in tall glasses. Native of Texas.

Commelina caelestis.—This plant, though it cannot be considered hardy, may, with *Salvia patens* and *S. azurea grandiflora* (Pitcheri), be left with impunity in the open through the winter in the south-west. In cold districts the tuberous roots may be lifted and stored during the cold weather.

The colour of the three-petalled flowers, which are about 1 inch across, is a clear gentian blue. Plants attain a height of between 3 feet and 4 feet, and a group makes an exceedingly pretty picture on a bright morning. Early in the afternoon the flowers close, though as the days shorten they remain open until between 2 p.m. and 3 p.m. Self-sown seedlings often bloom the first year.

Lobelia syphilitica alba.—A white variety of the dingy blue *L. syphilitica*, pure in colour, and a good contrast to the vermilion of *L. fulgens*, *L. cardinalis*, and their varieties. Perfectly hardy, and increasing rapidly in the border.

Calystegia pubescens flore-pleno (the double Chinese Bindweed).—This climber is very attractive during the summer and early autumn with its shell-pink, double flowers. It will grow to a height of from 6 feet to 7 feet, and is admirably adapted for covering tightly strained wire netting or for clambering over rocks or dwarf bushes. It is by no means such a land-grabber as the majority of Bindweeds; indeed, it is often difficult to establish in cold, damp soils. It is, however, of rather rambling habit, shoots often coming up 2 feet or more away from the site of the main rootstock. S. W. F.

TREES AND SHRUBS.

CISTUS LAURIFOLIUS AT KEW.

BEAUTIFUL as nearly all the *Cistus* are, it is really only very few of them that can be grown permanently out of doors in even the South of England. Some fifteen species or so can be obtained that will survive winters as mild as those we have experienced during the last few years, but sooner or later a spell of frost comes that, with two or three exceptions, clears the whole of them off.

Among these exceptions, fortunately, is the species figured in the accompanying illustration, *C. laurifolius*. At Kew it is the largest, most beautiful, and hardiest of the *Cistus*. A single specimen will get to

be put to a severer test in South Britain. The species was introduced from South-western Europe in 1771. W. J. BEAN.

NEW AND UNCOMMON SHRUBS.

THE "Editor's Table" is always a particularly interesting portion of THE GARDEN, and recently it was to the lover of uncommon shrubs especially so, for several of the flowering subjects mentioned therein are seldom seen. The favoured climate of Devonshire was answerable for some that in many districts of the country require the protection of a greenhouse, particularly

Mitraria coccinea, one of the few shrubby Gesnerads that we have in cultivation. It is a native of the Island of Chiloe, off the coast of Chili, and like most plants from that part of the world needs a humid atmosphere to be seen at its best, hence in Devon and Cornwall, as well as in some parts of Ireland, it does well. This *Mitraria* will strike from cuttings of the young growing

In his paper on trees and shrubs at Castlewellan, published last year in the Journal of the Royal Horticultural Society, Lord Annesley writes thus of this *Tricuspidaria*: "From Chili we have fifteen good things. One of the best is *Tricuspidaria hexapetala*, which is better known as *Crinodendron hookerianum*. It grows to about 5 feet high, the foliage dark green, the flowers a rich crimson on long peduncles. This is a beautiful plant when in flower, and we used to keep it in the house in winter being afraid of losing it; but we have had it in the open for many years now. It flowers regularly and is perfectly hardy."

Philisia buxifolia is a low, dense growing plant with flowers like a miniature *Lapageria*, to which indeed, it is closely allied. A cool peaty soil essential for both, and they are equally liable to have the young shoots eaten by slugs. About thirty years ago Messrs. Veitch raised a hybrid between the *Lapageria* and the *Philisia*, to which the name of *Philageria Veitchii* was given. After some years it was distributed, but it is still a very rare plant. For the introduction of *Philisia buxifolia* we are indebted to Mr. William Lobb, who, when travelling in South America for Messrs. Veitch between the years 1840 and 1848, was the means of introducing, beside the *Philisia*, *Lapageria rosea*, *Pieris elegans*, *Escallonia macrantha*, *Embotrium coccineum*, *Desfontainia spinosa*, *Berberis Darwini*, and many others, including a large quantity of seeds of *Araucaria imbricata*, which up to the time it was very rare in this country.

Metrosideros floribunda (the Scarlet Bottle Brush) has before now puzzled me, and probably others, for the name, though well known in gardens and nurseries, may be sometimes sought for in vain in botanical publications. In the "Kew Hand List" it is given as *Callistemon salignus*.

Buddleia variabilis merits all that has been said in its favour on page 163, for it is a delightful and promising shrub. From the specimens that have come under my observation the specific name of *variabilis* appears to be particularly appropriate, for there is a considerable amount of variation in the colour of the flowers.

Ceanothus Indigo.—This *Ceanothus* which is justly praised for its great beauty, was raised in the well-known nurseries of MM. Barbier freres at Orleans, which were formerly in the possession of M. Trason. Some fine examples of this *Ceanothus* were brought up to the Royal Horticultural Society's meeting on September 2 last year by Mr. Fielder, gardener to Mrs. Barnes at North Mymms Park, and an award of merit was at that time bestowed upon it.

Cantua dependens from the Isle of Wight, noted on the above-mentioned page, is one of those subjects in the culture of which failures are more frequent than successes. It is a native of the elevated regions of the Peruvian Andes, and unless in particularly favoured districts of England, where it will stand out of doors, the conditions most suitable to it are a well-drained border in the greenhouse composed of loam, peat, and sand, a free circulation of air, and a liberal supply of water, especially during the summer, and all the sunshine possible. In this way it may be treated as a pillar plant, or the long rambling shoots may be employed for clothing the end of a greenhouse or conservatory, under which treatment it will often flower well. The genus *Cantua*, of which this is the best species, belongs to the natural order Polemoniaceae, having for its immediate relatives the *Phloxes* and *Cobaeas*. H. P.

MAGNOLIA GLAUCA.

THIS tree is not so well known as it should be, for, though it is not so showy as some of the other

CISTUS LAURIFOLIUS AT KEW.

be 8 feet high and even more in diameter. It flowers during June, July, and August, and when we remember that the blossom only lasts a single day its total production of flowers is extraordinary. All those seen in the picture would have fallen by night and would be succeeded by as great an abundance the following day, just as they had been preceded by as large a crop the day before. The flower is white and 3 inches across. The shrub is an evergreen with narrow ovate leaves, dark green and viscid on the upper surface, and covered with a pale brown wool beneath. During hot sunshine the plant gives off a very pleasant rather spicy perfume. Seeds are produced in great quantity, and they afford the best means of increase.

The merits of this *Cistus* as a hardy evergreen shrub for soils of poor quality have not yet been fully appreciated. The plants in the illustration stood the winter of 1894-95 without injury, and it is not likely to

shoots as readily as a *Fuchsia*, if they are taken during the summer months, dibbled into pots of sandy peat, and kept in a close propagating case.

Tricuspidaria hexapetala, which is far better known in gardens as *Crinodendron hookerianum*, is a very distinct and beautiful shrub, native of the low valleys of Chili and Valdivia, where it is said to reach a height of 10 feet or more, but in this country it will flower freely when not more than 3 feet high. The leaves, which are about 3 inches long, are harsh in texture, dark green, and wrinkled at the edges. The flowers are very striking, being when expanded of a globular urn shape, and of a bright crimson colour. A notable feature is the length of time the buds take to develop, and being borne on unusually long stalks they hang like Cherries a long while before they open. It is essentially a peat-loving plant, though I have seen it doing well with a one-third mixture of loam. It is one of the many subjects that we owe to Messrs. Veitch, who first flowered it in 1880, and by whom it was distributed a year or two later. It is, however, of slow growth, and has always remained a rare shrub.

Magnolias, it is well worth growing for its sweetly-scented flowers. It makes a small tree about 20 feet high, and as much, or more, through the head. The branches are crooked and spreading, covered with tough, rather leathery oval leaves 4 inches or 5 inches in length by about 2 inches wide. The upper sides are of a dark, shining green, while the lower surfaces are covered with a thick, bluish glaucousness. When ruffled by the wind, the tree has a distinctly pleasing appearance, as the two sides of the leaves are alternately displayed. The flowers open in August, and are of a cream colour on first expanding, changing to an apricot tint later. They are not very showy, but have a scent nearly resembling that of a good *Maréchal Niel* Rose. I have enjoyed it on a calm evening 20 yards or more away from the tree, and, unlike some of the *Magnolias*, there is nothing at all unpleasant in the scent.

M. glauca is a native of North America, and is known there as the Swamp Bay, being mostly found in moist places. It delights in a deep, damp soil, a tree here thriving luxuriantly at the foot of a slope in about 4 feet of rather wet, sandy peat. It is deciduous, but sometimes plants are met with that retain the majority of their leaves throughout the winter, but this is most probably due to local causes. It can be propagated by seeds or by layering.

Bagshot.

PUBLIC GARDENS.

BATTERSEA PARK.

THE SUB-TROPICAL GARDEN.

MOST interesting of the many good features in Battersea Park is the sub-tropical garden, where plants of other climes than this flourish so luxuriantly as almost to make the visitor wonder whether it is the distant roar of London traffic that is faintly audible, or whether he is not in reality in a sea-girt garden of the sub-tropics. The change from typical park land to almost tropical plant life is rapid, the walk of a minute along a shaded path and the view before one is totally different. The transformation is complete. The panorama before one, in which tropical trees and plants of strange foliage and brilliant flowers play an important part, seems more fairy-like than real.

Turning to the right as one enters from the west end of the park, there are, it is true, banks of Laurel and other familiar bushes, but they are so cleverly bordered by bold groups of *Cannas*, brilliant in flower and attractive in foliage, the blue Gum Tree, with its peculiarly beautiful leaves, *Yuccas*, *Polygonums*, *Palms*, and *Dracænas*, that in admiring and enjoying the latter one totally forgets the former.

On the left the foreground of the lawn is broken up by beds that are full of luxurious and often richly coloured foliage and attractive flowers. In one is planted *Paulownias*, their huge leaves towering above an undergrowth of the gold, green and white-leaved *Abutilons*, which in their turn are bordered by an edging of *Funkias*. *Palms*, *Dracænas*, and Indian rubber plants are in another, while a bed of

red-flowered *Hibiscus*, variegated *Abutilons*, with a ground covering of *Alyssum* provides still more variety of flower and foliage. A peep across the lawn between the ornamental flower-beds reveals a distant view of *Musæas*, *Palms*, *Bamboos*, *Ailanthus*, *Dracænas*, and *Gunnera*, while if the morning sun has not yet dispelled the October mist some of the surrounding trees will, with little stretch of imagination, appear as *Olives*, *Eucalyptus*, *Cypresses*, &c., and the sub-tropical picture will then be complete.

Following the path which turns to the left are many well-planned beds and borders to

it were, in a strange land. Soon the scene depicted in the accompanying illustration—the climax of sub-tropical gardening in Battersea Park—is reached. It does credit to the designer and planter. At the end of this glade, that one might guess to be anywhere but in Battersea Park, are giant *Musæas*, *Palms*, the Traveller's Tree (*Ravenala*), and other tropical plants; those most largely used in furnishing the remaining parts of the glade are *Aralias*, *Philodendron*, *Hedychium*, various *Palms*, *Monstera deliciosa*, *Dracænas*, New Zealand Flax, *Clivias*, *Magnolia grandiflora*, the Birds' Nest and other Ferns. They are so admirably arranged and so well cared for as to produce a pleasing and unique garden picture.

A few more beds of succulent plants, comprised largely of bizarre, almost weird-looking *Agaves*, *Cotyledons* and *Sedums* that vary from cup to saucer shape, still proclaim the sub-tropical garden. They are, however, but the introduction to more familiar sights, for after passing beds bright with *Liliums*, *Wigandias*, *Yuccas*, *Solanums*, &c., the green expanse of park land again comes in view, and one realises that the muffled sound was but an echo from metropolitan streets, monotonous, never-ending.

A. P. H.

A SUB-TROPICAL GLADE IN BATTERSEA PARK.

ROUND ABOUT A GARDEN.

THE WEEDS' BAD TIME.

A REALLY good garden is always at its best; but an ordinary garden, one not innocent of weeds, with plants allowed to grow very much after their own desires, is usually at its best just now. Weeds do not distress one so much in autumn. The time to clear the place up approaches, and whether you propose to do this yourself or leave it to the gardener, you know that the weeds are soon going to suffer an overwhelming, if temporary, defeat. Besides, most of one's autumn flowers have a large luxuriance and a robust freedom of habit which renders them, without your assistance, awkward antagonists for the weeds. When a clump of Torch Lilies, or Red-hot Pokers—it is always a pity when a plant has two names, which both suit it, because one never knows which to use—is blazing with scarlet and gold, and flinging its long, bent blades of grey-green leaves over everything within a half yard radius, it is a poor chance that any neighbouring weed has. And one feels almost sorry for the confiding weed that has ventured to dispute the ground with a Dahlia. You may catch a glimpse of the end of one of its poor leaves here and there, struggling for a peep of daylight through the solid mass of the Dahlia's greenery; but what does it gain for all its efforts? When the first cold snap of autumn comes—it may have come before these lines are printed—down comes the Dahlia with a flop, and down comes the weed under its dead weight. And presently comes

interest the visitor. *Verbena venosa* is particularly bright, *Daturas* have a striking and uncommon effect and appear to flower well, while some intricately worked carpet beds hardly give results commensurate with the labour and skill their production entails. A little farther on the lake comes in view on the right, and then for a moment the scene changes and becomes typically English; Flags and Reeds are luxuriant on the near bank, while on the island Weeping Willows, Silver Poplars, Alders and Acers in the first flush of autumn beauty fringe the waterside.

Still proceeding, the visitor comes across large groups of *Palms*, *Eucalyptus globulus*, and other rich vegetation, and once again is, as

the gardener, who clears away the wreckage in a wheelbarrow. I have never known a gardener tenderly to stoop and disengage that poor weed from the toils of its sudden fate.

BUTTERFLIES, IVY, AND NETTLES.

These are samples of the many reasons which make one happier in an ill-kept garden in autumn than in summer. You can hardly see the weeds for the flowers; and, if you can, it does not matter now. Besides, the butterflies and bees, and flying things of all sorts, seem to like the ill-kept garden best. Trimmed Ivy never blossoms; and in the late year, when the sun shines, the blossoms of the Ivy are something to look at, with their crowds of insect guests. And before the Ivy blooms, the tangled flowers, and sunny, sheltered nooks of a wild garden are always favoured of butterflies and bees, though the dominating factor in the number of autumn butterflies that you will see in a garden is not so much its character or the quality and number of its flowers as the vicinity of Nettle-beds, for both the Peacock and the Red Admiral, as well as the Tortoiseshell butterfly, fed as caterpillars upon Nettles. If one could persuade one's neighbours to grow only Nettles in their gardens, while we cultivated butterfly-flowers in ours, we should be

"country" enough for him. The robin has done with the country, too, for a season, and prefers a handy perch in a shrubbery, opposite one of your doors if possible. Here he can see and be seen, so that when you come out and catch sight of his red waistcoat—how hard it is to remember, by the way, that a robin's breast is not red, but a tawny yellow—he can bob and curtsy to you, with a jaunty flick of his tail afterwards, suggesting confidence in your good intentions, you may exclaim, "Oh, here's a robin! Let us give it some food." And if you give the robin food, a day-long procession of other feathered guests will invite themselves to share it with him.

THE WONDER OF MIGRATION.

But you must wait for the hard times of frost and snow before any distinguished visitors will consent to become pensioners at your bird table, though just now they are accepting the hospitality of the secluded parts of your garden in, perhaps, unsuspected numbers. For, during the whole period of migration in autumn as in spring, every shrub-grown spot becomes a welcome resting-house for many weary travellers, scarcely seen at other times between the Arctic regions and the tropics. Even London has its autumn and spring visits from feathered

sleeping London, and discovering that it could get a night's lodging in the great wheel, one realises the vastness of the ordeal which the migrant small birds go through when, with the blind instinct of travel when the cold wind blows, they leave their northern homes in autumn for lands, which they have in most cases never seen, situated they know not where.

THE GOLDCREST AND HIS FRIENDS.

But you need not go to the top of the great wheel at Earl's Court to see a migrant goldcrest; nor need you wait on the East Coast on the chance of having the good luck of the naturalist who saw a cunning little goldcrest alight from its journey across the North Sea off an owl's back! There is hardly any shrubbery so poor at this season but it has its wandering goldcrests. Restless little imps they are, hardly ever still enough to let you make quite sure that they are only goldcrests, and not the rarer firecrests. And, as they go drifting from tree to tree, piping to each other in needle tones, you discover that they have company in their wanderings. Blue tits, coal tits, marsh tits, long-tailed tits, and great tits, with tree-creepers and nuthatches, make up a lively company that will give you a good hour's entertainment if you care to watch them.

And they are only one collective factor in the wealth of bird life, which is daily changing in your garden at this season. E. K. R.

DIANTHUS CÆSIUS. (From a photograph by Miss Willmott.)

able to combine horticulture with entomology to great effect.

FAMILIAR BIRDS.

It is in the wilder parts of the garden, too, that we find the birds. On the lawns, no doubt, there are plenty of blackbirds and thrushes. These increase daily in numbers now, partly by immigration from further North, and partly by their natural movement from the fields, which have been stripped at harvest, to the shelter which gardens afford. Nor need you wander to the wild garden to see the sparrow. When the harvest was ripe he ruralised a good deal; but now that all the grain has been gathered into stacks, mostly with the ears inwards, your waterpipe is

tourists which breed in the far north and winter in Africa—tourists of the sky, who, traversing the area of fogs that hang above the metropolis, have been glad to catch glimpses of the green of the parks, and have descended to rest and feed, and occasionally to gladden the eyes of some London naturalist. The most pathetic—for there is always pathos in the journey of these feathered mites over unknown lands and seas—instance of this forced halt in London was, I think, the wee goldcrest that was discovered one morning in one of the topmost cars of the great wheel at Earl's Court. When one thinks of this little bird, measuring only 3½ inches from the tip of its tiny beak to the end of its little tail, all alone in the air above a

country, it is found growing on the limestone rocks at Cheddar in Somersetshire, from where it obtains its common name, as well as in many parts of Europe in alpine pastures. W. I.

CROCUS PULCHELLUS.

ONE of the prettiest, though not the most showy, of the autumnal Crocus species is *C. pulchellus*, which opened here early in September, and which has been enjoying to the full the spell of fine weather which set in on September 13. It has since that time had every opportunity of opening its little flowers fully to the sun, which has been more with us of late than for months before. It is a very beautiful little species from the shores of the Bosphorus and adjacent woods and mountains

NOTES ON HARDY PLANTS.

DIANTHUS CÆSIUS.

MANY choice gems the genus *Dianthus* embraces, and the Cheddar Pink is undoubtedly one of the most useful and pretty rock plants that help to furnish the rock garden. It has a neat and compact habit, forming a dense cushion of glaucous foliage, from which appear in spring the solitary rose-coloured, fragrant flowers on stems varying from 4 inches to 10 inches in height. A rather variable species, there are different forms in cultivation bearing this name, some having a very dwarf habit with large flowers, while others are taller with rather smaller ones. Easy of cultivation, it is quite at home on old walls or sunny ledges in the rock garden planted in gritty or calcareous soil. It is easy to establish on walls by sowing the seeds in cracks with a little soil, when germination soon takes place and tufts are quickly formed. Native of this

BRITISH-GROWN FRUIT AND VEGETABLES.

A GREAT EXHIBITION AT CHISWICK.

THE exhibition held at Chiswick on Tuesday, Wednesday, and Thursday last by the Royal Horticultural Society produced a much finer display of fruit and vegetables than was anticipated owing to the unfavourable season. Hardy fruit was, on the whole, somewhat lacking in colour, but in size and quality the specimens shown appeared to be up to the usual standard. Grapes, as compared with the display at Shrewsbury and Edinburgh, must be classed as poor; competition was only moderately keen with one or two exceptions, and the quality was not of the highest order. The special county classes are a most interesting feature at the Royal Horticultural Society's autumn show, and this year proved no exception. Those confined to the southern and south-west counties were best contested. The famous old vineyard at Chiswick presented a very pretty sight, with the effectively arranged displays of fruit on either side of the central walk, and the roof covered with vines in bearing. The exhibits of home-preserved and home-bottled fruits were interesting, and progress in this important matter is evidently being made. Vegetables were magnificently shown, and the opinion was freely expressed that never before had a finer exhibition of vegetables been seen.

A pleasing incident which took place on the opening day was the presentation by Sir Trevor Lawrence, Bart., of the Victoria Medal of Honour to Sir Thomas Hanbury, K.C.V.O., in recognition of his splendid gift of the Wisley garden to the society. The presentation was made at luncheon (a report of which appears elsewhere), and occasion was taken publicly to thank Sir Thomas Hanbury for his generosity.

Mr. Thomas Humphreys, for many years assistant secretary to the Royal Horticultural Society, and who is leaving to take up his appointment as curator of the Birmingham Botanic Gardens, was presented by the floral and fruit committees with an illuminated address and various articles, and by the gardening Press with a roll-top desk.

A conference on vegetables was held in the afternoon, when the following papers were read: "On Cooking Vegetables," by Dr. Bonavia and Mr. James Hudson; "On Vegetables all the year round for a private family," by Mr. W. H. Divers; "On Vegetables for Exhibition," by Mr. E. Beckett; and "On Vegetables for Market," by Mr. W. Poupert. We shall give a report of these next week.

Chiswick is not an ideal place for an exhibition, and the Rev. W. Wilks, Mr. S. T. Wright, and their assistants must have worked hard and well for things to pass off as smoothly as they did.

DIVISION I.—GARDENERS AND AMATEURS ONLY.

Collection of nine dishes of dessert fruit: First, Earl of Harrington, Elvaston (gardener, Mr. J. H. Goodacre), who staged in splendid form Washington Apple, Nectarine Albert Victor, Peach Princess of Wales, Melon Thornton Hero, Apple Ribston Pippin, Peach Eagle (very fine), Pear Doyenné du Comice, with Grapes Muscat of Alexandria and Gros Maroc. These were a very fine lot. The second prize went to the Hon. Mr. Justice Swinfen Eady, Oatlands, Weybridge (gardener, Mr. James Locke), who had Smooth Cayenne Pine, Grape Muscat of Alexandria, Fig Brown Turkey, Barrington Peach, and Apple King of Pippins.

Collection of six dishes of dessert fruit: First, J. Willis Flemming, Esq., Chilworth Manor, Hants (gardener, Mr. W. Mitchell). In this class Mrs. Pince Grape was good, also Muscat of Alexandria. Peaches Sea Eagle and Walburton Admirable were very fine.

Collection of thirty dishes of hardy fruit: Major Powell Cotton, Birchington, Thanet (gardener,

Mr. J. Cornford), was first with Figs, Damsons, Mulberries, Peach Sea Eagle, Apple Ribston Pippin, Archduke and Monarch Plums, &c. Pears, too, were very fine in this lot; second, T. L. Boyd, Esq., Tonbridge, Kent, who was very strong in Apples, Pears, Filberts, &c.

Grapes.

Six varieties (three bunches of each): First, Mr. J. H. Goodacre, Elvaston Castle Gardens, with very good Muscat of Alexandria, Barbarossa, Gros Maroc, Madresfield Court, and others. There were no more competitors, and none in the class for four varieties of Grapes.

Black Hamburg (three bunches): First, Mr. W. Mitchell, Chilworth Manor Gardens, Romsey; second, Mr. Goodacre; third, Mr. G. Lane, Highfield Gardens, Englefield Green.

Mrs. Pince (three bunches): First, Mr. W. Mitchell, with excellent samples; second, Mr. James Day, Galloway House Gardens, N.B., with smaller bunches.

Alicante (three bunches): First, Mr. H. H. Brown, Castle Hill Gardens, Englefield Green, with Grapes having a splendid bloom; second, Mr. W. Brodie, Wargrave Hill Gardens, Twyford, Berks; third, Mr. W. Allan, Gunton Park Gardens, Norwich.

Madresfield Court (three bunches): First, Mr. W. Mitchell, who showed very well; a good second, Mr. R. Milner, Margam Park Gardens, Port Talbot.

Any other black Grape (three bunches): First, Mr. W. Mitchell, with Gros Maroc; second, Mr. W. Harrison, Hollingbury Place Gardens, Bishop's Stortford, with Gros Maroc; third, Mr. W. Allan, also with Gros Maroc.

Muscat of Alexandria (three bunches): First, Mr. J. H. Goodacre, Elvaston Castle Gardens with well coloured fruit; second, Mr. James Lock, Oatlands Lodge Gardens, Weybridge; third, Mr. W. Allan. There were several more competitors; this was the best contested Grape class.

Grapes (any other white): First, Mr. W. Taylor, Tewkesbury Lodge Gardens, Forest Hill, S.E., with Chasselas Napoleon (very good); second, Mr. James Lock with Mrs. Pearson; third, Mr. Robert Grindrod, Whitfield, Hereford, with Golden Queen.

DIVISION II.—NURSERYMEN AND MARKET GROWERS ONLY.

Table of hardy fruit, 32 feet by 6 feet: Messrs. George Bunyard and Co., Maidstone, were first with a collection of Apples and Pears that was just about as good as it could be. The fruits were finely coloured and well developed, and the exhibit was tastefully arranged. Peasgood's Nonsuch, Washington, Cox's Pomona, James Grieve, Gascoigne's Scarlet, Golden Spire, Bramley's Seedling, and Lane's Prince Albert were among the finest of a splendid collection. A gold medal was awarded. Messrs. Bunyard have now won the first prize in this class no less than eighteen times. Messrs. John Peed and Son, Norwood, were second in this class, and showed very good fruit also. They had not quite the fine colour of the first prize lot, however, Peasgood's Nonsuch, Lane's Prince Albert, Lord Suffield, Wealthy, Allington Pippin, Warner's King, and Gascoigne's Scarlet were of the best. Messrs. H. Cannell and Sons were third, and exhibited some remarkably good Apples, Peasgood's Nonsuch was splendid, and so, too, were Bismarck, Cellini, and Bramley's Seedling.

The Hogg Memorial medal for a table of hardy fruit (16 feet by 6 feet) was awarded to Mr. J. B. Colwill, Sidmouth, Devon. Though somewhat small the fruits were finely coloured. Lady Sudeley was a splendid dish.

Messrs. Cutbush and Son, Highgate, N., exhibited a collection of hardy fruit that included some good

dishes of Pears, notably Marguerite Marillat, Pitmaston Duchess, and Beurré Superfin.

Messrs. George Bunyard and Co., Maidstone, were given the gold medal for a collection of orchard house fruit and trees. They had well fruited trees of Apples, Pears, Crabs, and Peaches. Very fine specimens were shown in baskets, for instance, Pears Pitmaston Duchess, Verulam, Doyenné Boussoch, Winter Windsor, Marguerite Marillat (splendid), Van Mons Léon Leclerc, Beurré Boac, Uvedale's St. Germain (six fruits weighing 9lb. 8½oz.), and General Todtleben. These were all in the pink of condition, and many dishes of fine Apples were included also.

Messrs. Thomas Rivers and Son, Sawbridge-worth, had an exhibit of fruit trees in pots and orchard-grown fruit, for which they were given a gold medal. The former included Vines, Apples, Pears, and Plums, all bearing good crops. Plum Rivers' Late Orange was a picture, heavily laden with rich golden fruits. The fruits shown in baskets were of wonderfully fine colouring and perfect finish. We may single out for special mention Apples The Queen, Cox's Orange Pippin, Peasgood's Nonsuch, and Ribston Pippin, Pears Marguerite Marillat, Louise Bonne of Jersey, Lebrun, and Conference, Peach Galway, and Plum Coe's Golden Drop.

Mr. John Basham, Bassaleg, Newport, Mon., although an unsuccessful competitor in the class for a large table of hardy fruit, had a fine display of good produce, which was well arranged.

Messrs. J. Cheal and Sons, Crawley, exhibited an attractive table of hardy fruit also, in which were many good dishes.

Messrs. S. Spooner and Sons, Hounslow, Middlesex, showed hardy fruit extensively. Although of large size the Apples rather lacked colour.

Mr. George Mount, Canterbury, had some very good Apples in his collection of hardy fruit, and Messrs. Pewtress Brothers, Tillington, Hereford, exhibited a table of Apples and Pears in good variety.

Messrs. Paul and Son, the Old Nurseries, Cheshunt, showed a table of hardy fruit decorated with autumn foliage and fruits.

Messrs. Hugh Low and Co., Enfield, exhibited hardy and tender fruits. Some of the Apples and Pears were really first-rate.

A gold medal was awarded to an exhibit of Grapes and Pine-apples from His Majesty the King's gardens at Windsor (gardener, Mr. A. MacKellar). Splendid Smooth Cayenne and Queen Pine-apples were shown, and Black Hamburg Grapes from Cumberland Lodge.

The Horticultural College, Swanley, also showed hardy and other fruits, such as Grapes, Melons, Strawberries in pots, &c.

DIVISION III.—GARDENS AND AMATEURS ONLY.

For twenty-four dishes of Apples, of which sixteen were to be cooking and eight dessert, there were five competitors, but the first prize was easily won by the fine collection exhibited by Major Bythway, Warborough, Llanelly (gardener, Mr. W. Wilkins). Amongst the finest sorts shown were Peasgood's Nonsuch, Alexander, Stone's, Lane's Prince Albert, Gascoigne's Scarlet, and a magnificent dish of Ribston Pippin, the largest probably ever shown at any exhibition of this kind. The second prize was won by Mrs. Haywood, Wood-hatch Lodge, Reigate (gardener, Mr. C. J. Salter); and the third by R. H. B. Marsham, Esq., East Sutton Park, Maidstone (gardener, Mr. W. Lewis). In both these collections many varieties were the same as in the first prize group.

The first prize for eighteen dishes of Apples (twelve cooking, six dessert) was deservedly won by Mrs. Alexander, Chevering, Hunton, Maidstone

(gardener, Mr. Charles Crane), who had some fine Kentish Fillingbasket, Newton Wonder, Emperor Alexander, Tower of Glamis, and The Queen, besides others. The second prize was won by Mr. Thomas Ridgwell, Orsett Grange, Essex, for a clean, healthy-looking collection; and the third prize went to Major Powell Cotton, Quex Park, Birchington, Thanet (gardener, Mr. J. Cornford), for what looked at least an equally good collection.

Mrs. C. J. Hanbury, Belmont, East Barnet (gardener, Mr. A. Porteous) carried off first prize for twelve dishes of Apples (eight cooking, four dessert), a clean, healthy, hardy-looking collection, that were a credit to Middlesex. The second prize collection from Henry Partridge, Esq., J.P., Castle Hill, Bletchingley, Surrey (gardener, Mr. J. W. Barke), looked as if they came from a cold and bleak region; while the third prize group came from the Right Hon. Viscount Duncannon, Bessborough, Piltown, Ireland (gardener, Mr. J. G. Weston), and were it not that they were a little bruised in travelling would probably have secured a higher award.

There were ten competitors in the class for six dishes of cooking Apples, and the judges must have had a hard task to spot the winner of the two first prizes, so even and good looking were the fruits shown. Lord Biddulph, Ledbury Park (gardener, Mr. J. Dawes), took the first prize; Major Bythway (gardener, Mr. W. Wilkins) second; while the collection from Mrs. Carl Jay, Blendon Hall, Bexley (gardener, Mr. W. E. Humphreys) was commended.

For six dishes dessert Apples, Major Bythway (gardener, Mr. W. Wilkins) took first prize with Ribston, Allington, and Cox's Orange Pippins, Gascoigne's Scarlet Seedling, Egremont Russet, and Worcester Pearmain; the second prize went to R. H. B. Marsham, Esq., East Sutton Park, Maidstone (gardener, Mr. W. Lewis), for a highly-coloured collection composed of Wealthy, Gascoigne's Scarlet, Lady Sudeley, Duchesse's Favourite, Worcester Pearmain, and Cox's Orange Pippin.

Roger Leigh, Esq., Barham Court, Teston, Maidstone (gardener, Mr. G. Woodward), easily secured first prize for his eighteen dishes of dessert Pears. He had some very fine examples of Marguerite Marillat, Durondeau, Emile d'Heyst, Gansel's Bergamot, Louise Bonne of Jersey, and the yellow coloured Le Brun; indeed, all the sorts shown were excellent.

The Right Hon. the Lord Mayor, The Mote, Maidstone (gardener, Mr. W. H. Bacon), won the second prize for a good collection, in which Marguerite Marillat, Directeur Hardy, Beurre Hardy, and Durondeau were very fine; the third prize went to Major Powell Cotton.

For twelve dishes of dessert Pears there were no exhibitors, and in the class for nine dishes of Pears the first prize was given to the solitary exhibitor, F. A. Bevan, Esq., Trent Park, Barnet (gardener, Mr. H. Farr), whose fruits deserved the award.

For six dishes of dessert Pears Alfred Benson, Esq., Upper Gatton Park, Merstham (gardener, Mr. W. Mancey), won first prize with very good samples of Pitmaston Duchess, Durondeau, Marie Louise, Louise Bonne of Jersey, Doyenné du Comice, and Marie Louise d'Ucole, the second prize going to C. H. Garton, Esq., Banstead Wood, Surrey (gardener, Mr. J. Moore).

There were three exhibitors in the class for three dishes of outdoor Peaches. The first prize was won by J. B. Fortescue, Esq., Dropmore, Maidenhead (gardener, Mr. C. Page), for Sea Eagle, Dymond, and Nectarine; but no awards were given to the exhibits from Roger Leigh, Esq., and the Earl of Harrington, as the judges made known by writing on the back of the cards that the fruits were "not outside grown," rather a strong assertion, perhaps.

For one dish of outdoor-grown Peaches the Right Hon. and Rev. Lord Braybrooke, Audley End, Saffron Walden (gardener, Mr. J. Vert), secured first prize for a finely finished dish of Sea Eagle, while the second prize went to J. Willis Fleming, Esq., Chilworth Manor, near Romsey (gardener, Mr. W. Mitchell), for the same variety less highly coloured.

The Earl of Harrington, Elvaaton (gardener, Mr. J. H. Goodacre), was awarded first prize for Albert Victor Nectarine grown out of doors. Only one dish was on the table, although three were specified in the schedule.

For one dish of Nectarines grown entirely out of doors the second prize went to the Hon. Mr. Justice Swinfen Eady, Otlands Lodge, Weybridge (gardener, Mr. J. Lock), for Victoria. A dish of Humboldt from J. B. Fortescue, Esq., Maidenhead, was shown in the same class, but received no award.

For six dishes of Plums the only exhibitor was Major Powell Cotton, Quex Park (gardener, Mr. J. Cornford), for a good collection.

For one dish of dessert Plums the Right Hon. and Rev. Lord Braybrooke took first prize with Coe's Golden Drop, and Mrs. Alexander of Maidstone second with the same variety.

The first prize for one dish of cooking Plums was also won with Monarch by the Right Hon. and Rev. Lord Braybrooke, while G. J. Gribble, Esq., Harlow Grange, Biggleswade, secured the second with the same variety.

The Morello Cherry class only fetched four exhibitors; J. B. Fortescue, Esq., Dropmore (gardener, Mr. C. Page), won the first prize, and was closely followed for second by the Hon. D. P. Bouverie, Coleshill House, Highworth (gardener, Mr. S. Haines).

DIVISION IV.—SPECIAL COUNTY PRIZES. (GARDENERS AND AMATEURS.)

Open to Kent growers only.

Dessert Pears, six dishes: First, Mr. E. Coleman, North Frith Gardens, Tunbridge, with large fruits. Apples, six dishes: First, Mr. W. Stowers, Whitehall Gardens, Sittingbourne, with splendid fruits; second, Mr. E. Coleman, North Frith Gardens, Tunbridge.

Surrey, Sussex, Hants, Dorset, Somerset, Devon, and Cornwall.

Apples, six dishes: First, Mr. J. Ellicott, Halden House Gardens, Exeter, with well coloured fruits; second, Mr. H. Avery, Battle Abbey Gardens.

Dessert Pears, six dishes: First, Mr. T. Turton, Sherborne Castle Gardens, with splendid fruits; second, Mr. G. Grigg, Ashburnham Place Gardens.

Wills, Gloucester, Oxford, Bucks, Berks, Beds, Herts, and Middlesex.

Apples, six dishes: First, Mr. C. J. Ellett, Chicksands Priory Gardens, Bedford. Warner's King was a splendid dish. A good second, Mr. W. H. Davies, Friary House Gardens, Newent, Gloucester.

Pears, six dishes: First, Mr. W. H. Bannister, Cote House Gardens, Westbury, with well-coloured fruits; second, Mr. A. Carlisle, Harlow Grange Gardens, Biggleswade.

Essex, Suffolk, Norfolk, Cambridge, Hunts, and Rutland.

Apples, six dishes: First, N. R. Page, Esq., Marine Parade, Clacton-on-Sea; second, Mr. W. Harrison, Hallingbury Place Gardens, Bishop's Stortford.

Pears, six dishes: First, Mr. W. Allan, Gunton Park Gardens; second, Mr. J. Vert, Audley End. The first prize exhibit was much superior.

Lincoln, Northampton, Warwick, Leicester, Notts, Derby, Staffs, Shropshire, and Cheshire.

Apples, six dishes: First, Mr. John Lee, Kingscrott, Higher Bebbington, with very good fruit; second, Mr. J. Naylor, gardener to Henry Knott, Esq., Stamford.

Pears, six dishes: First, Mr. W. H. Divers, Belvoir Castle Gardens; second, Mr. J. Naylor.

Worcester, Hereford, Monmouth, Glamorgan, Carmarthen, and Pembroke.

Mr. J. Dawes, Ledbury Park Gardens, was first for six dishes of Apples and six dishes of Pears. The Apples were splendid, especially Warner's King, and they were from standard trees; Mr. John H. Wootton, Byford, Hereford, was second for Apples.

The other Counties of Wales.

Apples, six dishes: First, Mr. H. Forder, Ruthin Castle Gardens, Ruthin; second, Mr. R. A. Horspool, Castle Gardens, Llangollen Road, Ruabon.

Pears, six dishes: First, Mr. R. A. Horspool; second, Mr. Fox, High Mead Gardens, Llanybyther.

Six Northern Counties of England and the Isle of Man.

Apples, six dishes: First, Mr. J. McIndoe, Guisboro' Hall, Gardens; second, Mr. W. Chuck, Brodsworth Hall Gardens, Doncaster.

Pears, six dishes: First, Mr. W. Chuck; second, Mr. Ben. Ashton, Ormskirk Gardens, Lanca.

Scotland only.

Apples, six dishes: First, Mr. James Day, Galloway House, N.B., with good fruits; second, Mr. John Cairns, gardener to the Earl of Howe, Coldstream. Messrs. Day and Cairns were also first and second respectively, for six dishes of Pears.

Ireland only.

Apples, six dishes: First, Hubert F. Broad, Esq., Bridewell, Aghern, Conna, County Cork; second, Mr. J. G. Weston, gardener to Earl Duncannon, Bessborough, Piltown.

There were no entries in the Channel Islands class.

DIVISION V.—SINGLE DISHES OF FRUIT GROWN IN THE OPEN.

(GARDENERS AND AMATEURS ONLY.)

Dessert Apples.

Adams' Pearmain: First, J. F. G. Bannatyne, Esq., Exeter.

Allington Pippin: First, Mrs. Talbot, Port Talbot (gardener, Mr. R. Milner); second, G. H. Dean, Esq., Sittingbourne.

American Mother: First, Right Hon. Lord Poltimore, Exeter.

Blenheim Orange: First, T. Lloyds Davies, Esq., Addlestone (gardener, Mr. George Cable), who had excellent fruits; second, G. H. Dean, Esq., Sittingbourne.

Charles Ross: First, Mr. T. B. Colvill, Sidmouth, with fine specimens of this Apple.

Cox's Orange Pippin: First, G. H. Dean, Esq., Sittingbourne.

Egremont Russet: First, Colonel C. Harad, Gunton Park, Norwich.

James Grieve: First, J. T. Atkinson, Esq., Caversham, Reading, with fine fruit.

King of Pippins: First, Rev. T. McMurdo, Weybridge, with very fine fruit; second, A. W. G. Wright, Esq., Newent, Gloucester.

Mannington's Pearmain: First, Mr. J. Lee, Higher Bebbington.

Margil: First, Mr. G. J. Gribble, Biggleswade, Beds.

Ribston Pippin: First, Earl of Ashburnham (gardener, Mr. G. Grigg).

Washington: First, Colonel G. B. Archer-Houlton, Bishop's Stortford (gardener, Mr. W. Harrison); second, Mr. A. W. Wright, Newent, Gloucester.

Cooking Apples.

Bismarck: First, G. H. Dean, Esq., Sittingbourne, with a splendid dish.

Blenheim Orange: First, Rev. T. McMurdo, Woburn Park, Weybridge; second, G. H. Dean, Esq., Sittingbourne.

Bramley's Seedling: First, G. H. Dean, Esq. (gardener, Mr. W. Stowers), with excellent examples in so far as size is concerned; second, Mrs. C. Pearson, Brickendonbury, Hertford.

Gascoigne's Scarlet: First, G. H. Dean, Esq., Sittingbourne, whose samples were finely coloured. Golden Noble: First, A. W. G. Wright, Esq., Newent, Gloucester (gardener, Mr. W. H. Davies), with fine fruits.

Lane's Prince Albert: First, G. H. Dean, Esq., Sittingbourne, with excellent examples; Mrs. Haywood, Woodhatch Lodge, Reigate, second. This class was strongly represented.

Lord Derby: First, Hugh C. Smith, Esq., Southampton, and G. H. Dean, Esq., second.

Mère de Ménage: First, G. H. Dean, Esq., with finely coloured examples.

Newton Wonder (open only to exhibitors in the Midland and Northern Counties): First, Colonel Hon. C. Harbord, Gunton Park, with Earl of Galloway a good second.

Newton Wonder (Southern Counties only): G. H. Dean, Esq., Sittingbourne, with a fine lot.

Peasgood's Nonsuch: First, G. H. Dean, Esq., Sittingbourne (gardener, Mr. W. Stowers), with a grand set, possibly the finest examples in the exhibition.

Stirling Castle: First, Colonel Archer-Houblon, with good even fruits of first size.

Warner's King: First, Mr. J. Lee, Higher Bebington. There were many good exhibits in this class.

Any other variety: First, Mrs. Haywood, Woodhatch Lodge, Reigate, with Stone's in fine condition. This class was strongly contested, some sixteen dishes being staged.

Dessert Pears.

Beurré Superfin: First, K. D. Wingfield Digby, Esq., M.P., Sherborne, with very fine Beurré Superfin.

Comte de Lamy: First, J. T. Charlesworth, Esq. Doyenné du Comice: First, Hon. Lord Worthbourne.

Darondeau: First, K. D. W. Digby, Esq.

Emile d'Heyat: First, Colonel the Hon. C. Harbord, Gunton Park (gardener, Mr. W. Allan).

Louise Bonne de Jersey: First, G. J. Gribble, Esq.

Pitaston Duchesse: First, H. Partridge, Esq., Betchingley, Surrey.

Thompson's: First, Colonel H. C. Harbord, Gunton Park.

DIVISION VI.—MISCELLANEOUS.

Home-preserved or bottled British-grown fruits: First, The Lady Warwick Hostel, Studley, Warwickshire (warden, Miss Edith Bradley; gardener, Miss May Crooke), with a very attractively displayed exhibit of good produce; second, Messrs. T. E. Austin and Co., Kingston-on-Thames.

Bottled fruits, one dozen bottles: First, Mr. J. Babbell, Sandling, near Maidstone; second, Miss Alice M. Smith, The Bungalow, Southwick.

Eighteen bottles of bottled fruit: First, Mrs. C. P. Markham, Hasland Hall, Chesterfield (these fruits looked in perfect condition); second, Mr. E. Beckett, Aldenham House Gardens.

A silver Knightian medal was awarded to the Agent-General for British Columbia for an exhibit of Canadian preserved fruit.

DIVISION VII.—VEGETABLES.

Collection of vegetables (100 square feet): Messrs. Richard Smith and Co., Worcester, were the only exhibitors in this class, and had a fine and representative display. Greens, Cauliflowers, Onions, Leeks, Turnips, Tomatoes, &c., were all well represented. Silver-gilt Knightian medal.

Collection of vegetables (50 square feet): Messrs. J. Cheal and Sons, Crawley, were given a silver-gilt Banksian medal for a very attractive display. Messrs. George Bunyard and Co., Maidstone, and Messrs. R. Veitch and Son, Exeter, also showed in this class, and were awarded a silver Knightian medal and a silver-gilt Knightian medal respectively.

Collection of vegetables (amateurs) (50 square feet): First, Mr. E. Beckett, gardener to Lord Aldenham, with a splendid display of produce, finely arranged and of great variety. The Celery, Greens, Carrots, and Onions were particularly good, and the variously coloured Potatoes, Tomatoes, Capsicums, &c., added a touch of picturesqueness to what might easily have been unattractive. Mr. Beckett's exhibits of vegetables are always much admired, partly because they are so attractively staged. Mr. James Gibson, Danesfield, Marlow, was second with a display that contained much finely grown produce. Onions, Savoy, Parsnips, and Beans were excellent. Mr. W. Fyfe, The Gardens, Lockinge Park, was third; his Celery and Cauliflowers were very good. Mr. G. Look, gardener to B. H. Hill, Esq., J.P., Newcombes, Crediton, was fourth.

Collection of vegetables (24 square feet): First, Mr. J. Bowerman, gardener to Lord Bolton, Hackwood Park, Basingstoke, with an excellent lot. Celery, Blood Red Onion, Dwarf Green Curled Savoy, Ailsa Craig Onion, and various Tomatoes were among the best of a very good lot. Mr. A. Basile, gardener to the Rev. Thomas McDermid, Woburn Park, Weybridge, was a good second, with good produce well arranged; Mr. S. Haines, gardener to the Hon. D. P. Bouverie, Colehill House, Highworth, was third.

Potatoes, twelve varieties: First, Mr. Ben Ashton, gardener to the Earl of Lathom, Ormskirk, Lancashire, with a splendid lot of tubers; second, A. Ayling, Esq., 16, Church Hill, Newhaven; Mr. Silas Cole, Althorp Park Gardens, was third.

Potatoes, eighteen varieties: First, Mr. R. W. Green, Wisbech, Cambs, with splendid tubers; second, Mr. J. B. Colwill, Sidmouth.

MISCELLANEOUS.

Messrs. T. Rivers and Son, Sawbridgeworth, exhibited several very fine bunches of Grapes, notably Black Alicante, Gros Maroc, Diamond Jubilee, and Golden Queen.

Mr. George Kelf, South Villa Gardens, Regent's Park, showed a collection of Melons of the variety Regent's Park, which received an award of merit on September 1 last.

Mr. Metcalfe, gardener to the Marquis of Exeter, Burghley, Stamford, exhibited several fruits of some four or five varieties of Melons. Ne Plus Ultra (beautiful rich golden colour), Royal Jubilee, Blenheim Orange, Best of All, Sutton's Empress, and Sutton's Scarlet were the varieties shown. Silver Knightian medal.

Messrs. Sutton and Sons, Reading, had an admirable display of Potatoes arranged in baskets. Included was Sutton's Discovery, said to be even a heavier cropper than Northern Star. The produce of a single tuber, cut into eyes and grown under ordinary farm culture, was 38lb. Numerous other standard varieties were included in this representative exhibit, to which a silver-gilt Knightian medal was awarded.

Messrs. Dobbie and Co., Rothesay, N.B., had an extensive exhibit of vegetables. The Leeks were excellent, as also was the Celery. Dobbie's selected Parsley, Golden Globe Onion, Victoria Kale, Marrows, Gourds, Ailsa Craig Onions, Tomatoes (notably Improved Conference), Dobbie's Selected Brussels Sprouts, Large Red Shallots, &c., were all good. Messrs. Dobbie also showed a collection of Potatoes, altogether some 4,000 tubers. They were awarded a gold medal.

The Horticultural College, Swanley, Kent, showed a collection of vegetables that included Eclipse Cauliflower, Musselburgh Leek, Onion Coccanut, Bottled Rhubarb, &c. Silver Knightian medal.

Messrs. H. Cannell and Sons, Swanley, Kent, had a collection of vegetables that included Tomatoes, Onions, Potatoes, Greens, &c., of the best quality. Silver-gilt Knightian medal.

Messrs. John R. King and Sons, Coggeshall, Essex, had a display of Cabbages, Carrots, Celery, Onions, &c. Silver Banksian medal.

Messrs. Harrison and Sons, Leicester, exhibited a collection of vegetables that included excellent Tomatoes, Onions, Peas, Broad Beans John Harrison, Leek Leicester Hero, &c. Silver Banksian medal.

Mr. W. Seward, Hanwell, showed Tomato Hanwell Victory in pots bearing heavily.

Mr. J. Brown, gardener to Mrs. A. Bramwell, King's Worthy, Winchester, showed some splendid Onions. Silver Banksian medal.

Messrs. James Veitch and Sons, Chelsea, showed an admirable lot of vegetables, for which they were awarded a gold medal. Onions, Greens, Tomatoes, Potatoes, Beet, and others were exceptionally fine.

Messrs. Ambrose and Son, Cheshunt, showed Apples and also a new Grape called Melton Constant Seedling.

Open air Grapes of the variety Brandt were shown by H. M. Tod, Esq., 22, Billiter Street, E.C.; they were grown at Cheshunt.

Mr. P. W. Green, Wisbech, showed a collection of Potatoes.

Apple Norfolk Beauty was well shown by Mr. William Allan, Thorpe Market Nursery, Norwich.

Mr. George Cannon, nurseryman, Ealing, showed an excellent lot of trained and pot fruit trees.

The following had exhibits in the sundries tent: Messrs. Corry and Co., Limited, London, S.E.; Wood and Sons, Wood Green, N.; H. M. Hamilton, baskets, &c.; Junofloria, High Holborn, a preparation to preserve cut flowers; John Pinches, 3, Crown Buildings, Clerkenwell, Acme labels; Joseph Bentley, Limited, Hull, insecticides and manures; D. Dowel and Son, Hammermith, pottery; J. George, Putney; H. Pattison, Streatham, lawn horse boots; Lubrose Paint Company, Limited, Moorgate Station Chambers, imperishable paint; A. P. Bruce, Chorlton-cum-Hardy, flower display; Pulham and Son, Newman Street, W., vases and rockery; Valls and Co., Coleman Street, E.C., Beetlecute; Champion and Co., tubs for shrubs.

THE LUNCHEON.

Sir Trevor Lawrence, Bart., presided, and was supported by Sir Thomas Hanbury, K.S.V.O., and Dr. Cooke, and there were present some hundred of other well-known and representative horticulturists.

After the usual loyal toasts, Sir Trevor Lawrence presented the Victoria Medal of Honour to Sir Thomas Hanbury, and said how deeply grateful the council and Fellows of the Royal Horticultural Society were to Sir Thomas for his splendid gift of Wisley Garden.

Sir Thomas Hanbury, in reply, said he felt flattered by the very kind remarks Sir Trevor Lawrence had made. There was no particular merit in what he had done, it was simply transferring a few figures from one book to another. He had simply saved Wisley from being cut up for building purposes. Wisley is at a disadvantage in being so far away from London, but this will not, doubtless, deter Fellows from visiting it. He hoped Wisley would remain a garden for an indefinite period, and would prove a joy to all Fellows of the society.

Sir Trevor Lawrence, in proposing the toast of the judges and committees, said that was probably the last time they would meet at Chiswick. The gardens have been leased from successive Dukes of Devonshire since 1822. Then the area of the gardens was thirty-three acres; now it is only thirteen. The entrance fee was then six guineas, and the annual subscription was four guineas. Sir Trevor referred to Dr. Lindley's association with and good work for the Royal Horticultural Society. He was assistant secretary in 1822, and thirty-six years later, in 1858, became a member of the council. Collectors used to be sent out by the society, and many valuable plants were thus introduced by the Royal Horticultural Society. Among the collectors were Reeves, Don, Hartweg, Douglas, Fortune, and others. The Royal Horticultural Society used never to know how to take care of money. Sir Daniel Morris first did good work in this direction, and they had since had excellent treasurers. Sir Trevor again referred to the gift of Sir Thomas Hanbury as having solved happily the question of a new garden. They were extremely grateful to the committees and judges for their services—it would be impossible to do without them.

Mr. Bateson, F.R.S., thought this great gift of a new garden should be carefully considered, so that the best means of making use of it for the benefit of horticulture generally might be found. He said that horticulturists were not able to put into practice definite scientific principles in the way that other workers do, and he asked if it were not possible to make use of a part of Wisley Garden for the purpose of determining scientific principles.

Mr. William Crump, on behalf of the judges, and Mr. Molyneux, on behalf of the committees, replied.

Sir Trevor then thanked the exhibitors for their valuable assistance. He said also how

sorry they were to lose Mr. Humphreys; the value of his services was known to all.

The presentation to Mr. T. Humphreys of an illuminated address was then made by Mr. Marshall, Mr. R. Dean first informing the meeting that in addition to the address several other articles would be given. The wording of the address was as follows:—

"This address, together with a cabinet canteen of cutlery and silver and a Queen Anne tea and coffee service, is presented to Mr. Thomas Humphreys, secretary of the floral committee of the Royal Horticultural Society, by those whose names are appended, in warm appreciation of his services to the floral and fruit committees of the society, both at the Drill Hall, Westminster, and the gardens of the society at Chiswick. They desire heartily to congratulate Mr. Humphreys upon his appointment as curator of the Botanical Gardens, Edgbaston, Birmingham, and cordially wish him and his family good health with increasing prosperity."

H. B. MAY, *Chairman*.
R. DEAN, V.M.H., *Secretary*.

Seventy-five names were appended.

Mr. George Gordon (in the absence of Dr. Masters) then read the following address to Mr. Humphreys from the gardening Press:—

"On your retirement from the Royal Horticultural Society's historical garden at Chiswick, the undermentioned representatives of the horticultural Press desire to offer you an expression of their good wishes. They acknowledge with appreciation and thanks the courtesy and assistance you have freely afforded them at the society's exhibitions and on other occasions, and they beg you will accept the accompanying roller-top writing-desk with their autographs engraved upon a plate as a token of their wishes for the future health, welfare, and prosperity of yourself and family. They hope that the work you will do in the Edgbaston Botanic Gardens at Birmingham will succeed in further popularising the art of gardening and encourage a greater love for plant life.—E. T. Cook, H. G. Cove, C. H. Curtis, J. Harrison Dick, John Fraser, A. S. Galt, G. Gordon, M. T. Masters, F. Moore, R. H. Pearson, W. P. Thompson, H. H. Thomas, H. J. Wright, W. P. Wright."

Mr. Humphreys, in a few well-chosen words, acknowledged these tokens of goodwill.

THE GARDENERS' DINNER

In 1866 a great gathering of gardeners assembled in St. Martin's Hall, but the dinner on Tuesday evening last at the Holborn Restaurant completely eclipsed that, according to Mr. Ker of Liverpool, who was present on both occasions; it may therefore safely be said to be the most representative gathering of British gardeners ever known. Lord Duncannon presided, in the regrettable absence of Mr. Leopold de Rothschild, who was unwell, and proved an ideal chairman. Everyone expressed themselves as delighted with the evening, and the committee deserve high praise for their hard work. There were far too many speeches, one reply to each toast would have been quite enough; but if, as was suggested, the dinner should become an annual function, this error will doubtless not be repeated. There were several splendid speeches made, but the audience would not give the speakers a fair hearing. Mr. Leopold de Rothschild, in order to show his sympathy with the gathering, besides both writing and wiring regretting his absence, generously provided each guest with wine. Messrs. James Veitch and Sons, Limited, Chelsea, very kindly decorated the tables, which were much admired. This generosity was greatly appreciated.

Mr. A. Dean first read letters from Dean Hole and Mr. Rothschild regretting their inability to be present. Both were unwell.

After the usual loyal toasts, the chairman gave the toast of "The Royal Horticultural Society and all Other Horticultural Societies." The following telegram from Mr. Leopold de Rothschild was then read: "Warm greeting

from me, with every sincere regret at not being present, and every wish for a most pleasant evening." Lord Duncannon then said I must first sympathise with you in not having Mr. Leopold de Rothschild as chairman. Many have come from distant parts who would like to have seen Mr. Rothschild. However, I must ask you to be blind to my faults, to my oversight kind. The chairman referred to the centenary of the Royal Horticultural Society, that, thanks to the munificence of Baron Schröder and Sir Thomas Hanbury, would be celebrated by a new hall and a new garden. The prospects of the society are now more encouraging than ever before, thanks in a large measure to Sir Trevor Lawrence and the Rev. W. Wilks, assisted by a loyal and energetic council. The Royal Horticultural Society has done much to popularise gardening, and now greater things than ever will be expected of it. Fifty or sixty years ago gardening was a luxury of the few, now it beautifies the homes of many. Indeed, home would not be home to many were it not for the garden surrounding it. All horticultural societies are doing a great work in giving encouragement in gardening to our working population, inculcating thrift and sobriety. His lordship mentioned that the Royal Caledonian Society will hold an international exhibition in 1906, at which Colonial exhibits will be a feature. Now, one word about gardeners, they can do much to leave the world better than they found it. Generally speaking (and I say this with all respect), gardeners spring from the industrial class, and may not have had the advantages of education that are now available, yet they have by dint of hard work, skill, and perseverance overcome all difficulties, and have succeeded in raising gardening upon a higher pedestal in Britain than it occupies in any other part of the world. Gardeners must feel grateful to the committee for affording them an opportunity of shaking hands with many old friends, but those present must suffer because they had thought fit to ask an Irish landlord to preside (cries of "No, no!") Lord Duncannon said he thought Ireland had great possibilities in commercial fruit growing. In his own district (Beasborough, Piltown, County Kilkenny) Apples do well, Plums are often superabundant, and Violets are successfully grown for market. His lordship desired to record the services of his own gardener (Mr. Weston) to those in his own neighbourhood. Lady Duncannon loves and studies her garden, and is really better qualified to take the chair to-night than myself. Long may these societies exist, and continue to add to the pleasure and welfare of the community. Lord Duncannon concluded an admirable speech with the following generous invitation: "If any of you happen to be passing my way give me a call, and I shall be delighted to see you."

In replying to this toast, the Rev. W. Wilks said that the Royal Horticultural Society was now in its hundredth year, and it was time that its vicissitudes were forgotten. In 1887 its life was despaired of, but, thanks to the efforts of Sir Trevor Lawrence, Baron Schröder, Mr. H. J. Veitch, George Paul, and a few others its prospects brightened. In 1887 there were only 770 subscribing Fellows; now there are some 7,000. The income from that source is over £7,000 a year, and from accumulated funds £450 a year. Since 1887 the Royal Horticultural Society had concentrated its energies upon gardening pure and simple, and the speaker thought therein lay the secret of its progress. In addition to the £15,000 wanted for the new Hall, £5,000 would be required for the garden, and, as it was most important that the society's invested funds should not be touched (the income from them will be wanted for the upkeep of the Hall and garden), Mr. Wilks made a strong appeal for support. Are there not, he asked, sufficient ladies and gentlemen in the country who take delight in gardening to give the paltry sum of £20,000? He suggested that gardeners should give a hint to their employers.

Mr. F. W. Burbridge thought it a pity that so much was spent upon such luxuries as motoring, yachting, &c., and, although he would not say how those who had money should spend it, he thought they might spare a little for "the garden that I love." He wished the Royal Horticultural Society would extend its influence to Ireland, and thought the Royal Horticultural Society of Ireland should be affiliated with the Royal Horticultural Society of England. Mr. Burbridge said that in Ireland there were great opportunities for commercial fruit culture. Mr. Fudge, of Southampton, also replied to this toast.

Sir Trevor Lawrence, Bart., gave the toast of "Gardening and Gardeners," and in doing so referred to the great difference in gardening (especially commercial gardening) now and a few years ago. Then flowers were hardly seen in a rich man's house, now they are everywhere. Referring to the good influence of gardening Sir Trevor said that a well-kept cottage garden invariably gives evidence of a happy home. A gardener's position is one of responsibility, all details must be thoroughly and carefully carried out, and for their good work a debt of gratitude is owing to them. The art of gardening (particularly fruit culture) is understood at home as nowhere on the Continent. With reference to women gardeners, Sir Trevor was sure they would be treated in a friendly way, especially if they did not interfere too much with the Apples. Sir Trevor referred to Mr. Chamberlain's love for his garden, and caused loud laughter by saying that when votes were being counted (as perhaps they soon might be) such a good gardener as Mr. Chamberlain should not be forgotten. The speaker concluded by saying that much of the pleasure of his life was due to gardening, and he and many others owed a deep debt of gratitude to British gardeners.

Mr. Challis, in an admirable speech, replied to this toast. He likened himself to gardeners when, after the terrible weather of last April, they found themselves fruitless, hopeless, and speechless. Mr. Challis said he was in rather a difficulty, as he hardly knew whether now to refer to gardeners as masculine or feminine. We ought as gardeners to wish our sisters every success. We have much to learn from them; they appreciate, as we cannot, many delicate branches of gardening, yet, said Mr. Challis, we trust they may be speedily transplanted to the sphere of life that is

more congenial to them, and for which they are so pre-eminently suited. Mr. Challis referred to Chiswick in its best days, and spoke of the men who were giants then. He hoped that a gardening school would be established at Wisley.

Mr. McIndoe said, as one from the North, they were very glad to be able to come down to the Chiswick show and the gardeners' dinner, and hoped that the latter would become an annual institution.

Mr. Richard Dean, in an eloquent speech, proposed the toast of "The Gardening Charities." Some are bound to go under in life's struggle, he said, and for such the Gardeners' Royal Benevolent Institution was founded in 1838. As this institution falls short of its possibilities, so the measure of support given to it also falls short. Mr. Dean advocated the claims of the Royal Gardeners' Orphan Fund and the United Horticultural Benefit Society in a very able manner.

Mr. H. J. Veitch replied, and urged all those present to try and help gardeners less fortunate than themselves. Mr. H. B. May and Mr. C. Curtis also replied to this toast.

Mr. Owen Thomas gave the toast of "The Horticultural Press," and eulogised the services rendered by gardening journals in the advancement of the art, and of their ever-ready help to all movements worthy of support.

In the absence of Dr. Masters, Mr. George Gordon briefly replied.

Mr. W. Crump proposed "The Horticultural Trade," to which Mr. Arthur Sutton, Mr. George Bunyard, Mr. George Dickson, and Mr. Peter Kay replied.

Mr. A. Dean proposed the toast of "The Chairman and Mr. Leopold de Rothschild," which was given with musical honours. The meeting closed with thanks to Mr. Owen Thomas, Mr. A. Dean, and the committee for their arduous labours.

Gladiolus princeps.—This splendid Gladiolus has been for some weeks a glorious sight. Well-grown flowers are fully 6 inches in diameter, and their colour—a glowing scarlet—renders them remarkably striking in the garden. Strong spikes will reach a height of 5 feet and carry eighteen to twenty flowers. These are produced in succession, not more than two being usually expanded at the same time, so that the spike retains its decorative qualities for a month or more. This fine hybrid, the result of a cross between *G. cruentus* and *G. Chidsii*, was first offered to the public at £1 sterling per corm. As it is, however, perfectly hardy and reproduces itself freely by means of offsets, it has already fallen to less than a fifth of that price, and should in the near future become sufficiently cheap to obtain an entry into the majority of gardens, which will gain enormously by its introduction. It appears to succeed equally well in soils of very dissimilar character.—S. W. F.

Potting and planting bulbs.—A very common mistake in the potting or planting of bulbs is to delay that operation till they have suffered considerably from being kept out of the ground so long, and consequently the display of flowers is much inferior to what would otherwise have been the case. The solid bulbs, such as Hyacinths and Tulips, are less affected than many others, but when exposed for sale, as may be often seen up to Christmas or even later, failure is sure to result. Unless there are some exceptional circumstances in the case, all of what are known as Dutch bulbs should be in their permanent quarters by the end of October at least, and many of the smaller kinds a month earlier than that. The pretty little *Ixias* and *Sparaxis* soon lose a good deal of their vitality if kept too long out of the ground, and the *Freeseas*, which reach this country by the beginning of August, are often sold two or three months later, and, of course, fail to give satisfaction. Lilies, again, have to put up with a deal of rough treatment in this respect, the loose scales of which the bulbs are composed admitting a circulation of air and allowing them to dry more quickly than in the case of a solid bulb. Yet *Lilium candidum* (the earliest of all to grow) is often planted in October instead of August, and *L. Harrisii*, of which ripened bulbs from Bermuda reach here early in August packed in boxes of stone dust, suffer greatly if kept out of the ground for any length of time after being unpacked. The extent to which bulbs deteriorate during a given time depends, of course, upon the place and conditions under which they are kept, but in the case of those for sale they are for the most part stored in hot and dry warehouses, where the existing conditions are most unfavourable to them. The gardener with cool storage rooms can, of course, keep bulbs out of the ground without injury for a longer period than those on shelves in shops and warehouses.—T.

and, as it has been imported in considerable quantity in recent years, it is now far from being an expensive Crocus to purchase. It has now been in my garden for a number of years, my original corms coming from near Broussa, where it is very plentiful. During all these years it has proved a most pleasing Crocus, and one, too, which has given the minimum of trouble, all that it has required being an occasional top-dressing when some of the corms had become bare of soil. Now, however, it appears to stand somewhat in need of lifting and replanting, as the corms are becoming crowded both from the increase by offsets and also by the number of self-sown seedlings which have appeared, not only in the border but also in the gravel of the adjoining path. It seeds freely every year, and it thus soon increases with considerable rapidity.

Although a comparatively small Crocus, especially when compared with such fine-sized flowers as those of *C. speciosus*, there is something exceedingly attractive about the blooms, which have been called bluish lilac, but which one would prefer to say are pearl blue. They are almost self-coloured on the exterior, though towards the base there are a few short, deep-coloured lines.

The interior of the segments is more frequently deeply lined, but this feature varies much in the individual plants. As already said, the flowers are a kind of pearl blue, but they vary greatly in depth, some approaching to white, and pure albinos have also been found among both collected plants and seedlings. The leaves appear after the flowers, so that *C. pulchellus* is all the better of being carpeted with a low-growing plant, such as one of the Thymes, but the drawback is that such carpetings are often frequented by slugs, which have an obnoxious habit of eating through the tubes of the Crocuses. S. ARNOTT.

IPOMCEA RUBRO-CERULEA.

A NOTE on this Convolvulus in the open air appeared on page 206. It has been a beautiful sight with me against a sunny wall in the open for the last six weeks, and it seems strange that so few employ this lovely plant for the adornment of their gardens during the late summer and early autumn. The pale blue flowers, from 3 inches to 4 inches in diameter, are the admiration of all beholders, and supply a tint absolutely unique in the summer garden. The best plan is to raise the seeds in heat, placing them separately in 4½-inch pots in porous soil, and to grow the plants on until they are from 18 inches to 2 feet high, with the flower-buds formed. They should be planted in rich soil against a sunny wall, care being taken not to disturb the roots in turning them out. Thus treated they receive no check, and continue to make growth and to form additional flower-buds, readily ascending wire or string strained tightly 2 inches or so away from the wall. It is well to have them ready to put out about the end of June or commencement of July, when hot weather can generally

be reckoned on, though in this exceptional summer this has been conspicuous by its absence. Even during a cold and rainy season, however, *Ipomcea rubro-cerulea* has formed a welcome and much-appreciated feature in the garden. S. W. F.

NEW AND RARE PLANTS.

SENECIO TANGUTICUS.

A VALUABLE addition will this Chinese plant prove to the few species of *Senecio* now grown in gardens for their ornamental foliage rather than for any merit their flowers may possess. The small yellow, starry-shaped blossoms are abundantly produced in large pyramidal panicles on stems about 5 feet high. The foliage is most ornamental, the divisions of the palmately-lobed leaves are deeply cut into segments, thus producing an elegant effect. In the border

SENECIO TANGUTICUS (REDUCED).

(Flowers yellow. Shown by Messrs. J. Veitch and Sons, Limited, at the Royal Horticultural Society's meeting on September 15, and then given an award of merit.)

or in good isolated positions on the lawn this *Senecio* will prove to be most useful. There is a good plant of it growing in the rock garden at Kew. Messrs. James Veitch and Sons, Limited, Chelsea, exhibited this plant before the floral committee of the Royal Horticultural Society on September 15, when it was given an award of merit.

GARDENING OF THE WEEK.

KITCHEN GARDEN.

CAULIFLOWERS.

PLANTS that have been raised from seed sown at the end of August or early in September will now be ready for pricking out into cold frames or hand-lights to stand the winter for an early supply of heads next June. Place a layer of material to form drainage at the bottom of the frame, and fill up to within 9 inches of the glass with soil that is not too rich. Ordinary garden soil will answer provided it is not too impoverished or rich. Make it fairly firm, and insert the young plants 6 inches apart both ways if room can be spared; they should not be inserted closer than 5 inches in any case. Afford a good watering in, no more will then be required for some days. Keep the lights right off on fine days and mild nights, and replace them only to throw off excessive rains and frosts.

CELERIAC.

This delicious bulbous vegetable being tender requires lifting and storing before sharp frosts occur. The method advised for lifting and storing Turnips will answer for these, viz., lift and trim off the tops with a knife, and store in sand or dry earth until wanted for use. During the winter months, when choice vegetables in variety are scarce, Celeriac makes a welcome change, and having in view the ease with which this plant is cultivated it should find a place in all gardens.

GAS LIME.

In old gardens that have been under cultivation for many years grubs and wire-worms are often very troublesome, and as these are hard to extirpate when the ground is cropped it behoves the gardener to do something to destroy them when it is vacant. I am convinced of the efficacy of gas lime for the purpose, provided always it is used judiciously and at this period of the year. There are properties in the material harmful to plant life if mixed with the soil fresh from the works, but if applied thinly upon the surface of vacant ground and allowed to remain for a few weeks before digging it in to allow the rank gases to pass off none but good results will accrue.

Large quantities of manure will soon be required for applying to the vacant plots. In well regulated gardens there is an out of the way part of the garden set apart for the various composts required and for turning and mixing manures. Hedge clippings, weeds, and other rubbish may here be burnt, and the ashes therefrom mixed with stable or other manure, when well turned and decomposed will make excellent material for wheeling on to vacant ground that it is intended to dig or trench. Where stiff soil has to be dealt with large quantities of charred refuse will prove very beneficial both when used alone or in conjunction with manure or road scrapings.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

FRUIT GARDEN.

STRAWBERRIES.

PLANTS of the different sorts selected for early forcing having filled their pots, which are generally small and full of roots, some little care will be needed in their management, particularly in the way of watering, as an excess of water may start the most prominent crowns, and the want of it seriously injure the roots by causing the soil to shrink. Later plants in larger pots are less liable to suffer in this way, but with these judicious

waterings until the time arrives for storing away are important. The best time to water is early morning, when every plant should be examined and supplied for the day without wetting the crown or foliage, particularly when diluted liquid manure is used. Let all plants be kept quite clear of weeds and runners, and give an abundance of space between the pots to let in light and warmth, which will facilitate the ripening of the roots as well as the crowns. Worms often find their way into the pots, and soon do considerable mischief by running through the rich, heavy compost and clogging the drainage. Water with lime water to dislodge them before the plants are stored away for the winter.

VINES.

Late houses that were started early and helped forward with fire-heat will now be finishing crops of ripe, well-coloured fruit, which may be expected to hang and winter better than Grapes that still require fire-heat, and the wood and foliage being well ripened. All lateral growths may be shortened back to prevent crowding, and those which emanate from the base of the buds on old Vines should be cut away. As days and nights get colder gradually reduce the temperature to a minimum of 50°, with a rise of say 10° on fine days, and ventilate freely to secure a circulation of air when external conditions are favourable, but keep the ground ventilators closed when the weather is wet. The above remarks apply to black Grapes; but Muscats, when quite ripe, will keep well under similar treatment. Houses in which Hamburgs and other thin-skinned Grapes are hanging must be kept dry and cool, not by having all the ventilators open every day, but by keeping them closed in wet weather, and by dispensing with fire-heat as much as possible. Look over the bunches at least twice a week, and remove every faulty berry before it has time to taint its neighbour. Discontinue sweeping and raking, as dust soon disfigures the fruit. Place a tarpaulin over the external borders from this time until all the Grapes are cut. If manure is used for external borders of early vineries it should not be applied until the buds are on the move, but some light covering may be placed over the roots to protect them from cold, chilling rains. Many people do not think it necessary to expose their Vines or Peaches to the weather, but we have always felt better satisfied with the results after they have had the benefit of fine autumnal rains which so thoroughly cleanse the foliage and buds and sweeten inside borders. If maiden Vines are still growing and do not show a disposition to ripen properly, this process may be greatly facilitated by maintaining a strong dry heat with air through the day, and by shutting off the fire and keeping the house cool at night. Have fruiting pot Vines pruned, top-dressed, and placed in position ready for starting.

Madresfield Court.

W. CRUMP.

FLOWER GARDEN.

CARNATIONS.

ALL layers should by this time be well rooted and fit for planting out in their permanent quarters. The early part of October is undoubtedly the best time to plant. Many of the failures one hears of in the cultivation of the Carnation in the open borders can be attributed to late planting, also the lifting of plants after frost may in some measure be attributed to the same cause. The beds or borders in which it is intended to plant should be well prepared; the soil should not be over-rich nor too poor. If it is heavy road grit and ashes from the garden fire should be used in about equal proportions. If possible let the soil be tolerably dry at the time of planting, and great care must be taken not to break the roots away from the tongue made in layering. In planting the roots should be well covered with soil. This should be well pressed round them, and the bed altogether should be made quite firm. However much we may try there will sure to be some losses through the winter, and it is well to have some plants in store for filling in the gaps in the spring. I find it a good plan to lay in under a north wall a stock sufficient for all contingencies. Plants treated

thus are far better than those potted up and wintered in cold frames. But where the potting system is carried out there is the same necessity for early potting as for early planting. The layers should be potted singly and firmly into 3-inch pots, well watered, and stood in a frame placed in an open position and with the lights left entirely off, except in bad weather.

LIFTING TENDER PLANTS.

Now we are fairly into October we can never be sure of the weather, and the early approach of frost being very probable the spade should be run round some of the tender plants with the view to their early lifting. The large-flowered Paris Daisies come in very acceptable for cutting when the frost has cleared the borders of outdoor flowers, and stand well in water. If the plants are large it is advisable to choose a dull day for the lifting. The operation should be performed carefully. Put up directly, give a good soaking of water, and stand in the shade for a few days until they have recovered from the check caused by removal. If the small-flowered variety is grown a few of these may also be lifted, for if the flowers are not useful the plants will help to brighten the conservatory until the Chrysanthemums are ready. Plants from a good strain of *Margarite Carnations* may also be potted up. Those from late sowings will now be just coming into flower and be bristling with flower-buds. Cannas, with their striking foliage, often come in very useful where the supply of large Palms and Dracenas is not extensive. Now is a good time to look through beds of seedling *Petunias* and *Verbenas* to see if one has anything special. Sometimes one or two may be considerably in advance of existing varieties, and the old plants may in this case be also potted up.

T. B. FIELD.

Ashwellthorpe Gardens, Norwich.

INDOOR GARDEN.

AT this season of the year the glass department will require generally looking over, as the summer arrangements must now give way or be modified to meet the exigencies of the season. Advantage should be taken to clear out from the stove and other houses all plants that are approaching a condition of rest, and at the same time, if an opportunity occurs, remove all the occupants of the houses for a time, and give the interiors a good cleansing with hot water and soft soap. Afterwards syringe them thoroughly with water as hot as can be used. Such plants as *Gloriosa superba* and *G. Plantii* that flowered early should have the wood ripened correspondingly early by placing them in a light, airy house where the temperature does not exceed 55° by night, at the same time withholding moisture from both root and atmosphere as rapidly as the condition of the foliage and stems of the plants will permit. If ripened too soon, however, the tubers often refuse to start readily in the spring. The plants from the latest batch of *Gloxinia* tuber should also be ripened. The process should be carried out as gradually as possible, for if too hastily done the tubers are liable to start prematurely during the winter, the result of which is shrivelling and a large loss.

CLERODENDRON THOMSONÆ.

If growing in large pots or tube plants should now be removed into a cooler house and exposed to full light and more air. Care should also be exercised as to the amount of water given at the root, as growth will now be suspended for several months. The bark of the current year's wood should be allowed to shrivel, but very slightly, or the plant will not start again in the spring. The bushy section of *Clerodendron*, as represented by *C. fallax*, should also undergo a process of ripening at this season before the plants are cut back. Should they bear seed encourage the ripening of the same, as seeds sown as soon as ripe germinate freely and seedling plants will bloom the first year.

DIPLADENIAS

are frequently termed evergreens, but the safer treatment is to ripen the wood by gradually withholding the moisture given at the root, so that the plants cast their foliage by the early part of

December, but under any circumstances avoid an excess of moisture to the roots at this time. Strong-growing climbers, such as Allamandas, Bougainvilleas, Bignonias, &c., should have the late sappy wood removed entirely. Except in the case of Allamandas do not shorten the shoots.

LAPAGERIAS.

The young wood of these frequently becomes much entangled. Where the knife has to be used remove the shoots the full length, as, if shortened back, the evil is only aggravated. As regards moisture at the root, this plant is an exception to those previously referred to, and should not at any time be allowed to become dry. Phryniun variegatum will now do with a less liberal supply of moisture and more light before being allowed to die down for the winter. Freesias and Lachenalias that have started into growth should be gradually inured to light, and as they become strong place them near the glass in a light, cool pit. The earliest lot of Primulas should now be given plenty of room in a light, airy position in a pit where a little pipe-heat can be introduced in damp, dull weather.

Wendover.

J. JAKUES.

THE FRUIT GARDEN.

APPLE BEAUTY OF KENT.

FEW varieties of Apples give better results from young dwarf trees than does the cooking variety Beauty of Kent. The accompanying illustration furnishes plenty of evidence in support of this statement. Beauty of Kent is a large and handsome Apple, a vigorous grower, and a good bearer. It forms either a large pyramid or a standard with satisfactory results. This Apple is seen at its best when given garden culture in a warm soil, and grafted upon the Paradise stock. In cold and uncongenial soils it loses quality. It is in season from November to January. Our photograph was taken in the Langley nurseries of Messrs. James Veitch and Sons, Limited.

GRAPES AT MELTON CONSTABLE.

DURING the last two or three years the Grapes from these gardens have been so prominent at shows, especially at Shrewsbury, that readers of THE GARDEN will be interested in them, especially when it is known what wonderful crops are produced annually by Mr. Shingler. Let those interested in Grape culture hear that a single Vine produces in one season six dozen bunches, not one of them less than 3lb., and many weighing as much as 6lb., and they will be curious to know how such results are obtained, and especially when such a prize as the champion vase for Grapes is carried off by these bunches, as was the case last year at Shrewsbury.

Too many persons run away with the idea that Vines which win high honours at leading shows are allowed to bear a small number of bunches. This is not so with the Vines at Melton, as I know, having seen them annually during the last five years. True, Mr. Shingler did not again carry off the coveted prize this season. It is but fair to him, however, to say that the conditions were so altered as practically to render it impossible that he should win this year, for he does not cultivate the varieties especially catered for, viz., Muscats. A note on how such wonderful results are obtained may be read with interest and, perhaps, profit.

The vineries at Melton Constable are span-roofed, 95 feet long and 20 feet wide. In the autumn of 1894 four such houses as these were erected. They are parallel to each other and run north and south, so

that all sides obtain an equal amount of sun and light. The height of the vineries admits of 14-feet rafters. Instead of planting thirty Vines on each side of every house in the orthodox manner, as many cultivators would have done, thus requiring no less than 240 Vines—a serious item in expenditure—only twenty-four were planted, six in each house for permanent bearing. Planting was done in the spring of 1895, one Vine in the centre of each side, the remaining four a few feet from each end. So successful has been the growth that the vineries are now thoroughly furnished. No. 1 house was planted with four Vines of Madresfield Court and two of Gros Maroc; No. 2 with Muscat of Alexandria entirely; No. 3 with two Gros Colmar and four Alicante. In No. 4 house there is more variety, two Vines each of Gros Maroc and Gros Colmar, one of Lady Hastings, and one of Alnwick Seedling. It will thus be seen that but seven varieties are cultivated. The borders are entirely inside, and were made on the piecemeal system.

Mr. Shingler is a firm believer in a restricted root run. He knows exactly then what his Vines receive in the matter of stimulants. Too often in planting Vines more rooting space is given than is desirable; the cultivator cannot possibly know what the roots are doing. The borders are 3 feet deep, 6 inches of this is drainage on a bed of concrete. In the preparation of the compost due attention was paid to the natural soil; as this was destitute of lime, considerable quantities of old lime rubble and burnt refuse, with some slaked lime, were mixed with turf out from a pasture, no manure of any kind was added. The border was made quite firm, so that the roots could not penetrate through the soil rapidly, in quill-like fashion. Firm soil is admittedly a precursor of fibrous roots, and this is what all successful Grape growers seek to produce. The training of the Vines was so arranged that two, and in some instances three, canes were allowed to extend the first year for providing future rods. Some of the rods were trained horizontally along the bottom wire to the right and left of the main stem. From the horizontally-trained basal rods growths at intervals of 3 feet and 4 feet, according to the varieties, were trained directly up the roof. Mr. Shingler is a strict believer in ample space for leaf development, overcrowding of the growths is strictly guarded against.

One of the secrets of success here is the splendid foliage, thick and leathery to the touch; no undue

grossness. The colour is all that could be desired; no paleness or lack of chlorophyll. While encouraging ample foliage an excess of it is not allowed. One good leaf thoroughly exposed to light and air is worth a dozen of a flimsy character with attenuated stalks, the result of overcrowding, which is all too common in an ordinary vinery nowadays. In laying the foundation for future success only a short length of leader was retained annually. Vines after twenty years' cropping should produce bunches as large at the base of the Vine as at the extremity, and this can only be done by restriction at first. If, say, 6 feet of cane is allowed to remain from the leader annually the rods will be indifferently furnished with side spurs. As might be expected in Vines of such growth as these, surface-roots are encouraged and are present in quantity. An annual mulching of cow manure in the spring does much towards inciting the multiplication of surface-roots. Dickson's Vine Manure is here highly thought of; it is dissolved overnight and applied in a liquid state next morning. Thinning the bunches is also paid great attention to. Nowhere can better examples of such large-berried varieties as Gros Maroc and Gros Colmar be seen; each berry has sufficient space to swell in and no more. This is a point in Grape exhibiting not always receiving as much attention as it deserves. Many first prizes are annually lost through this defect.

A word as to the results attained may not be uninteresting. The year after planting, viz., 1896, each Vine was allowed to carry twelve bunches. The year following, 1897, twenty-five bunches were taken from each Vine. In 1898 Alnwick Seedling was bearing forty-three well-developed bunches with full-sized berries, the colour perfect; Alicante, forty bunches, many weighing 5lb., several 7lb.; Gros Colmar, with forty bunches, many would turn the scale at 6lb. In the case of Muscat of Alexandria one Vine carried sixty bunches, many weighing 4lb. each, the berries large, and of that amber tint of colour which renders this Grape so popular. Last year, 1902, the crop results were extraordinary, and these Vines succeeded in carrying off the Shrewsbury Cup, the quality was so excellent in spite of the enormous crop. Madresfield Court carried no fewer than seventy bunches; Gros Colmar, sixty-seven; Alnwick Seedling, fifty-one; Gros Maroc, seventy-five; and Muscat of Alexandria, sixty bunches, many weighing 4lb. each.

Mr. Shingler has a strong liking for raising new varieties. Lady Hastings, to wit, originated here

APPLE BEAUTY OF KENT IN MESSRS. JAMES VEITCH'S LANGLEY NURSERY.

as a sport from Muscat Hamburg. In appearance it is much like Madresfield Court—in shape and colour of the berries as well as in formation of the bunch. The flavour of the parent is preserved in its progeny in a remarkable degree. Fertilisation is easy, the berries "set" evenly, and there is no cracking of the skin—a defect with Madresfield Court. Several seedlings are also on trial. One especially deserving notice is a cross between Gros Colmar and Lady Hastings. I fear, however, the new comer does not possess much of the latter's flavour, but it certainly colours more easily than Gros Colmar. Even Vines growing in small pots carrying small as well as large bunches possess a density of colour and bloom much more resembling Gros Maroc than Gros Colmar. No difficulty is experienced in "finishing" this Grape, whether the Vines are confined to pots or planted out in the ordinary way. Certainly it is easier of cultivation than Gros Colmar, and for that reason is valuable; it even keeps longer than that variety. This is another point in its favour. Mr. Shingler evidently thinks well of it, judging from the stock he is working up. E. MOLYNEUX.

NURSERY GARDENS.

ALPINE FLOWERS AT COMELY BANK, EDINBURGH.

FOR many years the nurseries of Messrs. Cunningham, Fraser and Co., at Comely Bank, Edinburgh, a short distance from where Thomas Carlyle lived for some years, have been among the few in Scotland where alpine flowers are considered a speciality. They are yearly visited by an increasing number of amateur growers on the search for new plants or for old ones to replace the inevitable losses. A recent visit showed no abatement of the interest taken in these flowers by the firm, and the present condition of the collection shows that much credit is due to the present manager of this department, Mr. Austin. Within the last year or two, two large rockeries have been erected for the better display of the flowers in a natural way, and these are occupied by many good plants, although the greater portion of the stock is grown in pots in frames for the convenience of purchasers.

Saxifrages are very largely cultivated, and the moist season seems to have suited these popular rock plants unusually well, as all the sections were in capital order. There are many rare ones and others not at all plentiful in British nurseries, besides the commoner species and varieties which are more frequently seen. The Saxifrages cultivated cannot all be detailed, but one may mention such as *S. Grisebachii*, *S. zuthricana variegata*, *S. Elizabethae*, *S. Salomoni*, *S. Boydii*, *S. Boydii alba*, *S. kolaniana*, and the new encrusted hybrid raised by Mr. R. Lindsay, and named *Dr. Ramsey*, with the scarce *S. Ferdinand-Coburgi*. Alpine Primulas are also numerous, and no one need desire to see finer grown plants of such species as *P. frondosa*, which is in great quantity, or of the comparatively small stock of the uncommon *P. suffrutescens*.

A plant very largely cultivated here is the beautiful little *Morisia hypogaea*. Dwarf Campanulas are also in great numbers, and on the rockery one observed some good forms of *C. carpatica* such as *Robert Parker*, and some good varieties of *C. garganica*, including the scarce lovely white form *C. garganica hirsuta alba*. Achilleas are also well represented, and one was pleased to hear of *A. ageratifolia* (*Anthemis Aizoon*) having given a double-flowered sport here. This is being propagated, and it is hoped that it will prove permanent. The double variety of *Gypsophila paniculata* is also cultivated, though the difficulties of propagation will probably always keep this plant high in price. *G. repens monstroea* is easier to increase here. Another plant which is difficult to propagate is the pretty and curious *Astragalus Tragacantha*, a fine plant of which was on one of the rockeries. Near it was the pretty

Helianthemum lunulatum, a valuable thing on account of its beauty and its lateness of blooming. Several other Sun Roses were noted, but one which is at its best in the beginning of September in a season like this is worthy of special note. Mr. Hill-Normand's double yellow Sun Rose, Jubilee, was also in bloom. It is a very pretty one, and superior to the ordinary double yellow *Helianthemums*. One was pleased to see a large quantity of the distinct *Lobelia Tupa*, though this is not considered very hardy in the Edinburgh district. There was also a good stock of the *Ramondias* and *Haberlea rhodopensis*. Hardy Geraniums were also in considerable numbers, among them being the scarce *G. sessiliflorum*, although out of flower. The allied *Erodiums* are also in some variety, *E. guttatum* being prettily in flower, though past its best. This is one of the few nurseries where one meets with the pretty *Leucjum autumnale* in bloom, and equally pure, though, of course of entirely different character were the white flowers of *Linum catharticum*, a good alpine Flax, far too little grown for late bloom.

One might occupy a good deal of space by mentioning other plants, but there are too many things which might be named to venture upon further detail. It is sufficient to state that the leading genera of alpine flowers are represented by both rare and common species suitable for the rockery. This remark is intended to include plants of a shrubby character, for which this nursery has long been noted. S. ARNOTT.

MESSRS. ROBERT P. KER AND SONS, LIVERPOOL.

ALTHOUGH Messrs. Ker's nursery does not rank among the most extensive (it covers about twelve acres of ground), it certainly is worthy of inclusion among plant-growing establishments in England which have a special interest. For many years the name of this firm has been associated with the Amaryllis, and it is not too much to say that the efforts of Mr. Ker have materially assisted the progress that has been made in this flower during the last decade. But besides the Amaryllis (of which all the horticultural world knows), Messrs. Ker grow several other plants particularly well—in fact, they make them a *specialité*; they are Crotons, Cyclamen, and in a lesser degree Palms and pot Vines, while they cultivate, of course, a collection of general nursery stock, including hardy plants and plants under glass.

We will mention first the Amaryllis, for doubtless Mr. Ker would class them as most important. Not only are these plants well grown in this Liverpool nursery, but Messrs. Ker often exhibit them well also. And that they are prepared to go to very considerable trouble and expense in upholding the fame of English-grown Amaryllis was well exemplified by the splendid exhibit sent to the Ghent Quinquennial show. The plants were universally admired, as well for the good culture evidenced as for the distinct and finely-coloured varieties included. At the time we noted the best of them, so there is no need to do so again, and, in fact, it would not be possible to do so altogether, for they are over. We must, however, mention one variety called *Exquisite*; it is undoubtedly one of the best yet raised. It is a large asymmetrical bloom of most attractive colour, crimson-lake margined with white. Primrose Queen, also a large flower and almost white, is worthy of special note. Several houses are filled with Amaryllis, all of which are growing in pots. A great many are unflowered seedlings, and as they are already vigorous plants, with eight or nine leaves each, some are certain to flower next year. We were informed that as a rule about two years and eight months elapse between the times of seed sowing and flowering. It may be of interest to give the exact composition of the soil in which the bulbs are potted, viz., three parts of loam, one part of leaf-soil, with a fair quantity of sand and some artificial manure intermixed. The plants are growing in low, wide, span-roof houses that admit a maximum of light. They remain in these warm houses during summer and are wintered

in others unheated, but from which, of course, frost is excluded. It should be mentioned also that the plants are plunged almost to the pot-rims in a bed of ashes. They are well syringed during bright weather.

Crotons are hardly a less important item than the Amaryllis. The Aigburth Nursery (as Messrs. Ker's nursery is known) is the home of several well-known Crotons; we may mention for instance Aigburth Gem, with pretty leaves of the form known as "interrupted" (each leaf consists apparently of two leaves joined together by a thread) and Aigburthensis with narrow, green marginal yellow centred foliage, both these popular ones were raised in the Aigburth Nursery. Besides these all the best of other raisers' varieties are cultivated. We saw many good plants of *Croton Reidii*, *Flamingo*, *Prince of Wales*, *Hawkei*, *anetumensis*, and other good ones.

The Cyclamen, too, were splendid, and, like the other plants mentioned, their culture is evidently perfectly understood. Thousands of plants, recently potted into flowering pots, were in the best of health, and most creditable to the cultivator. Among other plants grown under glass that should be mentioned are Palms and Cannas. The former are largely grown, and among the latter we noticed several new varieties that are as good as we have seen this year. For size of bloom and richness of colouring they were all one could wish, and demonstrated forcibly the great improvement that has been made in this flower of late years. With reference to the plants growing out of doors we will not write of them in detail further than to say that among shrubs the Hollies were most noticeable, many good varieties are cultivated, and we saw some large plants of several. Fruit trees are also grown in quantity, and the same may be said of hardy herbaceous perennials.

THE INDOOR GARDEN.

THE MOST USEFUL PALMS.

(Continued from page 172.)

PROPAGATION.

WITH the exception of the *Elm*, all the Palms described are increased only by seed, and which is ripened in this country. As some of them at least do not long retain their germinating power they are as a rule sown as soon as possible after arrival, hence nurserymen seldom offer them for sale, preferring to sow them and sell the young plants afterwards. Nevertheless, they can sometimes be obtained, for large quantities are sold in the London auction rooms. In sowing the seeds it will be found that they germinate all the more readily if soaked for twenty-four hours in water at a temperature of 80° to 90°, but not more. The pans prepared for sowing the seed should be thoroughly but not excessively drained, with suitable compost for the purpose is good, lightened by a little well-decayed leaf-mould, peat and sand. This soil must be pressed to a moderately firm, leaving sufficient space to sow the seeds, covering them with about their own depth of soil. The best place for the seeds after the time to plunge the pans in a gentle bottom heat in a stove, but though established plants of many years will thrive in a greenhouse, yet they are greatly helped by a little additional heat at their earlier stages. After sowing sufficient water should be given to keep the soil fairly moist, the saturation stage must be avoided. When young plants make their appearance a good time to pot them off singly into small pots is just as the first leaf is developed, for if done then they start away into the new soil, whereas if allowed to grow larger before potting many of them will greatly check the removal. Small pots should be chosen for the first potting, as most Palms when large are impatient of a mass of soil over the roots. A compost such as that in which the seed was sown, will, if passed through a sieve of half an inch mesh, do well for potting off the young

plants. After potting they should, if possible, be again plunged in a gentle bottom heat, as if checked during their earlier stages they take a long time to start again. A liberal use of the syringe is beneficial even among small Palms; indeed, frequent syringing will generally keep the soil almost if not quite moist enough. As the pots get full of roots the plants must of course be shifted into larger ones. The seeds of many Palms germinate very irregularly, that is to say, a few only will make their appearance at first, and from time to time some more will push through the soil. When this happens the early ones should be carefully lifted with a pointed stick without disturbing the others, and then potted into small pots, leaving the pan until another crop appears above ground.

CULTURE.

Palms as a rule succeed best in a fairly shaded structure, and atmospheric moisture is also beneficial, hence they may with advantage be syringed two or three times a day. This also tends to keep them free from red spider, which, if the structure is kept too hot and dry, is in the case of some sorts apt to cause the foliage to turn yellow. The amount of water required will largely depend upon the condition of the roots, as in the case of well-rooted and drained plants it is scarcely possible during the summer to give them too much, whereas if they have been newly potted the watering must be carefully done, otherwise the fresh soil into which the roots have not yet penetrated will turn sour, and the plant is consequently liable to fall into ill-health.

Palms may be potted at any time from March to August, but the best months for the purpose are April and May. For most Palms a loamy soil is more or less necessary; a suitable compost for all free-growing Palms is good turfy loam two-thirds or three-quarters, according to its consistency, and the remainder made up of leaf-mould, well-decayed manure, and sand. Repotting should not be done unless necessary, for Palms are often irreparably injured by being put in pots too large for them. Many of this class of plants form stout deep-descending roots, which coil around the bottom and lift the ball of soil out of its place. For such as these an ordinary shaped pot is not deep enough unless its diameter is far too great, hence many cultivators that are conveniently situated as to a pottery have pots made considerably deeper than usual for some of the Palms. When the roots are tightly coiled round the bottom of the ball the crocks that were originally put in for drainage should not be removed, as it is impossible to do so without bruising the roots, which will soon injure the plant. The soil should be pressed down moderately firm, particular care being taken not to leave any vacant spaces around the old ball of earth. Palms of all kinds are greatly benefited by the foliage being kept quite clean, and if necessary they must be thoroughly sponged. If scale makes its appearance it should be borne in mind that a stitch in time saves nine, and if carefully sponged with soft soap dissolved in warm water these pests may soon be eradicated while they are still few in number, but if allowed to increase they are not so readily destroyed. Palms are benefited by an occasional dose of liquid manure or one of the many soluble manures that are now on the market.

As seedling Palms make slow progress during their earlier stages, most people buy them from nurseries when they have attained a fair size. In purchasing plants in this way remember that where Palms are grown in quantity for sale they are kept much warmer than is absolutely necessary for them, in order that they may attain a saleable size more quickly than they otherwise would. Such being the case, when Palms are obtained from nurseries the better way will be gradually to harden them off before they are treated as plants that have not had such a tender upbringing.

PALMS IN THE DWELLING-HOUSE.

Enquiries are frequent as to the treatment of Palms in the dwelling-house. A good sponging with milk-warm water about once in ten days or a fortnight on the under sides as well as on the upper surfaces of the leaves is very beneficial, except in

very cold weather. Then in summer the well-rooted ones should be liberally watered, but on no account must the water be allowed to stand in the ornamental pots, vases, or saucers in which they may be placed. The plants should never be so placed that the sun after 8 a.m. shines directly on them. In winter remember that the window is

SIDALCEA CANDIDA ROSY GEM.

(Given an award of merit by the Royal Horticultural Society, September 15. From Messrs. T. S. Ware, Limited, Feltham.)

the coolest part of the room, hence on frosty nights the plants should be removed to the middle of the room away from all direct exposure. H. P.

MISCELLANEOUS.

SIDALCEA CANDIDA ROSY GEM.

MESSRS. T. S. WARE, LIMITED, Feltham, showed this new addition to a somewhat neglected genus on the 15th ult. at the Drill Hall meeting of the Royal Horticultural Society, when it obtained an award of merit. It is highly probable that this variety is of hybrid origin. The flowers are of a deep rose colour and very

attractive. They are as large as a florin, and profusely borne on stems 3½ feet high. It is without doubt an excellent autumn-flowering plant.

TOWN FRONT GARDENS AND HOUSE DECORATIONS.

WHILE it may be unfair to assume that the borough of Kingston-on-Thames is alone in its efforts to promote the beautifying of the town by offering prizes for front flower gardens and house front or window floral decoration, yet does it set an example which towns universally might well follow. Recently the fifth of a series of competitions was held, and now for their purpose the town is divided into north and south sections, these being in area and in population about equal. There are in each section classes for gardens over half a rod in area and for smaller ones, also for the handsomest house front or window floral decoration. There are five prizes in each class, the highest amount being 20s., or thirty prizes in all. The entries are limited to houses not rated over £20, and of that character there are literally thousands in the borough, as the working class element largely dominates. The judging is done as a rule during the month of August, not only thus enabling competitors to have their gardens well furnished, but they are also thus compelled to keep them in the best possible condition well through the summer. The competitors include persons of diverse vocations—garden labourers, small tradesmen, mechanics, and ordinary labourers. There seems to be no limit to the vocations, which includes men having essentially garden tastes, and the competitions show in a forcible way that true gardeners are those born to gardening rather than those who may become gardeners accidentally. Efforts to depict some of these small gardens have hardly been successful because of their severe limitations and artificial surroundings. House fronts come out best, and the photograph shows, though perhaps imperfectly, one of the prettiest town fronts to be seen on a labourer's cottage anywhere. It is the residence and work of an employé of the corporation named Norris. This man, who is, we believe, a carter, has secured the first prize in the house front class on his side of the town each year, but his arrangement has never been prettier than it is this season. The cottage is one of a row looking north-east, and situate in the Cambridge Road, a thoroughfare along which passes a heavy traffic. The face of the cottage is neatly draped with Ampelopsis, thus forming an admirable background and framing for the well-filled window boxes on the sills above and below, and also for the many plants in pots and baskets that are either suspended from the house or stand securely fixed on brackets. The doorway, too, is charmingly decorated in this way, and the whole forms a picture such as arrests the attention immediately of all who pass by, and is a feature of which any town might well be proud. Fuchsias, Ivy-leaf Pelargoniums, Lobelias, Campanulas, and many other plants all help to produce a singularly charming effect. There are in the town very many other floral effects, and all beautiful of their kind, while the gardens, large and small, contain in most cases very charming features, worthy of all praise and encouragement. A. D.

FLOWERS IN GREENWICH PARK.

ALL those who go to see the flower-beds in Greenwich Park cannot but congratulate Mr. W. J. Marlow, who has succeeded Mr. Webster in the post of superintendent. Among the more notable changes which have come about under his rule are that the sward in the enclosure and thereabouts is shorn close instead of having paths cut through, with the result of a beautiful emerald

setting to the flower-beds and license to the visitor to stroll here and there at will. All the plants are labelled with both scientific and common names. Among the more striking plants which go to make up the floral display around the lodge are fine specimens of Hydrangeas, Cannas, Abutilons, and Celosias. Set by themselves in the sward are *Phoenix dactylifera*, the Coral plant, *Latania borbonica*, *Araucaria excelsa* (the Norfolk Island Pine), and *Dicksonia antarctica*, all doing very well indeed. In the lake the Water Lilies are in bloom, and a gallant show is to be expected here next year, when some twenty varieties of Lilies in various shades of red are expected to come into flower. In the beds in the lake enclosure flowers of old and new fashion flourish side by side. *Convolvulus minor* is there in great masses of blue, set off by the dark red of the feathered coxcombs, masses of *Phlox*, *Marigolds*, *Mignonette*, &c. Something that attracts a great deal of attention is a bed of curious Cacti, although at present they are not in bloom. To walk along the paths is to feast the eyes upon a floral panorama, and it is good to have it on the authority of Mr. Marlow that there is absolutely no trouble with the public in the matter of the regulations which forbid the plucking of the flowers—even children are content to gaze, and leave the blossoms that please them to charm others.

Another portion of the park where the flower lover may find much to please is close to the Ranger's Lodge, where a great Cedar and a Copper Beech keep guard over the beds. In the nurseries bounding that portion of the park known as the Wilderness preparations are even now being made for the spring, and Primroses and vernal plants are being got ready for transplanting in the park. Mr. Marlow and the forty or so men under him have to use their time economically and well that the park may always present such a picture of perfection as it does at present.—*Kentish Mercury*.

NOTABLE GARDENS.

RECENTLY I was enabled to take four days' holiday, and resolved to see all I could of gardens in the time, as in such a way I find the best enjoyment. In that brief period I saw six gardens. My first call was at

SHERBORNE CASTLE, DORSET,

where I had, as usual, a hearty welcome from the gardener, Mr. T. Turton. Like so many other gardens these have suffered severely from the ungenial season, and there is little of outside fruit. Within the houses there is, or has been, plenty. Vegetables are capital here, and I saw the finest bed of spring-sown Onions I have been privileged to see anywhere this season. The varieties were *Maincrop* and *Veitch's Globe*. On an outside wall with a south aspect *Solanum jasminoides* was blooming luxuriantly. On a raised border fronting a plant house is a glorious mass of *Portulaca*. The soil is full of seed, and, no matter how dug, there is a glorious mass on it every summer. A beautiful tall annual much liked here for vases is *Sutton's Empress*, double carmine annual *Larkspur*. It grows fully 3 feet in height.

CHEDINGTON COURT.

My next call was at this beautifully situated residence of a great garden lover, Sir Henry Peto, Bart. It is some four miles from Crewkerne, faces west on a lofty elevation, and looks out over a vast extent of beautiful pastoral country. The gardens are not large, but handsomely timbered, and there are some fine specimens there. Specially fine was a perfect *Thujopsis borealis* 30 feet high and 26 feet through, a splendid object. As a background to one lawn is a row of *Thuja Lobbi*, of great height, and forming a dense face 100 feet long. What a remarkably fine background and break these *Thuyas* make. Just fronting them stand out several Irish Yews of the most perfect proportions, each of considerable height. The whole with its base of low shrubs makes a most

effective piece of planting. A good deal of the lower grounds, especially under a magnificent grove of Horse Chestnuts, is planted with bulbs, and wild gardening is being largely introduced. It is just the place of an enthusiastic amateur gardener as is Sir Henry Peto.

MELBURY.

The second day of my outing was largely occupied with a drive of some seven miles to Melbury, with my old friend Mr. J. Crook for company. Melbury is, indeed, a very fine place. The park is a most extensive one, and is grandly wooded. Some of the trees in it are of huge size and noble in form. The deer and fine cattle in it help to make it a truly delightful place. The mansion is of great dimensions, and climbers are used on it with good effect. Within the enclosed pleasure grounds is planted a remarkable collection of trees and shrubs, the place forming in that respect a notable arboretum. The green and golden forms of *Taxus Dovastoni* are especially good, and conifers generally thrive luxuriantly. There is a fine lake fronting the mansion, and on that side is a noble occidental or cut-leaved Plane such as is rarely seen. In a bed near to a mass of *Verbena Miss Willmott* was a rich scarlet variety named after the noble owner, Lord Ilchester, that merits wide cultivation.

FORDE ABBEY.

It was a long drive of twelve miles later in the day from Chedington Court to Forde Abbey, near Chard. This charming old place is most interesting, and standing on the upper part of the sloping lawn, near which is one of the finest *Pinus insignis* in the country, and from there looking down on the whole front of the ancient building charmingly clothed with climbers, it is not possible to withhold a warm tribute of admiration from the taste which characterised the architects of the remote days of its erection. Just now I found most interest in the kitchen garden, where on cool borders Mr. Crook has a huge batch of *Polyanthuses* such as will make a beautiful show next spring. He, too, has very little outside fruit, but has plenty of Grapes, Peaches, &c., within houses. His splendid rows of *Runner Beans*, of a first-class stock, were fruiting marvellously, and there was, forming a tall, dense hedge on either side of a long walk, *Canary Creeper* 8 feet in height and a remarkable show. How very beautiful were *Sweet Peas* *Salopian* and *Lady Grisel Hamilton* blending with this creeper.

CRICKET ST. THOMAS,

a few miles from Forde Abbey, to which I paid a short visit on the third day, is a singularly charming place, and is situated on the margin of a deep valley or gully, through which flows a broad stream—the *Axe*—that is here and there broken up into a series of small lakes. The grounds are admirably laid out and effectively planted. Many years since a former gardener, Mr. S. Lyons' predecessor, constructed an extensive rockery, which is now getting well covered with various suitable plants, although in the formation spaces for planting were rather cramped. There are extensive kitchen gardens and many fine plant and fruit houses. In one there are numerous Peach and Nectarine trees grown as cordons, planted 5 feet apart. These have single straight stems, the branches on either side radiating off and furnishing every inch of the roof. Not only in that way is a house soon furnished, but a dozen varieties can be grown where but two ordinarily are. This charming place is now the residence of L. Fry, Esq.

HACKWOOD PARK.

On my way home on the fourth day of my outing I called at Basingstoke, and walked out to Hackwood Park, Lord Bolton's fine Hampshire residence, to see Mr. Bowerman's vegetables. The walled-in garden of some six acres is one of the best in the kingdom, and its noble, broad grass walks and flower borders add to its unwonted charm. In spite of the general paucity of fruit on the walls, on which there is a grand lot of trained trees, every care is bestowed on them in the hope that the present year's scarcity may be followed by others of plenty. The new *Runner Bean* growing here, and well named *Hackwood Success*, is, indeed,

a grand stock, carrying a wonderful crop of fine long pods. Winter-raised Onions are always very fine, and all vegetables are of the best. The ground is deeply trenched each year, although the chief manure is leaf-mould. Potatoes are splendid crops, especially *Up-to-date* and *Sir J. Llewelyn*, with not a vestige of disease visible in the tubers. The Spruce woods are a remarkable feature, and contain really superb trees. A. D.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

DISEASE-RESISTING POTATOES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In the notice of exhibits at the Drill Hall on the 15th ult., which appeared in your issue of the 19th, you state that *Recompense* Potato is a hybrid between *Beauty of Hebron* and *Champion of Scotland*, both good disease-resisting varieties. The great importance of really disease-resisting varieties of Potatoes is becoming yearly more marked, hence my reason for troubling you. I am convinced that we ought to cull as much good from such serious seasons as the present as possible. One man near me has ploughed in eight acres of diseased Potatoes, and I hear many others have suffered as cruelly. But surely there must be really valuable sorts that come through such a season as this sound and free from disease; and it is to be hoped we shall not for many years have such an opportunity of practically proving the best of all disease-resisting sorts.

If such of your readers as grow Potatoes would write you their experience of the disease-resisting qualities of the different varieties they grow, with the nature of soil grown upon, &c., and any other particulars, it would be of the utmost value to Potato growers in general. And if, when the correspondence ended, *THE GARDEN* would publish the results in a tabulated form, such would prove an inestimable boon to growers of the tuber. I notice on page 206 a letter from "W. S." of Wills. Similar letters from all parts of Great Britain and Ireland would be invaluable.

Messrs. James Carter and Sons of Holborn secured the contract to send some hundreds of thousands of tons of *Champion of Scotland* to Ireland, after the last serious Potato famine there about 1868, as the best disease-resisting Potato of the day. *Beauty of Hebron* is always considered the best disease-resister of the American sorts. This is the second year I have grown my new variety *Recompense*, and it has never yet shown the slightest sign of disease, but every tuber of it so far has been perfectly sound and the picture of health, although some greatly-lauded new varieties growing next to it were much diseased. I have this year grown the following varieties quite free from disease: *Evergood* (Finlay), *Northern Star* (Finlay), *Edward VII.* (Butler), *Schoolmaster*, *Early Puritan*, *Snowdrop*, *Sharp's Victor*, *Rivers' Royal Ashleaf*, *Up-to-date* (Finlay), *Empress Queen* (Finlay), and *Recompense*. These varieties were all grown upon a heavy, tenacious clay, and were often for days in a complete puddle of water. I do not know if it is right to include the last named (*Recompense*), as it will not be offered for sale until after next season.

East Horndon, Essex.

G. R. KING.

[We hope that others interested in Potato culture will be so good as to send their experiences concerning the best disease-resisting varieties.—Ed.]

BOUVARDIAS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was much interested in the notes of A. Hemsley, in *THE GARDEN*, page 197, respecting *Bouvardia* King of Scarlets, which certainly is, I consider, the finest of all *Bouvardias*. I quite agree with him that they are very useful for winter flowering. He appears to advocate pot culture. I find the following method most satisfactory: In

the first place, cuttings are best from the root; insert five or six round the edge of a 5-inch pot, and place in a warm propagating case, temperature 65° by night and 70° to 85° by day, with a close moist atmosphere; these will be found to root readily. When rooted pinch out the points to produce bushy plants and remove to a cooler house, with a temperature of 55° by night and 65° to 70° by day, keeping them well syringed. When the plants have started to break pot singly into 3-inch pots, shade from bright sunshine, and syringe twice daily.

When the pots become full of roots the plants may be removed to a cool frame, admitting air at all times when favourable, and about the end of June or the first week in July plant them out in a frame, keeping the lights on for a few days, and then remove them entirely for the rest of the summer. They should, however, be put on to keep off very heavy rains. The soil for planting should be rich, consisting of two parts good loam, one part leaf-mould, and one part rotten manure. About the first week in September is a good time to place the plants in their flowering pots, but before doing this they should be cut round with a spade a week before lifting; they then go into much smaller pots. After potting place in a cold pit on ashes, keep well shaded, and syringe once or twice a day. After a few days the shade may be left off and then admit air by degrees. If flowers are wanted early place the plants in a warm house, but if wanted in winter keep cool for a few weeks and then move to a warm place. Treated in the above way I have successfully grown *Bouvardias* much finer than keeping altogether to pot culture. The best varieties I consider are King of Scarlets, Humboldtii, Jasminoides, Dazzler, President Garfield, President Cleveland, Purity, and a very pretty little one is *angustifolia*.

J. S. HIGGINS.

The Gardens, Corwen, Rûg, North Wales.

THE KITCHEN GARDEN.

RUNNER BEANS.

YOUR correspondent Mr. E. Beckett expresses surprise that the old short podded varieties of Scarlet Runners should still be grown by market gardeners. I go even farther and express some surprise—because I know the market grower pretty well—that he has not ere now got away from his old plan of growing these Beans as pinched dwarfs, and adopted the garden plan of growing them on tall rods. In the course of some visits to good gardens recently I have seen splendid rows of Beans so grown, and as compared with the produce of the market or field rows on the dwarf method the crops have been almost astounding. Did our market men but cast off the old short podded varieties and grow those new ones, of which Hackwood Success is so fine an example, they could not do justice to them. Still further I feel assured that if the very finest of long podded varieties be thus grown, even for seed, they would in time lose their greatly improved character, and gradually revert to the short podded type; grown literally on the ground, with the strong climbing bine subdued by pinching, the quality of the stock must inevitably deteriorate.

When the other day at Hackwood Park, Basingstoke, I saw three long 10 feet high rows of Mr. Bowerman's superb selection Hackwood Success. As grown there the stock is, indeed, a splendid one; all the pods of great length, very straight, fleshy, green, and tender for cooking, even when from 10 inches to 12 inches long, but apart from the length of pods the quantity was remarkable. How many bushels of edible pods might be gathered in an ordinary season it would be difficult to say, but it would be a surprising number. The pods, too, being so densely hung would be easily and cheaply gathered, and the fine, young, clean straight sample should readily obtain fully 1s. per bushel more than would the rather poor bent and too often old sample got from field rows.

But at Forde Abbey, Chard, Somerset, I specially noted a row admirably staked of Mr. J. Crook's fine selected long podded Scarlet Runner, just 60 feet long and 9 feet in height. It was as perfectly furnished a row of Runner Beans as I have ever seen. On each side from top to bottom the Beans hung in great profusion; indeed, the crop was singularly abundant. Calculating that both sides the row gave a superficial area of 120 square yards, and reckoning that each yard would during the season produce a peck, that would work out for the row at thirty bushels, which at 3s. per bushel, not a big price for a first-class sample, would give a return for the row of £4 10s. What vegetable is there that would pay better, even after cost of rods, seed, labour, and manure was deducted? Were an acre of good ground well trenched in the winter and heavily manured, then sown with high-class Runners for staking, as described, at 10 feet apart, using the intervening ground for early dwarf Peas, followed by Lettuces, Radishes, Endive, or similar low crops, the produce would run in value to materially over £120 per acre. A. DEAN.

NATURALISING SPRING-FLOWERING BULBS AND PLANTS.

(Continued from page 223.)

As to soil, a good loam is best suited to the requirements of the majority, and I am inclined to prefer it rather stiff than too light. The grouping should be done in as informal a way as possible, in drifts and masses, in open places among the trees, on the margins of shrubberies, and in orchard or meadow grass, keeping the tall-growing varieties separate from those that are dwarf, and the trumpet Daffodils from the star Narcissi. The white trumpets should not be mixed with the yellow ones, and the dwarf kinds should be planted nearer the path than those that are more robust, as they are easier to see when not too great a distance from the pathway.

The best time to plant is in August and September, but they may be planted much later with good results.

There are besides the Daffodil many other spring-flowering bulbs and plants that will do well in the wild garden, and I will name a few which will be most likely to give the best effect.

Winter Aconite (*Eranthis Hyemalis*).—This is a hardy little plant about 6 inches high, which blooms with or before the Snowdrop. A rather light porous loam suits it best, but it will grow in any soil. It thrives under the branches of deciduous trees, and should be planted freely to cover bare places round the trunks of trees, where, owing to the dense leafage during the summer, other vegetation will not grow. The flowers are yellow, and are borne on short erect stems, which rise through a quaint little frill of green. They seed freely, and soon become established. The foliage dies down early, so that it does not interfere with mowing in the summer.

The Snowdrop delights in a cool bank with rather open soil, and spreads freely in shady places under trees, where it gets the protection of a carpet of fallen leaves during the winter, and shade from the hot sun in summer. There are several varieties, but the common single (*Galanthus nivalis*) and double are the best for naturalising. The bulbs should be planted close together for good effect.

Crocus.—This spring bulb is one of the best to plant in grass. Select open sunny places facing south, where the grass does not grow very long. Plant them in broad masses and the effect on a bright sunny spring morning will be glorious. The purple and white

varieties blend well together, but the yellow are, I think, best by themselves. The purple *Crocus* seeds freely. Do not plant the bulbs deep; 1 inch below the surface is quite deep enough.

Scilla.—Besides the common wood Hyacinth or Bluebell (*S. nutans*) there are other varieties such as *S. siberica*, which are very suitable for planting in the grass; but none are so useful, perhaps, as the common Bluebell, which clothes so many of our woods with sheets of blue every spring. It should be planted in places where the grass is not mown, as it is late in ripening its seed and dying down.

Anemones.—The single and double white wood Anemones do very well in the grass and open spaces in woodlands where the herbage does not grow strong. The blue Anemone *apennina* also, which harmonises so excellently with the yellow of the Daffodils, should be planted freely amongst them, remembering, however, that the Anemones require the full sun to induce them to open their flowers.

Chionodoxa Lucilæ is one of the most beautiful of the early dwarf spring-flowering bulbs. It is perfectly hardy, and should be naturalised on banks and in the grass, where its sprays of drooping blue flowers with their white centres are very effective, especially when planted with the pale yellow Daffodil *pallidus præcox*, which blooms at the same time.

Muscari (*Grape Hyacinth*), with its lovely little conical heads of tiny clustering blue flowers, is another very good subject for naturalisation; the bulbs should be planted quite close together where the grass is not too coarse; it prefers a bank to flat ground; height about 6 inches.

Erythronium Dens-canis (the Dog's-tooth Violet), a very beautiful drooping rosy lilac-coloured little flower, about 6 inches high, with spotted leaves, does very well when established.

Fritillaria Meleagris (the Snake's-head Fritillary), both the purple and white varieties, with their chequered drooping bell-shaped flowers on their slender stems, are suitable for planting in rather cool, low-lying grass land. They spread when they become established if they are allowed time to mature their seed, which they produce freely. The seed is generally ripe about the middle of July. It is easy to gather the seed-pods, however, before the grass is cut and ripen them in a sunny window, sowing the seed when the ground has been cleared.

Pulmonaria (*Lungwort*).—A very useful and early-flowering little plant, about 8 inches high, with flowers opening bright pink and turning to blue before they fade; the foliage is dark green, spotted with paler green. It grows well in shady, rather damp places amongst shrubs, where it can be left undisturbed all the year round, and where it will cover the ground with a mass of leaves and flowers in the early spring.

Saxifraga granulata flore-pleno (the double meadow Saxifrage).—This bears several pretty little double, Rose-shaped, greenish white flowers on each stem about 8 inches high. Will grow in almost any situation and in any soil where there is little or no other vegetation. Even under Beech trees it will form a colony with its slender stems and clusters of drooping flowers.

Doronicum (*Leopard's Bane*).—This has yellow flowers. It grows from 2 feet to 4 feet high, and is very useful for covering rough places amongst shrubs and in woods, and will grow, though less vigorously, on bare places in the grass where it gets a little shade.

The common *Primrose* should be on every bank. It will, if allowed to mature its leaves and seed during the summer, soon carpet the ground with its sweet flowers. If planted in masses on the margin of a shrubbery it is very pretty.

Polygonanthus.—The beautiful sweet-scented bunch *Primrose*, so useful for cutting, should be planted in half-shaded places amongst shrubs and on the margin of woodlands. They enjoy the sun when in bloom, but resent being burnt up during the summer. The illustration, although it does not show the dark varieties at all clearly, will give an idea how they may be planted at the edge of a rough shrubbery or woodland. The ground was turned over and plenty of leaf-mould added to give them a start, and the plants were some which had bloomed their first season in the garden and had grown too large for their quarters there. The variety of their colouring is one of their great charms. They are easily raised from seed sown in the spring in boxes or pans in a cold frame, and if pricked out when large enough to handle they will be ready to plant about June or July, and will give an abundance of bloom the following spring, or the seed may be sown in the autumn in a piece of ground prepared for them in the open, and they will then begin to bloom the next autumn, but will not produce many flowers until the spring following.

The above should, each and all, if care is taken to plant them in suitable positions, give good results, and be as pleasing, if not more so, than many of the delicate things which require the protection of glass during winter. There is one great satisfaction in this natural gardening, and that is, when it is once well done it is a permanency, and needs little or no attention afterwards. There are some bulbs in the grass here which have bloomed year after year, ever since anyone can remember, and they will in all probability go on doing so indefinitely if left undisturbed. There is also the pleasure each year of adding some new group and looking forward during the winter to seeing the result.

I will now shortly describe what I have found to be the best method of planting bulbs in the grass. The rough sketch of a tool a local blacksmith made for me from my own design may be useful. I find it answers very well for making the holes in the turf. It punches out a piece 4 inches in diameter to the depth required, and the turf which it lifts is pushed out at the top by the act of punching out the second one. If made rather heavy it will almost by its own weight penetrate sufficiently deep into the ground for planting all but the very large bulbs. If a deep hole is required it can be forced into the ground with the foot on the cross stay. By using this tool a great many holes may be made in a short time, and they are large enough to take the largest bulbs quite comfortably, and of smaller ones, such as Snow-

drops, six or more may be planted in one hole.

It is well to break some of the soil from the turf punched out and crumble it round the bulb when in position before replacing the turf and treading it down. The proper depth to plant most bulbs is about twice their own depth, measured from the shoulder to the base of the bulb. I have tried many other ways of planting. Raising the turf with a spade with a V-shaped cut is not a bad way, but one cannot this way get much idea of the shape of the group that is being planted. A dibber may be used, but it should be a large one, and the holes must be filled with prepared soil placed beneath and over the bulbs, or there will be a cavity beneath the bulb, which is very bad, and, if the soil is at all stiff, a dibber leaves the sides of the hole it makes very hard and unsuitable for the roots to get hold of. Another way is to skim the turf off, loosen the soil beneath, plant the bulbs and replace the turf; but there is one thing against this—a number of bulbs all forcing their way through at once may lift the turf.

I like when arranging groups to make all the holes before beginning to plant the bulbs, and by placing each little turf by the side of the hole it came out of a very good idea will be gained of what the group will look like. When planting the smaller bulbs make the holes quite close together, and those for the larger ones farther apart, according to size. Do the work thoroughly, remembering that it will be permanent, and bulbs once planted in grass are not easy to get up, and a good group well arranged need not be disturbed, but will each season be more beautiful than before, and there are few garden effects more pleasing than that produced by spring flowering bulbs well planted in the grass.

There is one very important thing to remember, and that is, never to cut the foliage off any bulbs or plants until they have died down, and for this reason it is well to select a position where you will not be tempted to cut the grass before the second week in July at least, and it should be left still longer where such late flowering *Narcissi* as the *Biflorus* and the double *Poeticus* are planted.

Bronwylfa, St. Asaph. W. A. WATTS.

ORCHIDS.

ODONTOGLOSSUM CRISPUM AND ALLIED SPECIES.

FOR many years past *Odontoglossum crispum* has been, and still is, one of the most popular Orchids ever imported. Its usefulness and beauty combined are not excelled by many others in cultivation. The varieties of this species are very numerous, and some can be bought for a few shillings, while others cannot be had for less than a thousand pounds. The former are, nevertheless, beautiful, and for decorative purposes are more suitable than the valuable ones.

CULTIVATION.

Generally speaking, *Odontoglossum crispum* is one of the easiest Orchids to grow, yet to get perfection of growth and flowers requires perseverance, cultural skill, suitable houses, and, in addition to these, a proper position also. To bring out the true character and colouring of the flowers of the spotted forms of *Odontoglossum crispum* is of the utmost importance, yet this is never done unless the plants are grown in suitable places. For instance, if a spotted form of *O. crispum* is grown in a district suitable to them the commercial value of the plant may be one hundred pounds; remove the same plant for a year to another district, allow it to bloom and it may

not then be worth one hundred shillings, yet the health of the plant may have remained unimpaired and the size of the bulb increased.

IMPORTED PLANTS.

Examine these as soon as they arrive, cut away dead and decaying bulbs, clean, and make tidy. If sound and otherwise in good condition they may be potted up without delay; if, on the other hand, they are shrivelled and there are signs of decay in many of them, they should be laid out upon the stage in a well shaded part of the house upon sphagnum moss or some damp material and occasionally sprayed until the young growths are on the move, when they should be potted up (in not too large pots) in the usual way.

REPORTING.

With *Odontoglossum crispum* and its allies September is a favourable month to perform this work. Root disturbance during very hot weather is injurious to them, while in autumn they have time to recuperate before winter sets in. It is therefore a suitable time to look through the *Odontoglossum* houses and repot, if necessary, any that are in or near the proper stage, i.e., when the young growths are a few inches long. Do not disturb the plants unless they really need it; resurfacing with fresh sphagnum moss will suffice for those that have sufficient rooting space. When it is not necessary to disturb the plants with the object of placing them in the correct position in the pot, they should be transferred intact. A good general compost for *Odontoglossums* consists of chopped sphagnum moss and good fibrous peat in equal proportions, with chopped Bracken rhizomes used as a substitute for crocks, filling the pots about half their depth with this substance and the remainder with the above-mentioned compost, pressing it moderately firm, and working in among it a few rhizomes to allow a freer passage of water. *Odontoglossums* also grow equally as well if potted entirely in leaf-soil, with one or a few crocks over the bottom of the pot. The leaf-soil must not be too dry and by no means wet, and placed moderately firm and evenly round the roots of the plant, the base of the latter being kept just below the rim of the pot, which should be filled with leaf-mould to within half an inch of the top, and finally surfaced with a layer of fresh, finely-chopped sphagnum moss.

F. W. THURGOOD.

Rosslyn Gardens, Stamford Hill, N.

CULTURE OF ODONTOGLOSSUMS.

THESE are among the most popular of Orchids. Their culture is so easy that all who possess a glass structure should have a few varieties of them. A house having a temperature varying from 45° to 55° will suit them. *Odontoglossums* like plenty of light, and therefore should be shaded only from direct sunshine. Being very impatient of root disturbance, they must not be potted except when necessary; chopped sphagnum and peat is the compost generally used, but I strongly advocate the use of Belgian leaf-soil and sphagnum. Place the plants near the glass, and during the growing season give plenty of water. Damping the stages with liquid manure water has a beneficial effect upon the plants. Ventilation is an important factor, and, when possible, air should be admitted to the house under the stages. The atmosphere of the house should never be allowed to become stagnant. Being evergreen, *Odontoglossums* do not, as some suppose, require to be kept dry during winter. Water may be withheld for a time, but on no account should the compost be allowed to become dry.

Imported plants by the time they reach the cultivator's hands are in a very shrivelled condition. First of all, cut out all rotten and useless bulbs, and place them in boxes in which has been placed some damp sphagnum. They should be potted as soon as they show signs of growth. Imported plants should never be placed in a high temperature to start them.

JOHN R. MORGAN.

Waddesdon Gardens, near Aylesbury.

DAHLIAS AT CRAWLEY.

THE enviable position attained by Messrs. J. Cheal and Sons as Dahlia experts justifies one in expecting to see a display of a somewhat unique kind when visiting their well-known nurseries at Crawley, Sussex. There is, indeed, a most representative collection, each type of this glorious autumn flower having a large area devoted to its culture. For the single-flowered sorts Messrs. Cheal have long been famous, and on the occasion of a recent visit, notwithstanding the severe undergrowth of the previous day, the singles were in fine condition. Recently in THE GARDEN the appearance of the old decorative Dahlias was greeted, but this should not give lovers of these flowers much concern, as with the singles, Pompons, and the erect-flowered Cactus Dahlias of to-day we have plants for garden embellishment of which too much cannot be said in their praise.

THE SINGLE-FLOWERED SORTS

Lowfield Nurseries, Crawley, were a picture, for rich and pleasing colours, combined with purity and elegant form, creating an effect in the garden which few persons are probably aware they are capable of. Some of the more noteworthy single-flowered varieties are Hugo, a rich scarlet, shaded purple, and a plant with a good habit; Emma, a rich dazzling crimson self, with a plain disc, making a fine contrast; Columbine, a brilliant rose colour, with stiff erect stems and flowers of perfect form, and a bushy habit; Lady's Eye, a pretty mauve-coloured flower, with a crimson ring round the disc; Snowdrop, a finest white single yet introduced, being a seedling raised by this firm. This plant is to be put out in the spring of 1904. Another new sort raised by the Messrs. Cheal is Serita, being a splendid companion to the last named, but in this instance the colour is a rich crimson, with a purple shading towards the margin of the florets. At Crawley this sort is regarded as a perfect "garden" plant. The best striped sort undoubtedly is Meta, a deep orange, striped and shaded crimson-scarlet. There were many other really first-rate varieties, but space does not allow one to describe them. Hard by

THE POMPON VARIETIES

were most interesting. The plants were making a really fine display, their freedom of flowering being quite remarkable. The better Pompons, which, of course, were represented by small to medium-sized blooms, were easy to distinguish, and the following were the more noteworthy varieties: Bacchus, an old and tried sort, colour bright crimson-scarlet, very neat compact flowers; Darkest of All is, as its name implies, a very dark sort, developing flowers of good form quite freely. A pretty coral-red flower is Ernest Harper, and the plant in this instance is free flowering. No collection of Pompons would be complete without Nerissa; its pleasing soft rose colour, tinted with silver, gives the flowers a very refined appearance. Rosebud is a neat and well-built flower of a white colour, edged bright rosy pink. The blossoms are small and the plant re-flowering. The cardinal-red tipped white flowers of Tommy Keith are well known. Most exhibits of the Pompons include a bunch of this consistent variety. Thalia is valued because of its rose-pink flowers, which are of a lovely shade of this colour, with a well-defined eye of ivory white. Pale apricot flowers always have a charm, and in the case of Sunny Daybreak the flowers are edged with rosy red. A pure white of lovely form is Violet; as a plant for producing out flowers this variety has a good reputation. In Dr. Jim we have a Pompon of a most consistent kind; the plant bears very neat flowers, heavily edged rosy purple on a pale ground. Other good sorts are Adurene, crimson-scarlet; Adelaide, bluish, edged lavender; Crimson Gem, deep crimson, shaded purple; Jessica, amber, edged with red; and The Duke, a deep velvety crimson. Visitors to

THE CACTUS DAHLIAS,

which occupy a very large area, were numerous, and from this fact it is easy to see where the keenest interest is felt. The collection here em-

braces all the newer varieties, as well as the more praiseworthy of the older ones. There were many excellent seedlings, for which it seems safe to predict a brilliant future. A fact to be given prominence on this occasion is the attention that is being given to the raising and introducing into commerce of plants of varieties with more erect flower-stalks. In this respect there is a great improvement, and in the case of varieties mentioned below this essential characteristic was well-defined. A grand seedling Cactus-shaped flower is Mrs. D. B. Crane. This is a pure white sort, with long florets of true form and large size. The following were selected as the best dozen sorts of this type from the whole collection, and those with stout erect flower-stalks were regarded with special favour: H. F. Robertson, a deep yellow of good form, free and distinct; J. H. Jackson, a deep glossy crimson-maroon, almost black; this is a flower of good form and the plant is a free bloomer. A prettily curled and twisted variety is Mrs. Mortimer; the colour is a rich terra-cotta or salmon red, and the flower is quite distinct. Mrs. de Luca, a Crawley seedling, is highly spoken of, and rightly so; it is a profuse bloomer, bearing flowers of a high standard of quality, colour a rich shading of orange and yellow. The rich bright vermilion ground colour of Columbia, the tip and centre of each floret being pure white, gives us a flower of a most pleasing kind; the form in this case is excellent. Clara G. Stredwick is one of the most perfect of these flowers, its lovely clear salmon shading to yellow at the base of the florets making a most attractive bloom; the plant is dwarf and free flowering. Another good rich dark velvety maroon is Aunt Chloe; the florets are beautifully pointed and build a well-finished flower. Mrs. Winstanley is another flower of refined appearance and good form, colour soft scarlet, shading to yellow in the centre; this is a free and continuous bloomer. The clear yellow blooms of Mrs. Edward Mawley have caused this variety to be regarded with the highest favour; the florets are long and slightly incurve, and the plant is good for all purposes. Ajax is a rich orange-coloured flower, suffused with salmon, having twisted and curled florets. Floradora is a flower of splendid shape, with blossoms on stiff stems well above the foliage, colour wine-crimson; Mrs. H. J. Jones, scarlet, edged cream, and heavily striped white, is most attractive, and the plant has a fine habit.

SHOW AND FANCY SORTS

are also cultivated to a large extent, the best of each section being represented in good form. The Tom Thumb Dahlias still find much favour with the general public, and their pretty single flowers on plants of compact and bushy habit are much admired.

SOCIETIES.

READING AND DISTRICT GARDENERS' ASSOCIATION.

THE last two gatherings of the members of this association were of a most enjoyable character, visits being paid to Danesfield, Marlow, by permission of Mr. R. H. Hudson, and to Hillaide, Reading, by invitation of the president. The outing to the former place was by steamer, and the party numbered about sixty. Arriving at Medmenham the visitors were met by Mr. J. Gibson, the head gardener, and conducted across the meadows to the polo ground, where lunch was partaken of. The president, Mr. Leonard Sutton, presided, and on behalf of the members tendered to Mr. Hudson their thanks for allowing them to visit Danesfield for the second time. After lunch the party first inspected the kitchen garden, and needless to say great interest was manifested in the various crops of vegetables, specimens from which have made the name of Danesfield famous in horticultural circles throughout England and Scotland during the present year. A stroll through the grounds and a game of cricket made the remainder of the day pass pleasantly.

The visit to Hillaide took place on the 14th ult., and was the first meeting of the present season. Previous to the meeting over 100 members sat down to a substantial tea, afterwards making an inspection of the gardens. The subject for the evening's discussion was "Notes on a Recent Visit to the Gardens at Bear Wood," questions on the culture of crops seen to be answered by the head gardener, Mr. W. Barnes. This proved to be a very interesting evening. Those taking part in the debate were the President, Messrs. Powell, Fry, Exler, Judd, Burditt, Tunbridge, Challis, Hinton, D. Dore, E. J. Dore, Lever, and Alexander. The subjects touched on were Strawberries, Begonias, Peas, Melons, Carnations, Vines, Peaches, Cauliflower, Potato, Sea Kale,

Onions, Lily of the Valley, Beans, Celery, Solanums, soils, &c. Before separating a hearty vote of thanks was accorded to the president for his kind hospitality and to Mr. Barnes for leading the meeting. Several new members were elected.

BRISTOL AND DISTRICT GARDENERS' ASSOCIATION.

THE closing meeting of the summer season was held at St. John's Parish Room on Thursday, the 24th ult., Mr. E. Poole, F.R.H.S., presiding over a good attendance. The lecture for the evening was given by Mr. H. Kitley, his subject being "The Duties of a Gardener." He traced the life of a gardener from the time when he would enter an establishment as garden boy until he managed to reach the highest pinnacle of his profession. Among many good points made by the lecturer was the necessity for beginning at the bottom rung of the ladder, and the still greater necessity for continued perseverance if the learner had any hope of being able to grapple with the many and varied duties of his profession. Gardening, he claimed, demanded and deserved the closest attention on the part of the student who would master the art. It demanded earnest toil, because for the horticulturist there could be no cessation from the multitude of duties he has to face, and it deserved his noblest powers because, poorly remunerated though the gardener is, yet he has the assurance of belonging to a profession ranking among the highest in the world. Mr. Kitley was heartily thanked for a lecture which from beginning to end maintained a very high level. Prizes offered for two bunches of black Grapes were secured by Mr. J. B. Brain (gardener, Mr. Atwell), Mr. A. Cole (gardener, Mr. Bird), and Mr. W. F. Powell (gardener, Mr. Balke). Certificates of merit were awarded Mr. A. Cole, for three Cockscabs; Mr. Ambrose, collection of Sweet Peas; and Dr. Eager (gardener, Mr. Cane), three Odontoglossum crispum. A certificate of special merit was recommended for a box of fine Magnum Plums sent by Lady Cave (gardener, Mr. Poole).

ROYAL HORTICULTURAL SOCIETY.

CHISWICK, SEPTEMBER 29.—FLORAL COMMITTEE AWARDS.

THE following received an award of merit:

Chrysanthemum Polly.—A very free and profuse semi-early flowering kind, in which the dominant colours are chestnut-red and orange. These are in almost equal proportions, and the flower is well upheld on good stems. From Messrs. Wells and Co., Limited, Redhill.

Lilium speciosum magnificum.—Despite expressions of opinion to the contrary, this is undeniably a fine, as it is also a handsome, form of *Lilium speciosum*; indeed, it may be cited as one of the most decided forms of *L. speciosum* we have seen, and we speak with a knowledge of some thousands of bulbs during a quarter of a century. It is less blood-red and more rosy than *L. cruentum* generally, while the massive, less reflexed flowers at once command attention by a greater presence than is clear to all admirers of good garden plants. This handsome flower came from Messrs. Wallace of Colchester.

Dahlia Spotless Queen.—A nearly pure white Cactus Dahlia of somewhat dwarf habit. Shown by Messrs. Green and Co., Dereham, Norfolk, and by Messrs. Dobbie and Co., Rothsay.

Dahlia Spitz.—A very brilliant red-scarlet Cactus, with slight tip of orange to the florets. A very showy and effective kind. From Messrs. Dobbie and Co., Rothsay.

Dahlia Amos Perry.—This is the variety that has been selected for the special prize offered for the best garden or decorative Cactus Dahlia, the award having been conferred by reason of the erect character of the flowers and the strong all-supporting foot-stalks. The special prize was awarded by the National Dahlia Society, and the merit of the variety confirmed by the above committee. From Messrs. Green and Co., Dereham.

Oranges at Mount Edgumbe.—

When in the vicinity of Plymouth it would be worth while for anyone interested in the cultivation of Oranges in tubs to cross the ferry to Mount Edgumbe there to see an exceptionally fine collection. When I saw them in September they were in the Italian garden and near the Orangery in which they are placed for the winter. There are numerous specimens, and many varieties are represented, every plant being in splendid condition. Most of the plants were carrying fine crops of green and ripe fruit. Among others the Myrtle-leaved Orange *Citrus Aurantium* var. *myrtifolia* was conspicuous by reason of its dense habit, small leaves, and small fruits, the latter being borne in profusion. There were also some very fine Seville Oranges and various sweet ones. The plants are grown as standards and bushes, some being of immense size. Some of the standards are quite 20 feet high, with large heads, and stems 6 inches in diameter. The tubs are in proportion to the size of the plants, and these are seldom disturbed at the roots. An annual top-dressing of rich loam and bone-dust is given, and liquid manure twice a year. Mr. Richards, the head gardener at Mount Edgumbe, may be justly proud of them.—W. D.

Amaryllis Belladonna.—Growing in borders along the front walls of the Aroid house and Orchid houses at Kew, large numbers of this pretty West Indian bulbous plant are grown, and at the present time some hundreds of spikes of

blossoms may be seen in various stages of development. Growing side by side with the type may also be seen the variety called A. B. kewensis. This originated at Kew, and differs from the ordinary Belladonna Lily by being of stronger growth, having larger heads of flowers, the flowers much deeper in colour, and by flowering a little earlier. At Tresco Abbey, Soilly, the type and the variety are grown side by side in beds in the open, and about the middle of September the variety was in full flower, while the majority of plants of the type had only thrown their spikes up a few inches above the ground. For warm, well-drained borders along the wall of a house the Belladonna Lily is very suitable, flowering, as it does, when outdoor flowers are becoming scarce, for when well established it flowers freely annually, and the spikes will either stand for a considerable time on the plants or cut and placed in water indoors.—W. D.

Solanum pensile.—This is one of three climbing species of Solanum, all of which have for several years past been seen in good condition at Kew, and in many gardens where at present unknown they might be advantageously cultivated. The species at the head of this note (*S. pensile*) is a free, slender growing climber, whose flowers, produced during the summer and early autumn months, are borne in long, pendent racemes, and for clothing a rafter in the stove or intermediate house it is well adapted, as its drooping, informal style of growth eminently fits it for this purpose. The starry flowers are about 1 inch across, of a bluish purple colour, with a yellow eye. In Demerara, where it grows wild, this Solanum behaves much as our British *S. dulcamara* at home. A second species (*S. seaforthianum*) is said to have been introduced about a century ago, but it was for many years lost or nearly so till within a recent period. This has prettily divided bright green leaves and large drooping clusters of deep lilac blossoms with a yellow centre. Though grown for many years at Kew, strange to say it does not occur in the "Kew Hand List" either as *S. seaforthianum* or *S. venustum*, under which name it was figured in the *Botanical Magazine*. The third species (*S. Wendlandii*) is one of the finest of all climbers for a large, light structure. The flowers of this are lilac-purple, 2 inches or even more in diameter, and borne in huge pendent racemes. To this note of climbing Solanums must be added the name of *S. jasminoides*, which in the West of England is such a desirable hardy climber.—T.

Chrysanthemum Mrs. A. Willis.—This is one of the most recently introduced early-flowering Chrysanthemums, and, owing to its parentage, is sure of a good reception. It is a sport from the well-known early-flowering Japanese Mme. Casimir Perier, the colour being a pleasing shade of tawny yellow, shaded and striped with red. In their earlier stages the blooms are very pretty, the red colouring being much better defined than is the case with the blossoms as they age. I have before me a vase of the rich yellow Horace Martin and this new variety in association, and the contrast is distinctly pleasing. Left to develop its growths in a perfectly natural manner, handsome sprays, each one containing quite a number of charming blossoms, may be cut for decorative uses. Each flower may be detached from the spray with a useful length of flower stalk, and this must be considered a decided advantage, as individual flowers may be used without altogether spoiling the spray. No one would think of disbudbing these early sorts after seeing the grand display which naturally-grown plants produce. This fine sport inherits all the good points of the parent variety, and attains a height of about 3 feet. Its period of flowering commences in late August and continues well into October.—D. B. C.

Garden labels.—Labels of some description are an unfortunate necessity in the majority of gardens, but the great drawback to the general run is that, while clearly indicating the plants by name or number, they detract from their beauty by the uncompromising formality of their appearance. After trying all manner of labels, and being

dissatisfied with every one, I have settled upon a form which, though retaining the name in perpetuity, is practically inconspicuous. I have a sheet of copper, one-thirtieth of an inch in thickness, cut into pointed labels 5 inches long and three-quarters of an inch wide. On these, with letter dies an eighth of an inch high, I stamp the required name, which is absolutely permanent, while the copper soon assumes a dark brown colour. Thinner copper is inadvisable, since it is difficult to insert into the soil and fails to maintain an upright position.—S. W. F.

Spiraea Anthony Waterer.—It has been suggested that this *Spiraea* cultivated as compact bushy specimens in pots would make an excellent plant. It is well adapted for pot culture, as it has been found to begin to bloom when only a few inches high, and when full of compact trusses of crimson flowers is sure to be attractive. More than that; it has been found possible to have it in bloom not only during summer and autumn, but also through winter and up to Easter. It is thought it can be made particularly useful in Easter decorations. Certainly, it is one of the most beautiful shrubs of recent introduction, but time is required for such a subject to become thoroughly known. It can now be purchased at a very reasonable price.—R. D.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 30, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—H. T. Allen.—*Abelia rupestris*.—H.—*Asclepias tuberosa*.—J. R. K.—*Pernettya mucronata* and *Hypericum patulum*.—Mrs. Davenport.—Most probably *Dimorphanthea Eklonia*, a tender perennial, but the specimen was withered on arrival and no leaves were sent, so it is impossible to say with certainty.—W. S. Tillett.—Probably *Mollotus officinalis*, but the specimen sent was too incomplete for correct identification.—S. T., Ulverston.—*Epilobium nummularifolium* var. *longipes*.

Book on table decoration (W. BALCOMBE).—We are sorry that we know of no book on this subject.

Book on Trees (A. HILL-WALKER).—There is no 1s. or 1s. 6d. book on trees; the cheapest are A. D. Webster's "Ornamental Trees and Shrubs" (*Gardening World* office, Shoe Lane, E.C.), and "The Tree Book," recently published by Messrs. Lane, Vigo Street, W.

Gardening instruction (E. D. D. S.).—Your best plan would be to encourage the young men to study for the examination in Horticulture, which is held annually in April by the Royal Horticultural Society. You can obtain a syllabus of the subjects prescribed for study from the secretary, 117, Victoria Street, S.W. Medals and certificates are awarded to the successful candidates.

Fungus on drive (T. R. OWEN).—The Alga you found so plentiful on your carriage drive belongs to the genus *Noctoe*, commonly known as Star Jelly or Fairy Butter. This plant often makes its appearance suddenly after rain on paths, &c., and was considered by the ignorant and superstitious to have fallen from the skies. Probably there are always a number of the spores floating in the air, which germinate whenever they fall on a suitable surface and grow in a remarkably rapid manner. One species (*Noctoe edule*) is used in China to thicken soup.—G. S. S.

Pink Bridal Wreath (E. JONES).—We have been puzzled in exactly the same way as yourself, for seed of the white *Francoa ramosa* saved where there were no coloured forms yielded plants, all of which produced pink flowers, after the manner of the sprays sent. The only explanation which we can suggest is that the flowers of *Francoa ramosa* were originally pink, then the white sport asserted itself, and became generally grown under the name of *ramosa*, so that the seedlings are simply reverting to the original type.

Ivy destroyed (MOONKWOOD).—The caterpillar that is destroying the foliage of your Ivy is that of the scolloped hazel moth (*Odontoptera bidentata*), a very common insect belonging to the family Geometridae. You might destroy them by spraying with a solution of paraffin emulsion or 1oz. of Paris green mixed in ten gallons of water. The Paris green is very heavy, and soon sinks to the bottom of the vessel in which the mixture is, so that you must be careful that the mixture is kept well stirred, or else some of it will be too strong and the remainder too weak, and be sure that the undersides of the leaves are wetted as well as the upper.—G. S. S.

Wallflowers diseased (AJAX).—Your Wallflowers are attacked by the club-root fungus (*Plasmodiophora bras-*

sica), a disease to which nearly all cruciferous plants are liable. I should certainly pull up and burn any plant which you think may be infected; probably those which are now diseased will escape. If you transplant any of them you need not trouble to dress the roots with any fungicide, for if the roots are infested by the fungus no outward application will be of the slightest use, but if they are not, and are planted in ground which is free from the fungus, they will not be diseased. The soil in which the plants are now growing should be cropped with plants which are not members of the family Cruciferae for at least two years or fallowed for some months and well dressed with gas lime.—G. S. S.

Rose queries (G. W.).—1. The variety Dawn is a very vigorous Rose, and should be planted in the centre of the bed, its growths supported by a stake. The four other varieties—Mrs. Paul, Hermosa, Irish Glory, and Chequerboard—would need quite 4 square feet for each plant in order to develop their full beauty. Providing your bed is large enough, there is no reason why they should not be grown with such plants as Lavender, Iris, and Day Lilies. 2. Round bed to hold seven plants of Mme. Jules Grévy should be 4 feet in diameter, but 3 feet would suffice if space is limited.

Grapes unsatisfactory (J. H. J.).—The foliage of your Vine is healthy and clean, and we can detect no disease in either leaf or berry. Judging from appearance we conclude you have allowed the Vines to carry too heavy crop, and that the atmosphere of the house has been too moist, either with the long-continued wet weather or through insufficient ventilation. The skin of the Sweetwater Grape is very thin, and must have a fairly dry atmosphere, especially when it is on the point of ripening.

Roses failing (E. MORLAND).—As you say Mark Houtte and Crimson Rambler will grow very well, we are inclined to think there is more in the selection of suitable hardy and vigorous varieties than in the matter of soil. The latter, however, will certainly bear improvement. It is possible to add some good turfy loam from pasture land. If you could reconstruct your beds or borders and add at least two-thirds of this soil, mixing with it some bone-meal and well-rotted stable manure, you should be able to grow many of the delightful Roses that are now procurable, for instance, Caroline Testout, Marie d'Orleans, G. Nabonnand, Mme. Ravary, &c. If the soil is really deficient in lime a dressing in November at the rate of half a pound to a square yard would be of much help to established plants, but we should not advise its application to any newly-planted beds this year.

TRADE NOTE.

A BULB PLANTER.

Now that the bulb planting season is here, the "Bulb Planter" sent out by Messrs. Barr and Sons, King Street, Covent Garden, will be found of great value where planting in grass is required. It cuts out a clean piece of turf 2 inches in diameter and of sufficient depth, and on making the second cutting clears itself of the first piece of turf, which lies ready at hand for covering the bulb. This handy implement saves an immense amount of time and labour, and the soil is not in any way tightly pressed and made hard, which is the case when an ordinary dibber is used, and the appearance of the grass is not spoiled; in fact, after planting 10,000 bulbs with this tool on a green sward one could hardly detect that the grass had been touched.

PUBLICATIONS AND BOOKS RECEIVED.

Commencing with the October part, which will be the first of a new volume, *The Studio* will be permanently enlarged by the addition of a considerable number of pages. The series of articles on the subject of the late Mr. Whistler, accompanied by many illustrations in colours and in black and white, will be continued. The special winter number of *The Studio*, entitled "The Genius of J. M. W. Turner, R.A.," will be ready in October. As is usual in the case of special numbers of this magazine, reproductions in colour will form an important feature of the publication, while sixteen facsimile illustrations of rare plates of the "Liber Studiorum," reproduced by a special process, will be included in the work.

CATALOGUES RECEIVED.

Grasses.—MM. Vilmoren Andreux et Cie, Paris.
Roses.—Messrs. William Paul and Son, Waltham Cross; Benjamin R. Cant and Sons, The Old Rose Gardens, Colchester.
Daffodils.—Messrs. Barr and Sons, King Street, Covent Garden, W.C.
Lilacs and Hardy Plants.—Messrs. Wallace and Co., Kilmfield Gardens, Colchester.
Bulbs.—Messrs. Gilbert and Son, Dyke, Lincoln; Amos Perry, Winchmore Hill, N.; Barr and Sons, Covent Garden; Webb and Sons, Worsley, Stourbridge; Ant. Roosen and Son, Overveen, Haarlem (Agents for Great Britain, Metcalf and Co., 3, Cross Lane, St. Mary-at-Hill, E.C.); G. Zeuthen, Keaton, Kent.
Hardy Perennials, Alpine Plants, &c.—Mr. Maurice Prichard, Christchurch, Hants.

* * The Yearly Subscription to THE GARDEN is: *Island*, 15s.; *Foreign*, 17s. 6d.

THE GARDEN

1664.—VOL. LXIV.]

[OCTOBER 10, 1903.]

DISEASE-RESISTING POTATOES.

our last week's issue (October 3) we published a letter from Mr. G. R. King giving his experience as to which are the best disease-resisting varieties of Potatoes. As this subject is of such importance to horticulturists and agriculturists throughout the kingdom we express a wish that other growers would note the results of their experience. We have already received several letters in reply, and we publish below, hoping that others will kindly send notes upon the value and uselessness of those varieties of Potatoes largely grown at the present time. The crop is of enormous importance to the gardener, market grower, and farmer, such a season as the present the destruction by the Potato disease must have been serious and widespread. Growers therefore had an opportunity of proving the merits of the sorts they have grown as resisters. If they will kindly write us their opinions they have formed they will assist us to find out which are really the reliable Potatoes to grow, and their results will be welcomed by other growers. The present depressed state of agriculture is only too glad to turn their hands to a crop that gives promise of a fair return, among these must be reckoned the Potato. The introduction of varieties that regularly produce large crops and successfully resist ravages of disease, Potato culture for food and home use might be made a more profitable industry than it now is. In order, therefore, to be able to determine the most healthy sorts we invite the co-operation of large and small growers. Other notes as to variety, cropping, kind of soil, &c., will also be welcomed.

frequency with which the question "Which Potatoes would you recommend me to grow next year?—mine are so badly diseased" is asked indicates a most serious state of affairs. To these questioners my reply is: "You must experiment and find out for yourself what sort of Potato, round or oval, and next, which varieties will do best in your particular soil. When you have found out those which give the best results stick to them for your main crop. If you are so inclined, by all means try new varieties, but only in small quantities, and do not form any decided opinion from one year's trial. A frequent change of seed is most desirable."

In these gardens we can scarcely grow a round Potato fit to eat. The soil is very light, and for manure we use, perforce, almost solely leaf-mould. Our supply of animal manure is not sufficient for the needs of the other crops, and the deficiency cannot be made up with chemical manures.

Previous to this year Early Puritan served us admirably as our earliest Potato; whether grown in frames, borders, or in the open ground, it rarely showed signs of disease to any extent; but this year it has been rather badly attacked. Myatt's Prolific has escaped the disease to a great extent, but with me this variety is a light cropper, and the tubers are somewhat small.

Although not a heavy cropper, Satisfaction has behaved well. We have a very fair crop and little disease. Up-to-date is our mainstay; of this sort we grow a large quantity. Here it is an enormous cropper, of high quality, and a good keeper; and, although a goodly number of tubers are diseased, there is a very satisfactory crop, providing that there are no losses in the store, and on this point I am doubtful, for the continued wet is greatly against storing the tubers in anything like fair condition.

As preventive measures—unfortunately we are not able to spray—I believe in giving the plants plenty of room, so that light and air can freely circulate around the plants. The early sorts are planted 2 feet 6 inches apart in the rows, and the late ones fully 3 feet apart. I am convinced that not only is this a check to the disease, but the crop is heavier than when closer planting is practised, and, of course, the labour of planting and digging is less. As soon as possible all the haulm, diseased or not, is collected and burnt.

Besides the varieties above named, several growers in this neighbourhood speak highly of Beauty of Hebron, Windsor Castle, and Daniel's Sensation as being good croppers, and not so prone to disease as many others.

Most of the villagers here grow their Potatoes in "brakes," that is, high exposed land which some years ago was reclaimed from Furze and Heather, and cultivated by a farmer, the last farm crop invariably being winter Oats. The farmer sublets to the cottagers at the rate of 6d. per yard if unmanured, and 1s. per yard if he manures it. Most of the sub-tenants take a plot of 14 yards unmanured, and sow two bags of ordinary corn manure at a cost of 6s. per bag. The farmer ploughs the land, harrows it, and banks the rows. All the labour the cottager does is to plant, hand-hoe between the plants in the rows, and, of course, dig. By these methods they get really good crops, and very free of disease. Next year the "Potato brake" is planted with a green crop, and in the ordinary rotation comes back to Potatoes in about four or five years.—A. C. BARTLETT, *Pencarrow Gardens, North Cornwall.*

In this neighbourhood I may say that the usual conditions have been reversed this year, for owing to the long spell of very dry weather we had early in the summer early Potatoes generally escaped disease. The main crop, however, is very badly affected. Up-to-date, which is the main crop variety chiefly grown in this district, is badly diseased, and I do not see that as a resister it is any improvement on others. Lifting is in full swing just now, as growers are trying to prevent any further ravages, but one's experience tends to the conviction that many tubers, now apparently clean, will go wrong after storage, and the heaps will need careful attention in picking over. I have grown none of the very new and high-priced varieties. One can only hope that among them a real disease resister of good quality and a good cropper may be found, though it seems too much to expect.—J. C. TALLACK, *Shipley Hall Gardens, Derby.*

This year has not proved so bad in the gardens here as I have seen, though some varieties are touched with the disease. We grow four varieties of Kidney Potatoes, namely, Ringleader, Sharp's Victor, Star of Reading (Brinkworth's), and May Queen. These four varieties are only slightly diseased. Star of Reading is the worst of the four. I consider it the earliest, though not the best variety. Ringleader is the best quality. I have grown it here for twenty years. It is also a good cropper. I have seen it badly diseased in some years. British Queen and Cramond Blossom are grown side by side. The former is very badly diseased this year, and the latter are almost all sound. Cramond Blossom is almost new in this district, but I consider it too strong a grower for the garden; the quality is first rate.—W. SMITH, *The Gardens, Oxenford Castle, Dalkeith.*

[Many letters are left over until next week.]

NEW AND RARE PLANTS.

KIRENGESHOMA PALMATA.

FOUND in open woods on Mount Ishizuchi in Japan, at an elevation of 5,000 feet by Dr. Yatabe of the Tokio Botanic Gardens in the year 1888, was this remarkable plant here illustrated. It was described by him as a new genus and placed in the natural order Saxifragaceae, near Hydrangea, although other authorities contend that it more rightly belongs to Crassulaceae or the Sedum family. Seeds of this plant were received at Kew from the Tokio Botanic Garden in 1891, from which a plant was raised and planted in a warm, rather moist position, exposed only to the midday sun. It flowered for the first time in 1892, again two years later, and in 1897, but since then it has done indifferently. This year, when, probably owing to the exceptionally

wet and sunless season that we have had, it has revealed its true character and flowered well.

A perennial herb, it forms a bushy plant 2 feet to 3 feet high (Dr. Yatabe says 3 feet to 4 feet in its native woods), of purplish unbranched stems, clothed with mostly opposite dark green palmate leaves, terminating in leafy panicles of bell-shaped yellow flowers, the corolla of which is composed, when fully expanded, of five very fleshy, somewhat recurved petals. What might be considered by some a drawback to this interesting plant is the fact that the flowers do not all expand, many retaining their globular shape till they fall. This, of course, may be due to its position, which may not quite fulfil its requirements.

So far, no seeds have been ripened on the Kew plant, but it may evidently be increased by division of the root. There is a possibility of its being adapted for planting in shady places or open woods where the soil is of a moist nature and where its rich yellow flowers would provide a characteristic feature.

W. IRVING.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

October 13.—Royal Horticultural Society's Drill Hall Meeting, 12 noon; Horticultural Club, Hotel Windsor, lantern lecture by Mr. Charles E. Pearson on "Bird-nesting in Russian Lapland," 6 p.m.; Committee Meeting of the National Rose Society, 3 p.m.

October 14.—East Anglian Horticultural Club Meeting.

October 27.—Royal Horticultural Society's Drill Hall Meeting.

November 11 and 12.—The Liverpool Horticultural Association's Chrysanthemum and Fruit Show.

Royal Horticultural Society.—The next fruit and flower show of the above society will be held on Tuesday next in the Drill Hall, Buckingham Gate, Westminster, 1—5 p.m. A lecture on "Autumn Strawberries and Raspberries" will be given by Mr. James Hudson, V.M.H., at three o'clock.

Horticultural Club.—A lantern lecture.—The next house dinner of the club will be held next Tuesday at 6 p.m. at the Hotel Windsor. Mr. Charles E. Pearson has kindly promised to give a lantern lecture entitled "Bird-nesting in Russian Lapland." Mr. Pearson has informed the secretary that in several of the slides (kindly lent by Mr. Henry J. Pearson) Arctic plants are shown.

United Horticultural Benefit and Provident Society.—The seventeenth anniversary dinner will be held at the Holborn Restaurant, High Holborn (Royal Venetian Chamber), on Tuesday, the 27th inst., at 6.30 p.m. Peter Barr, Esq., V.M.H., has kindly consented to preside. The secretary, Mr. W. Collins, 9, Martindale Road, Balham, S.W., will be glad to know, not later than Saturday, the 24th inst., how many seats members may wish to reserve for themselves and friends. The musical arrangements will be under the direction of Mr. W. Morris (Amphion Quartette Singers, Acton). The tickets are 5s. each.

Lilies in Regent's Park.—Among the many good flowers in Regent's Park the Lilies are particularly bright. They are used with excellent effect towards the margins of some of the larger beds; peeping between sombre-hued foliage plants they add bright colour just where it is wanted. The typical *Lilium auratum* is very fine, in fact we have never seen it better out of doors this season. *L. auratum rubro-vittatum* marked with deep red bands down the centre of the petals is very striking, and attracts attention from some distance. *Lilium speciosum* and some of its varieties are very noticeable also; in fact, Lilies are so numerous

and so well grown as to fill the air with their perfume, which, although it may be rather objectionable in a room, is very pleasing in a London park.

Beds of succulent plants.—In several of the London parks large beds filled with Agaves, Aloes, Sedums, Echeverias, and other allied plants are quite a feature, and an excellent one too, for they are a pleasing change from the mixed beds of flowering and foliage plants that are now so familiar in all public and many private gardens. In both Battersea Park and Regent's Park the succulent plants have been used with striking success. In the latter there is a large bed of irregular shape filled with them, and the most striking plants used are the Agaves, *A. americana* chiefly. Large specimens of this are placed on mounds at intervals throughout the bed, while close around them are smaller plants of the same species, *A. a. variegata* and *A. applanata*. The surface of the bed is carpeted with such plants as *Echeveria glauca*, *Mesembryanthemum cordifolium*, *Sedum glaucum*, and *Lotus jacobaeus*. Various other Aloes, *Dracaenas*, *Echeveria metallica*, &c., are prominent in different parts of the bed, whose undulating surface is altogether most pleasingly planted.

Cockscomb Glasgow Prize.—Those who are on the look out for a really good Cockscomb should make a note of this, for it is one of the finest I have seen. It would be interesting to know by whom the strain was originated. It is planted in Regent's Park in a small border, backed by a Privet hedge, and although there may not be more than 100 Cockscombs the result gives one of the prettiest bits of colour association in the park. The deep rich crimson of the Cockscomb and the green of the Privet go admirably together. The leaves also of the former are now crimson-red, so that with the good heads of flower that are admirable in themselves and the richly coloured foliage as well, Cockscomb Glasgow Prize is a plant whose value in the flower garden in the autumn is hardly to be overstated.—A. P. H.

South-Eastern Agricultural College.—The South-Eastern Agricultural College, Wye, commenced its tenth session on the 25th ult. Seventy-seven students are in residence, this number being an increase of twenty-two on the number at the commencement of last session. The equipment of the college has been improved by the addition of a carpenter's shop, and of an ironwork shop fitted with lathe and three hearths for farriery and other forge work. A forestry department is also in course of establishment, additional land having been taken for the purpose.

Outdoor flowers can often be saved for three or four weeks' blooming by covering with papers or other protection the first one or two frosty nights; it is worth trying.—*The American Florist*.

Lady Warwick College.—We have received a booklet descriptive of the new Lady Warwick College, whose headquarters now is Studley Castle, Warwickshire, instead of the Lady

KIRENGESHOMA PALMATA AT KEW.

Warwick Hostel, Reading. It contains a long letter written by Lady Warwick to the students, in which we make the following extracts: "The fact that Studley Castle is in Warwickshire, within a distance of Warwick, is a great point in its favour as I have long wished my hostel to be within reach of one of my homes, so that I may have constant communication with it, and able to devote more time to the detail of its affairs. Studley Castle is situated fifteen miles from Birmingham, a direct line, and is midway between Redditch and Alcester. Studley Park is 340 acres in extent, not only beautifully wooded in the ordinary sense, but has also been planted with all kinds of rare and shrubs. Accommodation can at once be provided for sixty students, and if there is a great demand than supply it will be easy to add another storey. There already exist the beginnings of every kind of garden, from the Rose garden to the Italian garden. In the walled garden, about a mile from the house, is a very fair range of about 400 feet; then there is a large orchard on other land laid out." Lady Warwick concludes her letter thus: "The future lies in our own hands to make this college second to none in the world for solid practical work, and for training women on useful lines in the sphere we have taken up. I think it is proved beyond doubt that the work—the production of butter, cheese, poultry, eggs, vegetables, fruit, and flowers—kind of work that, for a better word, we call the 'lighter branches of agriculture,' can be profitably done by women. Nor is it hardly necessary to say that training is necessary for success in any branch of life, therefore I know I shall not be in vain to your loyalty to our college, our work, and our Warden to prove what women can accomplish who fix their ideals high, and know nothing satisfies but the best." Full particulars of entrance to the college may be obtained from the Warden. A correspondent recently visited the college and gave an interesting account of the work he found being done there.

Alonsoa Warscewiczii.—This is a most little annual for the flower garden. The brick-red flowers are freely produced when the plants are 18 inches or so high. A succession may be had from July to September if sown early in March. A plant that is so raised and that flowers for so long a time is the most useful to gardeners for small beds in border to larger ones. It is not of vigorous growth so when put out the plants must be placed close together, otherwise the display will be

Mme. Antoine Mari.—These plants this Rose upon its introduction two years ago have no cause to regret so doing, unless that they wish they had planted more of it. It is worthy of being grouped with that best of annuals, *G. Nabonnand*. The general effect of *Mme. Antoine Mari* is white, but its real beauty is in the delicate pink shading and exquisitely pointed buds. These buds are almost pink, and are very conspicuous when peering out among the white expanded flowers. The habit of the plant is dense, as strong in growth as *G. Nabonnand*, and as free from autumnal mildew, which is the otherwise beautiful effect of such Roses as *Edith Gifford*, *Mme. Jules Grolez*, &c.—**P. H.**

Smith's Ornamental Runner.—At the great show of fruit and vegetables at Chiswick last week one of the best trade displays of vegetables was made by Messrs. Richard and Co., Worcester. Among the many interesting vegetables shown by them was a red Bean bearing the name of Smith's Ornamental Runner. It is a semi-climber, reaching 6 feet high, and crops well, particularly at the end of the plant. The pods are of good quality and cook well. They are of good average size, and, striking of all, are heavily splashed with red on a pale yellow ground which shows through in the white. Those who wish for a novelty in the way of runner Beans, without at the same time having to sacrifice quality, should try Smith's Ornamental.

Extraordinary Potatoes.—Rapid advances have been made during the last ten years in the improvement of Potatoes, largely in the matter of quality. At the present time, however, the yielding capacity of varieties seems to be almost even a more important matter, and very rarely the best disease-resisting sorts are becoming widely known. All have now heard of the Northern Star, that became famous on account of its cropping capacity, and was recently sold at such a high price. Messrs. Sutton and Sons showed tubers of a Potato at the Chiswick fruit and vegetable exhibition that, however, has apparently eclipsed even Northern Star in the matter of yielding. One tuber of this new variety, which is called Discovery, when cut up into eyes produced no less than 38 lb. of Potatoes. Surely this is a most record. A Lincolnshire journal gives some interesting particulars about "The battle of the potatoes"—as it is called—which has recently been going on in South Lincolnshire. The favourite sorts are Northern Star, Evergood, and King Edward VII. Mr. Atkinson of Weston, Spalding, an extensive Potato grower, had deposited £25 and invited anyone to dig among his crop of Evergood, offering 20s. for every pound of diseased tubers found, the condition being that the digger should pay £5 for every two hours digging. Messrs. Macleair and Son of New York, near Boston, accepted the challenge, and the result of the digging by two men was that out of nearly 11 cwt. of Potatoes dug only fifteen small tubers were diseased. Their weight was 1 lb. 14 oz. Mr. Atkinson therefore won his challenge, and demonstrated his contention as to the disease-resisting qualities of Evergood. A striking result of the digging was the evidence as to the enormous crop, this working out at more than 18 tons per acre.—**A. P. H.**

Lilium szovitsianum.—I enclose a photograph of a couple of these Lilies, although I am afraid it is not suitable for reproduction in THE GARDEN. [Unfortunately, it is not.—ED.] But it will, at any rate, show you that the growth of the plants was vigorous. The plant in blossom bore fourteen flowers on it, all of which duly opened. For many years I experienced nothing

but failure in my attempts to establish this particular Lily. I tried dormant bulbs without success. Then I tried planting growing bulbs out of pots, but also in vain. At last I found that the only way I could succeed was to start with quite small bulbs and let them get established by leaving them severely alone. I now have some eight or nine groups similar to that photographed, nearly every one of which bloomed this season after two years previous growth without flowers. I should think I had an average of six flowers to each, so that I hope I have at last succeeded with them. They are in ordinary loam in a border facing south.—**T. J. WEAVER, Thirlwood, N.**

Auchincruive, Ayr.—By the kind permission of Mr. R. A. Oswald of Auchincruive and Cavens, a large party of members of the Glenfield Ramblers, an important Kilmarnock Natural History and Scientific Society, visited Auchincruive a few days ago. Under the guidance of Mr. Leven, the head forester on the estate, the party spent an enjoyable time in the gardens of Auchincruive. Among other trees which attracted the notice of the visitors were a noble Oak of unusually large dimensions, large Beeches, a Scotch Fir 11 feet in girth 5 feet from the ground, a Spanish Chestnut 17 feet in circumference, and a Lucombe's Evergreen Oak covering with its branches an area of about 80 yards in circumference. The gardens were greatly admired with their tastefully arranged and admirably cultivated bedding and other plants, while the fine old herbaceous borders were the object of much interest to the admirers of such flowers. Noticed also by many were the fine old Yew hedges. The Rev. Dr. Landsborough moved a vote of thanks to Mr. Oswald before the party left the grounds.

THE ROSE GARDEN.

JOTTINGS ABOUT ROSES.

ON the whole, considering the appalling combination of frost, wind, rain and gloom which has characterised this season, Tea and Hybrid Tea Roses have come out of the ordeal very well, and a comparison with other things—such, for instance, as Geraniums and many other bedding plants—is greatly in their favour. I have been taking careful notes as to which varieties have stood the bad weather well and also those which have failed, and I append the list as it may be of some use to readers of THE GARDEN.

Successes.—*Princesse de Sagan, *Gustave Regis, *Mme. Pernet-Ducher, *La Tosca, *Mme. Berkeley, *Papa Gontier, *Grüss an Teplitz, Killarney, Morning Glow, Mme. Cadeau Ramey, Mme. Abel Chatenay, Antoine Rivoire, Mrs. Bosanquet (China), Mme. Lambard, Liberty, *Marquise de Salisbury, K. A. Victoria, Ferdinand Batel, Ferdinand Jamin, Grand Duc A. de Luxembourg and Marie d'Orleans. N.B.—The varieties marked * are the most impervious to wet.

Failures.—*Etoile de Lyon, Maman Cochet and its white variety, F. Dubreuil, Bessie Brown, Comtesse de Turenne, *Alliance Russe, Comtesse de Panisse, *Mme. Hoste, Souvenir de Catherine Guillot, *Jean Ducher, Beauté Inconstante, *Sylph, and Souvenir de President Carnot. N.B.—The varieties marked * are most susceptible to damp.

It will be noticed that Princesse de Sagan heads my list of successes, and I know of no better all-round crimson bedding Rose, with a dwarf habit of growth, than this. It shares with Papa Gontier the distinction of being indifferent to weather, and this is saying a great deal. Among the really hopeless Roses in a wet season are Sylph, Etoile de Lyon, Alliance Russe, Jean Ducher, and Mme. Hoste. Sylph is such a grand Rose when well grown that it is a great pity it should be so easily spoilt by bad weather. I had some splendid flowers from this variety in 1901, but since then it has completely failed. The new Tea Roses which I have had on trial have not had a fair chance this season for their merits or demerits to be proved.

However, I can recommend four varieties with the utmost confidence, these being Souvenir de Pierre Notting, Morning Glow, Lady Roberts, and Mme. Vermorel.

SOUVENIR DE PIERRE NOTTING.

This is certainly a glorious Rose. From quite a small plant I have cut a number of superb blooms of most exquisite colouring, and as perfect in shape as one could wish. The pointed buds at first are so small that it appears almost impossible for them to open into such fine deep-petalled flowers. Like Maman Cochet (which I consider it excels in beauty, though not in size), its blossoms are so heavy that they droop, and as a consequence their beauty is not seen until they are cut. Apparently they open very much easier than Maman Cochet, and are not prone to damp off as is the case with that variety. With me it has so far not proved a strong grower, and no doubt a hot season would have made some difference in this respect. It appears to have a fair constitution, but I do not expect it to prove very hardy. No doubt the finest blooms will be grown on standards, and in sheltered districts it should certainly be tried in this way. As a bedding Rose it is scarcely likely to be useful, and of course the drooping habit of the blooms is greatly against it for this purpose. Of

MORNING GLOW

I cannot speak too highly. It is a perfect bedding Rose, being a splendid grower, extremely free, and of most exquisite and fascinating colours. It reminds me very much of Mme. Lambard, not so much in colour as in wood, growth, habit, and general appearance. To describe its colouring accurately would indeed be difficult, as, like many of the Teas, it is variable, but rosy crimson usually predominates, suffused with tints of orange, fawn, and yellow. In spite of the continual wet its constant succession of flowers has been but little harmed. A Rose that everyone should grow, and one that will be found in all good gardens as soon as it becomes plentiful.

LADY ROBERTS.

Those who obtained a plant or plants of this variety last autumn are not likely to have regretted their purchase, and one has to go back to the advent of White Maman Cochet to find a variety which from its first appearance in public was received with so much favour as this. One can see at a glance that this Rose is a sport from Anna Olivier, and this fact in itself was naturally a great recommendation, for few Teas are harder or more satisfactory than that good old sort. Sports are sometimes liable to revert, but in Lady Roberts I have not found the slightest tendency in this respect. The colouring is unique and the shape of the flower all that can be desired, and besides these qualities it possesses all the good points of Anna Olivier. My plant has grown and flowered exceedingly well, and given a good season next year it will probably display its sterling worth to still greater advantage. I have never met with a Tea Rose which has more magnificent foliage than

MME. VERMOREL.

This Rose was sent out by A. Mari in 1901, and is, I should imagine, a cross between Maman Cochet and some other variety, because the flowers almost exactly resemble that grand Rose in shape, size, and appearance. In a really good season I should say that this variety will certainly come to the front. Probably owing to the weather, I have been unable to reconcile the colour description given by the raiser with the blooms I have cut from my plant, which have been a very fine ivory yellow shade. The raiser's description is as follows: "Rose and coppery yellow centre, shaded and lined with red, extra large buds on strong stems; growth vigorous." My flowers have shown no trace of rose, copper, or red, but in other respects this new Rose bears out all that its raiser claims for it. The blooms, which are solitary, come as large as those of Maman Cochet, with the added advantage of being held up on splendid long sturdy stems. The growth is vigorous and the foliage massive and of most exquisite colouring. I can recommend this Rose with confidence, and

I learn from one of our leading growers that it has proved very fine under glass.

ABOUT NEW ROSES.

The question is frequently asked as to what becomes of the dozens of new Roses which come from the various Continental raisers each year. If the truth were told I think that at least 70 per cent. of them fall into obscurity and are catalogued, as well as grown, only by the raisers themselves. It is a certain fact that the standard of quality in England is a great deal higher than that of the Continent, and we do not often find our English raisers introducing varieties that are inferior to those already in commerce, as is frequently the case with Continental growers. I am open to admit that numbers of good Roses have been raised abroad which have not proved suitable to an English climate. Also the fact must not be overlooked that there have been cases when a really good new Continental Rose is discarded without being given a fair trial. Such a case came under my notice only the other day, when I had the pleasure of seeing the choice and well-grown collection of Roses made by Mr. and Mrs. Stobart of Belbroughton, near Stourbridge. Among the many good things which I saw none gave me more pleasure than the Hybrid Tea

AMATEUR TEYSSEIER,

of which I saw two fine standards. This fine Rose was raised by M. Gamon, and distributed in 1900. It is a seedling from that capital Hybrid Tea *Souvenir de Mme. Eugene Verdier*, and is more vigorous than its parent. The buds remind me somewhat of *Gustave Regis*, but, instead of being semi-double, they open into fine double flowers of exquisite shape. The colour is perfectly distinct from that of *Souvenir de Mme. E. Verdier*, the centre being deep saffron and the outer petals shaded with canary yellow. This variety is an abundant bloomer, and as a standard it is particularly meritorious, because the flowers all expand together and thus produce a very fine effect. Rosarians who visited the Temple show this year will remember a magnificent plant of *Souvenir de Mme. E. Verdier*, and this variety appears to be especially adapted for forming fine specimens in pots, from the fact that the majority of its flowers are in perfection at the same time. From its behaviour out of doors Amateur Teyssier has evidently inherited the good qualities of its parent, and it is rather astonishing that a really good garden Rose such as this is to be found only in one English grower's catalogue, i.e., that of Messrs. W. Paul and Son.

Buying new Continental Roses first hand is certainly a lottery, and, though many amateurs are frequently tempted to do so by the glowing descriptions, the results are generally disappointing. However, I must plead guilty to buying a few each year, always, however, taking the precaution to obtain if possible a little information as to which of the varieties are likely to prove worthy of trial. The other day I received a note from Mr. Peter Lambert (of Trier) recommending me to try the following four new varieties, all Hybrid Teas: *Königin Carola*, *Frau Lilla Rautenstrauch* (Lambert), *Gustav Grunerwald* (Lambert), and *Oberhofgärtner Terks* (N. Welter). This last is said to be a very fine variety, the result of a cross between *Belle Siebrecht* and *La France*.

A NEW CLIMBING ROSE, PERLE DES NEIGES,

is being sent out from France with a flourish of trumpets, and is stated to be a perpetual flowering Crimson Rambler with white flowers. I always notice that most Continental growers, when giving descriptions, compare their novelties to well-known varieties, and the numbers of new Roses which have been sent out as improvements upon those two popular sorts, *Belle Siebrecht* and *Kaiserin Augusta Victoria*, are prodigious.

THE WORTHY USE OF GARDEN ROSES.

I scarcely think even now that we make as much use of the free-growing Teas and Chinas as their beauty and usefulness really warrant. Certainly when planted in groups they form glorious masses

of flowers, but there are other ways of utilising them which are equally as satisfactory, though seldom met with. At the Bath Botanic Garden Mr. Milburn has planted them amongst beds of *Flag Iris*, and the effect has been to light up these beds when they would otherwise be dull. Moreover, the exquisitely tinted flowers display themselves to great advantage against the cool *Iris* leafage, and this also serves to protect the young shoots from the cold winds of spring. In a garden which possesses a soil of peaty loam the plan has been adopted of grouping China Roses amidst and between masses of the hardy Heaths. The effect is beautiful in the extreme, and these two instances which I have cited only go to prove the adaptability of these lovely flowers for other purposes than being cooped up within the confines of the Rose garden. ARTHUR R. GOODWIN.

USES OF BRITISH PLANTS.

COMPOSITEÆ.

ALTHOUGH this is an enormous family, it does not supply many useful plants at all in proportion to its numbers. We have in England more than forty genera, but the following are the only ones worth mentioning:

Lettuce (*Lactuca virosa* var. (?) *Scariola*).—Some botanists make it a separate species. Like all the plants of the tribe *Cichoriaceæ*, with long, ligulate corollas, it has a milky juice, somewhat like opium, but it is really different. "Lac"—Latin for milk—suggested the name, which also supplied that of a noble Roman family, *Lactucinus*, just as the *Fabii* took their name from Beans (*Faba*). It was introduced in the Middle Ages, as it is mentioned in the fourteenth century as "latewes." The name "Coe" seems to indicate a Mediterranean source, though De Candolle thinks it was of Indian origin. Hooker gives Europe, Siberia, and Himalaya as native places. It was lately found in higher Egypt by Dr. Sickenburger, of Cairo.

Chicory (*Cichorium Intybus*).—Easily recognised by its wiry, branching stem and bright blue flowers of the size and shape of a Dandelion. It is the tap-root, much enlarged by cultivation, which supplies the chicory of commerce when roasted and ground to powder. The leaves when blanched form the salad known as *Barbe de Capucin*.

Several of the *Cichoriaceæ* formed the "bitter herbs" of the Jews.

Tansy (*Tanacetum vulgare*).—This was a remedy for wounds in the fourteenth century. It is bitter and a tonic, being used in the country for fever and other illnesses, and is drunk as a "tea." It was used in cookery in the sixteenth century, when Tansy cakes were highly esteemed in Lent, as well as Tansy puddings, according to Gerarde.

Sea Wormwood (*Artemisia maritima*).—All the species are bitter and aromatic, having powerful scent, as *A. Absinthium* and *Southernwood*. The minute flower-heads of a Russian variety of the Sea Wormwood, dried, constitute the drug "Santonica" of our Pharmacopoeia, and the English name indicates its use.

Wormwood (*Artemisia Absinthium*).—This is the true Wormwood. According to Pliny the name was derived from the goddess *Artemis*. It was a favourite drug in the Middle Ages. It was also hung up in rooms as a preventive from infection. Even in the last century a spray of *Southernwood* with Rue was always placed by the prisoner in the dock as a preventive against jail fever. It is used in beer on the Continent and flavours absinthe. The common Mugwort (*A. vulgaris*) was so-called, as it was also used to flavour beer by our ancestors.

Coltsfoot (*Tussilago Farfara*).—This has been used as a demulcent and pectoral drug. The leaves, being mucilaginous, furnish a suitable remedy for coughs. The leaves are sometimes smoked, being said to be a part of British tobacco.

Elecampane (*Inula Helenium*).—A local and usually naturalised plant, having been cultivated for centuries, as it was a common remedy for sicknesses in the fourteenth century. Its use was for

pulmonary complaints. It is now chiefly employed as a sweetmeat, formed of the candied root.

Chamomile (*Anthemis nobilis*).—This is a common wild flower on the cliffs round our shores. It is not to be confounded with "wild Chamomile" (*Matricaria Chamomilla*). The receptacle of the form is covered with scales between the florets, while that of the latter has none. Both species are (the "wild" being more so on the Continent) stomachic qualities, but in commerce it is used the "double" form, in which the yellow florets of the wild species are converted into white flowers like those of the ray. This kind is also a milder nature than the single and wild form.

CAMPANULACEÆ.

Campanula (*C. Rapunculus*) the *Rampion*, formerly cultivated for its root, which was used as a salad, raw or boiled. Gerarde called it *Rapuntium parvum*, the Small Rampion. The several foreign species are in our gardens. British wild species cultivated are *C. latifolia*, occurring from Banff to North Wales and Gloucester, as well as Surrey. Both blue and white flowered are grown. *C. rotundifolia* is the *Harbottle* of England, but *Bluebell* of Scotland. Of these there are white, blue, and double varieties. *C. Trachelium* and *C. glomerata*, of which there are several cultivated varieties, are also known.

Phyteuma (*P. spicatum*), called *Rampion*, the Great Rampion, by Gerarde, is cultivated for its root as a salad. It is a native of England, occurring in East Sussex, and is a useful native.

ERICACEÆ.

Bilberry, **Blaeberry**, or **Whortleberry** (*Vaccinium Myrtillus*).—The berries were much used in the Middle Ages. They were boiled till thick and honey and sugar were added—in fact, they are now used for tarts in the more northern counties. The fruit is a favourite food of the poor.

Cowberry (*V. Vitis-Idæa*).—The fruit is more eaten on the Continent than in Britain, as round the Baltic. It is said to be sold as Cranberries in London, having been imported from Sweden.

Cranberry (*V. Oxycoccus*).—This is a plant, frequenting peat bogs, &c. It bears a small fruit. Though collected in the mountains of England, the greater quantity are imported from Sweden.

Bearberry (*Arctostaphylos Uva-Ursi*).—This is a trailing evergreen with dark green leaves. Dried is a drug in a pharmacopoeia, valued for its astringency. The berries are only of use for grouse, &c. The leaves are used for tea in Sweden, as well as for a dye.

Strawberry Tree (*Arbutus Unedo*).—This is native of the mountains of Killarney, and is the Spanish group of plants in the south of Ireland. The peasantry eat the red fruit, "eat one" is said to be the origin of the Latin specific name, as being enough. Turner, however, refers the name to the habit of only one berry being borne at a time. They are made into a wine in Corsica.

Ling (*Calluna vulgaris*).—This useful plant covers the ground on many mountains, supplying fodder for sheep, but less so for cattle. It is said their milk is tinged red by it. Highland dwellers make places are made with alternate layers of Ling and earth, and then thatched with it, as well as affording material for bedding. In the eighteenth century it was much used for tanning leather, as well as for yellow and orange dyes. Last year, brushes, brooms, baskets, &c., are made of the pliable shoots of Ling.

PRIMULACEÆ.

Cowslip (*Primula veris*) was called *Britannica* cusloppe in the tenth century, and used as a drug in the fourteenth; but now, perhaps rarely, for Cowslip wine. When well prepared it has been described as very intoxicating, resembling the sweet wines of Southern France.

Sowbread (*Cyclamen europæum*), so called because swine eat the roots greedily in Sicily and elsewhere in Southern Europe. The globular tuber is very acrid and dangerous to man, though pigs

re immune to it. The poison resides in an active principle called Cyclamine.

Poor Man's Weather-glass, or Pimpernel (*Anaallis arvensis*).—Strange to say, this little plant as borne the reputation of a cure for hydrophobia; though it seems to possess some acrid property, as birds have died from eating the leaves given to them instead of Chickweed.

(To be continued.)

NOTES ON HARDY PLANTS

SALVIA SCLAREA.

(CLARY.)

MANY are the virtues which have been ascribed to the Salvias or Sages, either as plants of healing or for the more prosaic purpose of flavouring articles of food or drink. One of the most emphatic and best known of the proverbs expressive of their value is that which was current in the old school of Salerno,

group of which is shown in the accompanying illustration. It is now mainly used for seasoning, though the flowers were, even in London's time, used for making wine.

Its value in the kitchen has practically relegated it to the kitchen or herb garden, but when in a group, as illustrated, it may be made serviceable for ornamenting the border or wild garden, though its biennial character lessens its value for wild gardening. It is a biennial in its habit, and should thus either be raised from seed or propagated by cuttings or slips. It grows about 2 feet high, has large wrinkled, hoary leaves 8 inches or 9 inches long, and rather viscid stems bearing racemes of pale blue flowers. Though fairly familiar to many, there are a great number who have never seen this old plant in growth.

The best time for sowing seeds is at the end of March or beginning of April in the open border, transplanting the seedlings to from 14 inches to 18 inches apart, or, if wanted principally for an ornamental group, about 12 inches apart. The plants will flower the following summer. Though there are some prettier Salvias, the Clary is an

Bravoa geminiflora comes from the mountains of Central Mexico, where it ascends to a height of 7,000 feet. It was introduced in 1838, and belongs to the natural order *Amaryllidæ*. The bulb should be planted about 2 inches deep.

HELIANTHUS DANIEL DEWAR.

AMONG the numerous species and varieties of perennial Sunflowers which we have available for our gardens in autumn, and which frequently supply so much good material for cut flowers, we ought not to omit *Helianthus Daniel Dewar*. It belongs to the type of *Helianthus* of similar habit to *H. rigidus*, and really appears to have been raised from that useful and free-growing species. Unhappily, it also shares its spreading habit, which makes it often so troublesome in a mixed border. It is, however, so pleasing in itself and so valuable when in a out state that it is worth giving some space to, particularly if it can have a corner to itself where it will not injure other flowers. It resembles *H. rigidus*, but has the great superiority of having more elegant flowers, seeing that when not too old they have sharply pointed and twisted petals. It is always much admired when in bloom with me, and is aptly called the Cactus Sunflower. It flowers earlier than *H. Miss Mellish*, and lasts for a long time in bloom. *H. Daniel Dewar* was raised at Rothesay by Mr. Michael Cuthbertson, and was named in honour of the late curator of the Glasgow Botanic Gardens. S. ARNOTT.

DRACOCEPHALUM PEREGRINUM.

THOUGH this plant is little known in private and nursery gardens it deserves, I think, to be more grown, and will eventually become popular among lovers of hardy flowers. It is valuable on account of the pleasing blue of the flowers, which are produced in pairs. It grows about 1 foot in height, is well suited for the rock garden or mixed border, and does not suffer in the least from heavy rains such as we have experienced this year. It has flowered for several weeks now, and plenty of flowers continue to appear, which clearly demonstrates its value in a season like the present, the majority of herbaceous plants having had anything but a favourable time. A good loamy soil appears to suit this Dragon's Head to perfection, and the flowers, which are produced with great freedom along the stems, make a good mass of colour, and one that is much appreciated. A. E. THATCHER.

CAMPANULA RHOMBOIDALIS IN THE ROCK GARDEN.

THIS is one of the most beautiful of the Campanulas. It is of medium height, about 2 feet high, and is of very erect habit. It thrives well in most soils, especially in a good loam on a sunny site in the rock garden or herbaceous border, is a perfect cloud of rich blue during July, and remaining a thing of beauty for some time. It is easily increased by division either in the autumn or spring, ripens a quantity of seed, and is also quite hardy.

THE ROCK GARDEN.

ROCK GARDEN-MAKING.

XIII.—SMALL ROCK BEDS ON FLAT GROUND.

AMONG owners of gardens there are, comparatively speaking, but few who would find it expedient to construct a rock garden on a scale as large as that illustrated in the previous chapter (see THE GARDEN of August 8). There are many, however, who, though possessing a garden of only small dimensions, are, nevertheless, desirous of adorning the same by some modest and simple arrangement of rocks and mountain plants. For such, a rock bed or two will often supply all that is needed, and these, besides being a great source of pleasure to their owner, may also be a great ornament to the garden generally. A rock bed of

A GROUP OF SALVIA SCLAREA. (From a photograph by Miss Willmott.)

and has been translated as follows: "How can a man die who grows Sage in his garden?" The precise species of which this is said is not easy to determine, for medicinal virtues have been ascribed to quite a number of the species, and the one which forms the subject of this note—*Salvia Sclarea*, introduced in 1562—has been freely used as a medicine, though nowadays it is of more service for the less important purposes of cookery, and it can hardly be said that a plant which ministers in this way to human enjoyment is not a valuable one. An old work in my possession—"Dictionarium Rusticum, Urbanicum et Botanicum"—(thus speaks of it: "Clary, when tender, is an herb not to be rejected in Sallets and in Omelets. 'Tis made up with cream, fried in Sweet Butter, and eaten with Sugar, Juice of Orange and Lemmon. This plant is raised of the Seed, and said to be good for the Eyes, as also for strengthening the back."

In these olden days there were several plants called by the name of Clary, and variously classed under the names of *Sclarea* or *Sclarea* and *Horminum*. More recently the name has become limited in its application to *Salvia Sclarea*, a good

interesting old plant, more worthy of cultivation than many frequently seen in gardens.

BRAVOA GEMINIFLORA.

AT this season, when so many lovers of flowers are purchasing bulbs for next season's bloom, it may be useful to draw attention to one of the most charming of summer-flowering bulbs—*Bravoa geminiflora*, the Twin Flower. Unfortunately, one cannot say that it is hardy except in a few favoured places in the south or in Ireland, but those who have their gardens in such districts may well experiment with the *Bravoa*, which is not very expensive; while others who may desire a little-seen plant may profitably give it the protection of a frame in winter and early spring. This can be removed in summer before the 2 feet or rather shorter stems reach their height and the flowers begin to open. They will be well repaid by the brilliant orange-red flowers, which come in, as a rule, in July. The flowers, which are tubular and drooping, are in pairs, whence the popular name, the perianth being nearly 1 inch long as a rule. The leaves are from 1 foot to 1½ feet long.

this kind is illustrated in the accompanying engraving. It was constructed a few years ago at the Manor House, Dawlish, the property of Miss Jackson. Although in this case the rock bed in question forms only the forerunner, so to speak, of larger and more elaborate work only a little way off, it is also at the same time complete in itself, and might serve the purpose of illustrating a small rock bed on flat level ground.

Seen from the particular point from which I took the photograph, the view is foreshortened and the bed appears long and narrow, while in reality its width and length are approximately equal. It will be observed that it has no clearly defined margin, but that the lawn and the plants in the bed amalgamate without any formal dividing line.

especially necessary in the case of narrow crevices destined to become the home of alpine plants. It will be seen that by using this method the depth of soil in the rock bed would vary very considerably; in the raised portions it would be 4 feet or more, while some of the low portions would have little more than 6 inches of soil in them.

In planting such a rock bed as the one described, care must of course be taken not to destroy its irregular character by unsuitable planting. As a general rule it will be found advisable to plant the highest and most prominent portions of such a bed with plants of a bold type, and clothing the low lying parts with the dwarfest kind of vegetation only. By this means the contrast is emphasised and the little rocks look more effective. A glance

nook has either its budding grace of spring or its swelling promise of summer's loveliness, and all over the ground old friends are thrusting themselves up in their remembered corners. Then a walk round the garden is a series of welcome surprises. Wherever you look there is something that "was not here yesterday." Besides, you are full of ambitions and ideas. There are all sorts of things in the glass house and the frames which will go into the garden later, and schemes of colour or arrangement of foliage for effect hover like a mirage before your eyes in every vista. With your eyes on the ground you do not even see half of the birds which pay your garden a flying visit, the songs which vibrate in the shrubs, the berries fall on your ear as a chorus only, a refrain to the song of spring in your own mind.

SUMMER'S LAST SET PIECE.

But in autumn you have had your say in the matter of horticulture. By no means have all of your colour schemes and foliage effects been realised, but in some respects you have done better than you expected, and as for your failures, summer's superfluous tide of flow rose above them and covered them before you had time to deplore them much. In September, before the early frosts have come, you walk the garden amid autumn's overwhelming blaze of colour, as if who is looking on at the last "piece" of the year's fireworks. It is magnificent, but it will soon be over, and after that—the winter. Then you instinctively turn with sympathy to the robin, who almost comes to meet you as you enter the particular section of the garden which he has constituted his domain and greet you, as it seems, with a song of grateful welcome. To a certain extent you are making the same mistake which you made in spring. Then you interpreted the multitudinous song of the birds as a chorus to your own thoughts of coming

joys, whereas each song-thrush and blackbird was really shouting defiance to its neighbour over the way. So now, when you feel that summer is slipping away from you, and you are glad to hear a cheery voice, you accept the robin's welcome of himself to your premises as an appropriate compliment of the season. Yet all the while the tawny-cheeked rascal is only shouting defiance to every other robin—including her who was his wife until a few weeks ago—within hearing.

THE FAMILIAR ROBIN.

Yet there is just a little of something else in the robin's mind as he deliberately sings at you from the branch where he has taken up his position full in view and close at hand. He could have defied his neighbours just as effectively from any other tree; and the fact that he comes near to you and accompanies your progress through his domain, also that he always perches near the gardener when the latter is digging, shows that the robin's acquaintance with man has been long-lasting enough to stamp an ancestral instinct of friendship and familiarity upon his mind. Judging by the permanence of many obsolete instincts in the world of animals (not excluding man) this must mean that our ancestors have known the robin's ancestors for a very long time indeed. There is, therefore, some reason after all why we should accept the robin's

ROCK GARDEN AT MANOR HOUSE, DAWLISH (THE RESIDENCE OF MISS JACKSON).

Plants of all kinds cover the bottoms of the stones, which being thus partly hidden from view convey the idea of being the tops of really large rocks receding below the surface of the ground. It is surprising how fine an effect can be easily produced by stones cropping in this apparently natural way through a plant-covered surface. Such a bed would not even look out of place on perfectly flat ground, provided its surroundings are also kept irregular.

DETAILS OF CONSTRUCTION.

As the rock bed is rather low on the whole it was necessary to prepare the ground at some depth below the surface. The ordinary method of trenching would be useless in this case, as the soil would afterwards settle too much; as there would thus be a danger of stones and plants becoming dislodged, greatly to their disadvantage, instead of trenching excavation was resorted to, and the soil of the whole bed was removed to a depth of about 2 feet. Since it is a mistake to build rocks on the top of loose soil, the building was commenced on the solid ground after excavation. The height of the rock bed varied from 2 feet or 3 feet above the original surface to a foot or 18 inches below it. Where, therefore, the rocks would be buried inferior stones were used, but were so placed that, while forming a solid foundation for the rocks above them, there would be between them narrow crevices filled with soil for alpine plants. The best of the earth previously removed was mixed with small broken stones and a little leaf-mould, and was then put back between the stones and firmly rammed. This ramming is

at the picture will reveal that this principle was practised in the bed here illustrated. Here the most prominent parts were adorned with *Linaria dalmatica*, *Yucca recurva*, and *Armeria Cephalotes*, while the lowest parts in the central part of the bed (not visible in the picture) were clothed with a carpet of *Hernieria glabra*, *Veronica rupestris*, *Pratia angulata*, *Gentiana verna*, *G. acaulis*, and other very dwarf plants. In the foreground on the right may be seen a group of *Edelweiss* cropping up between half-hidden stones.

Among other plants used for this rock bed were *Acantholimon glumaceum*, *Dianthus alpinus*, *D. neglectus*, *Morisia hypogaea*, *Ramondia pyrenaica*, *Saxifraga longifolia*, *S. oppositifolia*, *S. burseriana*, &c.

In making rocky beds of this kind the great aim should be simplicity, and above all natural appearance. When well carried out small beds such as the one described may often be more pleasing in their effect than much more elaborate structures.

Elmside, Epseter.

F. W. MEYER.

(To be continued.)

ROUND ABOUT A GARDEN.

AUTUMN AND SPRING.

DURING the first half of October the bird life of a garden in the country is almost more interesting than at any other time. In the spring we can spare them less attention, because the plants are moving so fast. Every

October song as in some sort a greeting; at any rate, it is something which lasts for us through the centuries which see so much of change.

TOO FAMILIAR DOVES.

But the robin is by no means the only bird which enlivens the garden now. While sitting on my cap one morning in the hall I looked through the glass door and saw one of the Barbary doves on the bird-table. These doves might be called hardy exotics for the old garden. Even on the bleak Norfolk coast they thrive out of doors at all seasons, and multiply amazingly. They become curiously tame, too, with a little encouragement, and for a stranger coming into the garden it is rather embarrassing to hear a sudden whirr of wings and find that he has a dove on his head. The first thing that you usually have to do on entering a neighbour's garden is to take off your hat to somebody, and it becomes quite a complicated operation when you have to take off a dove too, especially when the bird resents the proceeding and pecks your fingers or buffets your head with its wing. But you need not discourage your doves to be tamer than you are, and the readiness with which they go to a free life makes them very pleasant additions to a garden in which there are stable evergreens for nesting-trees. Budgerigars thrive and multiply out of doors too, but they do not seem to have sufficient sense to evade cats, while parrots, though they are hardy and happy at large, fly too far and offer so gorgeous a temptation to the casual wanderer to be safely acclimatised anywhere but in a large estate.

EXOTIC GARDEN BIRDS.

We have not yet, however, reached the time—though it is coming, no doubt—when part of the recognised charms of a garden will be the exotic birds which have made their homes there, and meanwhile we can do well enough with our British kinds. While the Barbary dove was sitting on the bird-table a thrush suddenly popped on to it, and it was amusing to see the way in which the dove pretended that he had not been startled. Encouraged by the thrush's presence, the verandah robin dropped down to the table from the Honeysuckle overhead, and the dove departed, as much as to say, "This place is becoming too common for me." After the robin came a blue tit, and, seeing that the bird-table was in fair working order, I sallied forth.

TRESPASSING ON YOUR OWN GROUND.

My appearance was the signal for an exodus of starlings from the lawn and for a missel thrush to "churr" excitedly from the Poplar opposite, because he regards the near shrubbery as his winter domain and objects to human beings entering it. He objects even more strongly to song thrushes and blackbirds, but these birds are so elusive that he never knows how many of them are lurking in the evergreens, though as you pass through the "chuck-chuck-chuck" of the startled thrush on one side and the "chak-chak-chok-chok-chok" of the agitated blackbird on the other must inform him what an ineffective blockade he has established. These birds have all adopted their solitary bachelor or grass widow lives for the winter, as has the great tit, who scolds at you from the Larches in a slightly louder tone and hoarser key than that of the blue tit, but otherwise using the same notes with the same pretence of menace. The shrubby robin chitters in expostulation at the disturbance which you are creating, and

you cannot help walking stealthily, like a trespasser, since the birds resent your presence in your own shrubbery so much. But by so doing you gain much, for you catch pretty glimpses of small wild life at every turn.

E. K. R.

TREES AND SHRUBS.

THE LARGER BROOMS.

THERE is a considerable difference in the size attained by the various members of the Broom family, for whereas the white Spanish or Portuguese Broom (*Cytisus albus*), herein figured, will reach a height of 7 feet or 8 feet, some of the species are quite procumbent, being, in fact, ideal plants for the rockwork. Taking the larger Brooms in their order of flowering, the first to unfold its blossoms is

CYTISUS PRÆCOX, known popularly as the Sulphur Broom. This is a hybrid between *C. albus* and the more uncommon *C. purgans*. It is a native of Central Europe, and seldom seen in cultivation. *C. præcox* is in every way a delightful shrub, denser in growth than the white Spanish Broom, though quite as free. In the early days of May a thriving example of this Broom will be quite a

after a time—at least, under certain conditions—it becomes leggy and worn out, in which case the only thing to do is to plant young ones to take their place, for cutting back these old plants is never a success.

C. SCOPARIUS (the common Broom of the British Isles) is not only one of the most beautiful of the genus, but it has also given rise to two or three very striking varieties. It is essentially a plant for gravelly soils, and on open commons it often forms a gorgeous feature when in bloom. The fact that it is hardy in many parts of the country must not be allowed to militate against employing it for ornamental purposes in the garden, particularly where it is not common in a wild state. The variety that has attracted by far the larger share of attention of late years is *andreas*, which was discovered in Normandy by M. E. André. It differs from the type in the wings being of a rich brownish crimson, which feature causes it to stand out conspicuous among all the Brooms. This variety after its discovery soon became generally cultivated, but the usual method of increase—at least in its early days—was to graft it on to young seedling stocks of the *Laburnum*. Plants so obtained had an unpleasant trait of dying off suddenly without any apparent reason, but for all this the grafting still goes on. Seed ripens freely and plants can be readily obtained in this way, but as a rule a large percentage of the seedlings revert to the normal golden-flowered form. Cuttings, too,

GROUP OF THE WHITE SPANISH BROOM (*CYTISUS ALBUS*).

(From a photograph kindly sent by Mrs. Frank Garnett, Adsett Court, Westbury-on-Trym, Gloucester.)

mass of sulphur-coloured flowers. It seeds freely, but the plants cannot be depended upon to come true when raised in this way, hence it is often propagated by cuttings, which strike root more readily than many others.

C. ALBUS comes as a succession to the species just named, and for a fortnight or so it is one of the most conspicuous shrubs that we have. It is easily raised from seeds, which germinate readily, and the young plants so obtained increase quickly in size. As they grow up, however, they transplant badly, hence this Broom must be permanently planted when young, or in some instances the seed may be sown where the plants are to remain. One feature of the white Broom is that

do not strike readily, though a few are obtained in this manner.

C. S. PALLIDUS (Moonlight Broom) is an old, still uncommon, but very beautiful form, in which the flowers are of a pale whitish yellow, well expressed by the word "moonlight." Besides these two varieties there is a creeping form, which is a good rock plant. Though often grafted standard high it has at best an artificial appearance so treated.

C. NIGRICANS can hardly be regarded as one of the larger Brooms, for its usual height is 3 feet to 4 feet, but it is so beautiful that it must not be passed over. This forms a rather upright shrub with slender branches clothed with trifoliate leaves, and terminated by numerous spikes of

GLADIOLUS SAUNDERSI HYBRID.

bright yellow flowers, of which a succession is kept up from July till the autumn. It must certainly be included in any list of choice flowering shrubs.

One great merit of the different members of the Broom family, and indeed many of their allies, is that they will thrive even in dry, gravelly, and sandy soils where many other shrubs would soon perish. This is, to a great extent, owing to the deep descending nature of their roots, as by these they obtain nourishment, which is beyond the reach of more surface-rooting subjects. This is the principal reason that they do not transplant well, as there are scarcely any fibrous roots, and in lifting the main ones are almost sure to be more or less injured. H. P.

COTONEASTER FRIGIDA.

As a rule, this Himalayan species can be depended upon to flower and fruit freely every year, and as at both periods it is ornamental it makes a very desirable shrub for the shrubbery or pleasure grounds. It was first introduced in 1824, and in some places very large specimens are to be found. In habit it makes a large, shapely bush, with strong-growing branches, shoots 4 feet or 5 feet in length being made in a single season. The leaves are elliptical, 4 inches to 6 inches long, and 1½ inches wide, and are woolly beneath, especially when young. The flowers are in large corymbs and are white, the flowering period being late spring. The bright red fruits set freely, and are ripe about September. In mild weather they hang until winter, but in severe weather birds clear them off quickly. At Carclew, near Falmouth, the residence of Colonel Tremayne, a very fine specimen may be seen. About the middle of September it was smothered with fruits. The plant is about 25 feet high and 40 feet through, of perfect shape, clothed with branches from base to

summit. It would have been larger, but has had to be hard pruned from want of space. For a shrubbery of strong-growing plants it is excellent, while as an isolated specimen it is also valuable. It is increased readily by means of seeds, and young plants come into bearing when about five years old. W. D.

THE FLOWER GARDEN.

THE GLADIOLUS.

CONSISTING of nearly 140 species, the genus *Gladiolus* is a large one, but of these a considerable number are of small garden worth—at any rate, compared with the magnificent hybrids associated with the names of Suchet, Lemoine, and Max Leichtlin on the Continent and Kelway and Burrell in our own country. It is of these latter I propose to give my cultural experience, but, before proceeding to details, I think it is advisable to touch on a section of early-flowering *Gladioli* which are largely cultivated on the Continent and deserve much more attention by us than they seem to get.

I refer to the varieties and hybrids of *G. blandus*, *G. ramosus*, and *G. cardinalis*, fitly associated together, as they may be planted in the autumn, flower in May and June, and can be lifted in August, when, after sorting, they may be replanted later in November. The *blandus* (nanus) varieties are the dwarfest, averaging from 1 foot to 2 feet, and flower in May in the open ground; *ramosus* and *cardinalis* varieties average 2 feet to 3 feet and over, and flower in June and July. Nearly all the named varieties listed in the Dutch and French catalogues are worth growing, and some are of great beauty, lasting well when cut, for, though the pips on some spikes are not very numerous and of somewhat fugitive duration, they open in quick succession.

A deep, rich, well-drained soil and sunny site suit them; the chief protection they seem to require is from excessive wet in the autumn and winter, and from winds and pelting rains when the spikes appear. Without this protection, unfortunately, the usual sequence of climatic events in this country goes against them, and mild autumn and winter rains induce premature top-growth, which, though capable of enduring a good deal of dry cold at that season resents exceedingly the succession of freezing and thawing which generally occurs with us. They are charming in pots if plunged outside in coal ashes and kept fairly dry till the end of February, when they may be allowed to come on gradually in a sunny corner of the greenhouse. Place from three to six corms in a 5-inch or 6-inch pot, with good fibrous loam and coarse grit and very free drainage. The water-can needs restraint till growth indoors is active, and then a pinch of a good fertiliser in the pot is a great help. After flowering plant them out in a warm corner to complete growth and ripen. The following is a selection of charming varieties:

BLANDUS SECTION.—Blushing Bride, white and crimson; Carnot, scarlet; Eulalia, rose; L'Unique, orange; Peach Blossom, pink; Salmon Queen; and Sydonic, rose.

RAMOSUS VARIETIES are not so numerous, but Amsterdam and Queen Victoria, red and white flaked; Van Speyk, salmon-pink; and formosissimus, scarlet and white, are good. *G. cardinalis* and *G. insignis* are also brilliant reds and very showy, flowering with the above. Next in order of flowering are

LEMOINE'S HYBRIDS, originating from a cross between *G. purpureo-auratus* and *G. gandavensis*. This resulted in the introduction of Lemoinei and Marie Lemoine, two varieties which, though thought much of then, are nowhere now. The small hooded type of flower and the harsh contrasts of colour are giving way to varieties with stronger spikes, large well-opened flowers, and colours of beautiful harmony and softness, extending from white to the deepest maroon, and including several forms also of violet-blue shades. In the production of these the consistency of hybridising appears to be being adhered to; in fact, I believe that in a few years' time there will be no clearly defined types representative of the various sections of *Gladioli* classed under the names of Lemoinei, Saundersi and *gandavensis*. The only important differences will be habit and time of flowering.

However, at present the Lemoinei hybrids are distinct enough in many cases by flowering earlier (July), in having more slender peduncles, and flowers from 1 inch to 3 inches across, with the basal segment or segments usually blotched or spotted with a colour different to that of the ground colour. Their culture is identical with that of the next two sections. I have not found them appreciably hardier or any advantage in autumn planting. Some of the varieties are positively ugly by reason of the harsh contrasts of colour. The hooded flower is also to my mind highly objectionable. The following varieties are, however, very pretty: Venus of Milo, white, purple spot; Prince Altieri, white, crimson blotch; Gil Blas, salmon.

GLADIOLUS GANDAVENSIS.

large blood-red blotches; Devil de Carnot, crimson; Lacordaire, fiery red; M. Lereque, crimson, pencilled yellow; Eldorado, yellow, dark blotch.

The varieties of garden Gladioli included under the names of

SAUNDERSI, NANCEIANUS, AND CHILDSI

are, or were, originally hybrids between *G. Saundersi* (species) and varieties of *Lemoinei* and *gandavensis*. This cross resulted in a type of plant having very large open flowers, too large often for the peduncle, which partook of the character of *G. Saundersi* in being rather weak. Personally I do not think the majority of varieties of this section are any improvement in themselves on those of *gandavensis* forms, the flowers being very often loose and flimsy in petal and just as ugly in form as the hooded type of *Lemoinei*. The colours also, in quite a number of varieties listed in catalogues, are not pleasing, and, what is an important character from a decorative point of view, there is not usually an orderly sequence of development of the flowers up the spike. Two or three gigantic flowers at the base will open and wither before those above develop, and these are very much smaller, out of all proportion in fact. Nevertheless, the introduction of this section will, and already is, leading to grand results. Careful and judicious crossing between the sturdy varieties of *gandavensis*, with their thick-set spikes, and good coloured varieties of *Saundersi* is resulting in Gladioli of splendid type, with the faults on both sides of the parents nicely corrected.

A few good varieties are Abbé Roucourt, deep crimson; A. R. Smith, carmine and yellow; Ferdinand Kegeljahn, orange and salmon; Pacha, orange. And under the Childsi group are Kitty Leyland, very large rich pink; Mrs. Bird, rose; Ben Hur, a very large flowered but dwarf variety, with a much dotted and pencilled pink flower. A number of the Childsi varieties are, in my opinion, very much overrated.

Coming now to the best known, the most cultivated, and still the most useful, as well as the finest section, the varieties of

G. gandavensis, we may as well refer to its origin, or what is said to have been its origin, viz., a cross between *G. cardinalis* and *G. psittacinus*, though I believe there is no doubt that *G. oppositifolius* is accountable for the origin of the light ground varieties, the whites and purples. Anyway, the best types of *G. gandavensis* are magnificent garden flowers. Every colour except clear blue has been attained, and the most fastidious sentimentalist may be satisfied with the perfection of form and bearing of their massive spikes, whether as seen in the open garden or when cut for the decoration of the house. Their cultural requirements are not exacting. There are certain conditions under which they will not thrive, but these are few; they cannot endure shade of any kind, and prolonged drought induces abortion of their spikes and premature ripening, hence they rarely succeed in dry, shallow soils. Organic manures should be kept away from their corms. On the other hand, if an open site is obtainable, I believe Gladioli can be successfully grown in any soil, provided it is (1) deeply worked 2 feet at the

least, (2) made firm before planting, (3) and an abundant supply of phosphatic fertiliser be afforded. The two first considerations are best effected by autumn trenching, or at least bastard trenching. The soil then settles down naturally during the winter. As to the third, basic slag, along with a good dressing of stable manure dug into the second spit, is, perhaps, best for stiff loams, clays, and genuine peaty soils. On lighter soils steamed bone flour is preferable. In both cases let the application be liberal the first time, say 1lb. for every 3 square yards. For really sandy soils superphosphate of lime 3lb., along with sulphate of potash 1lb., for every 3 square yards raked into the topsoil about a month before planting gives markedly good results. A regular dressing of slaked lime over the beds during the winter at the rate of a bushel to the rod the first time, and half this quantity each succeeding winter is nearly always of great value. Gladioli especially seem to appreciate it, moreover it is worth noting that superphosphate has been found by experiment to fail in the absence of

which is due to their fancied resemblance the genus *Crocus*, which belongs to the family, whereas *Colchicum* belongs to Lily order, and must not be confounded with the true autumn-flowering *Crocus*, of which there are now so many beautiful ones. Owing to their habit of flowering when leafy *Colchicums* look best when planted in grass, and there are few more pleasing sights the garden or woodland during the winter months of the year than a patch of them.

They are also extremely useful for help to brighten the herbaceous borders when other plants are fast passing their best, while choicer sorts are fit for the rockery. *Colchicums* are not particular as to soil, provided it is fairly rich and has a tendency to conserve the moisture, as when planted on very light soils the foliage is apt to become burnt by sun if the summer be at all dry, causing premature ripening and, as a consequence, weakening of the bulbs. Planting should always be completed before the middle of August, as root action commences about

COLCHICUM AUTUMNALE IN THE PHYSIC GARDENS AT CHELSEA.

a sufficiency of basic lime compounds in the soil. Twice during the growing season I give my beds a sprinkle of nitrate of soda, 1lb. to each 10 square yards, the first time in May and again in the first week in July, the results this rainy season have been most marked, some untreated beds being far behind the nitrated beds in vigour. If the above procedure as to chemical fertilisers seems complicated, then try a combined manure (after trenching and manuring in the ordinary way) such as Clay's. Use as a top-dressing 28lb. to the rod after planting, and again in June, raking it well in between the rows.

Thanet.

W. C. BULL.

(To be continued.)

MEADOW SAFFRONS AT CHELSEA.

THE members of the genus *Colchicum* are, with very few exceptions, autumn-flowering bulbs, particularly called "autumn-flowering Crocuses,"

that time, and it is important for the health of the bulbs to preserve these early rockers. *C. autumnale* is found wild in some parts of England. It contains a poisonous alkaloid called Colchicine, which is used in medicine, and on this account must not be planted where cattle can eat it, as it may prove dangerous.

Physic Gardens, Chelsea.

W. HALES

TYING.

HAPPY of old in their gardens were the fabrace of the Hyperboreans who lived in perpetual calm, beyond the sources of northern storm, and happy were the dwellers in the sheltered vales round Athens, where—so says the native poet—the bright golden *Crocus* and the Daffodil with its fair clusters flowered winter untouched by any gale. It is in fashion to denounce tying, and to say that flowers look best in the posture in which Nature places them, but let these critics try

season in Edge Hall Garden, into which winds contrive to twist themselves, from whatever point of the compass they blow. Add to this the wetness of the subsoil, which makes the plants grow tall and deficient in backbone, so that they not only get blown sideways but turn over until their heads touch the ground behind them like acrobats. If these flowers are to be kept visible tying them becomes a necessity.

But few gardening operations require more study and practice than tying. The tying apparatus at Edge Hall forms a very important part of the gardening stock. It consists chiefly of several tons of iron rods, not made for plant stakes, or they would cost four or five times as much as they do, but plain round iron bars, varying in size from a quarter of an inch to five-eighths of an inch in diameter, and cut obliquely, so as to form a sort of blunt point, into lengths of from 2 feet to 6 feet. These cost about 10s. per hundredweight, and last for ever; they are generally painted green. The prunings of Apple trees are useful for tying small plants such as double Daffodils. Westerly gales sometimes twist Daffodils off at the ground line by dozens, so in exposed places choice Daffodil flowers like King Alfred and Weardale Perfection have to be tied. Small branching sticks of Hazel, such as the tops of Pea rods, are useful for things with slender stems, like single and double florists' Pyrethrums. These should be inserted whilst the growing stalks are still short, and their height should be less than that of the plant at flowering. Raffia is a better tying material than string for small plants, but for larger stalks soft sacking twine, costing 5d. per lb. is used, or for some of the largest and most top-heavy, like the tallest perennial Sunflowers or the double Rudbeckia laciniata, tarred thatching cord is required.

No one would wish to tie up a stalk which was likely to support itself without it, so discretion founded on experience must be used. For instance, there is a black-stalked late-flowering Sunflower, said to be a variety of *Helianthus tuberosus*, which grows 6 feet high, with a spreading forest of stalks, and will resist a whole gale. Plants of this nature are few, but they are carefully noted and cherished. One or two of the tallest species of *Cimicifuga* are equally wind proof. In the year 1896 the writer tried how far he could do without tying up, and a decree went out that nothing was to be tied without his special orders. July was fine and calm and gave encouragement to the experiment, then came a wet August, followed by a September of gales. The tallest of the untied plants were twisted off at the ground level first, then followed such a general destruction that it was resolved never again to trust to the tender mercies of *Æolus*.

To descend to particulars about the using of the iron rods: Delphiniums, tall Phloxes, Michaelmas Daises, and such like stalks ought to have a loose tie before they are 2 feet high to prevent the stems getting bent when young, in which case it is very difficult ever to get them straight again; this is merely a preliminary precaution. If there are many stalks, at least three or four rods should be used to each plant. It is better not to fix the rods quite upright, but they should lean a little outwards, as it is not well for the stalks to present a stiff row like a company of soldiers on parade; nor is it wise generally to make a sort of cradle of the rods, and place the stalks loose inside, or they tumble about from side to side according to the wind. A portion of them should be made fast to each rod, and room enough should be given for every side of each panicle of flowers to expand. The tops of the rods ought

not to project above the flowers. Thin Bamboo Canes have lately become very cheap and are much used for supporting plants in borders. They do not hold up nearly so much weight nor offer so much resistance to wind as iron rods, and unless the tie is made just above a joint it slips. They are also less durable than metal, and are less easy to fix in the ground. For making holes for that purpose a short bar of iron an inch in diameter, sharpened at one end and at the other turned round into a handle will be found useful.

The habit of leaving plants to be tied until they are in bloom and sprawling on the ground, and then collecting all the stalks together and tying them flowers inwards like a besom head, as is done in some gardens, is enough to discredit the whole practice. Tying must not be deferred but the need for it must be anticipated, and it must be done leisurely to be done well. There is no operation in gardening of which the proverbial verse of the old Greek poet, the author of "Works and Days," is more true—"The man who puts off work till to-morrow is for ever struggling with calamities," so do not wait until the barometer jumps down half an inch in a night and we are told that the warning cone has been hoisted in all districts. Gales are sure to come sooner or later—

"tu nisi ventis
Debes ludibrium, cave."

A little forethought might have prevented the wreckage of choice ornaments which "all the King's horses and all the Queen's men cannot set up again."

GARDENS OF JAMAICA.

(Continued from page 72.)

THE LACE BARK.

THIS is not a tree that would attract particular attention. Its form is very ordinary as well as its foliage. But the bark in which the trunk and limbs are encased is of a very peculiar and beautiful kind. When stripped from the tree it looks white and regular, but in no respect different from that of the Trumpet tree and others which produce an excellent bark for making ropes. If this is soaked for a short time in water the thin layers are easily separated. When these layers are drawn out with the fingers the fibres part one from the other, and the appearance is that of a very fine kind of net lace. It is astonishing how large a piece of vegetable lace may be drawn out of a small piece of bark, and how great is its strength. Some of the most beautiful ornaments and bags are made from it, and are greatly valued.

This leads us to observe a fine plant that grows in the hedges, which is commonly called

THE DAGGER PLANT.

It is so named on account of the sharp, dagger-like points of the long leaves which grow from the tall stem. The plant varies from 3 feet to 4 feet in height, and these long dark green leaves radiate from the stem on every side. But the peculiarity of this plant is the quality of the fibre of which the leaves are composed. These, when carefully peeled off, are of the most delicate softness and exquisitely fine; it resembles more the Chinese rice paper than anything that may be mentioned, though superior to it in the delicacy of its colour and the extreme closeness of its formation. Pieces are obtained about 3 inches or 4 inches square, but these are hardly capable of being used for the purpose of writing. Drawings and paintings are often executed on them, and in softness and beauty they exceed the miniatures that are drawn on ivory. There seems to be no substance so admirably suited for flower painting.

THE BAMBOO

is one of the most attractive and beautiful trees to be found in any part of the world. In every part

it is met with, and is made to serve in that which is ornamental as well as useful.

It is astonishing with what rapidity the shoots multiply from a young Bamboo plant. When looking at the elegant young reeds that are grouped together one could hardly imagine that they would by and by form such a magnificent and immense group of trees. The difference is simply in size and not in character. The small Bamboo, in the curious way in which it is jointed, in the nature of its growth, and in the appearance of its foliage is the miniature of the groups which are seen on hill and dale, in the plains, and in the woods.

The root of the Bamboo is a curiosity in itself. It is gnarled and knotted with rings and curves in the most fantastic variety. From this young shoots are continually springing up, so that, even when many are cut down, there is an abundant supply to replace them. But in process of time these huge canes so cluster together that it is impossible to count them. These monster reeds grow sometimes to the height of a large Oak. They gradually taper off from the root upwards, until they terminate in a fine point. From the upper parts small lateral Bamboos are thrown out, the whole being clothed with extremely delicate and long thin leaves. So light is the foliage that, however still the air may be, there is always motion among the Bamboo leaves. The size of some of the Bamboos is very great. The lower part of some may be a foot or more in diameter, and, being quite hollow between the joints, a vessel of considerable size may be formed from one of them, carrying water or any other liquid.

The smaller Bamboos are used for rafters and railings, but they are more valuable for the manufacture of a large kind of open basket, which is in general use throughout the country. They are often planted for hedges, and, when of moderate size, afford a useful protection and a grateful shade. But they are seen to most advantage in the large, park-like commons which are found on some estates, especially when they are planted beside a piece of water. But take a fine cluster of Bamboos as they stand, and we shall ne'er find their like again.

One of the rarest trees to be met with in the island is the

MAMMEE-SAPOTA.

It is about the size of a large Pear tree, with a bright green leaf not unlike that of the Horse Chestnut. But the fruit which it produces is its great peculiarity, as it is much esteemed on account of its rarity and quality. It is almost the size of a very large Pear. The skin is of a dull brown colour. On cutting it when ripe the fruit is found to consist of a pulp of a bright orange colour. The flavour of this would hardly be liked by those who were not accustomed to it. The seed is very remarkable; it is somewhat oval in form, and of a dark-brown colour. There is a slip down one side of a lighter colour which is easily cut, and in this way they may be formed into pretty pincushions or small boxes. They are capable of taking a high polish, and the fruit being uncommon the seed is accounted as a great curiosity.

THE BREAD NUT

is in many respects like our English Beech tree. Its leaves are larger, and of a darker colour, but of the same form. It strikes out its branches in the same lateral manner, and produces a Nut not unlike our Beech Nuts. The wood of this tree is of no particular value, but the leaves form a most admirable food for horses and cattle. In seasons where there is a scanty supply of grass the Bread Nut is a capital substitute, and contains at least as much that is nutritious. But there are other woods of great value for building and cabinet-work. Of these we may speak of

THE EBONY.

Few woods are so much esteemed as this. Were it not for the difficulty of getting large pieces of this tree it would probably be more used for large cabinet-work than it is. But the trees are for the most part stunted in growth. They are found among rocks and inaccessible places. The trunk, moreover, is generally crooked, so that there is a difficulty in obtaining straight pieces to

work up for furniture of any size. We are all familiar with the wood. The tree would not attract much attention. There are two kinds, the black and the green Ebony. Of these the latter is the most common, and therefore the least valued. The price of it, however, even on the spot, is great, so that a wood with plenty of Ebony trees is of considerable worth.

THE MAHOGANY

is one of our most familiar woods. A great deal of it is produced in Jamaica, but the largest supply is obtained from Honduras. This tree grows to a great size. A good tree will, like the Oak, have a fine and well-formed trunk. The branches are, however, straggling, and the foliage thin. The leaves are small and pale, but the interest connected with this part of the tree is increased by the curious seed-sepals which are found on it. These are about the size and shape of a very large Pear. The outer rind forms three compartments. These, when the pod is ripe, divide at the lower extremity, and have within three corresponding seeds of a dark brown colour. The pod itself has a bark-like appearance. They are curious, but it does not appear that the tree is propagated by these means.

THE CEDAR

is another tree which produces a wood of great value. In the parish of Manchester they grow to an enormous size, and some of their trunks almost rival those of the Cotton Trees. This tree must be carefully distinguished from that known in England as the Cedar of Lebanon. They have no resemblance one to the other. The form of the trunk and the branches, the appearance and colour of the foliage are altogether different. This will at once be evident when we say that the appearance of the Jamaica Cedar is not unlike that of the Horse Chestnut, if we only bear in mind that its bulk is greater. The blocks of wood cut from the trunk are so large that the boards made from them are sometimes of unusual size, and the wood, from its quality and grain, is considered to be very little inferior to Mahogany. In some parts where it is most common it is occasionally cut into shingles, which are used for roofing houses in the same way as slates are employed in England, but it is only inferior wood that would be thus used.

(To be continued.)

THE AUTUMN GARDEN.

CORNERS.

ONE of the advantages of being really keen on gardening is that it makes one accept the vicissitudes of seasons with so much complacency. The quiet time, the pause, that comes in October and November is even welcome. Those who have had to spend winters and summers in the tropics know what it is *not* to have seasons, and envy us the repose that autumn brings. Repose, for the plants and flowers I mean; for the gardener, there is work; more

to do sometimes than the short months give time for, and it is work that makes the autumn garden so cheerful.

We generally shut our eyes to the waning glories of our gardens as long as we can, not wishing to interfere with or hurry matters, but October rouses us from our summer trance, and we begin by taking up our bedders. This is a pleasant task. Like all gardeners, we are sure to have been living with half our minds in the future (it is the only way), and now we are going to realise. Imagination is one of the gardener's greatest comforts: with the eye of faith he already sees his beds and borders as they are going to be, and is happy in the prospect, but they give us much to enjoy even in the present. After they have been dug up, and are left to settle down, what is more restful than the comfortable look they wear, or more pleasing than the colour of the rich brown wholesome earth as it lies against a background of vivid reds, soft yellows, and shaded greens. There is even a fanciful pleasure in

stumps to do wonders with by and by, there will be boughs to make into pergolas, or use for Hop poles, and even to make edgings for herbaceous borders, where they look very natural and pretty, never more so than when Tufted Pansies are tumbling over them, a shower of blue and gold, or even wild Strawberry-runners, the Californian Nemophila, or sometimes the pretty grey green Artemisia, that is really Worm-wood, and used in France for making absinthe.

In our garden felling trees was last year's work, as doubtless it was in many another, but this season attention is going to be paid to the odd corners. No gardens are without these, some of them not very pretty to look at, but one cannot do altogether without poke-away places; the only thing is to allow as few of them as possible, and deliver the rest from bondage whenever practicable. This particular work might not have occurred to us this season had it not been for a happy accident of last year, when a delightful "odd corner" came of its own accord. There it stands in the sunshine, brightening the autumn garden, at once an example and an encouragement to us to make another. We neither planned nor fashioned it, all we did was to help it on a little at the last.

The corner came, of course, because of the cutting down of the trees; that began it. The King of Spades went on with it when he threw a lot of logs, as a temporary measure, on the top of some old Gooseberry bushes, in a place where before it had always been too shady even for Gooseberries to grow properly. The loosened sunbeams fell gladly over the piled up logs that had grouped themselves in the happy

A CORNER IN THE AUTUMN GARDEN.

watching the fork as it plays among the Geranium beds, lifting gently the Olive Carrs, the Queen of Whites, and the little tufted Dandys that smell so sweetly as they are handled. How terrible it would be if bedders rooted themselves like weeds, sticking to their guns with fiendish obstinacy! So far from that, they come up with amusing readiness, evidently acquiescing in the arrangements they and their families have been accustomed to for so many generations. One might imagine they find it a relief to give up the struggle to look beautiful, too long protracted, as sometimes happens to other faded fair ones.

The bedders gone and the early spring flowers launched on their winter campaign (how will they weather it?) bigger things claim attention. One season there will be trees to fell, a halcyon time in many ways, especially if Oaks are cut. Wood of Oak is such a treasure-trove in gardens. Besides the fun of the bonfires and the chopping of house-fuel, and the choosing of gnarled roots and

careless fashion that comes of not trying, and there, without another touch, the thing was done. No words were wanted, there was no occasion for the gardening parliament to meet, for there was nothing to discuss. The corner was beautiful already; all that was wanted were some barrow-loads of earth and a little planting. Not much of this; anything grand would have been out of place. Spaces were filled with the common flowers, that would have come up of themselves if we had given them time, the dear weeds that do not so much belong to the garden, as the garden belongs to them—Creeping Jenny, Gold-dust, Sailor's-blanket, Saxifrages of different sorts, Candytuft, Lungwort, Pansy, Alkanet, Fox-gloves—a tangle of the homely friendly flowers, that are so comforting because they furnish the places that would otherwise be bare.

In making improvements and alterations sometimes happens that it becomes desirable to raise walls and fences between our own and our neighbour's property. This may be

awkward. I have known frail fences to sever friendships. Here the otherwise detestable wire netting may come in useful; it answers very well to begin with, being so transparent it is hardly noticeable. Other and better boundaries can be substituted as time goes on and creepers grow, but no one need expect Ivy to grow on netting; it simply will not, and always runs away from it, annoyance and disappointment expressed by every twig and leaf.

Our new corner faces south-east and is very sunny, so that the scattering of summer seeds resulted in much sweetness after the spring flowers faded. Dwarf Sweet Alyssum and Virginia Stock were very happy together, and as decorative as the hundreds and thousands on a tipsy cake, which, when mingled, they greatly resemble.

Now that most of the annuals have faded it is well for us that we had the presence of mind (owing to living in the future) to place some autumn-flowering plants among the rest. In spite of an out-of-the-way position the corner has become a favoured nook, partly because it is so warm and dry and sheltered, a sort of focus for sunbeams. If any of the family are lost it is easy to know where to look for them; they are sure to have put themselves "in the corner" on the logs behind the Hop poles, and there could not be a pleasanter place in which to linger, as the silver misty mornings melt into mellow noons.

There is plenty of scent here, for the Alyssum has seeded itself, and is in bloom a second time, and we are not too far off the flower border to get a whiff from the late Roses and vigorous Verbena, and there is no lack of pleasant sounds. The dropping Acorns gently startle us as they slip through the branches with a quick rustle and then a patter as they touch the ground.

Now and then a winter Apple falls, so over-ripe that he breaks in two with a conchoidal fracture, scattering his sweet, sharp, cidery juice, or getting a bruise that oozes deliciously. Birds in the autumn garden are quiet, but twitter, making cosy, gossiping noises something like old maids at a tea party. Two blackbirds, Darby and Joan, enjoy themselves particularly in the Elder bush, black against black—or are the Elderberries purple? Rooks, after the sweet Acorns, are cawing and croaking, hoarse but cheerful, and best of all we are never long without the soft treble of the companionable red-breast.

Advising other people about their gardens seems something of an impertinence. Do we not all understand our own gardens best, as we know our own families, or think we do; but sometimes a chance word reminds. In the quiet of these autumn days could such time as we are able to devote to the garden be better spent than in routing out neglected spots and looking up forgotten corners? It matters not much where they are. An oasis garden is always a joy, and will be as long as mortals love so much the unexpected. Variety is still the spice of life. Who knows? Perhaps some distant corner, reclaimed from obscurity, may mean room for a new rockery or alpine garden, a Fern bank, or even for some lucky ones, space to begin a wall or water garden.

Such work makes happy the shortening days; routine is very well, but fresh starts are far more stimulating, and in gardens as in larger spheres there are not many better things to do than trying to make rough places plain, and desert spots to blossom like the Rose.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

MALMAISON CARNATIONS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The notes from Lady Tweedmouth (page 206) and that on page 224 from Mr. J. S. Higgins are of much interest. Certainly if exhibition blooms are not required and stock is sufficient the plants can be had in flower for a very long time.

Early and late propagation, potting, size of pots used, and age of the plants have much to do with the question. I should not recommend the varieties Lord Rosebery and Ivanhoe. Each is good in its proper season, but I should discard them altogether as perpetual bloomers. Princess of Wales and the old Blush are very good for winter blooming. For a scarlet I should strongly recommend Sir Charles Freemantle or Princess May. Nautilus, light flesh, is first-rate for this work, and also Maggie Hodgson, the darkest coloured Malmaison we have. I have found all these to be free blooming the whole year round. I have seen a two year old plant of Nautilus in a 24-inch pot with sixteen blooms in January.

Finchley, N.

STEPHEN CASTLE.

HELIOPSIS PITCHERIANUS AND H. B. LADHAMS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I have to thank Mr. E. Molyneux for his note with reference to the above. I find that *H. pitcherianus* is quite as deep in colour as blooms of *H. B. Ladhams* kindly sent me by the Rev. C. Wolley Dod the other day, though *H. B. Ladhams* is larger and, as Mr. Molyneux says, more pleasing in form. Even it, however, is surpassed in colour and other respects by a seedling raised at Edge Hall. It is considerably deeper in its shade of orange-yellow.

Carsethorn, by Dumfries, N.B. S. ARNOTT.

NARCISSUS POETICUS FL.-PL. NOT FLOWERING.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was surprised to read on page 216 of THE GARDEN that annual lifting is the only remedy whereby to obtain good blooms of this *Narcissus*. I take it this and the following remark, "one kind, the old double white, is a complete failure if left in the ground," applies to Mr. Cornhill's peculiar circumstances and soil at Byfleet, and that he does not advance "annual lifting" as the general remedy. I notice also that Mr. Cornhill appears to plant this variety somewhat shallow, as he advises digging in the manure only "6 inches deep." That this is done, so that the manure may "not come into contact with the roots," would indicate a very shallow planting of the bulbs. This in my experience would account for much. I have so frequently written of this *Narcissus* in THE GARDEN in the last few years, and made so many experiments with the best produce procurable, that I am interested in anything that is written about it. If Mr. Cornhill really obtains fine flowers year by year from the same bulbs lifted annually and grown in so light a soil as in the Byfleet district, and this by shallow planting, I may say at once that it is a quite new experience. In this district after a batch had been lifted and replanted the absence of flowers was noticed more than ever, and this fact with other experiences urged me to recommend that the bulbs were best left alone. Frequently, too, I have urged that at least they should be planted 6 inches deep, and better at 8 inches, and this preferably in rather heavy soils. I consider, too, that a cool position is also helpful, aiding, as it does, an increased longevity of the growth of this late-flowering *Narcissus*. My chief reason for advising the permanent planting was based on the more or less perpetual rooting of this little group and likewise the tenacity of the root-fibres even when out of the ground. I believe I am

right in saying that one may lift the above *Narcissus* at almost any season of the year and find root-fibres varying from half an inch to many inches in length. I know of no other set or section that has this characteristic so strongly marked. It was this profuse rooting character that made me decide that permanent planting was the best. As the subject is opportune Mr. Cornhill may have something further to add, and any means whereby a greater number of flowers can be obtained will be welcomed.

Hampton Hill.

E. JENKINS.

PRUNING CLEMATIS MONTANA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I can quite endorse the remarks made by your correspondent "S. W. F." on page 198 respecting *Clematis montana*. My experience of this useful and interesting climber is that it is very long lived and rather difficult to destroy. I have now one under my charge that was planted over forty years ago. This plant has had a lot of rough usage in the way of pruning, and is now as vigorous as ever. I planted two strong plants of *C. montana* twenty-eight years ago. One of these has been cut down to the ground three times since planting, and is now growing as vigorously as ever. The other plant has been left much to itself, and is now covering a very large space. It is covered each year with lovely white blossoms. *C. montana* is much like the common Traveller's Joy, or Virgin's Bower (*Clematis Vitalba*) in habit. How often do we see this ruthlessly cut down, and sometimes we wonder if it will ever survive such rough treatment, but after a year or two we find it growing stronger than ever and filling the air with its fragrance. *C. montana* will survive the roughest treatment, but it is well worthy of a place in every garden, and will amply repay the grower for the best of treatment. T. B. FIELD.

NURSERY GARDENS.

MESSRS. JAMES STREDWICK AND SON'S NEW CACTUS DAHLIAS.

MESSRS. STREDWICK'S *Dahlia* grounds were hardly seen to the best advantage when I paid my annual visit to them at St. Leonards on the 19th ult. The plants had not quite recovered from the effects of the severe storm of the 10th ult.; indeed, it was only the sheltered spot in which the gardens are situated that prevented further serious havoc from being made among them.

In spite of the drawback I have named some grand flowers were showing, exhibiting in a marked degree the fine form, freshness, and depth of bloom which have made this firm's flowers so famous and contributed to their numerous successes on the show boards and before the committees. In this connexion I may mention that this season out of twelve first-class certificates granted to new Cactus Dahlias this firm have obtained nine—truly a remarkable achievement.

Taking the new flowers in the order in which I saw them, first came Oliver Twist, a fine exhibition flower, with petals much twisted, as its name would imply; Rainbow, a pinkish heliotrope bloom of good shape; Mrs. Wilkinson, delicate pink; Comet, a pretty flower of the Alpha type, pale pink ground, spotted with crimson, a considerable improvement on Alpha in habit; Ella Kraemer, rose, one of the most beautiful; George Gordon, yellow, shading slightly to pink, about the best yellow Cactus Dahlia I have yet seen; Hereward, an improved Alpha; Ivanhoe, orange, beautifully incurved; Mrs. H. L. Brousson, a notable flower, of a colour difficult to name—perhaps pale buff would best describe it. A bunch of this won the president's silver medal at the Drill Hall show of the National Dahlia Society. Next is Pearl, pinky lilac, showing white reverse at the tips of the petals—a most refined and beautiful thing; Sirius, a yellow ground fancy, more constant than the

older Vesuvius; and last, but not least, Miss F. M. Stredwick, white, a most reliable flower in all ways, and one that will prove indispensable to exhibitors.

Messrs. Stredwick are the winners of the handsome silver challenge cup offered this year for the first time by the National Dahlia Society, an honour well merited for the careful and persistent pains they take to improve the Cactus Dahlia, not only in shape and colour, but also in what is now being considered of great importance, viz., habit of growth. The beautiful flower that hides its head is reckoned of no account now; it must have a bold, erect carriage, and be well seen above the leaves.

F. H. C.

THE FRUIT GARDEN.

THE NUT.

COB NUTS and Filberts require more pruning and cutting than any other fruit tree. When received from the nursery these trees have a small head upon a stem 12 inches to 15 inches high. This stem is provided in order that the ground beneath the bush may be more readily tilled and kept free from weeds. They are planted as received, and after being allowed to grow for one year the shoots are pruned closely, to make them throw out vigorous shoots to form the foundation of the future tree. At the annual pruning make the cut so that the terminal shoot is produced from a bud pointing outwards; in course of time a basin-shaped head of branches will result. The best shaped old trees I have seen started with six shoots cut back to form twelve main branches; from these spurs or short shoots are given off, on which Nuts are produced. If the trees are well managed, when 100 years old they will be 15 feet to 20 feet across the top, but not more than 5½ feet from the ground. From the bent portion of the main boughs a number of strong annual shoots are produced, which in Kent are called wands. Some of these are taken out in summer for packing the autumn fruit; in winter the remaining ones are broken out, and either sold for flower sticks or basket-making, or reserved to pack the soft fruit of next season.

The male catkins of the Cob and Filbert Nut are freely produced as early as February on the upper parts of the boughs, and should be allowed to remain long enough to fertilise the tiny crimson female flowers which are produced on the smaller boughs. When the weather is very warm and still it is advisable to tap the branches with a stick to disperse the pollen.

At the winter pruning the spurs are thinned, and, if necessary, shortened. Old wood is removed, and the stronger growths cut back and thinned, leaving the tree regularly balanced on all sides, allowing the free admission of air and sun among the branches. The foliage is larger on pruned trees. In July or August, if time permits, it greatly helps the tree to break off the stronger shoots on the upper boughs (a sharp twist with the finger and thumb being all that is required); this benefits the buds below the fracture and assists in ripening the wood. It is found better than cutting, as the broken surface allows the sap to exude, preventing the formation of a secondary growth, which would weaken the bush and be of no value. In summer gross central shoots should be cut away also. At the winter pruning the broken ends are severed with a sharp knife. A careful pruner will always proceed so that there is an abundance of fresh young wood in the trees; and when a twig shows signs of age he cuts so that a fresh one shall succeed it for next year's fruiting: worn-out twigs are thus never seen in old trees. Suckers from the roots

should be hoed off or severed with a sharp spade, and if well rooted may be reserved to make future plants.

Kent is noted for its fine Nuts, and only because in that county a vigorous system of pruning is carried out. Where the trees are allowed to grow naturally and wildly the Nuts are small, and the crop is almost worthless. They respond to a liberal treatment, and well repay for manuring occasionally as well as for the pruner's labour.

GEORGE BUNYARD.

FIG BROWN TURKEY ON OPEN WALLS.

IN spite of one of the most variable seasons on record the above excellent Fig has done remarkably well on a west wall, and the trees have made very strong growth; indeed, too strong probably, as unless we get fine weather the wood will not ripen, and will be liable to injury in the winter or early spring. No matter where grown the trees will repay some protection, say from early December to April, and it is an easy matter to protect by using Straw, or, what is better, Bracken cut when green and dried for the purpose. It is easy also to detach the leading shoots and draw together, and cover with the protecting material and fasten firmly to the wall. Few fruits are more delicious than well ripened open air Figs. This year our fruits were later than usual, not being ripe till the end of August, but a great deal depends upon whether the fruits are freely exposed or not. It is well to avoid crowding the main branches, and to stop lateral growths or entirely remove where necessary. In some of the southern counties this variety does well as a standard, and grown thus the trees crop freely for many years. In the Midland counties a south or west wall is most suitable for Fig culture; in Devon Brown Turkey gives grand crops on an east wall. No matter where grown the plant must not be allowed too much root run.

I find it well to feed when the fruits are a good size, but all foods are given in the way of rich surface dressings. With a restricted border feeding can be done readily, and the trees get the food when better able to absorb it. In very severe winters I have had the trees so badly injured that the wood has been killed to the ground level, but they soon push up new growth and recover, and fruit in two seasons. It is surprising what vigour these trees have, and as most growers know the

new wood at the end of a season is studded with the embryo fruits, these should be taken care of; it is the small fruits just showing that will furnish next season's early crop. Large fruits that do not ripen now are of no value for another year.

G. W. S.

GARDENING OF THE WEEK.

KITCHEN GARDEN.

PROTECTING VEGETABLES.

VERY much may be done to prolong the supply of summer vegetables by closely observing the weather, and affording some slight protection when frosts are likely to occur. In gardens where large quantities of each kind are required over as long a period as possible much preparation and forethought must be brought to bear upon the matter, and even then it is somewhat difficult to give the protection necessary owing to the extent of the crop; especially does this apply to Peas and Beans. A matter of first importance with these at this season is to keep them picked closely, and if stood on end in shallow vessels of water in a frost-proof shed they will keep good for several days.

By having several vessels, and attaching a label to each with the date the pods were gathered, and using those gathered the longest, the season may be prolonged many days after frost has cut up the plants. In smaller gardens the rows may be covered at night with any rough material, as tiffany, mats, and sheets. At this time Asparagus beds are usually mown over if the tops are sufficiently matured, and these may be laid lightly upon rows of late Peas and Beans. This operation is very simple and effectual.

CAULIFLOWERS AND AUTUMN BROCCOLI

not fully grown should have the leaves drawn loosely together and tied at the top to protect the hearts, while those that are ready for use may be dug up and hung head downwards in a frost-proof dark shed, where they will keep in good condition for several days. Continue to earth up Celery when the tops are dry in order to protect from frost and to blanch it. The same remark applies to Cardoons.

COB NUT BUSHES IN KENT.

Provision must be made for ensuring a supply of fresh green

PARSLEY

throughout the winter months, and if through any cause that sown or planted in frames is not healthy, then some rough frames should be placed over a bed in the open. Remove the lights on fine days, and replace at night when frost and cold rains are imminent. Aim at producing a sturdy growth before severe weather sets in.

POTATOES.

It is now time that all tubers were lifted and properly dried and stored. Fine days should be chosen for the work as far as possible, as then the tubers quickly dry and can be stored right away. Watch closely for any having the least suspicion of disease and throw them out. The seed tubers may remain upon the ground for a day longer if there are no signs of frost, but rather than run any risk collect them and place under cover, afterwards laying them out thinly in trays or on shelves in the root shed.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

FRUIT GARDEN.

PEACHES.

Now that the Peach season is over advantage must be taken of every fine day for renovating the borders in succession and late houses, as it is of no use trying to grow first-rate Peaches where the roots are in an unsatisfactory state. It unfortunately often happens that the proper period for lifting, which extends from the gathering of the last fruit up to the fall of the leaf, is allowed to pass away before this is the case. Very few, if any, new roots are formed before the trees are again excited into growth. Another important matter which is sometimes overlooked during the quiet time in this department is the watering of inside borders; hence the advantage of having portable roof lights, which can be taken off for a few weeks after the wood is ripe to expose the foliage to the cleansing influence of dew and autumn rains, and to ensure a complete and even soaking of every part of the border. If well drained and properly made, an internal Peach border can hardly be over-watered in summer, and certainly it never should be allowed to get dry in winter, neither should the buds be exposed to an exciting temperature after the leaves fall, but the chief aim should be thorough ripeness by the application of warmth and complete rest by exposure to the elements. A visit to the nursery before the leaves fall should always precede the purchase of young trees, as many of the varieties can be determined by their foliage. One section is without glands; nearly all the varieties have large flowers, and the trees are more or less subject to mildew. The next section, including many of the best varieties, may be determined by the leaves having round glands, and the last by their assuming the kidney shape. Equally important is the selection of the stock, as all the varieties cannot be induced to succeed on any one particular kind.

CUCUMBERS.

The August-sown plants will now be in a fit state for bearing a few Cucumbers if wanted, but if not required the removal of all male and female blossoms for some time longer will give increased strength and better prepare them for giving a full supply when the plants in the pits and frames are no longer profitable. Where former directions have been followed and plants in pots or boxes are placed on pedestals, thoroughly worked fermenting materials, consisting of Oak leaves and short stable manure, will now play an important part in keeping up a genial bottom-heat in every way preferable to that obtained from hot-water pipes, as the ammonia given off by the manure is obnoxious to insects, and the constant presence of atmospheric moisture reduces syringing to a minimum. In the arrangement of the plants an effort should be made to keep the stems well away from the top-heat pipes, as it is at this part of the house that spider first puts in an appearance, and the hot steam generated by constant syringing often increases the evil by scalding or making the foliage too

tender to withstand the attacks of the enemy. Young plants may still be raised from seed for fruiting in February and March, a time at which good fruit is never too plentiful. To succeed with these, light rich turf, medium-sized pots, and good drainage are essential.

WILLIAM CRUMP.

Madresfield Court Gardens.

INDOOR GARDEN.

FERNS.

SUCH plants as have been used for decorative purposes, particularly those for placing among large groups, will have suffered considerably, and as the bulk of these will consist of *Adiantums* and *Pteris* in variety, the fronds may now be cut off, the crowns of the plants cleaned over, and the plants placed in a close house where a temperature of 55° to 60° can be maintained with a little humidity in the atmosphere. There they will start into growth in a short time. When large quantities of these are required all fertile fronds should be preserved, and as the spores ripen sow them in shallow pans which have previously been drained and filled with a light peaty sandy soil; press firmly to half an inch below the rim of the pan. When sown cover with a sheet of glass and place them in a close house or case in 60° of heat, where a large proportion will germinate, but the sun must not be allowed at any time to reach the pans. Other Ferns now in small pots may receive a shift to one size larger pot. Plants in large pots should be allowed as much room as can be afforded them. *Gymnogrammas* should be elevated on an inverted pot; these last named require more heat than other Ferns and are best retained in the stove.

CAMPANULA PYRAMIDALIS.

The young stock of this *Campanula* should now be placed in 8-inch pots; a rather strong loam, with a little lime rubble, sand, and old Mushroom bed manure rubbed through a sieve will grow them well. A side stage in a cool house is a good position for the winter, as here they would retain their foliage better than if wintered in a pit where the light reaches the tops of the plants only.

MIGNONETTE.

The first sown batch should have a light airy position close up to the glass allotted to it; attention must be paid to watering of the plants, as should they become too wet they are apt to damp off. Seven or nine plants in a 5-inch pot are quite sufficient, which must be supported either by a light single stake to each plant or by two or three strands of matting encircling the plants and kept in position by four or five stakes pushed into the pot.

SHOW PELARGONIUMS

recently repotted should have a light position near the glass; these require to be carefully ventilated in changeable weather, and should not be subject to a lower temperature than 50° after they have once started until a good root action is established.

CALCEOLARIAS

should be potted on as they require it, and as they usually grow rapidly during September the strongest plants should now be large enough for 6-inch pots, which will carry them through the winter.

CALADIUMS

The later plants are still moderately fresh, but encourage the ripening of the earlier ones by laying the pots in the sun in a light house with abundance of air until the foliage dies down, when the tubers may be shaken out of the soil and carefully labelled in preparation for storing away. Even when at rest the *Caladium* tuber will not survive long exposure to a temperature of much under 55°.

Wendover.

J. JAKES.

FLOWER GARDEN.

WITH cold nights and a general decline of temperature the green colour of the leaves of many trees which have been this season very beautiful must give place to varied tints of yellow, brown, red, and purple; but, rich as these hues may appear, we must only look upon them as the forerunners

of stormy blasts, with cold and heavy rain, or perhaps frosty nights. We must, therefore, be ready to take up such plants as would suffer from the inclemency of the weather. Lawns should now be kept well rolled and closely mown, for if this is not done before winter they can neither be so easily nor so smoothly cut in spring; besides, as it will now be frequently necessary to remove fallen leaves, the latter can be much more easily swept up when the grass is smooth and cut short. Walks should now be kept well rolled, and the edgings neatly cut. When walks, edgings, and lawns are in high keeping the garden, though not now so gay with flowers as in summer, will nevertheless have a pleasing effect from the contrast with the decay of vegetation elsewhere.

FUCHSIAS.

These beautiful and deservedly-popular plants have had a good time of it this season, and many of them are now at their best; they can be had in various heights and colours, and many of them are most beautiful as border plants. When grown as pyramids they are splendid for centres in beds. For amateurs the hardy forms, such as *Riccartoni*, are very useful, and stand the severest winters if the roots and collars are well protected with a little litter. *Fuchsia Meteor*, with its crimson-toned foliage, makes a most effective bed in some places. It is as easily managed as any of the ordinary *Fuchsias*. *F. carolina* is an excellent variety for planting out in beds as dwarf standards. It is a vigorous grower and blooms freely. *F. Vanguard*, with its white corolla and red sepals, makes a good bed, and so does *F. Blanchette*. *Golden Fleece* is also very fine, and the hardy *F. Riccartoni* is very useful as a shrubby plant, and in the case of those who have not much glass it may be used for the centres of large beds. All the *Fuchsias* strike freely in autumn and spring in a little heat. They all delight in rich loamy soil when planted out, and are easily kept through the winter. A dry shed from which frost can be excluded suits them well.

THE AUTUMN LOBELIAS.

Where these are growing in situations rendering their removal necessary, they should now be bared up, using the ordinary border soil that is fairly moist. Pack them thickly together, and do not give them a drop of water until they are pulled to pieces and restored in spring ready for a start. We often hear of losses through the winter months; these can invariably be traced to too much moisture.

DACTYLIS GLOMERATA VARIEGATA.

This variegated form of a native grass is one of the most useful edging plants we possess. It is easily propagated by division, and now is the best time to divide it. It requires a rather heavy soil, but in this respect it is not very fastidious, and thrives in almost any soil if rich. If the soil be poor the plant is apt to get rusty-looking in a dry autumn. It should not be allowed to flower. It bears clipping well, and may be kept very dwarf if necessary. *Dactylis glomerata variegata elegans* is a good variety, and most useful for edging.

T. B. FIELD.

Ashwellthorpe Hall Gardens, Norwich.

CHRYSANTHEMUMS.

ON the whole the plants generally are looking remarkably well, and I shall be sorely disappointed if flowers of great excellence are not to be frequently met with next month. Many are under the impression that there has not been sufficient sun thoroughly to mature and ripen the wood, but if the plants have been allowed ample room and they have been grown in an open airy position, there need, I am sure, be little fear as to this. It is important that the plants are carefully tended after they are housed, one of the chief factors being that each one is allowed ample room; overcrowding at this stage is, as I have often pointed out, most detrimental to their proper development, and it is far better to consign any which are not likely to render a good account of themselves to the fire rather than attempt to place them too thickly together.

Thin out any growths which are not promising, oftentimes, for reasons which are unavoidable, there are two promising buds and one much later; the tall late one should be taken out, as retaining it after this date, though it may have served a useful purpose, will be prejudicial to the remaining ones. Each flower should be properly supported or in all probability many of them will become broken; thin tips of Bamboos make excellent supports for them if neatly tied on about 18 inches in length, as these serve the purpose and are not at all unsightly. The houses in which the plants are to flower should be made quite drip proof by repairing all broken and cracked glass, or much damage is likely to accrue from this. Admit air freely both night and day whenever the weather is favourable, and use a thin shading, especially during the early part of the day, to those which are likely to be too early, but on no account go to the extreme in this or the colouring will be much impaired.

SPECIMEN PLANTS.

Complete the disbudding of these as soon as possible, and keep them well supplied with manure water. Air freely and elevate the plants near the glass. No pains should be spared to retain as much of the foliage as possible, both for the sake of producing fine blooms and for appearance. Should rust show itself turn the plants on their sides and thoroughly syringe the undersides of the leaves with paraffin and soft water, using two wine glasses of the first named to every five gallons of water, care being taken to keep it well mixed; this should be repeated every other day, and if persevered in rust will do but little harm. Dust the foliage also with black sulphur to ward off attacks of mildew.

POMPONS.

Continue to disbud these as soon as the buds are large enough to handle with safety, but care should be taken not to do so too severely. A partial thinning out of the smallest of the buds is all that is required, just sufficient to allow each flower to develop perfectly. If not already done place them under glass where they can be aired freely, and give manure water every other watering. The final tying should be made at this date, looping in the growths to the central stake, using finely twisted bast in as pleasing and natural a manner as possible. No Chrysanthemums are more effective or useful than a well grown batch of these, and are sure to find many admirers. Late flowering sorts, which are specially cultivated for blooming at midwinter, should be kept outside for some time to come, but at the same time these should be arranged in a place of safety, where they can be thoroughly protected in case of severe frost; the points should in no case be allowed to become frozen. E. BECKETT.

Aldenham House Gardens, Elstree.

THE EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

ELDERS FOR THEIR FRUIT.

It is pleasant to be reminded by a contributor of fruits of the Sweet Elder or common American Elder (*Sambucus canadensis*) and the red-berried Elder (*S. pubens*); they were sent by Heinrich Henkel of Darmstadt, with the following note: "It may interest your readers to hear of these very free-flowering species; they flower nearly all the summer, and the immense white heads are a remarkable feature in large gardens. They are in beauty at a time when flowering shrubs are rare.

The fruit of *S. canadensis* is blue and of *S. pubens* of a red colour. Both these species of *Sambucus* enjoy a wet place." It may be well to point out that *S. pubens* is considered by many as a synonym of the scarlet-berried Elder (*S. racemosa*). We are pleased to draw attention to species so attractive for their fruit colouring at this season.

EUCRYPHIA CORDIFOLIA.

Miss Douglas Pennant sends from Penrhyn Castle, Bangor, North Wales, flowers of this beautiful white-flowered shrub, with the following interesting note: "Eucryphia cordifolia is not often seen in bloom out of doors. The enclosed sprig is from a plant here which has not flowered before this year."

DOUBLE WELSH POPPIES AND OTHER FLOWERS.

A most interesting contribution to our table comes from Mr. J. McWalters, The Mall, Armagh; it consists of several flowers. Among them is a *Gladiolus* called *micromegas*; the flowers are of a warm purplish colour, and though of uncommon shade are in a measure distinctly handsome. The purple *Aster hybridus nanus* and the richer purple *A. amellus elegans* are well worthy of note for their bright and yet deep colouring. We have written before of the double or semi-double Welsh Poppies from Mr. McWalters. The flowers are intensely rich in colour, orange, yellow, and other shades, and have the merit of lasting longer in beauty than the single forms. This double race is worthy of all praise.

HÆMANTHUS KATHERINE.

It is some time since we have seen this brilliant scarlet flower, but Mr. W. Richardson, of Messrs. W. Balchin and Son, of the Hassocks Nursery, Hassocks, Sussex, reminds us of its beauty. It has a greater refinement than many of its race, and is the one species we should like to grow. Our correspondent writes: "The spikes are from a plant in a 6-inch pot. It is so seldom that one sees this plant, though it is very bright in the stove at this time of year."

A FINE FORM OF SEDUM SPECTABILE.

Mr. Amos Perry sends from his hardy plant farm at Winchmore Hill, near London, a very richly coloured variety of *Sedum spectabile*, called *atropurpureum*; with Mr. Perry's opinion of the plant we are in full agreement: "It is without doubt the brightest coloured autumn flower we have, and when growing beside the type it makes it look quite a worthless plant. It is not new but very scarce, and will prove a valuable addition to our autumn flowers."

AUTUMN FLOWERS AND TINTS FROM IRELAND.

Mr. Newry sends from the Daisy Hill Nursery a large gathering of flowers and leaves of autumn colouring. We have not space to describe these individually, but give the list as an indication of the number of beautiful autumn-flowering trees and shrubs that now add richness to the garden.

<i>Vaccinium corymbosum</i>	<i>Trachymene coerules</i>
<i>Viburnum plicatum</i>	<i>Meconopsis cambrica auranti-plena</i>
<i>Cornus florida</i>	<i>Linaria maroccana alba</i>
<i>Clematis campaniflora</i>	<i>Vitis Thunbergi</i> (superb for size and crimson colouring of the leaf)
<i>Quercus rubra</i> fol. aureis	<i>Vitis dissecta</i>
<i>Cotoneaster acutifolius</i>	<i>Colnetiae</i>
<i>Arbutus canariensis</i>	<i>Prunus sinensis</i>
<i>Comptonia asplenifolia</i> (with very fragrant foliage)	<i>Pyrus melanocarpa</i>
<i>Ostrya virginiana</i>	<i>Colchicum giganteum</i>
<i>Verbasum densiflorum</i>	<i>Rhus copallina</i>
<i>Sanguinaria canadensis</i>	

ANNUAL ROSES.

I send for your table some sprays of tiny Roses (*Rosa polyantha multiflora*). They come into flower in June if the seed be sown in February. Here a long Rose and Lily border has had an edging of them. The plants, two years old, have blossomed profusely during the summer, and are now covered with flowers and buds; indeed, seem almost perpetuals, since they continue blooming until December under the shelter of a low wall.

I hope they will arrive in good condition; they deserve a word in their favour in your valuable paper. SUFFOLKIAN.

A delightful gathering of this sweetly scented, profuse flowering little Rose.

RECENT PLANT PORTRAITS.

THE *Botanical Magazine* for October contains portraits of

Areca? Micholitzii.—Native of New Guinea. A tropical Palm which, though it flowered this year at Kew, did not produce any fruit. It is thought that when it does fruit it may turn out not to be an *Areca*, but to belong to some other family.

Cotyledon (Echeveria) pulvinata.—Native of Mexico. This is a rather curious succulent, with hairy leaves and orange-yellow flowers.

Lysimachia crispipendens.—Native of Central China. This is also known under the synonym of *Stimponia crispipendens*. It is a pretty and very free-flowering species, with rosy purple flowers. It is believed not yet to have reached its best in cultivation, and ought to have a future in English gardens.

Tulipa przewalskii.—Native of Bokhara. This is a very bright early-flowering Tulip, remarkable for bearing two or more flowers on one stem.

Lissochilus purpuratus.—Native of tropical Africa. This is also known under the synonyms of *Limodorum cristatum*, *L. articulatum*, *Galeandra longibracteata*, *Eulophia articulata*, and *E. longibracteata*. It is a very ornamental terrestrial Orchid, producing long spikes of pale rosy flowers, with a rosy purple lip.

The first part of the *Revue Horticole* for October figures

Cotyledon macrantha, a handsome succulent, with bunches of deep orange flowers.

The October number of the *Revue de l'Horticulture Belge* contains portraits of

Callistemon lanceolatus, a bright and beautiful shrub from New Holland, with rose-coloured bottle-brush flowers; and

Selaginella watsoniana, a beautiful and distinctly variegated form introduced by Messrs. Sander.

In the *Revue Horticole* is described a new form of the pretty continuous blooming

Primula obconica or *poculiformis*, which is said to be by far the reddest shade of any yet seen. It is to be distributed this winter by its raisers, Messrs. Rivoire of Lyons, under the name of *Le Vesuve*.

In the same number is given a new remedy for that dreadful infestation, mealy bug; it is extremely simple, and said to be infallible. It is to wash the stems and branches of the Vines infested with a solution of permanganate of potash, consisting of 12.5 grammes to 10 litres of water. The application should be made in spring when the Vines are beginning to shoot, and the solution should not be made till immediately before its application, so as to lose none of its power. W. E. GUMBLETON.

SOCIETIES.

CONFERENCE ON VEGETABLES.

CHISWICK, SEPTEMBER 28.

THE exhibition of fruits and vegetables, with a conference on the latter, formed a fitting conclusion to the long series of interesting functions that have taken place at Chiswick. As Mr. George Bunyard, V.M.H., who occupied the chair, remarked, the gathering will ever figure largely in the annals of the Royal Horticultural Society as the last to be held in the Chiswick garden. And, as far as conferences are concerned, one can hardly regret the passing of the gardens, for of late years, at any rate, it has never seemed possible to make adequate arrangements to ensure the comfort of the speakers as well as of the audience. On this occasion there were the counter attractions of remarkable displays of fruits and vegetables.

The chairman's introductory remarks were rather those for a conference upon fruits than upon vegetables, but the intimate association of the two commodities in the garden as well as the exhibition justified the standpoint from which he spoke. In particular reference to vegetables one was glad to hear the insistence upon their health-maintaining properties as well in their consumption as in their production. Comparatively few people realise what an immense power for good vegetable gardening in rural England has come to be. It has stirred up a rivalry—happily, almost always friendly—amongst the visitors, and their keenness leaves them little time to devote to other and often less beneficial pursuits. Mr. Bunyard paid a graceful tribute to the giants who have crossed the great divide, and whose presence at previous conferences had done so much to help them on to success.

In the unavoidable absence of Dr. Bonavia and Mr. James Hudson, V.M.H., it was decided that their contribution "On Cooking Vegetables" be taken as read, and the chairman called on Mr. W. H. Divers for his essay, entitled

"VEGETABLES ALL THE YEAR ROUND."

Mr. Divers is a clever man and a most excellent gardener, but he found it impossible to deal with this vast subject in a complete manner in such a short paper. A less able man might have thought himself equal to the task. Not so Mr. Divers, who at once stated that all cultural points had to be omitted. At first glance this seemed regrettable, but the subject was so effectively handled that the lack of cultural data was hardly noticeable. The magnitude of the task in solid fact as well as on paper was acknowledged, and reference was made to the innumerable disputes that have arisen between employer and employed on this subject. Though Mr. Divers did not say it in just so many words, he strongly inferred that the cause of a break in the supply was seldom so much the fault of the cultivator as his misfortune in not having proper facilities. Give the gardener the essentials, and he will do the rest; but he cannot do impossibilities. The commonest fault, asserted Mr. Divers, was found in insufficient structures, both in the form of glass houses, pits, frames, and houses for storage, as well as sheds and cellars for forcing. The essayist, of course, made no attempt to say precisely what was necessary, as this is obviously governed only by the individual requirements of each establishment; but he laid down some general principles upon whose basis any place could be equipped.

As forcing plays such a conspicuous part in the maintenance of continuity of supply, houses were regarded as essential, and lean-to or hip-roofed as the most valuable form. Brick pits were spoken of as indispensable, as were also frames, cellars, and a Mushroom house. The growing popularity of cold storage was referred to, and Mr. Divers looked to the happy day when every garden would have such a structure, as this would assuredly facilitate the gardener's endeavours to supply vegetables all the year round. Of equal importance with proper buildings was the conveniences for heating them, and the desirability of having something in hand in boiler power and length of piping was insisted upon. The necessity for keeping all places in proper repair was also touched on by the speaker. Then Mr. Divers turned to the outdoor supply garden, and insisted that more care should be taken in choosing the site and the soil than has hitherto been the case. While admitting—even glorying in—the skill and resource of the gardener, the essayist said that it was an impossibility for him to entirely overcome natural disadvantages of this character. In form he would give the preference to a piece of ground running east and west and sloping to any quarter rather than the north. With suitable walls the oblong garden gave long borders, some warm and others cool, which were peculiarly valuable to the gardener either for pushing things along early in the season in the one case, or keeping them in steady progress in late autumn in the other case.

In dealing with cropping and manuring, Mr. Divers scarcely laid sufficient stress upon having a plan. Many cultivators rely upon their memories for the manner of cropping, but memories were ever treacherous things and apt to lead one into danger. The provision of a rough plan obviates all this, for the grower can then see at a glance how the cropping was done, and he is enabled to take the fullest advantage from the manuring by the institution of a perfect scheme of rotation and succession. References were made to the sowing and thinning of the seeds and young plants, these being regarded as important factors in the matter of providing a constant supply. As a filip to all growing crops Mr. Divers recommended a dressing of 3oz. of mineral superphosphate and 1oz. of nitrate of soda to the square yard.

"VEGETABLES FOR EXHIBITION."

In the exhibition arena Mr. Edwin Beckett constituted himself champion by winning the great class for a collection of vegetables, and at the conference he told the audience how such superb produce was to be grown. As a reader Mr. Beckett proved himself to be something more than a champion. His speech was too great for the reporter to turn a corner, not to speak of the opportunity to get on to a fresh page. There is no man in the country more capable of dealing with such an important subject as this than Mr. Beckett. He is able to lay down rules whose guidance will go far on towards ensuring success, and to him is due in no small measure the immensely increased interest that is now taken in vegetables at our great horticultural shows. Mr. Beckett insisted that production for show and production for home use were one and the same thing. He always, he said, directed his efforts towards perfection, and that found then his produce was suitable alike for the home or the exhibition table.

The essayist deplored the lack of uniformity in the judging of vegetables, asserting that the awards were made upon standards created by the adjudicators, and not, as should be the case, upon one clear and unanswerable principle. The question of size was, of course, touched upon, but until we attain to that Elysian state of having absolute rules neither Mr. Beckett nor anyone else will be able to make all judges agree as to where correct size ends and coarseness begins. It is precisely at this point that exhibition and home produce differs, for, speaking in the broadest sense, it can be said that all exhibition produce is larger than any that is sent to the table. Probably the most valuable portion of Mr. Beckett's paper was that which dealt *seriatim* with the several vegetables, and suggested the points upon which the judging should be done, and it was here that the lightning-like diction completely overpowered the reporter, making particulars impossible to secure.

In respect of the working of the land Mr. Beckett gave most admirable directions. He plumped absolutely for trenching under all circumstances, and recommended that it should be carried to the utmost depth possible. His suggestions for manuring were such as would make the less fortunately placed individual envious, but in this as well as the mechanical working, the directions may be taken as more particularly applicable to the Aldenham soil, as they might not be followed by equal success upon all the varying lands of the country. The time at which soils should be worked is of vast importance, as their fertility is largely affected thereby. Mr. Beckett advocated early autumn for light land and late in February for heavy ground, the latter having been lightly and roughly forked over in the autumn. He insisted upon the positions of all crops being changed every year, but referred to Onions as not necessarily being subject to this rule. The selection, preparation, and staging of produce for and at exhibitions were all adequately dealt with by the speaker, who urged uniformity in sizing according to the kind, and the most scrupulous care in washing, so that while every article would be spotlessly clean there would be no abrasion of the skin from scrubbing. Probably the best object-lesson in staging was Mr. Beckett's own exhibit in an adjoining tent, for few, if any, amongst us have ever seen a more beautiful exhibit.

"VEGETABLES FOR MARKET."

Though written by Mr. W. Poupert, this paper was read by Mr. W. J. Lobjott, and one can scarcely recall a happier case of collaboration. The paper was humorous as well as instructive, and its delivery was of exceptional excellence. The first complaint was that there had not been a corresponding advance in the methods of distribution with the march of time with its enormously greater demands. The same means that answered well in the Georgian days were expected to prove satisfactory now, when not only was more produce required, but it had to be carried greater distances, for the reason that the expansion of residential London had forced the market gardeners further and further from the centre of distribution. He made the statement—and it must surely be regarded as a remarkable one—that the municipal market at Brentford was the only one of its kind in London. The essayist urged the necessity of more direct supply as between the producer and the retailer. This he asserted would result in the consumer getting far fresher vegetables at lower prices. The local greengrocer worked on a limited supply and big profits, which was readily understandable when we remembered that he had to get up at unearthly hours to drive to market for his wares, which in all probability had passed his own door in the producer's vans some hours previously. He thought that the costermonger was a useful section of the community, and trusted that the efforts of the shopkeepers would not result in his complete extinction.

But if there has been little change in the methods of distribution there have been vast alterations in the means of production, whereby everything has been more or less cheapened. Still, perfection has not, in the opinion of the essayist, yet been achieved even in this direction. He wants a machine that will wash and brush up his Radishes, both operations now being done by tedious and comparatively expensive hand labour. He called for the reason why the people of England would insist upon having large vegetables. Quality, as he regarded it, was almost invariably to be found

in conjunction with medium rather than large size; but he was quite aware that his views were not those of the consuming army. The speaker's references to seedsmen's catalogues were distinctly humorous. He seemed to think that 129 varieties of Peas which he had found in one catalogue was carrying the thing a trifle too far.

The discussion was limited to one or two questions, and votes of thanks to the chairman and the essayists closed the proceedings.

NATIONAL AMATEUR GARDENERS. LIVERPOOL SECTION.

THE monthly meeting of this association was held in the Common Hall, Hackins Hey, on the 1st inst., Mr. Hancock presiding over a good attendance. Mr. R. Pinnington was the lecturer for the evening, the subject being "Round About the Flower Shows." In opening the subject, the lecturer said that in the short time at his disposal he intended to give them some lessons from his visits to the various shows, which he hoped would prove useful. Table decorations were dealt with at considerable length, Mr. Pinnington stating that the time had now arrived when societies should demand something original from the tedious round of Coreopsis, Sweet Peas, Iceland Poppies, &c., which were beautiful, and could be used at all times of the summer in many ways.

A pretty miniature pool with creeper-clad rocks in the form of a basket was illustrated with others as forming a centrepiece (this by way of change), with low shallow bowls of foliage and flowers. Many designs were far too heavy. It is far better to err on the lighter side, which always gives a sense of relief.

For amateurs the inclusion in schedules of vases of *Roses* and *Dahlias* was strongly pressed, as by doing so the taste in arrangement would often play an important part, even though the varieties might not be unusual. The selection of the newer *Dahlias*, *Roses*, and *Sweet Peas* seen at the shows gave great satisfaction. *Shrewsbury* was described in a pleasing manner, the *Pentstemons*, which were so well shown, and which are not too largely grown in the Liverpool neighbourhood, being strongly advocated by reason of their many good qualities and usefulness in other ways for decoration, cut or otherwise.

Many other points were touched upon, and at the close Mr. Hancock said that the lecture had been much enjoyed, and must have proved of the greatest possible value to all present. Mr. Dodd and Mr. Wallace also paid a high tribute, to which Mr. Pinnington suitably responded.

BECKENHAM HORTICULTURAL SOCIETY. WINTER SESSION, 1908-1904.

SYLLABUS of lectures and meetings at the Church House on Friday evenings during the winter season: October 9.—"Spraying Fruit Trees and Packing Apples as practised in Canada," by Cecil H. Hooper, M.R.A.C., F.S.I., F.R.H.S. October 16.—Library and reading room. October 23.—"Experiments with Manures on Bush and other Fruits," by F. W. Shrivell, F.L.S., F.R.H.S. October 30.—Library and reading room. November 6.—"Insectivorous Plants" (illustrated with lantern slides), by Dr. J. B. Bidley. November 13.—Library and reading room. November 20.—"Heating and Ventilating Horticultural Structures," by W. J. Simpson. November 27.—Library and reading room. December 4.—"The Beautifying and Utilising of Waste Spaces, Railway Embankments, &c.," by E. Lovett, F.R.H.S. December 11.—Library and reading room. December 18.—"Herbaceous Plants," by Richard F. Martin. January 1.—"Wall and Water Gardens" (illustrated with lantern slides), by John Gregory (Past Kewite). January 8.—Library and reading room. January 15.—"Strawberries," by J. Lyna. January 22.—Library and reading room. January 29.—"Stem Sections—showing how the various structures are specially adapted for the work they do," by J. A. Watson. February 5.—Library and reading room. February 12.—"Sweet Peas," by H. J. Jones, F.N.C.S., F.R.H.S. February 19.—Library and reading room. February 26.—"Horticulture in the U.S.A. and Canada" (illustrated with eighty lantern slides), by J. Cheal, F.R.H.S. March 5.—Library and reading room. March 12.—"Auriculas," by William Beale. March 19.—Library and reading room. March 26.—"Landscape Gardening," by G. Reid (F.E.C., Royal College, Berlin). Mr. George Bunyard, V.M.H., chairman of the fruit and vegetable committees, Royal Horticultural Society, has kindly consented to give an evening on "New Fruits." The date will be duly announced.

CARDIFF GARDENERS' ASSOCIATION. SYLLABUS, 1908-1904.

OCTOBER 6.—"Notes on Hardy Fruits, more especially Apples and Pears," by Mr. John Baaham, sen., F.R.H.S., fruit specialist, Basalgog. Mon. October 20.—"Use of Chemical and other Manures in Horticulture" (illustrated by a series of limelight views), by Mr. F. W. E. Shrivell, F.L.S., F.R.H.S., &c., Thompson's Experimental Farm, Torbridge, Kent. November 10.—"Vines," by Mr. H. E. Farmer, gardener, Cardiff Castle, recently awarded a Knight's medal by the Royal Horticultural Society for Vines in pots, and gold medal for group of plants at Cardiff show in July last. November 17.—Through the repeated kindness of Mr. John Ballinger, chief librarian, the members will visit the Central Free Library to view the numerous and valuable works on horticulture (ancient and modern). December 1.—"Seed Saving and Testing," by Mr. H. K. Kiley (seedman to Messrs. Garaway and Co., and representative of the Bristol Gardeners' M.I. Association). December 15.—"Bees as Fertilisers, Florists, and Fruit Producers" (with lantern views), by Mr. W. Richards, hon. sec. G.R.E.A. lecturer to the G.C.C., and expert to the pro- January 12.—A meeting of "Fruits and Vegetables to protect against the waste of their food," by Mr. K. H. Batman, Manager, Sewage Farm, Park Newydd, Aberystwyth (who intends to deal with his subject in a humorous style).

January 22.—"Orchids," by Mr. E. W. Davy, gardener to J. Neale, Esq., Orchid collector, Penarth. February 9.—"Tomatoes," by Mr. F. Waller, grower to Messrs. Norton & Co., Eastbrook Nurseries, Dynas Fowls. February 23.—"Our Summer Friends" (illustrated with various specimens). Mr. J. Mountney, naturalist (preserver to the Cardiff Museum), Royal Arcade, Cardiff. March 8.—"Wonders and rarities of the Vegetable World," by Mr. J. Pegler, horticulturist and representative of the Newport Gardeners' M.I. Association. March 22.—Annual meeting: Election of officers, selection of a suitable place for the outing, and any other business.

NATIONAL CHRYSANTHEMUM SOCIETY.

An early exhibition of Chrysanthemums annually organised by this society was held at the Crystal Palace on Monday and Wednesday last, but owing largely no doubt to the recent damp weather, which has played havoc with chrysanthemum blooms, the display was not a good one. In several classes there were no entries, and in some only one. However, the numerous exhibits of miscellaneous hardy perennials, Dahlias, and fruit from nurseries made up for the absence of Chrysanthemums.

Messrs. J. Peed and Sons, West Norwood, were first for a group of Chrysanthemums, having plants bearing some fine ones; Mr. Robert Forster, Nunhead Cemetery, was second.

Twenty blooms (Japanese): First, Mr. James Brookes, gardener to W. T. Newman, Esq., Totteridge Park, Herts. Second, T. W. Pickett, Mrs. J. C. Neville, and J. R. Upton, all excellent blooms. Second, Mr. W. King, gardener to Warren, Esq., Waltham Cross, Herts. Mrs. T. W. Pickett and Miss Fulton were the best. Mr. Henry Perkins, The Cedars, Greenlands, Henley, was third.

Twelve blooms (Japanese): First, Mr. G. Boakes, gardener to J. Dixon, Esq., Edenhurst, Sevenoaks, with Mrs. Greenfield and Miss Fulton as the best blooms; a good second, Mr. James Brookes; third, Mr. Mark Rayment, Northenden Gardens, Romford. Mrs. G. Milham was a good show.

Six blooms (Japanese): First, Mr. A. Mackay, gardener to H. Borden Smith, Esq., Danesbury, Bengeo, Hertford, an excellent stand. Miss E. Fulton was the best bloom. Second, Mr. J. Kirkwood, gardener to E. Wormald, Esq., Park House, Finchley; third, Mr. G. Boakes.

Twelve bunches of early-flowering Pompons: First, Mr. F. Such, Maidenhead. No more entries.

Two vases of large blooms: First, Mr. J. Kirkwood, Ashley, with two handsome displays; second, Mr. James Brookes, Totteridge Park Gardens; third, Mr. G. Boakes.

Twelve bunches of early-flowering Chrysanthemums: First, Mr. Eric F. Such, Maidenhead, Yellow Marie Maasé; second, Mr. J. Kirkwood, Finchley.

Three sprays of Chrysanthemums: First, Miss C. B. Cole, Vineyard, Feltham, who used yellow and bronze varieties. No more entries.

Twelve blooms (Japanese) (amateurs): First, Mr. Mark Rayment, North Ockendon Gardens, Romford. No more entries.

Twelve bunches of early-flowering Pompons (amateurs): First, Mr. D. B. Crane, Highgate, N. (excellent); second, Mr. Taylor, East Finchley.

Six bunches of early-flowering Pompons: First, Mr. E. F. Such, Maidenhead; second, Mr. D. B. Crane; both showed well; third, Mr. J. Kirkwood.

Six bunches of early-flowering varieties, from plants grown the open: First, Mr. D. B. Crane with an excellent display. Horace Martin and Ivy Stark were perhaps the best; good second, Mr. James Brookes; third, Mr. J. Kirkwood. There was one more entry.

One vase of Japanese blooms (yellow): First, Mr. W. King, 24, Mrs. T. W. Pickett; second, Mr. H. Perkins, who showed Hon. Mrs. A. Acland.

One vase of Japanese blooms (other than white or yellow): First, Mr. J. Kirkwood; second, Mr. H. Perkins.

Vase of early-flowering Pompons: First, Mr. Eric F. Such, Maidenhead; second, Mr. D. B. Crane, Highgate; third, Mr. J. Kirkwood, Finchley.

Vase of Chrysanthemums: First, Mr. J. Kirkwood, Grass Park House Gardens, Finchley. No more entries.

Six blooms of Japanese (amateurs): First, Mr. W. H. Hall, 224, High Street, Slough; two third prizes were awarded to Mr. F. Wells, South Norwood, and Mr. W. Gooding, Edenbridge, Kent.

Sprays of Chrysanthemums (amateurs): First, Mr. D. B. Crane, Highgate, who used bronze and yellow blooms with excellent effect; second, Mrs. A. Taylor, East Finchley.

Dinner table decoration (open), Chrysanthemums: First, Miss C. B. Cole, Feltham, who used a bright yellow variety; second, Mr. D. B. Crane.

Hand basket of Chrysanthemums (open): First, Miss C. B. Cole; second, Mrs. A. Taylor.

Hand basket of garden flowers: First, Miss Cole; second, Mr. E. F. Such; third, Mrs. A. Taylor.

Hand basket of autumn foliage and berries: First, Miss Cole; second, Mrs. A. Taylor.

Hand basket of Roses: First, Mr. E. F. Such; second, Mrs. A. Taylor.

MISCELLANEOUS.

Messrs. T. S. Ware, Limited, Feltham, Middlesex, had an admirable show of seedling tuberous Begonias, cut from the open ground. Both singles and doubles were splendid in colour, size, and texture of the blooms. Messrs. Ware also had an exhibit of Cactus Dahlias in great variety. Gold medal.

Messrs. Hugh Low and Co., Enfield, exhibited a collection of hardy fruit that included some handsome dishes of Apples, particularly King of Tompkins County, Warner's King, Newton Wonder, Cox's Orange Pippin, and others. Pears Pitmarston Duchess, Duchesse d'Angoulême, and Doyenné du Comice also were finely shown. Silver-gilt medal.

Mr. Eric F. Such, Maidenhead, showed a group of miscellaneous hardy flowers. Silver medal.

Messrs. J. Cheal and Sons, Crawley, exhibited a beautiful lot of Dahlias, single Pompon and Cactus varieties. The singles were especially attractive, and included the following: Flame, gold, splashed with red; Beryl, crimson-purple, splashed with maroon; Miss Roberts, rich yellow; Princess of Wales, rich deep pink with yellow centre; and Vesuvius, bright scarlet. Messrs. Cheal also showed some dishes of Apples and Pears. Gold medal.

Mr. E. J. Jones, Bycroft Nursery, Lewisham, exhibited a splendid display of Michaelmas Daisies and early-flowering Chrysanthemums. They filled half one side of the large central hall, and constituted really an admirable bank of flowers. Gold medal.

Messrs. H. Cannell and Sons, Swanley, Kent, exhibited a group of Cannas, among them some most brilliantly coloured varieties. Messrs. Cannell also showed Chrysanthemums in vases. Gold medal.

Mr. William Angus, The Gardens, Penicuik, N.B., exhibited Chrysanthemum maximum King Edward, a large and striking flower, which has been certificated by several societies.

Messrs. William Cutbush and Son, Highgate, N., exhibited miscellaneous hardy flowers, rock plants, Dahlias, Carnations, &c., making a wonderful show of colour. Included were Phloxes, Pentstemons, Montbretias, Asters, &c. Lobelia tenuis, a small group of which was shown, was very pretty, and one of the best Carnations was a white free-blooming tree variety Mrs. S. J. Brooks. Gold medal.

Hobbies, Limited, Dereham, showed Cactus Dahlias very extensively. Many good varieties were included in the exhibit, which filled one side of the central hall. Some beautiful cut Roses were also shown. Gold medal.

Messrs. John Peed and Son, West Norwood, S.E., filled a large table, pot plants of Turnford Hall Begonia bearing an abundance of flowers, and with Begonia Mrs. Leopold de Rothschild, a variety much resembling Gloire de Lorraine. Apples were also well shown by Messrs. Peed. Gold medal.

Messrs. S. Spooner and Sons, Hounslow, exhibited a collection of hardy fruit, in which were some fine dishes of Apples Hollandbury, Pot's Seedling, Wealthy, Alfriston, Royal Jubilee, Duchess Favourite, Vicar of Beighton, and others. Gold medal.

Tomato Hanwell Victory was shown by Mr. W. Seward, The Fir, Hanwell.

The Crystal Palace gold medals (considered, we understand, to be a higher award than the National Chrysanthemum Society's gold medals) were given to Mr. Norman Davis, Framfield, Sussex, and Mr. Godfrey, Exmouth, Devon, for exhibits of Chrysanthemums.

A first-class certificate was awarded to Chrysanthemum *Renda*.—A new Japanese seedling flower, of lilac-pink colour and good depth. Shown by Mr. T. Bullimore, Canons Park Gardens, Edgware.

CHRYSANTHEMUM FEAST AT TAMWORTH.

A most successful function was carried out recently in the gardens of Bolehall House, Tamworth, Staffordshire, the residence of Mr. William Sydenham, than whom there is no keener enthusiast in the cultivation and popularising of the early-flowering Chrysanthemums. This so-called feast was in reality an occasion for demonstrating the utility of the early-flowering Chrysanthemums for both garden and other forms of decoration when used as cut flowers. Mr. Sydenham began a few years ago to interest himself in the early-flowering sorts, and his efforts took practical form when in 1901 he engaged Tamworth Town Hall for the purpose of an exhibition. How far this initial effort was successful may be judged from the results achieved. Suffice it to say, the hall and ante-room were filled to excess with a wonderful display of the early-flowering Chrysanthemums. The flowers had been grown outdoors and the sprays were not disbudbed.

The total cost of this venture, which reached a considerable figure, was borne by Mr. Sydenham, except for a few classes in which his most intimate friends had given jewellery as prizes in the decorative classes. The display was at that time acknowledged to be a splendid success. Last year the feast took place in the gardens at Bolehall House. On that occasion a capital exhibition was held in a tent in the grounds, and to add still further interest to the proceedings a trial of an immense number of both new and old varieties was open for the inspection. It was the most complete trial of these plants ever held in this country, and all who were privileged to inspect the plants readily acknowledged its useful and comprehensive character. On the present occasion, however, an effort was made to improve upon previous experiences. There were some 4,000 plants to inspect, and these embraced every variety that Mr. William Sydenham had been able to acquire. Old varieties there were in abundance, and many of these appeared under new and unfamiliar names. How these new names were acquired it would be interesting to learn, and in probing this matter deeply there is little doubt some unpleasant facts would come to light. The garden-loving public owe a debt of gratitude to Mr. Sydenham for putting things right. Every plant in flower was carefully tested and proved, and in the case of synonyms the original name was given in each instance. Such a praiseworthy effort surely demands recognition. No less than 283 varieties of the Japanese type of the flower were planted in this extensive trial, and these were supplemented by seventy-one varieties of Pompons, all distinct from one another. Only a proportion of the plants were in flower on the occasion of the feast, but of those already in bloom there was a good list. As the figures already mentioned go to prove, the Japanese sorts largely predominated, and there is little doubt that they are the more popular of the two types. The immense crop of blossoms each plant bore without any apparent strain seemed to impress the visitors.

Mr. Sydenham does not believe in disbudbing the plants, preferring rather to let them develop their growths and buds in a natural way. Contrary to what was the rule in the earlier history of these plants, when mauve, rose, and magenta shades of colour were in the ascendant, they are now represented in almost every tone of colour familiar to growers of mid-season or November flowering sorts. Warm shades undoubtedly now preponderate, and beds and

borders in which the early-flowering Chrysanthemums are grouped in colonies of a few plants in each create an effect in the dull season of which too few gardeners are aware. It is evident that we are on the threshold of great developments, and in the near future the already long list of good sorts will be considerably added to, the newer ones in several instances superseding those which at present find favour. This trial was well worth travelling a long distance to see, and for many weeks to come, unless severe frosts prevail, the plants will provide much to interest and please.

In the afternoon Mr. D. B. Crane, of Highgate, read an instructive paper on the early-flowering Chrysanthemum. The audience were seated or stood around the lawn in front of Bolehall House. The evolution of the flower, more particularly between 1886 and 1903, was dealt with. We hope soon to publish Mr. Crane's paper.

The exhibition was a pretty one, and the two displays set up in competition for the silver bowl were two of the largest and best of the kind it has been our privilege to see. The space in which exhibitors made their display was not to exceed 24 feet by 4 feet. After spending a long time in adjudicating upon them, the judges found it impossible to give either one the much-to-be-desired award of first prize. Each exhibitor had points in his display which the other had not, and when these features were considered the only conclusion to be arrived at was the award of equal first prize. Mr. W. Sydenham generously came forward with another silver bowl, and thus settled a difficulty which was apparent to all.

Mr. Robert Pemberton, Tamworth, an accomplished *bond fide* amateur gardener, had a grand table of flowers, &c. Plants in pots filled the back of the table, and numerous vases of undisbudded sprays of blossoms, all grown in the open, were splendidly grown and beautifully staged. Designs of a heart, harp, and anchor, besides numerous ladies' sprays and button-hole bouquets, completed an exhibit of which anyone might be well pleased. Messrs. Harkness and Sons, Bedale, Yorkshire, were the other successful exhibitors. This firm put up enormous bunches of bright flowers of good quality, and the variety in this instance was most pleasing and varied. We counted quite twenty-four varieties of Japanese, and the Pompon sorts were freely displayed. This was, indeed, a noble exhibit. In the class for eighteen bunches of Japanese, distinct, Messrs. G. Gibson and Co., Leeming Bar, Bedale, Yorkshire, were placed first, with large and handsome bunches of popular sorts. For twelve bunches Japanese sorts, distinct, a Lichfield amateur, Mr. Thorpe, staged a very bright exhibit. Mr. Pemberton was again placed in the premier position in the class for six bunches and three bunches of Pompons, each distinct. Vases and other decorations were set up in competition, and as adjuncts to the show added materially to its attractiveness.

Visitors to the feast were charged 1s. each, and the total of this, after a small deduction for exhibitors' expenses, was handed over to the Society for the Prevention of Cruelty to Children, an arrangement which might be followed with advantage by others.

ROYAL HORTICULTURAL SOCIETY.

List of the medals and cups awarded at the fruit and vegetable show, held at Chiswick on September 29, 30, and October 1, 1903.

DIVISION I.

Collection of nine dishes of ripe dessert fruit.—First (Velth Memorial medal and £5), the Earl of Harrington, Derby (gardener, Mr. Goodacre).

Collection of six dishes of ripe dessert fruit.—First (Williams Memorial medal and £5), J. W. Fleming, Esq., Romsey, Hants (gardener, Mr. Mitchell).

Six distinct varieties of Grapes.—First (silver cup and £5), the Earl of Harrington, Derby (gardener, Mr. Goodacre).

Collection of hardy fruit.—First (Hogg Memorial medal), Major Powell Cotton, Birchington (gardener, Mr. Cornford).

DIVISION II.

For fruit grown entirely out of doors (32 feet run of 6 feet tabling).—First (gold medal), Messrs. G. Bunyard and Co., Limited, Maidstone; second (silver-gilt Knightian medal), Messrs. J. Peed and Son, West Norwood, S.E.; third (silver Knightian medal), Mr. John Basham, Basaleigh, Mon.

For fruit grown entirely out of doors (16 feet run of 6 feet tabling).—First (Hogg Memorial medal), Mr. J. B. Colwill, Sidmouth; second (silver-gilt Knightian medal), Mr. George Mount, Canterbury; third (silver Knightian medal), Messrs. Fewtrell Bros., Hereford.

For orchard house fruit and trees.—First (gold medal), Messrs. G. Bunyard and Co., Limited, Maidstone.

DIVISION VI.—FRUIT (MISCELLANEOUS).

Home preserved or home bottled British-grown fruits.—First (gold medal), the Lady Warwick College, Studley (Warden, Miss Bradley); second (silver-gilt Knightian medal), Messrs. Austin and Co., Kingston-on-Thames.

Foreign-grown and preserved or bottled fruits.—Silver Bankian medal, Miss C. E. Martin, Auburn, New York.

DIVISION VII.—VEGETABLES.

Collection of vegetables (occupying not more than 100 square feet. Open to trade only).—First (silver-gilt Knightian medal), Messrs. R. Smith and Co., Worcester.

Collection of vegetables (occupying not more than 50 square feet. Open to trade only).—First (silver-gilt Knightian medal), Messrs. R. Veitch and Sons, Exeter; second (silver-gilt Bankian medal), Messrs. J. Cheal and Sons, Crawley; third (silver Knightian medal), Messrs. G. Bunyard and Co., Limited, Maidstone.

Collection of vegetables (occupying not more than 50 square feet, amateurs).—First (Sherwood silver cup, value £10), Lord Aldenham, Elstree (gardener, Mr. Beckett).

Collection of vegetables (occupying not more than 24 square feet, amateurs).—First (Velth Memorial medal), Lord Bolton, Basingstoke (gardener, Mr. Bowerman).

Collection of eighteen varieties of Potatoes (open to the trade only).—First (silver-gilt Knightian medal), Mr. E. W.

Green, Wisbech; second (silver-gilt Banksian), Mr. J. B. Colwill, Sidmouth; third (silver Knightian), Messrs. R. Vetch and Son, Exeter.

Collection of twelve varieties of Potatoes (amateurs): First (bronze Williams memorial medal and £2), the Earl of Lathom, Ormskirk (gardener, Mr. B. Ashton).

MISCELLANEOUS CLASS.

Gold medals.—To His Majesty the King, Windsor Castle (gardener, Mr. McKellar), for Grapes and Pine-apples; Messrs. James Vetch and Sons, Limited, Chelsea, for a collection of vegetables; Messrs. T. Rivers and Son, Sawbridgeworth, for fruit trees in pots; and Messrs. Dobbie and Co., Bothesay, N.B., for a collection of Potatoes, also for a collection of vegetables.

Silver-gilt Knightian medals.—To Messrs. Sutton and Sons, Reading, for Potatoes; and Messrs. H. Cannell and Sons, Swanley, for a collection of vegetables.

Silver Knightian medals.—To the Horticultural College, Swanley, for a collection of vegetables; Agent-General for British Columbia, Finsbury Circus, for Canadian preserved fruit; and the Marquis of Exeter, Stamford (gardener, Mr. Metcalfe), for Melons.

Silver Banksian medals.—To Mr. R. W. Green, Wisbech, for Potatoes; Messrs. J. King and Sons, Coggeshall, for Cabbages; Messrs. Harrison and Sons, Leicester, for a collection of vegetables; and Mrs. A. Bramwell, Kingsworthy, Hants, for Onions.

HORTICULTURAL SUNDRIES.

Silver Flora medal.—To Messrs. Joseph Bentley, Limited, Barrow-on-Humber, for horticultural sundries.

Silver Banksian medals.—To Messrs. W. Wood and Son, Limited, Wood Green, N., for horticultural sundries; Messrs. Corry and Co., Limited, 13, Finsbury Street, E.C., for horticultural sundries; Messrs. D. Dowell and Son, Hammer-smith, for horticultural pottery; Messrs. Fulham and Son, 71, Newman Street, W., for Fulhamite stone vases; Messrs. Chamption and Co., City Road, E.C., for tubs for shrubs; and Mr. John Pinches, Camberwell, S.E., for Acme labels.

Bronze Banksian medals.—To the Lubrose Paint Company, Moorgate Station Chambers, E.C., for horticultural paints; Messrs. Valls and Co., Coleman Street, E.C., for Beestecuts; Mr. James George Putney, S.W., for horticultural sundries; Mr. J. Cannon, Ealing, W., for fruit trees; and Mr. H. M. Hamilton, Finchley, N., for horticultural sundries.

Commendé.—To Messrs. Day and Thelland, St. Heliers, Jersey, for new packing case for fruit.

DUNDEE HORTICULTURAL SOCIETY.

THE annual meeting of this prosperous society was held in Dundee on the 2nd inst., when there was a large attendance, presided over by Ex-Bailie Macdonald, president of the society. The treasurer's statement, submitted by Mr. J. S. Ritchie, was very satisfactory, showing an income, including the balance of £506 15s. 4d. from 1902, of £1,416 9s. 5d., and an expenditure of £922 15s. 3d., leaving a credit balance of £539 14s. 2d. The prize money amounted to £280 16s. But for extraordinary expenditure the gain for the year would have been about £45 more. The following office-bearers were appointed: Hon. president, the Earl of Camperdown; president, Ex-Bailie Macdonald; vice-presidents, Lord Provost Barrie, Bailie Melville, Bailie Robertson, and Mr. J. Scott Grey; secretary, Mr. W. F. Hill; treasurer, Mr. J. S. Ritchie. Next year's show is to be held on September 1, 2, and 3, the prize money to be offered amounting to £300.

A Silver Wedding.—Mr. and Mrs. David Pringle Laird, Pinkhill, Murrayfield, have just been presented with a handsome silver lamp, on the occasion of their silver wedding, by the employees of R. B. Laird and Sons, Limited, nurserymen, Edinburgh. The presentation was made by the oldest employee, W. Deas, Mr. Laird very suitably replying. Mr. and Mrs. D. P. Laird were married at Truro, Nova Scotia, on September 30, 1878.

The Cardiff and District Chrysanthemum Society are offering for competition at their forthcoming show, to be held on November 4 and 5 next, one handsome challenge cup value £10 10s., four challenge cups value £5 5s. each, a silver-gilt medal for fruit, besides a National Chrysanthemum Society medal and certificates for blooms. Apply for schedules to Mr. H. Gillett, 66, Woodville Road, Cardiff.

Horticultural classes in Edinburgh.—A promising movement in the promotion of horticultural teaching in Edinburgh was begun on Monday last. This was the inauguration of evening classes for instruction in practical gardening by experienced gardeners, and intended mainly for young gardeners and nurserymen, but also for youths in other employments desirous of making themselves acquainted with horticulture. The classes will be held in Preston Street School, and are under the auspices of what is known as the "Fifteen" Club, an association which has in view the promotion of true technical training in subjects untouched by the Heriot-Watt College and other bodies working on similar lines. The classes for gardening will have the great advantage of being under the superintendence of Mr.

M'Hattie, the Superintendent of City Parks. This is sufficient guarantee for the thoroughly practical nature of the training, and that at the same time such subjects as botany will receive a due share of attention. Courses of practical lectures by experienced gardeners are given, and visits to the best gardens are also to form part of the programme. The duration of each course is intended to be three years. The results of this teaching cannot fail to be beneficial to the young gardeners of Edinburgh.

New England Association of Park Superintendents.—Mr. J. A. Pettigrew, Superintendent of Parks, Boston, U.S.A., who is president of the above association, writes: "It may be of interest to you to know that the park superintendents on this side of the water have an association. I send you a copy of the institution and bye-laws, also the monthly bulletin, which is circulated among the members." The fact of their being able to form an association, which evidently prospers, shows how important a body of horticulturists are American park superintendents.

A rare old Irish gentleman.—Miss Martha L. Root, special correspondent of the *Pittsburgh Dispatch*, one of the most important newspapers of this country, is now in Europe visiting its famous gardens, and through her paper here telling us all about them. In describing her visit to Howth Desmone, Ireland, she writes of the gardener there as follows: "It may be out of place to mention 'tips' in connexion with this article, but the writer wishes to say that while gatekeepers and almost every other keeper in Ireland expects the customary little gift, one cannot offer it to a fine old gardener. Though this intelligent caretaker has given us the entire morning and shown us royal hospitality, I would have as soon thought of handing a sovereign to an emperor as to offer money to that rare old Irish gentleman, the head gardener. There is something so civilising about gardening that genuine lovers of the art possess a most indescribable but charming refinement." Bless that grand old man o' Howth. While I do not know him, I am proud of him; he is a ray of the glory of our profession. —WILLIAM FALCONER, *Allegheny Cemetery, Pittsburgh, Pennsylvania.*

Interesting flowers in Greenwich Park.—I have pleasure in sending you photographs of a large bed of *Hydrangea paniculata*, *Polygonum baldschuanicum*, and a picture of a section of the mixed border in the above park. The *Hydrangeas* occupy a bed in the centre of the lake enclosure, and have attracted much attention. Most of the plants carry between twenty and thirty very fine trusses of flowers, and being planted in so large a mass have been most effective, a carpet of Pansy Blue Bell assisting the general effect wonderfully. There is, perhaps, no more beautiful flowering climber than *Polygonum baldschuanicum* (the Eastern Buchara). Originally planted here on a small tree, it made such rapid growth during the early days of May that the superintendent decided to give it something more worthy to riot over, and the Chestnut, as shown in the photograph, was placed in position, of which it has rapidly taken possession. Its cordate foliage and long racemes of creamy white flowers, which are formed in the axils of the leaves and almost entirely hide the foliage, make it one of the most beautiful and graceful climbers in cultivation. Just now the flowers are taking on a rosy tint, which makes it, if possible, more attractive than ever. The other photograph represents a section of the mixed border of perennials and annuals, which has been a blaze of colour right through the season. The public have not been slow to appreciate the changes made, and in spite of the unfavourable season the park has never known so many visitors. —GRACE BRADLEY, *Blackheath Lodge, Blackheath.* [Unfortunately, the photographs would not have made good reproductions, but we thank our correspondent heartily for sending them.—Ed.]

A novel experiment.—At the great autumn show of British-grown fruits and vegetables held last week at the Royal Horticultural Society's gardens at Chiswick, one of the finest exhibits of

fruit, consisting of nearly 200 items, was acquired by the Imperial Cold Stores of Tottenham for experimental purposes. The company's successful efforts with the storage of Hops, bulbs, and other horticultural produce ensure the best result obtainable, and the outcome of the experiment will be looked forward to with interest by all concerned in British fruit production.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor wishes to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 90, Tottenham Court Road, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—A. Derby.—Scrophularia nodosa variegata.—Plant from Eastbourne in box, but signature torn off.—Verbena venosa.—Emily W., King's County. 1, Linaria bipartita; 2, L. bipartita alba; 3, Lychnis diem. fl.-pl.; 4, Campanula muralis; 5, C. m. var.; 6, C. rotundifolia; 7, Myosotis scorzica; 8, Campanula capensis var.; 9, Sedum apurium roseum.—A. K.—Without flower, fruit, or a word of description it is impossible to name a specimen unless it is of a very pronounced character, which is by no means the case with that sent.

Name of fruit.—Constant Reader.—Apple Stankei Pippin.

Marrows under glass (J. F. R.).—You would find the growing of Marrows under glass in winter a complete failure.

Book on table decoration.—Mr. J. Stacey, Mellington, Fernanarworth, Cornwall, writes: "Will you kindly allow me to inform you and your correspondent that there is a book out on table decoration by William Low, and printed by Messrs. Richard Clay and Sons, London and Bungay. Mr. Low wrote this book in 1887. He was a gardener to His Grace the Duke of Grafton, Eaton Hall. I have had the book for many years; it is a very good one. I think the price is about 5s."

Pontederia cordata (R. C. D.).—With 6 inches of water covering the crown this plant is quite hardy, and especially so in your district. You may immerse it more deeply if opportunity affords. There is no period of the whole year to compare with early April for breaking up and replanting the Irises you name, and not only these but the entire flag section may be most advantageously dealt with at the same period. The vigour and apparent indifference to treatment of the latter group has caused many to regard the season as immaterial. It would, however, be easy to prove the contrary.

Pears and Apples for ornamental planting (S. C. C.).—Apples: Gasconne's Scarlet, Cox's Pomona, Peasegood's Nonsuch, Loddington Seedling, Court Peas Plat, Newton Wonder, Lane's Prince Albert, Lady Sadler, Bismarck, Beauty of Kent, Cox's Orange Pippin, and Scarlet Nonpareil. The above are quick growing and bear handsome fruits. John Downie Crab should be included. Pears for ornamental planting: Jargonelle, Catillac, Beurré d'Amélie, Pitmastron Duchesse, Louise Bonne of Jersey, Doyenné, Beurré Hardy, Clapp's Favourite, Conference, Williams' Bon Chrétien, Beurré Superfin, Marie Louise, and Doyenné du Comice. The Quince is also handsome in bloom and is fruit.

Wire fence (R. SEABROOK).—Our correspondent is desirous of covering a barbed wire fence fastened to railway sleepers, running north and south across an exposed field for a length of 800 feet, and suggests Raspberries or hybrid Raspberry and Blackberry. We presume from the position of the plantation that no special culture or care is to be given to whatever crop is planted, but that a crop of some sort is wanted that will, more or less, take care of itself and give some returns in fruit yearly. We think that our correspondent could not possibly do better than plant the Superlative Raspberry. It is a certain and heavy bearer, and the fruit is large and handsome, always commanding the top price in the market. The ground should be deeply dug and well manured before the trees are planted, and with ordinary care afterwards in keeping the surface of the ground clean, cutting the old stems away as soon as the fruit is gathered, and tying the new canes in the place of the old, and shortening them to the height of the trellis they will bear heavy crops of fruit for many years. Strong stools with three or four canes to each should be planted 3 feet apart.

CATALOGUES RECEIVED.

Fruit Trees, Plants, Shrubs, &c.—Messrs. C. R. Schilling, Winchfield, Hants.
Bulbs.—Messrs. J. B. King and Sons, Coggeshall, Essex, and Reading; T. S. Ware, Limited, Feltham.
Roses.—Mr. George Prince, Longworth, Berks.
Hardy Border Carnations.—Mr. W. A. Watts, Bromley, St. Asaph.

THE GARDEN

No. 1665.—VOL. LXIV.]

[OCTOBER 17, 1903.]

LILIES IN 1903.

A MISERABLE RECORD.

CAPTAIN REID, of Yalding, Kent, whose contributions on Lilies to THE GARDEN are always welcome, sends the following interesting notes on their behaviour during the present abnormally wet and cold year:—

On the whole, Lilies did as well as most things with me this miserable year, though few of them were as good as I could have wished, and only three—*L. szovitsianum*, *L. Hansonii*, and *L. Henryi*—were above the average. Such a season as the one just over almost makes one think of giving up the attempt to grow Lilies at all; but then there is the consoling thought that other favourite flowers also were most unhappy and feeble under the distressing conditions that prevailed, and we cannot have many years like 1903, surely!

Beginning with the failures, I must with a sigh record the fact that *L. Parryi* was a most miserable spectacle, not more than fifty flowers all told, many of which never properly expanded, while the foliage was weak and discoloured, and the stems disfigured by ominous-looking brown patches significant of the dread disease. What will happen next summer I fear to think, but I have left the bulbs undisturbed in the hope that it was only the weather after all. My seedlings are doing well, and one or two sent up a flower spike carrying a single bloom; but I have not put them into their proper quarters yet.

L. Batemanniae, *L. Kramerii*, and *L. Leichtlini* were absolute failures, perhaps not entirely owing to the season. None of them seem inclined to grow here, in spite of all my care, and I am not aware that there is a "royal road" to their successful cultivation out of doors—at any rate, in this part of the British Islands.

L. longiflorum was excessively feeble, the new bulbs of the fine form *insulare*, which did so well last summer, not attempting to flower. I planted two bulbs of *L. Alexandræ* two years ago, and they have made no sign so far. I fear they have "joined the majority"; but I will not give up all hope after my experience with other Lilies in the past, though of course they must be included in the failures this year. Those that have partially failed are *L. auratum*, few blooms of which were perfect, *chalcidonicum*, *L. tigrinum*, *L. testaceum*, *excelsum*, and the various forms of *L. Martagon*, all of which were extremely disappointing, though in the case of the last-named do not attach much importance to this, as the bulbs have not long been planted, and they take some time to establish themselves. The flowers of the variety known as *L. dalmaticum* Catani were very striking, and would combine admirably in a group with those of *album*.

It is pleasing to be able to record that the following species were fairly good: *L. Browni*, one spike with three flowers; *L. rubellum*, one with four flowers; *L. candidum*, in spite of an ominous withering of the lower leaves in some cases; *L. bulbiferum*, *L. elegans*, *L. unibellatum*, *L. speciosum*, *L. canadense*, *L. giganteum* (one of four bulbs had a nice head of flowers, though the spike was rather short), and *L. sulphureum*. Two bulbs of the latter, from Mr. Wallace, which have been planted two years among shrubs in stiff loam mixed with a little peat and sand, are apparently doing well, though they grow but slowly. One of them sent up a spike about 3 feet high this year, but did not flower, though it produced a good few bulblets in the axils of the leaves. The other was more ambitious and towered up to 7 feet, high above the surrounding shrubs, where it bore a solitary sweet-smelling desirable bloom, besides affording a supply of bulblets like its companion.

Oddly enough, an enthusiastic amateur of Chicago, U.S.A., Mr. W. D. Hollis, with whom I am corresponding on the congenial topic of Lily culture, informs me that he has also two bulbs of this fine Lily, one of which only has bloomed this year, and has, like mine, produced a solitary flower! But we both have great hopes for the future, and as my friend (I take the liberty of calling him so, though we have never met and our gardens are thousands of miles apart, for are not all lovers of the flowers, especially of one particular kind, bound to be friends?) appears to be, like myself, a devout worshipper of the goddess Liliūm, and, moreover, is the fortunate possessor of an ideal Lily soil, he is more than likely to be successful with this fine species. I may mention that I was first induced to try it by the short but interesting paper on its growth and culture at Naini Tal, North-West Provinces of India, read before the Lily conference at Chiswick in 1901, and included in the pages of the Royal Horticultural Society's Journal for December of that year.

From what I can gather, the secret of its successful cultivation may be expressed, as in the case of other Indian or Burmese Lilies, in the words "shaded roots and sunny flowers." To how many Lilies, now either being roasted in a hot, sunny border or languishing in gloomy obscurity, do these same words perhaps apply! I sincerely hope that a good trial may be given, in any case, to *L. sulphureum*, or *wallichianum* superbum as it was formerly called.

To proceed with my own record, already, I fear, much too long. Three species acquitted themselves in such a way as to deserve the letter "g." after their names, while only another trio were deemed worthy of a "v.g." Good may certainly apply to *L. croceum* (a fine reliable old sort), *L. pardalinum*, and *L. Grayi*; this last seems to be a very satisfactory Lily, and should be tried by all growers; the growth is elegant, and the flowers, though rather small, are of a very pleasing colour.

The "v.g.'s," which did much to cheer one at various periods of despondency, were *L. szovitsianum*, the old-established bulbe of which again flowered grandly; *L. Henryi*, always good and reliable, and which improved much on its last year's form; and last, not least, the invaluable *L. Hansonii*. My two bulbs, which last year bloomed very fairly on spikes about 3 feet high, shot up to 6 feet this time, jealous perhaps of some adjacent branching stems of *L. speciosum* Melpomene, which had hitherto overtopped them, and they carried fine heads of flowers, one with sixteen, the other with fourteen blooms. I may mention that they are in a sheltered border facing west, the bulbs covered with a dense growth of *Anemone japonica*.

And now I think, having touched on nearly every species I possess, I will conclude this long story with the heartfelt wish that I may have a better account to give of my favourites in 1904. We know that hope springs eternal in the human breast, but also that hope, handicapped by unfavourable weather, will not ensure success with Lilies.

THE EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

EUCALYPTUS GUNNI.—AN OFFER.

Mrs. Alfred R. Wallace sends from the Old Orchard, Broadstone, Wimborne, "a young *Eucalyptus Gunni* raised from seed of the tree described in THE GARDEN of January 25, 1902." Having a large number of similar seedlings, Mrs. Wallace would be glad to send one or two to any readers of THE GARDEN who may wish to grow them and will send Mrs. Wallace a stamped and addressed envelope. They are perfectly hardy, the tree being now fifteen years old. We well remember the tree of which Mrs. Wallace writes, and the account of it by Dr. Wallace in the number referred to should be read by all interested in *Eucalypti*.

MISTLETOE.

Mr. W. Herbert Smith, Pelam House, Sherburn Road, Durham, writes: "Some months ago one of your correspondents enquired about Mistletoe. I enclose a twig cut from a bunch growing on an Apple tree; this is the result of sowing two berries in a T incision in the bark of the Apple tree about four years ago.

THE SHASTA DAISY.

Mr. Smith also sends specimens of this much-vaunted flower; it is large, of the purest white,

and distinct, but there are many forms of the common *Chrysanthemum Leucanthemum*, of which this is one, like it. Our correspondent sends the covering of the seed packet, and the following are the instructions as to sowing, which may be helpful to those who have seed of the flower: "The originator, Mr. Luther Burbank, describes it as follows: 'Flowers snowiest white, with yellow centre, extremely large and graceful, freely produced on strong, wiry stems about 2 feet in length. New hardy perennial, blooming abundantly the first season from seed.' Sow early in shallow, well-enriched boxes of sandy soil in the house, keeping quite moist; transplant to a rich, sunny location about 1 foot by 3 feet apart, or sow in carefully prepared soil in the open air as soon as the ground can be cultivated. These seeds will produce flowers varying much in form and size, and, being a new hybrid race, some exquisite ones may be expected. The best may then be multiplied to any extent by division."

RHODODENDRON NOBLEANUM.

Mr. Major sends from Lamellen, St. Tudy, R.S.O., Cornwall, flowers of the beautiful *R. nobleanum* with the following note: "I enclose three blooms of *R. nobleanum* for your table. It is a shrub which deserves more general cultivation owing to its habit of flowering through the autumn and winter. I picked the first flower this autumn on September 8, and generally gather some on or about Christmas Day. Being a hybrid between *R. arboreum* and *R. caucasicum* it is fairly hardy, but should have a sheltered situation, because of its season of flowering. I may mention a fact which may be of interest. Having frequently noticed small ragged holes at the base of the corolla I tried to find out by what agency they were caused. After watching I found that they were made by the great tit (*Parus major*), presumably to get at the drop of honey at the bottom of the flower."

FERNS FROM IRELAND.

Mr. R. B. O'Kelly, Glensaera House, Ballyvaughan, County Clare, sends a very interesting series of hardy Ferns, as follows:

Variegated Hart's-tongue.—This is *Scolopendrium vulgare variegatum Willisonii*, originally found wild in North Yorkshire; a plain frond of normal dimensions, variegated yellow. There are also *S. v. v. Elworthii* and *S. v. v. Claphami*, both of which are variegated with pure white.

Polypodium vulgare serrulatum.—Originally found in Devonshire by Mr. Wollaston and Mr. Hillmann, and also near Malton by Mr. C. Monkman, generally growing on trunks of trees.

Adiantum Capillus veneris incisum.—Originally found at Ballyryan, County Clare, by Dr. Allchin, and also at Menstone Bay by Mr. E. Newman, and in Guernsey by Mr. J. James. There is no reason why it should not occur also on the Burren Mountains.

Another Fern was given as *Polypodium vulgare serrulatum robustum* (O'Kelly). This form is unknown to us, neither can we find it in any book. It has all the appearances of a gigantic form of *Polypodium vulgare serrulatum*, and therefore the name is appropriate.

One Fern is given as the "French Maiden-hair," which is a wrong appellation. On the market and with the florist's decorators it is commonly known as "the French Fern," not as the "French Maiden-hair," which name has no doubt been given to it on account of the enormous quantities brought weekly to our markets from the western parts of France, principally from Brittany, where it grows abundantly. But it is also found very plentifully in Cornwall, Devonshire, Ireland, Hampshire, and Somerset growing at the foot of trees, on old walls, and in disused quarries. It is *Asplenium Adiantum-nigrum*, popularly known as the Black Maiden-hair Spleenwort, and is very variable, several forms crested, incised, and variegated being very distinct. Mr. Neill Fraser of Edinburgh, in a printed list of his collection published in 1865, enumerates no less than twenty-six forms, many of which are not to be found to-day.

Mr. O'Kelly sends a Fern under the name of *Ceterach crispum majus*, but this is unknown to us. We cannot find it in any book. It is exactly the same form as *Ceterach* or *Asplenium Ceterach crenatum* of Moore (*sinnatum* of Kinahan), originally found in County Clare by Dr. Allchin, at Waterford by Mr. J. R. Kinahan, at Blackhead and Galway by Mr. R. Barrington, and in several other counties in England and in Scotland by Messrs. E. J. Lowe, R. Barrington, R. J. Gray, W. G. Johnstone, and others.

A Fern labelled No. 7 is probably *Asplenium Adiantum nigrum obtusatum*, which was originally found in Ireland—in Antrim and at Newtown Castle, but also in Scotland, as well as in Kent, at Torquay, and near Nottingham. The frond received was too much shrivelled for us to be able to identify it.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

October 22.—Complimentary Dinner and Presentation of Testimonial to Mr. Latham, late Curator of the Birmingham Botanic Gardens.

October 27.—Royal Horticultural Society's Drill Hall Meeting; Annual Dinner of the United Horticultural Benefit and Provident Society, Holborn Restaurant.

November 4.—Ascot, Sunninghill, and District Chrysanthemum Show, at Ascot (two days).

November 11 and 12.—The Liverpool Horticultural Association's Chrysanthemum and Fruit Show.

National Rose Society.—At a recent committee meeting of this society it was announced that through the kindness of the Earl of Ilchester and the courtesy of the Royal Horticultural Society the date of the Holland Park show will be July 12 and 13, not July 6, originally fixed by the National Rose Society, whose annual show, therefore, will take place on the last-mentioned date in the Temple Gardens. The Royal Horticultural Society will co-operate with the National Rose Society in holding a Rose show in the new Hall on September 20 next. This is good news. We have constantly urged the importance of an exhibition in September. Ninety-six new members have been recently enrolled. The society has certainly progressed since it has held its annual shows in the Temple Gardens. There will be a small profit this year without calling upon the guarantors. No provincial exhibitions will take place next year. We are very glad to hear that the society contemplate reprinting and republishing the excellent "Hints on Planting Roses," bringing it up to date, and another little treatise is suggested, namely, "Pruning Roses." We shall welcome this.

A bulb planter.—In your issue of the 3rd inst. we see that on page 248 appears a notice of our bulb planter, and, by a curious coincidence, on page 244, in an article by Mr. W. A. Watts, there is described an almost identical tool. We are sure that Mr. Watts is unaware of the fact that we have had this tool on sale for some years, and that by our registration of the design we have the sole right to manufacture such an instrument. We shall esteem it a favour if you will kindly make a note of this in your valuable paper.—BARR AND SONS, King Street, Covent Garden, London, Oct. 7.

New Plum President.—Trees of this beautiful new Plum were staged in splendid condition by Messrs. Rivers of Sawbridgeworth at the great fruit show held recently at Chiswick. The fruits are large, oval, and of a deep purple, well covered with a bluish bloom, and a free-stone; its flavour is sweet and rich for a cooking fruit. I note in some cases that this has been considered a good dessert Plum, but the raisers, Messrs. Rivers, though they say it is sweet and rich, class it as a cooking or kitchen fruit. It is not, however, inferior for dessert when well grown. The fruits at Chiswick were excellent and fit for any dessert, and the trees referred to above were laden with

fruit, thus showing its excellent cropping qualities. This new fruit was given a first-class certificate on October 10, 1900, and the raisers state it is a splendid cropper. Its season is October, and it is even later than Monarch, which is a valuable late September fruit. Evidently it is a good pot tree, and grown thus it fruits well; the wood is short-jointed, and the growth compact. For wall culture it should prove a valuable addition to the late Plums, as it keeps well when gathered, and if left as late as possible on the trees is not inferior for dessert.—G. W.

New Plum Late Orange (Rivers). One of the best late Plums is undoubtedly the Late Orange, one of the many seedlings raised at the Sawbridgeworth nurseries a few years ago, and given a first class certificate by the Royal Horticultural Society. There can be no question that Plums as late as this variety if of good quality are most valuable, and these varieties keep good for some time after they are gathered if stored thinly on shelves in a cool room. The fruits of this variety are roundish, bright orange in colour, and covered with a heavy bloom; the flesh is firm, but rich and juicy, and it is a free-stone in addition, and in season during October. In the south law ripe fruits from a warm wall late in September, but for later supplies I would advise growing this variety on a cooler site. Grown thus it gives fruit of good quality when others are over. Messrs. Rivers staged some fine baskets of this Plum at Chiswick on the 29th ult., which were much admired. This Plum is noted for its cropping, but to do it justice should have wall culture, as grown thus it is a most valuable addition to the dessert fruits at this season.—G. WYTHES.

Wonderful Potatoes.—If we are to believe all the yarns concerning some new varieties of Potatoes that find their way into the newspapers, we should with equal readiness believe the story of Jack and the Bean-stalk. Readers of these stories, and sometimes believers in them, should endeavour to remember that they are the result of the strong and far from disinterested imaginations of those who, holding stocks of these wonders, want to sell at a vastly enhanced price. Special mention is made of a variety named Eldorado, a suspicious title. How many rushing is haste to find their Eldorados have found misery! A Potato with so attractive a name may be a very good one, but far from being a marvel, and even "Stars," whether Northern or otherwise, may, after all the booming so freely lavished upon them, be but minor stars. Those who may think that they see fortunes looming large in Potatoes that have been thus lavishly lauded should look up Potato history. If they did they would find that some years ago prices that were regarded as almost outrageous were paid one season for newly introduced Americans, and the following year or so they could hardly be sold at any price. We have had no Potato that so well merited a high price—and yet when put into commerce by Messrs. Sutton and Sons it was offered comparatively cheap—as the famous old Magnum Bonum. It was a grand Potato, and its introduction did more to save our Potato breadths from extinction than any other since introduced. Besides doing that it has given us a splendid progeny, and nine-tenths of the robust and comparatively disease-resisting varieties of to-day have come from Magnum Bonum. The present year has shown us that still our great need is for good robust disease resisters. Apart from the weakened, almost miserable growth that has characterised Potato breadths so largely, there is a great deal of disease in the tubers of comparatively robust varieties, far more than is, I fear, generally believed, but which only the knife can fully exhibit. This fact renders it more than ever incumbent that we should raise and should as widely as possible cultivate good robust growers and real disease resisters. I do not care where these come from, only let us have them in plenty. The three great Potatoes so far as knowledge and reputation go just now are the English Discovery, the Scotch Northern Star, and the Irish Maid of Cal. May all three be universally grown and tested together next year, and may all prove to be our Potato growers' salvation.—A. DEAN.

Kniphofia Burchelli.—Although introduced from South Africa upwards of eighty years ago, this fine species is not used to the best advantage. As a perpetual bloomer for massing in the herbaceous border I find it an extremely valuable plant. The colouring of the flowers is not so gorgeous as *K. aloides* and several others, but the mixture of scarlet and yellow shading down to green is pleasing, added to which it pushes up its spikes from May right on through the summer till cut down by hard frost. *K. Nelsoni* is a gem for the rockery when it is planted in groups on the higher and bolder parts. Quite small tufts are now throwing up ten to twelve good spikes 1½ feet to 2 feet high. The individual flowers, which are not so densely crowded together as in some others, are of a beautiful soft red colour. Coming into flower when the rock garden is none too gay, its value is greatly enhanced as a rock plant for September and early October.—F. C. TRIBBLE, *The Gardens, Apperley Court, Gloucester.*

Thunbergia grandiflora.—The genus *Thunbergia* contains many beautiful climbing plants, some of which are suitable only for large structures, while others may be grown in a more limited space. One of the best of the strong-growing kinds is *T. grandiflora*, a vigorous climber, which is suitable for clothing the roof of a large and lofty structure, as under this treatment it not only flowers freely but it also provides a certain amount of shade for the benefit of the plants underneath. The foliage is very pleasing, and about 6 inches long, while the flowers, which are quite 4 inches across, of a pale blue, lined with a deeper tint, with the interior of the throat almost white. Its season of blooming is during the autumn and early winter months. It is a native of India, where it forms one of the commonest of climbing plants. There is a variety—*alba*—which, except in the colour of its blossoms, is a counterpart of the type. It is at present little known. Like most members of the genus, *T. grandiflora* is easily grown and propagated, its principal requirements being plenty of head room and sunshine, for if confined within narrow limits or heavily shaded leaves, not flowers, will be the result.—T.

Episcia fulgida.—This showy-flowered Gesneriad may, in common with the nearly allied species, be with advantage treated as a basket plant, both foliage and flowers being well displayed under such conditions, but grown in a 5-inch pot, with the side shoots removed, it forms a Gloxinia-like plant now full of flowers. The leaves, which are roundish oblong in shape, from 6 inches to 8 inches long, have their surface puckered and are deep metallic green in colour, with the midrib and principal veins of a silvery whiteness, these last standing out conspicuously against the darkened surface of the rest of the leaf. The flowers themselves, borne on rather long stalks, are tubular in shape, with the five-lobed expanded mouth a little more than an inch across, and of a very pleasing shade of bright rosy scarlet. In common with many members of the same order a succession of flowers is kept up for a considerable time. This *Episcia* was introduced from Columbia thirty years ago, so that it is by no means new in gardens. Before its discovery the late Dr. Berthold Seemann was the means of introducing *Episcia chontalensis* from Nigarauga in the year 1867. In this the flowers are lilac, with a yellowish centre. Given stove treatment these plants are of very easy propagation and culture. Though now included in the genus *Episcia*, they were first distributed and are generally known by the generic name of *Cyrtodeira*.—H. P.

Nepenthes ventricosa.—Few *Nepenthes* are more distinct than this, which is a native of the Philippines. In the first place the shape of the pitcher is striking, broad at both ends it gradually tapers until in the middle it is quite narrow; its colour is clear pale green with a red margin to the mouth. The leaves are narrow, short, and of good substance, quite leathery to the touch. They are a good green colour with a pale mid-rib. The culture of *Nepenthes* has sadly fallen off during late years, but if anything can be done to encourage their reappearance in gardens, such species as *N. ventricosa* would do so. It is an ornament to

any plant stove. I believe this *Nepenthes* was introduced to cultivation through the Royal Gardens, Kew.

Kleinia Galpini.—Many a cool house would be the brighter at the present time for the inclusion of a few plants of the South African *Kleinia Galpini*. It has narrow fleshy leaves about 3 inches long by half an inch wide, and bears small heads of orange-coloured flowers. Plants remain in bloom for quite two months, and that is more than can be said for many greenhouse flowers of autumn. *Kleinia Galpini* may be propagated by cuttings without difficulty.

Stenoglottis longifolia.—"They grow like Daisies," such was a remark made to me recently by an Orchid grower who cultivates the *Stenoglottis* very successfully. Whether everyone finds this to be the case is perhaps doubtful. However, they are certainly not difficult of culture, and no one with a greenhouse that can be heated on a frosty night need fail to grow them well. The small Orchid grower is usually very conservative, and restricts his skill to the culture of some half-dozen sorts. This is rather a pity, for there are others that he might grow equally well, and *Stenoglottis longifolia* is one of them. It is a terrestrial Orchid, that is to say, it derives its nourishment from soil alone, and a native of South Africa. Small pots or pans and a mixture of loam and leaf-mould are best suited to its culture. If the latter are used several plants must be placed together. Less water is required during winter than when growth is active, but it must not be altogether withheld. This Orchid is of robust growth, and when in good health bears erect racemes of flowers 18 inches to 2 feet high. In colour the latter are light purple. They are freely produced, and if a number of plants are grown a pretty group of them can be arranged. The variety *alba* is also worth growing to place among plants of the type, and splendens, also a variety of *longifolia*, has rose-purple flowers and is of unusually robust growth.—A. P. H.

TREES AND SHRUBS.

LABURNUM CARAMANICUM.

NO more striking example can be imagined of two species of one genus of hardy shrubs differing to such a marked degree from each other as this species and our well-known friend *Laburnum vulgare*, for in the latter case good-sized trees are formed which bear dense, axillary, pendulous racemes of golden flowers during late spring, while the latter is only a loose-growing shrub a few feet high, with small, ternate, *Cytisus*-like leaves and large, loose, terminal panicles of yellow flowers, which are borne during late autumn, October being the month in which the flowers are at their best. It is a rare as well as an interesting shrub, and has been in cultivation since 1879. It is a native of Asia Minor, and makes a few long branches, rather stiff in texture. The flowers, as previously stated, are yellow and in upright terminal inflorescences. The plant is not in general cultivation, though it is to be found mentioned occasionally in catalogues. It likes good loam, and may be grown in a similar manner to most of the *Cytisus*.

THE SPINDLE TREE.

THOUGH for the greater part of the year the Spindle Tree (*Euonymus europæus*) cannot be said to be at all ornamental, it is very showy when smothered with ripe fruit in autumn, and the leaves change to deep red before they fall, while for certain positions it is also worth growing as a specimen bush. In some parts of the country it is a common shrub in hedgerows, where it is usually grown as a bush 6 feet to 12 feet high. When in gardens, however, the cultivation and perhaps better soil have a beneficial effect, and it grows upwards of 20 feet in height, making a small tree. The leaves are more or less ovate, and of no special interest except when brightly coloured in autumn.

The flowers are small, green, and inconspicuous, and are usually followed by a good display of fruit. When ripe, the capsules are deep rose or reddish colour, and as they open disclose the orange-coloured seeds within, the two colours forming a striking contrast. In addition to the type there are a number of varieties differing either in the colour of their leaves or their fruit. *E. e. var. atropurpureus* has purplish leaves, *E. e. aucubefolius* cream variegated leaves, fructu-albo white fruits, fructu-violacea violet fruits, and so on. As the Spindle Tree does not require any particular care, it grows well in a variety of soils, fruits freely in most seasons, and is inexpensive; it is excellent for plantations and other places where a bright touch of colour is required in autumn.

CLEMATIS GRATA.

IN many respects this species bears a strong resemblance to *C. Vitalba*, the Traveller's Joy of our hedgerows, to the American *C. virginiana*, and to one or two others which form a distinct set, and are all autumn flowering. Of the set, it is by far the most ornamental and distinct, while it is also the most uncommon. Loudon mentions it as flowering in the Physic Garden at Chelsea as long ago as 1833, but very few appear to have the true thing. At Kew a mass of it may be seen in the Clematis collection. As in the case of the other climbing species and varieties, it has a number of rough Oak branches to ramble over, and so forms a picturesque and informal mass. It is easily distinguished from surrounding species by its large deep green leaves. These are pinnate, and have five leaflets each, the leaflets being ovate and acuminate, and slightly hairy. The upper half of each leaflet is serrated, the lower half being entire. The flowers appear during September and October, and are in large, loose, axillary inflorescences, some of which are 18 inches or more long. The flowers are an inch or so across, the sepals being four in number and very narrow, purplish on the outside and white within. The stamens are numerous, half an inch long and white, and these form the showy part of the flower. It is a Himalayan species, and is said to have been introduced in 1831. For covering a rough fence or for growing on tree branches 12 feet or so high it is excellent, and is well worth a trial in gardens where it does not exist at present.

W. DALLIMORE.

RHODODENDRONS AND THE SEASON.

THE present year has proved to be a record one in the extent and quantity of the rainfall, and complaints are general of its ruinous effect on crops of every description, especially those on low-lying and heavy lands. Here on our dry, sandy peat we have not suffered at all from the excessive rains; on the contrary, the greater part of our stock has done much better this season than it has for some years past, *Rhododendrons* especially having made long, stout growths, which have ripened up much better than was expected; the buds are also more numerous than appeared likely at one time. On the drier ground the *Rhododendrons* have set buds extremely well, but in the low-lying and wetter ground they are not so prominent. The series of frosts experienced in April badly cut some of the earlier sorts in the low ground, and these, though they have made good growths, have not set buds at all well. In addition to the flower-buds being out, the young shoots which were just on the move were blackened and spoilt, and consequently the plants had to grow from later and weaker buds, which have not developed sufficiently to form flower-buds in such quantity as would otherwise have been the case. On the whole, however, the set of flower-buds this year has been an agreeable surprise, as, up to the middle of August it looked as if there would be a great scarcity of buds all round, but it has luckily turned out to be well over the average, and certainly far above our expectations. The season has been an ideal one for the planting out of the young stock, about 30,000 of which were put out at the end of July, and are now looking uncommonly well and fit to stand the winter. Other classes of plants have also done

well, Yews, Hollies, and Coniferæ especially, the majority of which have made as much growth this year as they usually do in two average ones; but I have heard several complaints of how badly these have done this year, especially on heavy clay lands or in low-lying districts.

Bagshot, Surrey.

J. CLARK.

AN ARTIST'S NOTE-BOOK.

NYMPHÆA GEORGE HUSTER.

SO far as we know this Nymphaea has flowered in three gardens only in Britain, namely, Gunnersbury House Gardens, Royal Gardens, Kew, and Cherkeley Court Gardens, near Leatherhead. Our drawing was

made from a plant growing in Mr. Leopold de Rothschild's garden at Gunnersbury. The flowers are very beautiful, rich rose coloured, and a tinge of purple is noticeable also. They open at night and close early in the morning.

If, however, they are cut while open and placed in water they do not close, and will last for several days. This Nymphaea is a hybrid raised by Mr. Dreer, Philadelphia, U.S.A., and flowered this year for the first time in this country. It was shown before the Royal Horticultural Society recently, but no award was made to it, probably because the flowers shown were not at their best. It is safe to predict, however, that its beauty and value will, before long, be recognised. The leaves are round and about 18 inches in diameter. It grows and flowers freely. Mr. James Hudson has had it in flower for the past two months at Gunnersbury. A heated tank is necessary for its successful culture, but the lovely flowers are a generous reward.

DISEASE - RESISTING POTATOES.

THE Potato crop in the south-west of Scotland has been on the whole rather under the average this year. No crop is more sensitive to bad weather conditions than the Potato, and the season we have just passed through has been about as bad as it could well be. Spring frosts retarded early growth, and during the summer months the want of sunshine and excessive rains hindered the full development of field and garden crops alike, so that, speaking generally, the yield all over, both in quantity and quality, is undoubtedly under the usual standard. Early varieties have given the best results, and in most cases were comparatively free from disease. Large growers in this district do not complain of the early liftings, and, though quite ten days late in getting into the

market, prices were favourable. But, as was to be expected after such a wet season, main crop and late varieties are under the average in size and badly diseased. The notion of any one variety being absolutely disease-proof under all conditions is misleading. In practice we find that the best remedy is to select clean, well-matured tubers. These, combined with good cultivation, change of seed, and change of situation, will repay large and small growers. Early varieties that find much favour in this district are Sutton's Ninety-fold, May Queen, and the same may be said of Early Puritan, Harbinger, Ringleader, and English Beauty, a variety that well deserves consideration. With us a good strain of the old Ashleaf Kidney still holds a place among the best early varieties where really good quality is a consideration. Among the late sorts we favour Veitch's Maincrop, British Queen, Longworthy, Magnum Bonum, Up-to-date, Reliance, Discovery, Schoolmaster, Satisfaction, and Abundance. We grow one or two other varieties, but cannot

which is in its leafage quite disease-resisting. Some may be less readily affected in the tips than others, but all succumb finally. It is rather absurd to write of a variety as disease-proof because it has been grown only two years. Plenty of varieties have been put into commerce that seemed to be disease-proof for five years, and then failed. I fear the term "disease-resisting" must ever be but a relative one. None is absolutely such.—A. DEAN.

ALTHOUGH we have had a bad season the Potato crop has been wonderfully free from disease in this district. Of all the varieties we cultivate in the gardens here I would give preference, taking quality and good cropping into consideration, to Sutton's Abundance. The only way to avoid disease in Potatoes is to continue hybridising and produce new varieties worthy of cultivation. For a few years seedlings do well and keep quite free from disease. Take The Champion for an example. For years there was no better Potato in cultivation, and now it is very little grown.—DAVID MURRAY, *Culzean Garden, Maybole, N.B.*

HAVING been engaged for the past two weeks in inspecting the crops of various Potatoes, I have noticed most carefully the deep-seated cause of the worst diseased sorts. One batch was planted in land in which a large number of old Brussels Sprouts

stems had been buried, and at the time of lifting had not thoroughly decayed, the consequence of this being that they were simply swarming with the little white maggots often met with. I noticed, too, that in cases where the manure had not been properly shaken out by the fork,

NIGHT-FLOWERING NYMPHÆA (N. GEORGE HUSTER). (Half natural size.)

as yet write of them from experience.—JOHN MACKINNON, *Terregles Gardens, Dumfries, N.B.*

As soon as lifting is sufficiently advanced to enable me to say which varieties are best I will write you again. We are growing several varieties new to me this season, some of which are good and others not worth culture. Denbigh Castle is the worst of them all.—JOHN DUNN, *Royal Kitchen Garden, Windsor.*

I NOTICE that a correspondent invites readers of THE GARDEN to give their experience of the disease-resisting qualities of varieties of Potatoes they may grow. I strongly advise all so disposed to wait before they commit themselves to opinions too hastily. I have found already this season that many tubers apparently perfectly sound when lifted have, either later or else when peeled for cooking, shown grave evidence of disease. If replies are held over until Christmas, then they may be assumed to have a fairly safe basis. Let it be clearly understood that there is no variety existing

but had been allowed to remain in lumps, that the disease was worse. The summer has been a deluge almost, and at the present time growth is a mass of decayed rotten stems. I have ever been an advocate of more room between the rows, and this year I am more than ever convinced of the necessity of this. Allow light and air to penetrate between the rows and you get a more sturdy growth, better tubers, and a far heavier crop with a minimum of disease.—A. B., *Liverpool.*

THIS has been an exceptionally wet summer, and I am sorry to say the autumn continues the same, which is having a serious effect upon the Potato crop. In this district—that is, North Lincolnshire—Potatoes never looked better and more promising up to the beginning of August, when there were no signs of disease; but now whole crops are practically destroyed in low-lying districts. The result is that many of the late varieties we used to depend upon are fast dying out. A somewhat new variety is coming to the front, The Factor, which hail

from Scotland; it is a good cropper, and resists, in a great measure, the bad influence of the wet weather. The three most popular Potatoes at present are King Edward the Seventh, Evergood, and Northern Star, and all are said to resist the baneful disease. The latter variety has caused quite a sensation here, and although very dear its cultivation is increasing. — J. GARDNER, *Elsham Hall Gardens, Lincoln.*

THE FLOWER GARDEN.

THE GLADIOLUS.

(Continued from page 253.)

DOWN here in the south-east of England I like to begin planting as soon after the middle of February as the soil will allow, commencing with the Lemoinei, and complete planting by the first week in May. The corms are put in 5 inches deep in beds 4 feet wide, with 2 feet between the beds, the number of rows in each bed depending on the size of the corms, but for convenience in staking, weeding, and getting among the plants when in bloom 12 inches apart each way between the large corms should be allowed.

I wish I could speak with experience as to the date for planting in the north, but I do believe in as early planting as possible. A great deal depends on the drainage of the sub-soil, but Gladioli will stand a lot of cold if the soil is not wet and stodgy, provided well ripened corms, which have been kept very cool all the winter, are put in. North country growers should, however, always stick to early-flowering varieties in each section.

Staking with 4 feet or 5 feet bamboos when the tops appear, keeping the top inch of soil loose and clean, releasing the spikes from the sheaths when the bracts of the flowers get caught just as they emerge, and keeping a look out for caterpillars in the opening buds, are the chief cultural details during the season.

In late October and November lifting should be done regardless of the degree of maturity of the foliage, though naturally one would lift the yellow-leaved plants before those still in active growth. A mild rainy November will often start the corms re-rooting, though the tops may still be quite green. A dry day should be chosen, the plants lifted entire, the labels tied on, and the whole batch spread out in single layers in a dry shed to mature. Protection must be given against actual frost. The tops when dead should be cut off close to the new corm, and the old defunct corm below, with its withered roots, separated by a sharp pull, when, if the new corm is mature, a clean dry scar is left, a natural line of separation between the two corms having been naturally effected by the formation of a few layers of brittle cork cells during the drying process.

The offsets or spawn, if to be preserved for increasing the stock, should be put into a small paper bag and labelled. Offsets attached firmly to the corm when lifting are best left on till cleaning up takes place. The number and size

of these offsets vary much; often the most beautiful varieties yield none, while rubbishy plants may yield dozens. While out of the ground the corms should be kept as dry and cool as possible. When dry they will bear safely several degrees of frost, but in a damp store-house immature ones get mouldy and rot and mature ones root prematurely. If loose, then shallow wooden boxes where the corms can be spread in single layers are the best receptacles. As regards

DISEASES there are several fungoid parasites; one quite common in this country appears on the leaves during the summer as brown spots. Sometimes the plant grows through the attack, but often the spotted area spreads, the leaves turn yellow, and the whole plant dies. On lifting in the autumn the corm is found to be either a rotten mass or else spotted with what I believe is the resting stage of the fungus. I find that, except in severe cases, if the spots are picked out with the point of a knife and the wound dusted with a mixture of equal parts of quicklime and sulphur the corm grows away in the spring, and often a choice variety is saved in this way.

ROSES AND SUMMER BEDS AT GIRTON COLLEGE, CAMBRIDGE.

The best preventive (cure there is none so far) is to grow the plants on a fresh site if possible every year, and clean the old sites with a crop of, say, Cauliflower or early Potatoes; at least, such has been my experience. Wireworm and the daddy grub or leather jacket when troublesome must be trapped in the usual way with a few bits of Rape cake attached to a piece of copper wire and just buried in the soil. Gladioli may be raised from

SEED by anyone having the patience to wait two or three years for a spike of bloom. Both seed and spawn are best sown outdoors under hand lights in April, covering with an inch of gritty soil. The resulting cormlets need identical treatment to the large corms, only they can be planted much more thickly and only 2 inches deep their second year. Seed can be bought or saved by one's self if artificial pollinating be performed, cultivation having enlarged the parts of the flower to such an extent that it is rare to get a capsule from flowers left entirely to the visits of insects. I give now a

SELECTION OF GOOD VARIETIES which can

be bought at a reasonable figure, and which I have had an opportunity of proving:

Reds.	Roses.	Whites.
Grand Rouge	Glaire de Feu	Hilda (Burrell)
L'Incendie	Mme. Polret	Dora Craven
Prof. Maxime	Pyramide	(Burrell)
Cornu	Pasteur	Cygnat (Burrell)
Iona (Burrell)	Lilley	Shakespeare
Martial (Burrell)	Opale	
Bizarre vars.		
Comedy (Burrell)		Diademe
Hesperide		Bernice (Burrell)
Parure		Caillida
Amitie		R. Milner (Kelway)
		Rajah

This is, of course, a very incomplete list of the finest varieties. It only pretends to give two dozen, which average not more than 10d. each. None are more than 2s., and some 5d. and 6d., but all are very beautiful.

Thanet.

W. C. BULL.

A GARDEN AT GIRTON, CAMBRIDGE.

THAT a garden is the purest of all human pleasures has never been more truly exemplified than in the case of the garden of which a corner is here shown. Some thirty years ago a great pasture field with hedgerow trees was all that met the eye of the student who looked out from the new college of Girton, and the austerity was perhaps in keeping with the beginnings of a new movement. The student of to-day approaches the building with its many creepers along a drive of Limes and Chestnuts already old enough to be imposing. On either side extensive lawns that show a vivid green against velvet clumps of Pines are skirted by a wild woodland path bordered by trees in every stage of growth, from the original hedgerow Elms and Oaks down to the latest variety of flowering shrub. This path, which runs round the entire property, some 33 acres in extent, encircles the golf course, vegetable gardens, and orchards, the pond with its swans and coots, the hockey field, and a fine avenue of young Wych Elms, one of the back approaches of the college. Thanks to the gardening skill of the mistress, Miss Welch, what was once the wilderness blossoms like the Rose, from the moment when the first Aconite shows its welcome head, through the long series of annuals and perennials—Rose, Carnation, Gentian, Shirley Poppy—everywhere masses of blazing colour and fragrant scent, until autumn with hardy Chrysanthemum and Michaelmas Daisy gives warning of the bleak moment when alone the Jasmine blooms in a golden shower, defying the winter. And so year in year out this garden is never without some sign of grace to entitle it to the high place it holds in the happy associations of students of the college.

E. E. CONSTANCE JONES.

Girton College, Cambridge.

FLOWERS IN PARK LANE, HYDE PARK.

THIS has been a most unfavourable season for bedding arrangements, but still the display in Park Lane on the whole has been satisfactory. Some good beds noted on a recent visit are worthy of mention. The bright mauve-purple Heliotrope President Garfield with Ivy-leaved Pelargonium Mme. Crousse made an effective association. Pink Pelargonium Mrs. Turner with Nicotiana affinis was also good, and tall Heliotrope and Lantana Drap d'Or margined with the pretty Gazania splendens variegata were very fine. Springing out of a groundwork of white zonal Pelargoniums, Ivy-leaved Galilee looked effective, as also did

Chrysanthemum Flora, Dactylis glomerata, and Lantana delicatissima in a carpet of Harrison's Musk. Beds of light and dark coloured Lantanas, carpeted with the beautiful Viola Blue Bell, deserve notice, while very good was an arrangement of Fuchsias gracilis and Sunray, carpeted with a purple Viola and dotted with a golden-leaved Fuchsia. Scarlet and crimson tuberous Begonias with Melianthus major and Dactylis-glomerata, edged with Sanvitalia, made a bright bed also.

Very fine were mixed Cockscombs with Dracenas and the elegant Grevillea robusta, while mixed Cockscombs were well placed with Lilium speciosum rubrum. Calceolaria amplexicaulis, carpeted with Ageratum, was bright; and so, too, was the beautiful leaved Acalypha musaica associated with Erythrina and Montbretias. Groups of Phormium tenax variegata, Agapanthus, Hydrangeas, and Heliotropes were admired also.

Quo.

THE ROSE GARDEN.

REICHSGRAF E. VON KESSELSTATT
ROSE.

OF all the tinted and Picotee-edged Roses I question if there is one of more exquisite beauty than this. I am afraid its popularity will be somewhat marred by its long name. It seems a pity when there are so many simple names available why Roses should be so hampered. This beautiful variety has a brilliant carmine edging, which is accentuated by the creamy yellow ground colour, and, in addition to its pleasing colours, it is a good though somewhat spreading grower. If we can obtain decorative Roses of the compact habit of Mme. Antoine Mari, &c., they will be a great boon. Though the Rose under notice cannot be commended for its habit, yet I am persuaded all who see it will desire to possess plants.

P.

THIS is a Rose that should be more grown. Introduced by the well-known firm of P. Lambert in 1898, it is only now finding its way into the catalogues of our largest trade growers. The flowers are of medium size, but most brilliant in their colouring. An accurate description is not easy, but writing with a flower before me I should say that on a ground of pale yellow they gradually shade into deep rose until the edge of the petal is carmine with a metallic lustre. Altogether a very beautiful Tea, a good grower, and highly scented. In shape and general outline it is reminiscent of Anna Chatron, and it would make an excellent contrast to that Rose.

MARIE PAVIC? PAVIE? FAVIE?

THIS delightful little Polyantha Rose, with its pale flesh, rose-centred flowers, was introduced in 1889 by M. Alegatiere, long enough ago, one would think, for its correct name to be known and generally recognised. It is to be found in the National Rose Society's official catalogue under the second of the above names, and so figures in most of the trade catalogues. I have reason to believe, however, that the correct name is as written in full above, Marie Pavic. Can any of your readers give any definite information on the subject? It is a pity, I think, for an error to be perpetuated even in such a small matter as the substitution of the fifth for the third letter of the alphabet. The other name is undoubtedly wrong.

HERBERT E. MOLYNEUX.

ROSE MME. MARIE LAVALLEY.

THE value and beauty of this Rose are not sufficiently known. It is scarcely more than semi-double, yet by the formation of its petals the flower appears almost full. A pleasing tint at all times, I think it is best in autumn when the glowing carmine-pink contrasts so beautifully with the snowy white base of the petals. This Rose is really

a strong grower, in fact one might say climbing, but as a big bush it is a pretty object. Just a centre stake is then sufficient, and even this is not wanted after the first two or three years, as the growths support themselves. Anyone not having wall space available need not despair of growing the many charming Roses to be found among the climbing sorts. In my opinion walls would often appear more beautiful when draped with other creepers, using Roses for pillars, arches, &c., where their beauty is made the most of.

P.

ROSA RUGOSA VAR. AGNES EMILY CARMAN.

THIS has been in cultivation for a good many years. It is just like the plain Rugosa, but the flowers have more petals and are of a deep vivid crimson colour. It was sent out by Messrs. Storrs, Harrison, and Co., nurserymen of this country, and named in compliment to Mrs. Carman, the wife of my lamented friend, the late Mr. Elbert S. Carman, editor of the *Rural New Yorker*. I think more of this Rose than of any other Rugosa extant, and last year bought and planted every plant of it I could get hold of, and this year I have given orders for every plant that can be spared of it. Why do not you folks in Britain grow it? Do not plant it as you would a Jacqueminot or a Neyron, but make great shrubby masses of it, and then your neighbours a quarter of a mile away will come right over to see what sort of vivid red flowers you have got there. Try it.

W. FALCONER.

Allegheny Cemetery, Pittsburg, Pa.

AMERICAN NOTES.

JOTTINGS FROM AMERICA.

XANTHOCERAS SORBIFOLIA. — Your reference to this beautiful little tree (page 407) prompts me to tell you something of my experience with it. I have grown it continuously since 1878; in fact, had the first plant, so far as I know, brought into this country. It is perfectly hardy with us, will stand 10° below zero with impunity, and will thrive admirably in any ordinarily good garden soil. It has fruited abundantly with me, and I have raised hundreds of plants from our own grown seed. Plants a foot high bloom, and they bloom copiously every year for ever after. In due time it becomes a small tree. Besides being a capital outdoor garden plant, it is one of our standard shrubs for forcing for Easter. If brought along slowly we bloom it in the greenhouse just as well as out of doors. But on account of its long, thick, fleshy yellow roots we cannot crowd them into conveniently small pots; instead we put say three 3-feet high plants together into a 9-inch or 10-inch pot, and in this way get nice specimens; but the flowers are of no use for cutting, they fade too soon. This Xanthoceras has now become one of the common shrubs or small trees in our nurseries, and is as cheap as Spiræas.

GARDENS OF JAMAICA. — I am much interested in reading of these, and hope your esteemed correspondent may long continue his notes. Jamaica is one of the most beautiful islands on the face of the earth, but I was disappointed there with the absence of big trees. Much of the arborescent beauty of the island is exotic, for instance the Bread Fruit trees, Akee Apple, and the Mangoes. Speaking of the "Scotchman hugging the Creole" (page 72), I believe it was a species of Clusia the folks in Jamaica told me was like unto a Scotch attorney, and I got plants and grew them at the Phipps conservatories. One of the biggest trees is the Silk Cotton tree, but I believe I saw as big ones in the Bahamas as are the giants between Kingston and Spanish Town. And the Oranges about Mandeville in Central Jamaica were delicious, far more so than those of California, not any better though than those of Southern Florida. But why do not you make a more systematic decorative use of your magnificent palms? Oh! your Tree Ferns, forested ravines of them, and your filmy Ferns, and a

hundred other species, even Bracken as Vines (a fact), and Gleichenias intertwining together on the sunny mountain slopes.

IPOMEA RUBRO-CERULEA (page 72). — This is as easy to raise from seeds as are common Morning Glories, and it grows luxuriantly in warm sunny places out of doors, but I do not think your English summers are long enough for it to bloom in the outside garden, therefore you had better treat it as an indoor Vine after the way of L. Leari. It is common in catalogues. A few years ago a "Heavenly Blue" Ipomæa, "a new hybrid," came from a California garden with a great flourish. I was then chairman of the Nomenclature Committee of the Society of American Florists, and had to squeeze the life out of that celestial name, for the new "Heavenly Blue" was nothing more or less than my old friend—the true species—*I. rubro-cœrulea*.

WEST INDIAN IPOMEAS. — How grand are these perennial Morning Glories in the West Indies in winter. There are blue ones, mauve ones, white ones, and big bright yellow ones. I remember with what pleasure I gathered the seeds of the several species and got roots of some of them and brought them home and devotedly cultivated them. But they were all too late-blooming for our outdoor cultivation; and indoors they proved barely profuse enough to be of service, except as botanical treasures. They all grew rampantly though.

CACTUS VIVIPARUS (page 108). — Your note prompts me to say that I have grown every species and variety of Cactus hardy in this climate here out of doors, and my experience is this: All of the hardy Opuntias grow splendidly and multiply exceedingly, bloom freely, and some of them fruit heavily, but no bunch or cushion Cactus, such as viviparus or Simpsoni, is of permanent duration. They may do well the first year, and fairly well the second season, but they will keep dying off. The frost heaves them out of the ground a good deal, but in the case of the Opuntias, no matter if all are heaved out in winter, they root afresh in spring and go ahead as if nothing unusual had happened. But the loss is not great, for we can buy them very cheap from the Colorado collectors.

MODERN BOTHIES. — When I look upon the beautiful, commodious, and sanitary bothies as shown in THE GARDEN (pages 412-413) and think of the bothies in the north of Scotland, where I spent the first five years of my apprentices and journeyman days, I note the change with pleasure. Such modern quarters must have an elevating and ennobling influence on the young men domiciled in them, and I earnestly hope that every head gardener in the country will use his earnest endeavours to secure for the young men under him a decent habitation. I do not for a moment say that fine lodgings make good gardeners, but I do insist that clean, cosy rooms have a most healthful and self-respecting influence on young men, and by all means stock the bothy, no matter if it be only a one-man affair, with a few good standard reference works on horticulture, and one or more of the weekly gardening papers. Thirty years ago I used to visit Frogmore frequently, the guest of my dear old friend the late Mr. D. Murray, the indoor fruit foreman there, and I have a very warm side for that splendid garden and its long list of able men.

IVY-LEAVED PELARGONIUMS (page 77). — Your illustration reminds me of these lovely flowers as grown in the gardens of California. There they are hardy all the year round, and are especially fine near the sea coast. They cover embankments, are trained on low trellises as if they were a hedge, they are used as vines on trellises, and one of the prettiest effects I remember was in Oakland, near San Francisco, where a great blanket of this Pelargonium grew over a Pear tree, and hung from the lower branches like a drapery, just like your illustration, a mass of pink and white, for there were two plants.

VERBENAS (page 82). — We do not grow named varieties; we grow them in separate colours or mixed, and mostly every year from seed. In order to have them in good bloom for sale in May many florists grow them from cuttings, but red spider and ill-health are more apt to affect the cuttings than the seedlings before planting-out time. While

variegated Geraniums (must I say Pelargoniums?) set into a ground carpet of *Verbena venosa* made a stereotyped flower-bed of my boyhood, and it is pretty too. I use *V. venosa* very largely yet, but never in a flower-bed. We always use it as a border to new shrubbery beds or belts, and it is fine for this purpose, blooming continuously from June until October. We raise it from seed every year and plant the seedlings out in April.

FLOWERS FOR BUTTERFLIES (page 21) reminds me that the different species of *Liatris* are a great attraction to these insects.

FRAXINUS ORNUS (page 25).—This is hardy, grows well, and blossoms very generously with us, but it is sorely troubled with borers. At Dorset, in New York, I had *F. floribunda*, too, in fine form.

CYDONIA SIMONI may not be uncommon in England, but it is not at all common here; however, it is the deepest crimson coloured variety I know, a distinct beauty, and worth growing. We got ours from Anthony Waterer, and they are not expensive. W. FALCONER.

Allegheny Cemetery, Pittsburgh, Pa.

USES OF BRITISH PLANTS.

(Continued from page 249.)

OLEACEÆ.

ASH (*Fraxinus excelsior*).—This tree supplies one of the most useful of woods, on account of its toughness and elasticity. An Ash pole bears a greater strain than any other wood of the same thickness, hence it has long been used for all purposes requiring lightness and strength, such as spears and handles of agricultural implements. The stumps produce an excellent coppice, the shoots being cut every five or six years. These make excellent packing-cases, as well as Hop-poles. Walking-sticks, hoops, baskets, &c., are made of the shoots. The lower part of the trunk is often veined, &c., and is used for veneering. The leaves have often been used for fodder. Manna, a form of sugar, is obtained from the sap of several species of Ash, including the British one, in Southern Europe, for it requires a higher temperature than Britain affords. It differs from ordinary sugar in being unable to undergo fermentation. It is mildly laxative, and included in the British Pharmacopœia. The half-ripe fruit or "keys" were formerly eaten pickled as a salad, and were esteemed for their supposed medicinal value.

Privet (*Ligustrum vulgare*).—The chief use of this shrub or tree is for hedges, which, when clipped, grow very compact. The dark black-purple berries have been used for a green-coloured dye for woollen cloth.

GENTIANÆÆ.

Gentian (*Gentiana*).—There are many species of this genus in Switzerland, the high mountainous ones being of a deep, brilliant blue colour. There are six in England, well known for the bitter qualities of their roots. The Swiss *G. lutea* is used in the British Pharmacopœia, but our own *G. Amorella* and *G. campestris* have been popular astringents.

Centaury (*Erythraea Centaurium*) is a little annual with rose-coloured flowers, and contains a bitter principle like the Gentians; hence it has been used for the same purposes, as tonics and febrifuges. It is an excellent stomachic.

Yellow Centaury (*Chlora perfoliata*).—This plant is a familiar one in chalk countries, easily known by its eight yellow petals and perfoliate, or rather connate, leaves. It is bitter like the others, and has been similarly employed. It also yields a yellow dye.

Buckbean (*Menyanthes trifoliata*).—This is an aquatic plant. The leaf has three oval leaflets, with a sheathing stalk. The flowers form a raceme, having fringed, pinkish white corolla. The

leaves in this case are used as a tonic and febrifuge. The foliage has been employed in place of Hops as an adulteration. Though fraudulent, it is not injurious.

BORAGINACEÆ.

Viper's Bugloss (*Echium*).—The word "Viper" is given from a fancied resemblance in the spots on the stem to those on a viper; but others say it was the shape of the seed that resembled the head of a snake, hence on the doctrine of "signatures" or resemblances the plant should cure snake bites. Of course, it has no such power.

Borage (*Borago officinalis*).—This is a common South European weed by roadsides in Malta. It was at one time highly appreciated as a cordial and for catarrhs. The fresh tops are still put into tankards for "cooling," this being due to the nitrate of potash in the plant. Gerard, in his "Herbal," 1597, says: "Those of our time do use the flowers in salads, to exhilarate and make the mind glad, to comfort the heart, and driving away of sorrow."

Comfrey (*Symphytum officinale*).—This was a famous remedy for wounds in the Middle Ages, and called *Consolida*, *Knytte-wort*, or *Knit-back*. As the plant abounds in mucilage it has been used like Marsh Mallow as an emollient for intestinal troubles. The foliage when young is often eaten in the country as a vegetable; it also affords excellent fodder for cattle.

Gromwell (*Lithospermum*).—The nutlets of this plant are very stony, having a polished silicious surface, consequently it was thought to be intended as a remedy for the stone. *L. arvense*, like *Alkanet*, yields a good red dye, and is said to be employed in Sweden for this purpose. Linnæus tells us that the women of Sweden stain their faces with it, perhaps in lieu of rouge.

Alkanet (*Anchusa*).—*A. officinalis*, Bugloss, or Ox-tongue, as this word means in Greek, was formerly much used as a cordial. Alkanet is a purple dye obtained from the root of *A. tinctoria*, a foreign species.

Hound's-tongue (*Cynoglossum*).—This plant smells very disagreeably of mice, but was formerly used in medicine, being astringent if not narcotic as well. The very disagreeable odour made it fall into disrepute. A recipe of the fourteenth century says: "For him that may not well speak, give him to drink Hound's-tongue."

NOTABLE GARDENS.

THE GARDENS AT BLICKLING HALL, NORFOLK.

"Nature's smile or frown
As cast on thee is beautiful."

THE ill men do lives after them.' Fortunately, so does the good. In the nature of this it is impossible for the new to rival the old in interest or charm; the modern and the picturesque will not go hand-in-hand. What would the little East Anglian village of Blickling be worth without the good deeds and good works of our ancestors? They have bequeathed us here a pleasant heritage. Ever since King Harold's time the village of Blickling has been growing and mellowing in beauty.

"Blickling" is spelt in many different ways, but it means the "Beck-meadow," and the old manor house where once King Harold lived, as well as the present structure, were placed in the lowlands lying along the course of a stream that runs from Blickling Mill to Ingworth. Blickling Hall, as we now see it, was built by Sir Henry Hobart at the beginning of the seventeenth century. The park and pleasure grounds cover 1,000 acres, and are graced by a crescent-shaped piece of water about a mile long, and bordered by soft green slopes and shady trees.

The Hall is reached after a short drive from the market town of Aylsham. It is built of fine brick with stone facings, is moated and turreted, and has a clock tower. It stands well back from the road, and is approached by a wide drive flanked by long lawns and broad Yew hedges; behind each hedge a row of trees. The outbuildings and ancient doorway remind one a little of the Cardinal's Palace at Hampton Court.

The gardens lie on the east side of the house, and are of extreme beauty, but they are modern. It was in the year 1872 that Constance, Marchioness of Lothian, laid them

YEW AND FLOWERS IN THE GARDENS AT BLICKLING.

out. Before that time a long grass slope stretched from this part of the house to a grove of trees on the highest point of the park, but a great storm wrecked the Oak trees, and after that a large portion of ground near the Hall was levelled and so arranged that the flower garden should be sheltered from winds, though open to the sunshine. This garden, the ground work of which is soft fine turf, lies all along the frontage of the library, a noble apartment containing pictures, low deep seats, and upwards of 10,000 volumes. It takes up the whole of one side of the house. This long façade is only separated from the garden by the moat, which was drained and dried by the second Earl of Buckinghamshire, and is now a

carved in stone; it bears the date 1697. The flower-beds are of many shapes and sizes, and are interspersed with arches, clipped Yews, and open bowery arbours, and there is statuary, but not of the year 1872. Every piece is clearly as old or older than the Hall itself. It was brought from another old Norfolk mansion, now in ruins, that belonged to an Earl of Yarmouth.

On entering the garden one is struck by the blaze of colour. So large a mass of beds, all filled with bloom, is wonderfully effective, but there is no crowding. Space is left so that one can walk with ease upon the velvet turf and enjoy the fragrance and beauty of each group of flowers. The garden is quite formal,

else, but, as it happened when we saw it, a flight of tortoiseshell butterflies enjoying the honey of the blossoms, and in the centre some trails of purple Clematis.

One unique feature of this garden is the four great square beds at each corner. They are raised in the centre, and here the tallest flowers are planted, such as the loftiest of Sunflowers, with great, round, yellow faces, Dahlias and Daisies, Phlox and Snapdragons, Southernwood, Starworts, Marigolds, and Lilies—all sorts of old-fashioned favourites are marshalled round the Sunflowers according to height and slope gradually downwards to close-cut borders of green or variegated Box. All the beds have permanent edgings. Another

BLICKLING HALL, NORFOLK: THE EAST FRONT.

green sunk garden, delicious with Magnolia and Rosemary. Rosemary grows wonderfully well in Norfolk, and appears specially content here, sending its roots deep down among the stonework in warm corners.

The accomplished and gracious lady who designed the flower garden took care that it should be in harmony with its surroundings. So quaint and old-world is it that but little stretch of imagination is wanted to picture fair Anne Boleyn wandering about its borders, followed by the fickle King who married her privately, as some say, from this very place. The wide lawn is gay with flower-beds, and in the centre is a fountain bright with gold fish. At the end near the steps that lead to the upper garden stands a sun-dial with four faces

and it is only when one stands a little distance away and takes a bird's-eye view that the exact precision of arrangement is noticeable. On either side the fountain, which is placed on a gentle hillock, run riband borders of Plantain Lily, its pale green foliage lovely enough without a flower. Every flower-bed or ornament on one side of the fountain has its counterpart upon the other.

It is the practice of the Blickling gardeners to place a centre-piece of some sort in every flower-bed. Beds of yellow flowers have yellow Roses trained invisibly above them; in crimson and pink beds there is often a small striped Maple tree. Some scarlet Lobelias are growing in great perfection in one round bed. In another there is a mass of Heliotrope, nothing

feature which is really remarkable are the solid blocks of close-clipped Yew, which stand between the upper and lower gardens. They are large enough for many men to stand upon at once, and look firm enough to support their weight. In colour they shade from darkest green to gold, the colour depending on the age of the foliage. There are four of them, and they are as neat as if a barber had cut them. An urn or two, of stone, with growing flowers are placed at this end of the lawn, which is divided from the flower-lawn by a path. There is here a feeling of repose, in pleasing contrast to the rest. Here stands the sun-dial. On one side of the brilliant garden runs a terrace walk hung with Ivy and Virginian Creeper, and bordered with Ferns. Under it there are

MIGNONETTE MACHET WHITE PEARL.

leaves in the masonry for seats and a summer-house. On the opposite side the garden melts into park, and it exchanges the beauty of flowers for that of trees. From this point one has a good view of the lake and the fine group of Beech trees by its side.

Some Oriental Plane trees here grow so luxuriantly as to strike one as something fresh. They spread themselves upon the grass almost like Willows. It was on the last day of September that we saw them; the deeply-notched leaves were showing touches of pale gold, and among them the fruits hung brown and crisp. Walks in these gardens are not many, but they are broad and comfortable; nothing here is small or cramped or meagre.

Lingering among the lawns and woodlands one wonders a little at the patriarchal appearance of some of the gardeners that are about sweeping or gathering fallen leaves. We learn upon enquiry that the late châtelaine of this fair domain had such a tender heart for the gardeners who had grown old in her service that, instead of pensioning them off, she kept them about the place to do light work. There are now fourteen gardeners employed about the grounds besides the master gardener.

The gardens are preserved in the same beauty that their recent owner loved so much, and during the summer months are open once a week, free, to visitors. Inhabitants of Norwich and visitors to Cromer and Sheringham are not slow to avail themselves of the privilege.

Blickling has been lived in by King, by Prelate, and by a Lord Chief Justice. It has been the home and haunt of beauty, law, and chivalry; in it the gardener, the antiquary, the historian, and the artist may alike find pasturage.

F. A. B.

NEW & RARE PLANTS.

LYSIMACHIA HENRYI.

CHINA, the home of the plant here illustrated, has furnished many of the

species belonging to this genus, as many as thirty-five being described in Forbes and Hemsley's "Index Floræ Sinensis." Since

this work was published twenty-five more species have been found and described bringing up the total number of species found in this region to sixty out of one hundred comprising the genus. Most of these are distributed over the temperate and sub-tropical regions of the northern hemisphere, a few coming from tropical and South Africa, South America, Australia, and the Pacific Islands. *L. Henryi* is a tufted perennial rapidly forming large dark green cushions a few inches high, composed of reddish interlacing hairy stems, rooting at the nodes as they spread. The bright yellow campanulate flowers are produced in dense, terminal heads all over the plant, keeping up a succession of bloom during the summer and autumn months. This species was found by Dr. A. Henry in the province of Szechuan at an elevation of 6,000 feet to 8,000 feet, and also in Ichang and its immediate neighbourhood, growing in moist situations. Its introduction to cultivation was however, due to Messrs. James Veitch and Sons, Limited, whose collector, Mr. E. H. Wilson, procured seeds and sent them home. Plants flowered at Coombe Wood Nursery last year, and a piece was sent to Kew. Probably owing to the moist condition of this season it increased rapidly, quickly forming large patches in the rock garden and herbaceous ground. The photograph here reproduced represents the plant in the rock garden, where it is growing in an open, sunny situation. Two other species of *Lysimachia* of recent introduction owe their origin to the same source—*L. crispidens*, with light purplish flowers and graceful habit; and *L. stenosepala*, a free growing plant, producing numerous white flowers in long racemes.

Kew.

W. IRVING.

MIGNONETTE MACHET WHITE PEARL (THE WHITE MACHET).

UNDER this name Messrs. Pape and Bergmann, Quedlinburg, Germany, send us a novelty which forms a counterpart to the varietie

LYSIMACHIA HENRYI IN THE ROCK GARDEN AT KEW (FLOWERS YELLOW).

ANEMONE NARCISSIFLORA (SEEDLING STAGE).

Rubin and Goliath (the red Machet), introduced by the same growers several years ago. The habit of this novelty is that peculiar to the Machet class, viz., vigorous and compact, and with richly coloured flowers. The flower-stems are erect, firm, and bear long and very thick panicles. The flowers are pure white, among which now and then appear single red anthers, rendering this novelty more striking still. These two colours together form a very good and pleasant contrast with each other. Mignonette Machet White Pearl is as satisfactory in pots as it is in the open ground. Combined with Machet Rubin, whether in beds or bouquets, it has an excellent effect, these two varieties being so well adapted the one for the other. It is not yet quite constant.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

LYCORIS SQUAMIGERA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Reference in THE GARDEN for the 3rd inst. to the Kew Belladonnas reminds me of the way in which this Lycoris flowered there last August, for on a visit in the early part of that month nothing surprised me more than the forest of spikes, each bearing several blossoms. They were planted against the wall of the tropical fernery, and almost every bulb must have sent up a flower-spike, the general appearance of the mass being exactly that of Amaryllis Belladonna, except in the colour of the flowers, which were by no means showy, being a kind of dull greyish blue. It certainly has little claim to be called the blue-flowered Belladonna Lily, by which name it has been known. Whatever its merits may be it was, however, quite a surprise to see this comparatively rare plant flowering in such quantity. It is a native of China, and first found its way here as Amaryllis Halli some sixteen or seventeen years ago. Of the other species of Lycoris by far the showiest is *L. aurea*, which has not hitherto proved very amenable to cultivation, though imported bulbs of sufficiently large flower freely the first season. A second species, *L. radiata*, used to be sent to this country from Japan in very large quantities under the name of *Nerine japonica*, in company with *Lilium auratum* and other Lilies, but they realised so little that for the last two or

three seasons I have not seen any. The bulbs grew freely enough, but the difficulty was to induce them to flower. T.

ANEMONES FROM SEEDS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—If I may once more encroach on your valuable space I can, fortunately, supplement seedlings of *A. narcissiflora* showing an earlier stage of growth, an illustration of which E. H. Jenkins in the very instructive and interesting note in your issue for the 19th ult. considers ought to have accompanied my previous remarks to make the information complete. The excrecence at the base of the stalk just above the root is plainly visible, though I rather think it would be misleading to speak of it as "tuberous" or "bulb-like," for in the earliest stage the embryo leaf, which really constitutes this "excrecence," is merely sheathed inside the base of the cotyledon stalk, which latter then only shows a slight swelling at that point. I had well observed this in a very early stage on digging up some of the seedlings on the occasion of my first note, but am now, unfortunately, unable to show it, the seedlings having all advanced a step further. In those I now send the embryo leaf already protrudes through the slit in its wrapping.

One of these seedlings has the cotyledons still perfectly fresh and green and the leaflet is stronger developed, while the other one with withered seed leaves and stalk appears to have gone to rest for the season.

I am now also able to show a seedling of *A. vernalis* which, seven weeks from the time of sowing the seeds, has already two leaves, which in the case of this species break from the central axis of the seed leaves. These seedlings come up within a fortnight, and in about another week the budding leaves could be discerned. I would here also take advantage to correct an error to which my daughter drew attention on reading my previous note, in which I said that seedlings from this year's sowing looked strong enough to flower in the ensuing spring, but this is not so, for those are last year's sowing. I can now say positively that they will flower in the spring, buds having meanwhile formed in all of them. Self-sown seedlings of *A. vernalis* are also coming up all over the place. I quite admit that I deserve E. H. Jenkins' reproach of imprudence for having rashly cast away seed pots, for I certainly ought to have known better, not being exactly a novice, but I was really prompted to my first observations by a question put to me quite recently by an English gentleman as to whether I could report any success with having raised *Anemone alpina* and *sulphurea* from seed, he himself having had unsatisfactory results, from which I concluded his case to have been identical with mine, and probably, also, with the failures of many others. I had previously heard similar complaints. In consequence of E. H. Jenkins' valuable hints on seedlings of bulbous, &c., plants I am now, moreover, obliged to own that without a doubt have I repeated the same blunder over again, of having rashly cast away without previous examination a pot of *Eremurus himalaicus* seedlings last summer, in which about a dozen of the very "tiny erect green blades" which E. H. Jenkins describes in the case of *Narcissus* seedlings had sprung up, but

A. VERNALIS ON SEPTEMBER 20, 1903, FROM SEED SOWN JULY 30, 1903.

which on my return from a holiday had vanished, owing to neglect, of course, as I thought, and in my annoyance I had nothing better to do than turn the pot out on the compost heap.

Many other amateurs like myself will for the future be able to profit by E. H. Jenkins' timely hints, and for my own part I wish here to convey my sincerest thanks for them. E. HEINRICH.

Planegg, near Munich (Bavaria).

NEGLECT OF THE VERBENA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I read your letter on the Verbena in THE GARDEN (page 117) with much interest. Like yourself, I have always admired that flower. Over forty years ago I remember going with a friend to see Mr. Link, gardener to Lord Herries of Everingham Hall, who at that time had some beautiful beds of such varieties as *Geant des Batailles* (crimson, with very dark shading round the eye), *Brilliant de Vaise* (pink), *Mrs. Holford* (white), &c., and who gave me some cuttings, and I have had Verbenas ever since. The winter before last, owing to illness, nearly all my Verbenas were lost. I had a very good white one with the merest tinge of green round the eye, but it perished, and I have never been able to replace it. I observe you say you have a white and blue. If you have a good white and a blue, the nearest you have to lobelia or sky blue, I should like to buy some cuttings.

I also notice you advise a cold frame to winter them in. I tried a cold frame years ago, but the cuttings damped off before Christmas, and I have not tried a frame for years. I winter mine on a high shelf in the greenhouse, where they do very well. A friend of mine, a beekeeper like myself, also sweet on the Verbena, says his father always wintered his in a cold frame, and I believe my friend has done so a time or two, but will ask him when I see him. The flowers enclosed are the two best I have now—*Foxhunter* (crimson) and a seedling.

Sheffield.

WILLIAM CARLTON.

DORMANT BULBS, CLEMATIS MON-TANA, AND GENTIANA ACAULIS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was much interested in Mr. S. W. Fitzherbert's note on bulbs remaining dormant, as I have had many such. Three years ago I had given me three bulbs which came from Burma; they all grew well the first year, but after the leaves died down and did not appear the next year I thought the bulbs were dead, but on turning them out

A. NARCISSIFLORA IN SEPTEMBER, 1903, FROM SEED SOWN IN THE AUTUMN OF 1901.

found them with good roots and perfectly sound. This year one has made leaves, but the other two still remain dormant but quite sound. *Ornithogalum arabicum* will keep dormant and also stand bad treatment. Five years ago I bought twenty-four bulbs, and they were put on a shelf in the potting shed and forgotten. On finding them twelve months later and being quite sound I have experimented to see how long they would keep so. I have potted four bulbs each year, and, though they have grown, they have not all flowered. I enclose two bulbs for your inspection, and, though somewhat shrunk, you will see they are quite sound if cut through. It is curious that bulbs of any sort can be kept out of the soil for five years and still remain sound, but I imagine that very few would like such treatment. *Clematis montana* I have twice cut down within 2 feet of the ground, having stems 5 inches in circumference, and both plants grew as vigorously after the operation as before. But these were both small compared with the one cut down by "S. W. F." *Gentiana scutellaria* I have had on one side of my garden for five years without its showing a bloom. The last week in August I pulled away some single stems and dibbled them in the other side of the garden. Many of these little pieces have now buds, and will shortly be in bloom. They have a good hard soil to grow in and get all the sun, but why should they have bloomed now? As they had very few roots I quite expected they would have spent their time in making roots, and not buds. *Gentiana septemfida* grows and blooms well in the same position.

Ancley, S.E. I. W. NEALL.
[The bulbs were quite sound.—ED.]

THE FRUIT GARDEN.

A FEW NOTES ABOUT PINES.

ALTHOUGH the culture of the Pine-apple is generally considered to be a thing of the past in this country, a few still consider that a well-grown English Pine is far superior to any imported varieties. Importation, owing to fast and improved steamship accommodation of late years, has been the means of bringing a quantity of Pines into the English market, inferior in quality, but at a more popular price. The result is that a great many people at the present day are unacquainted with the flavour of an English-grown Pine, and also their cultivation; and, more than that, are led away with the impression that Pine culture is the most expensive form of gardening that is pursued under glass. In reality, however, the expense is no greater than in the case of such plants as *Crotons*, *Dracenas*, and other stove foliage plants.

It is supposed that Pine culture was introduced into this country about the end of the seventeenth century, at a time when a temperature sufficiently high for the plant's requirements was far more difficult to get than at the present day, when all the modern glass structures and heating appliances are at command. Why such things as Cherries, Plums, Pears, &c., should be forced at the expense of driving Pines out of cultivation is a mystery when they can be had naturally. It can only be ascribed to fashion, which dominates gardening as well as other things.

Anyone undertaking the culture of Pines should proceed as follows: Obtain a quantity of suckers or tops. The suckers are, we will suppose, got in the spring. They should be

inserted in 4½-inch pots in good sandy loam, and plunged in a bed of Oak leaves or tan, with a bottom-heat of not less than 55° to 60°, and an overhead temperature averaging from 60° to 75° in winter and from 65° to 90° in summer, according to sun-heat. If grown as advised the current year, the following spring they should be potted into 8½-inch pots and grown on as before, always taking into consideration that the nearer the plants are to the glass the better. The pots should be plunged at least 18 inches apart each way. The plants should not be syringed overhead, except when sun-heat causes rapid evaporation, but keep the floors of the house well damped. This concludes the summary of the second year's growth.

The third spring repot the plants into 11½-inch pots in a mixture of soil consisting of two parts good, well-matured, turfy loam, one part leaf-mould, one part silver sand and broken charcoal. See that the pots are well crocked. This year the fruit should begin to show. When the plants are rooting freely an

PINE-APPLES IN THE GARDENS OF MR. S. HEILBUT, THE LODGE, HOLYPORT, NEAR MAIDENHEAD.

occasional watering of cow manure water will benefit them, or artificial manure may be used to advantage, little and often.

The varieties grown here are The Queen type, which is a summer-fruiting variety, and the smooth-leaved Cayenne, which fruits in winter and early spring. This latter variety is the one so largely grown in the Azores, from which the English fruiterers obtain their supply from August till the following May.

I may add that Pines are subject to insect attacks, but at the same time are most difficult to clean. Mealy bug and scale are the worst enemies, and sponging is difficult. Where affected syringe frequently, with the plants laid on their sides on a mat, with a mixture of water heated to 100°, one wineglassful of paraffin to one gallon of water. When syringing have another person continually stirring the mixture.

J. EUDALE.

The Lodge Gardens, Holyport, Maidenhead.

ALPINE STRAWBERRIES.

In order to obtain vigorous plants and to be certain of a good crop from them, a fresh plantation should be made every year. Three beds should be arranged in the garden—the first to lie fallow or to be occupied only by plants that will be done with before the end of September, the second to be occupied by plants put in the previous September (these should produce fruit from June to the first frosts), and the third to be planted two years previously. This should produce fruit from spring until the plants are exhausted, when those which survive should be pulled up, the soil deeply worked, left thus for the winter, and not replanted until the following September, and so on year by year, one bed every year being destroyed.

Growers are generally content with taking runners from plants which are still bearing fruit and planting them at once in beds prepared for the purpose. Good results are not always obtained by this method, for the planting is often done too late—at the end of October or even in November. Then the frost comes before the young plants have had time to take root. They suffer all through the winter, and in spring those which are

not already dead grow with difficulty, and form sickly and badly rooted plants. The following method has for the past six years always given me excellent results. In June I sow seeds obtained the previous year from the finest fruits.

The sowing is made either in the greenhouse or upon old hot-beds. As soon as the seed is covered with soil, which is pressed firmly, I cover it with light straw litter or, better still, with Moss, in order to keep it moist during germination, which ought to take place at the end of three weeks. I carefully water so as to keep the soil constantly moist. As soon as the young plants begin to appear I remove the litter, but continue to keep the earth moist.

About August 15 I plant out—rather closely together—in the nursery in order to preserve the young plants during the winter. The second fortnight of March I place the roots in pairs in beds, without covering, prepared for the purpose. When they begin to grow well, about the middle of June, I give plenty of water, and by August 20 I have a quantity of very fine runners. Of these I choose the best formed and place them two by two

in pots filled with soil. The pots are then placed under frames, watered, and shaded for about a week. They are then left in the open air until required for planting. This can be done late in November, for with this treatment there is no longer any fear that the roots will lose their hold of the soil through the action of the frost. I never allow runners in my Strawberry beds which are bearing fruit; I remove them every week. Still, in default of runners from seedlings, they could be taken from a fruit-bearing bed.

C. CHAILLOT, in *Le Jardin*.

APPLE BEAUTY OF KENT.

To your notes to the illustration of this valuable late variety (page 239) might be added a word as to its quality when cooked. If not absolutely the best in this respect in cultivation, it would be very difficult to find its superior. This is a comparatively neglected variety, and worthy of much wider cultivation than it at present receives.

Lowdham, Notts.

CHAS. E. PEARSON.

GARDENING OF THE WEEK.

FRUIT GARDEN.

HARDY FRUITS.

WITH the exception of late Apples, which will be quite fit for gathering, most of the fruit will now be stored, and, the weather being so mild and favourable for ground work, every operation pertaining to the disturbance of the roots of trees will repay early attention. On high and dry soils the importance of root-pruning is not always appreciated, but in cold, damp gardens it forms the keystone of success in the production of good crops of nearly every fruit. Another important matter in the management of wall trees is good coping, temporary or otherwise, for protecting the flowers from frost. It is generally discussed once a year, and is again forgotten until the early flowers remind us that the time is on the wing, and it is again too late to carry out the good intentions formed after the sharp frost of the preceding month of April. It is not for us to advise the kind of protection, as circumstances alter cases; but we may say we give preference to portable glass lights 2 feet in depth, which can be taken down and stored away as soon as the fruit is set and safe from spring frosts. Now is the time to set about making, purchasing, or providing protectors for next spring. It will not, however, be well to put them up until they are actually wanted, as constant protection makes the trees tender and more liable to be injured by severe frost. When the usual routine of root-pruning and planting of what may be termed modern trees has been brought to a close, there generally remains a large section formed of old friends in the orchard which would well repay attention; and, as many of the trees are profuse bearers, the old-fashioned plan of taking away the surface soil down to the roots and replacing it with a rich mixture made up of fresh turf, manure, charred refuse, road-scrappings, or almost anything that can be got together for the purpose, will have the desired effect in increasing surface roots and the size and quality of the fruit. We will assume that the ground is properly drained, and the heads of the trees well thinned out to let in sun and air; but if these matters are not satisfactory, the dead months now before us will be profitably employed in making them so.

PRUNING AND TYING.

Where the winter dressing of fruit trees forms a heavy item an effort should be made to get this work forward before severe weather sets in, as men can get on much faster, the work is performed in a better manner, and the early removal of all superfluous matter exposes the trees and walls to the cleansing influence of frost and rain. With us the Currant is nearly ready for pruning. Then will follow the Plum, the Cherry, and the Raspberry. The latter will have the canes securely tied to stakes

or trellises, the shortening back being performed later on, and a good mulch of rotten manure will make all safe for the winter. Peaches and Nectarines we always prune as soon as the fruit is gathered; the shoots are then neatly tied in close to the wall to ripen, and nothing more is needed till the time comes for untieing and drawing the branches away from the walls to prevent the buds from getting too forward. To prevent the shoots from getting injured by wind a few stout Ash rods are placed in the border 1 foot from the base of the wall and bowed into the coping. Every part of the tree is then washed with strong soap-water or a solution of Gishurst; 8oz. to the gallon of water will perfectly cleanse the trees from insect larvæ if applied with a hard paint brush.

Madresfield Court.

W. CRUMP.

ORCHIDS.

HEATING.

THE temperatures of the warm and intermediate houses should now gradually decline, after which the following should be artificially maintained, allowing a considerable rise by sun-heat: Phalæopsis and warm Cypripedium houses, 75° by day and 70° by night; Cattleya houses, 70° by day and 65° by night; Mexican houses, 70° by day and 60° by night; cool intermediate houses, 65° to 70° by day and 60° by night; cool houses, 60° by day and 55° by night.

DAMPING THE HOUSES.

Much less moisture in the atmosphere will be needed during the damp and mild days of autumn. The cultivator had better err on the dry side rather than have too much moisture, especially in the Cattleya and Mexican houses, or decay of the last made and improperly ripened pseudo-bulbs may take place. Should this occur the damp sheathing should be removed and the affected part of the bulb pricked with a needle so as to allow the excess of moisture to escape.

AIRING.

In the Odontoglossum houses admit air freely by the lower ventilators, using the top ones on all favourable occasions. The cool intermediate houses will need top air only in mild weather, using the bottom ventilators as freely as circumstances will permit. A little air should be admitted by the lower ventilators to the Phalæopsis and warm Cypripedium houses; when windy they should remain entirely closed. The Cattleya and Mexican houses need a freer circulation of air, and this should be carefully admitted by the lower ventilators on the leeward side.

WATERING THE PLANTS.

This will now need great care. The nature of the plants generally must be carefully considered and water applied according to their requirements. Though much less moisture at the roots will be needed, drought must not be carried to excess. Such plants as Phalæopsis, Cypripediums, and other bulbless Orchids should not be allowed to remain dry at the roots, while bulbous plants generally should be given sufficient only to keep them plump and healthy.

CLEANING THE HOUSES.

Begin with the Dendrobium, Cattleya, and Mexican houses whose occupants require the greater amount of light. Clean the glass inside and out, pots, walls, staging, &c. When returning the plants to their respective houses, note those resting, and place at the driest, coolest, and airiest end, and those that have not yet finished growth at the warmest end, and so arrange them that each may have the full benefit of the light. Any that may require repotting or top-dressing should be done as the work proceeds, and any plants badly infested with scale or other injurious pest should be thoroughly cleaned, otherwise the general sponging and cleaning of the plants is best left until the house cleaning is finished.

GENERAL REMARKS.

As soon as shading can be dispensed with, and tiffany blinds have been used, these should be

taken from the houses, choosing a fine day for the operation to dry the material perfectly before putting it away for the season. Carefully note what new ones will be necessary, and those in need of repair, what cord, hooks, rings, &c., will be required, that attention may be given to these details during winter. The heating apparatus should now be put in working order. See that all air taps and valves are movable, examine all visible piping, and see that there are no leaking joints or valves. Flues should be cleaned out and any defects in the brickwork made good. Carefully examine the boilers and see they are safe for the winter's work as far as can be ascertained. These should now be emptied and freed from all sediment. A mild day should be chosen, the temperature of the houses raised to the desired degree, and the fire kept low. Open all valves, turn the taps or remove the plugs from the boilers, and allow the water full force to remove all sediment from the bottom of them. The latter are sometimes ruined through neglect of this simple operation.

F. W. THURGOOD.

Rosslyn Gardens, Stamford Hill, N.

KITCHEN GARDEN.

SEAKALE.

THE plants being grown for providing crowns for forcing have made robust and healthy growth this year, and at the time of writing have not been checked by frosts. The crowns or plants require a few weeks' rest before being introduced into heat, and as they are late in ripening off, owing to the rainy season, very early dishes cannot be expected from them. To hasten the decay of the foliage a few dozen plants may be partially lifted with the spade at this time, and, after being subjected to frosts, the leaves may be removed and the crowns inserted in tan or similar material in the Mushroom house. A bottom-heat of 60° will be necessary, and the crowns must be syringed with tepid water twice or thrice daily, and all air and light excluded.

ASPARAGUS.

When the tops are quite ripe they should be mown off with a scythe or hook and burnt, if not required for other purposes, such as for affording protection to tender vegetables and salad plants. Hand-weed the beds and hoe the alleys, leaving the whole clean and tidy for the winter. Fresh manure for a hot-bed may now be collected and turned in readiness for making-up later on; some tree leaves may be incorporated with it. When the rank ammonia has passed away it may be neatly built up, and a frame placed thereon for forcing the first batch of plants. Like Seakale, this requires a short season of rest, but a few roots may be dug up from a bed that has been planted several years for the supply of a few early dishes. The roots may be placed in the frame in the first or second week in November. A few degrees of frost may be allowed to penetrate the roots before placing in the frame.

CABBAGE.

The plants having become well established, the Dutch hoe should be run through the alleys on fine days to destroy small weeds and to aerate the soil. Watch must be kept for grubs (leather-jackets), and where they have attacked the plants they must be searched for and destroyed, and the gaps made good with strong plants from the reserve bed. It is a good practice to draw some earth to the stems of the plants to prevent swaying by the wind, and also to afford some protection to the sappy stems from frost and snow.

CELERY.

Every opportunity should now be taken to follow on with the earthing of the main crop as it becomes far enough advanced in growth. Where large quantities are grown much labour will have to be bestowed upon this crop at this time, as growth is very rapid. The work should be performed when the tops are dry. Ascertain whether water is needed at the roots before finally earthing up, and, if thought necessary, give a good drenching a few hours before working among it.

CHICORY.

Lift the roots, and, after trimming off the tops, store in like manner to that advised for Carrots. Introduce a few roots every few days, according to the demand, into the Mushroom house, keeping it close and dark.

SALSAFY.

Lift and store in a frost-proof shed in sand or dry earth for use as required.

H. T. MARTIN.

Stoneleigh Abbey Gardens.

INDOOR GARDEN.

SUCH plants as are now being prepared for furnishing the show houses during the winter should have all necessary attention as to cleaning, tying, and training given them; also, by way of bringing them into bloom at the required time, it may be necessary to give a little additional heat, and to place some plants in a lighter position. Chrysanthemums and Salvia in variety will be found most useful for filling the larger spaces now vacant. Bouvardias in pots, the ornamental section of Capsicums, Libonia peruviana, Schizostylis coccinea, Reinwardtia, and the earlier batch of zonal Pelargoniums, late Celosias, Heliotropes in pots, Carnations in variety, together with Roman Hyacinths, Lily of the Valley, and Primulas will give abundant variety, and also serve to furnish the smaller spaces in the houses. Lycopodium, which has covered some of the borders of these houses during the summer, will require renewing about this time; therefore get in as many pots of cuttings as may be required, which, if dibbled into light sandy soil and placed in a warm, moist, and close house, will be ready for use in about three weeks time. As this carpeting of Lycopodium does not stand well during the winter it is desirable to put in successional batches occasionally.

POINSETTIAS

should be ventilated as freely as the atmospheric conditions will allow, and occasional applications of clear liquid manure should be given them, but avoid too much forcing or the plants become soft and do not stand when removed from the growing house. Thyrsacanthus rutilans should now occupy a light position near the glass in the plant stove, and must not be allowed to become too dry at the roots or the plants may drop a part of their foliage. Place successional batches of

WINTER-BLOOMING CARNATIONS

in light, well ventilated houses or pits, as near the glass as practicable, thin out the flower-buds before they are too far advanced, removing those borne on the lateral and weaker stems; an occasional light top-dressing of Clay's Manure or Bentley's special Carnation Manure, and a dose of clear soot water once a fortnight will greatly benefit them and keep the soil clear of worms. The points of the young shoots of

EXACUM MACRANTHUM

should now be taken for cuttings; these strike freely if dibbled in round the sides of small pots in any sandy soil, if plunged in a bottom-heat of 65° under a bell-glass or in a small enclosed case; cuttings rooted now will make nice plants that will bloom freely during next summer.

Wendover.

J. JAKES.

ORCHIDS.**CYPRIPEDIUM INSIGNE.**

NONE is so essentially an amateur's Orchid as *Cypripedium insigne*, of which we give an illustration, made from a photograph kindly sent by a correspondent, who has evidently succeeded with its culture. This is not difficult, for it may be grown in ordinary sandy loam, provided the pot or pan is well drained, and needs only the accommodation afforded by a green-

CYPRIPEDIUM INSIGNE IN AN AMATEUR'S GREENHOUSE.

house or frame from which frost can be excluded. This Lady's Slipper has the additional advantage of flowering during the winter. The plants continue to bloom over a long period, and the flowers keep fresh for some time. Perhaps the correspondent who sent the photograph will be good enough to let us know how such results as the illustration shows were obtained. We have, unfortunately, lost his name and address.

A NOTE ON CATTLEYAS.

CATTLEYA CITRINA.—This species is not often met with, and was introduced from Mexico. The bulbs are small, and are conspicuous from the downy substance in which they are enveloped in their young state. The flowers are produced from the top of the bulbs, and are a bright yellow in colour. They give forth a delightful perfume. *C. citrina* flowers in summer, the blooms lasting a month. It is best grown on a block of wood in a temperate house, and requires shade from bright sunshine.

C. GIGAS.—Undoubtedly this is the finest Cattleya in cultivation, producing exceptionally large flowers. The sepals and petals are of a delicate rose colour, the lip a rich purple in front, and two large yellow blotches in the throat. The flowers are produced in April. It succeeds best in a mixture of three parts peat to one of chopped sphagnum and coarse silver sand. During the growing season it requires plenty of water and a moist atmosphere. When the growth is complete water should be withheld and the plants allowed to rest, otherwise they will bloom very unsatisfactorily.

C. AMETHYSTOGLOSSA.—This is rather difficult to grow, and on that account is seldom seen except in large collections. The bulbs attain a height of 2 feet and 3 feet, and the leaves at the top of them are of a very dark green. The flower spike grows out of the apex of the bulb, and usually carries six or seven blooms. The sepals and petals are of a light rose colour, spotted with rich purple, the lip a deep purple. *C. amethystoglossa* flowers from March to May, the blooms retaining their beauty five or six weeks. It does best in pans suspended from the roof. The potting material should be the same as for *C. gigas*, and the plant raised above the rim of the pot so as to carry the water away quickly. They like abundance of water in the growing season, but require a long rest. Great care should be taken during the resting

season so that the plants do not become shrivelled from want of water. *C. gigas* and *amethystoglossa* require a temperature varying from 60° to 65°.

Waddesdon Gardens.

JOHN R. MORGAN.

KITCHEN GARDEN.**CARTER'S MICHAELMAS PEA.**

AT this season late Peas are appreciated, owing to other choice vegetables falling off, and any that continue the supply as late as possible are doubly valuable. The great drawback with late Peas in many gardens is that mildew is so troublesome. Once this appears it is difficult to arrest in a low-lying position or badly drained gardens, as though there are some good insecticides or mixtures to arrest the spread of this pest, it is much better to grow sorts that are less subject to attack. For the past three seasons I have seen excellent dishes of the Michaelmas Pea well into October, and even now the plants are blooming freely. They are in a very healthy condition, though they were much injured by wind a few weeks ago. This variety pods freely, and they are of a good length, containing seven to nine Peas of the best quality, with a true Marrow flavour. It is a dwarf grower, a little taller this year than usual owing to the heavy rainfall, but even now it does not exceed 3 feet. The growth is robust and the plants branch out grandly. The pods are of a beautiful colour, and the plant, owing to its strength, appears to resist mildew to a degree that is unusual in late Peas; it is certainly a grand October vegetable.

G. WYTHES.

STANDARD BEARER CELERY.

THIS fine variety is now so well known that to say anything in its favour may appear out of place, but it is certainly one of the best red sorts of Celery, and well worth a note. I have grown it for many years, and it will interest those who study quality in vegetables or good culture to point out that at the vegetable conference at Chiswick in 1889, fourteen years ago, Standard Bearer was certificated, and now after so many years it is the premier Celery being shown by that splendid grower Mr. Beckett. It easily secured first prize at Chiswick. I know of no Celery that

keeps better than this variety, and it is of fine quality. There are larger sorts, but mere size is no criterion as to quality in vegetables. I think this was seen in several instances at the recent exhibition, and it was a pleasing sign to note that there was an absence of coarseness that was rather prominent at the earlier conference alluded to above. Standard Bearer, though of compact growth, is very heavy and solid for its size, and the plants, given good culture, seldom run or bolt. The flavour is excellent. S. H. B.

BOOKS.

The Book of Herbs.*—Herbs are a fascinating study, and Lady Rosalind Northcote in her little book about them has risen to the occasion. Her "Book of Herbs," in which they are discussed so pleasantly, is the twelfth volume in a series of handbooks on practical gardening, published by Mr. John Lane in London and New York, and edited by Mr. Harry Roberts. The idea of herbs is as inseparable from folk-lore, mysticism, and magic as it is from cookery, medicine, and perfume. None of these points has been forgotten, and so rich a collection of interesting facts and graceful fancies can only have been gathered by one who took a real delight in the pursuit. The practical gardener might like to hear more about Lady Rosalind's own experiences among the herbs. "Circumstances dictated that my own herbs should grow in a plot rather overshadowed, though annuals, as a rough rule, do best where they can get plenty of sunshine." The chapter entitled "The Growing of Herbs," in which this sentence occurs, is all too short. In these days the old interest in herbalism and herb-growing is greatly renewed, and hints from others are peculiarly grateful. Amateurs who write for amateurs often hit upon the very points that specially interest and assist. Chapter III., which treats of the herbs used in decoration, heraldry, ornament, and perfume, is very interesting. Now that the still-room is again in favour, and the making of perfumes a pastime taken up by ladies of the twentieth century, any information about the uses and properties of fragrant herbs is opportune. Recipes are given in this chapter for pot-pourri and the less familiar sweet-jar.

SOCIETIES.

NATIONAL AMATEUR GARDENERS' ASSOCIATION. This excellent institution of amateur gardeners continues to make headway, and evidence of this fact was apparent to all who attended the last monthly meeting, held on the 6th inst. at Winchester House, Old Broad Street, London, E.C.

A splendid exhibition was arranged in the Great Hall, and on this occasion early-flowering Chrysanthemums, Michaelmas Daisies, and hardy flowers were well shown, besides other flowers, including a display of Orchids. The most noteworthy character of the exhibition, however, was seen in a remarkably fine display of vegetables, in which Mr. George Hobday of Romford, who is an ardent disciple of Mr. Edwin Beckett, the champion of the profession in this respect, staged exhibits of the highest merit.

For the Cannell trophy, value £10, presented by Messrs. H. Cannell and Sons, Swanley, for the best combined exhibit, consisting of six dishes of vegetables (distinct), six dishes of fruit (distinct), and six bunches of cut flowers (distinct), a superb exhibit gaining the maximum award in points found Mr. George Hobday an easy winner. His vegetables, embracing magnificent Leeks of the Champion type, Atlas Craig Onion, Standard Bearer Celery, Autumn Giant Cauliflowers, Runner Beans, and capital Tomatoes, were typical of what vegetables should be, and were not coarse. His fruits and cut flowers were also excellent. This is the second time Mr. Hobday has been placed in the premier position, and should he be successful on the next occasion he will win the trophy outright. Mr. F. M. Vokes was placed second with a fine exhibit, his flowers and fruits being very good. Mr. George Hobday was a good first and Mr. F. M. Vokes second in a class for a collection of six varieties of vegetables for a good series of prizes offered by Messrs. Sutton and Sons. These exhibits, as well as that of the third prize winner, were of excellent quality and splendidly set up. Mr. William Sydenham of Tamworth, offered a cup for six bunches of early-flowering Chrysanthemums, distinct. This was easily secured by Mr. D. B. Crane, Highgate, in a good competition. His bunches were large, and the blooms fresh and of good colour, and the varieties were Harvest Home, Ivy Stark, Miss Dorothy Humphreys, Martinmas, Anastasia,

and Veuve Cluquot, the last two being good Pompon sorts. Mr. Coates was placed second, and Mr. Levi, Weybridge, third. Michaelmas Daisies were well shown by Mr. Levi, who secured leading honours with six bunches distinct, and he was followed by Mr. W. D. Barnes, Woodford, also with a good series. There were numerous other classes, all of which were well contested.

The lady members were to the fore with several excellent dinner-table decorations, as well as with other representations of the floral decorator's art. This is becoming an increasing element in the monthly exhibitions, and provides much that is attractive and interesting.

In the lecture-room the meeting commenced at seven o'clock in the evening, Mr. D. B. Crane (deputy-chairman) taking the chair in the absence of the president, Mr. T. W. Sanders, F.L.S. Mr. W. Iggliden had promised a paper on "Tomatoes," but at the last moment was unable to be present. Mr. A. J. Foster, however, read a short paper on "Spring-flowering Plants for the Greenhouse," which was very acceptable. He referred to plants requiring a temperature of between 40° and 60°. He first dealt with bulbous subjects, which are embraced by the following: Hyacinths and Tulips, Daffodils, Crocuses, Polyanthus Narcissus, Cyclamen, Tuberose, Freesias, &c.; also other subjects, such as the Cineraria, Primula obconica and the Chinese Primula, Spiraea, Lily of the Valley, Amaryllis, Dieffenbachia, and the Indian and Mollis Azaleas, &c. Each plant was dealt with in turn, and brief and concise cultural instructions given. The management of the greenhouse was also considered, and a thoroughly practical and interesting paper listened to with attention. An excellent discussion followed, in which many members joined. The next meeting of the association takes place on Tuesday, November 3, at 7 p.m., when Mr. H. A. Smith will give a paper on "Ferns," a subject with which he is very familiar. Mr. F. Finch, the hon. general secretary, 117, Embleton Road, Lewisham, S.E., will be pleased to give particulars regarding the work of the association, and forms of application for membership.

CARDIFF GARDENERS' ASSOCIATION.

The first meeting of the season took place at the Grand Hotel on Tuesday, the 6th inst., the president (J. Lynn Thomas, Esq., C.B., F.R.C.S., J.P.) presiding over a very large attendance. Mr. John Basham, F.R.H.S., delivered a lecture entitled "Notes on Hardy Fruits, especially Apples and Pears." After addressing the audience at some length on the history of the Apple, Mr. Basham pointed out districts where centuries ago they were conspicuous for their beautiful and fruitful orchards. During the time of the Civil Wars great damage was done to the orchard trees referred to. Unfortunately, since then no one seemed to have replenished the orchard plots thus described. Mr. Basham did not hesitate to say that better Apples had been grown in the valley of Glamorgan than in any other part of the world. Yet, he said, people do not plant, owing chiefly to this reason— insecure holdings of tenancy on the part of the landlords. Twenty excellent dishes of very fine fruits of Apples and Pears were staged by the lecturer, which illustrated the fact that they were not only larger but better in flavour than is generally the case with imported ones. After such a lengthy lecture, full of historical and interesting details, Mr. Basham was accorded the best thanks of the meeting, and was also unanimously awarded a first-class certificate for the collection of fruit. Mr. F. G. Treseeder was also awarded a first-class certificate for a new type of Dahlia, viz., a Cactus Pompon, Mary. An unanimous vote of thanks was accorded the chairman for presiding, which brought the proceedings to a close.

CROYDON AND DISTRICT HORTICULTURAL SOCIETY.

This society's meeting took place at their rooms, Sunflower Temperance Hall, George Street, on Tuesday week last, when Mr. J. Cheal, Lowfield Nurseries, Crawley, lectured on his recent travels in America and Canada. The attendance was not so good as usual, owing, no doubt, to the very inclement weather experienced that day, when gardeners, perhaps, had other pressing engagements with their occupation after such severe storms. However, to those who could brave the elements a treat indeed was in store for them. The lecture was mainly devoted to the horticultural experiences gained by Mr. Cheal during his visit. The lecturer had taken photographic views of places of interest he had visited, and these were shown by lantern slides, which portrayed to his audience the methods adopted in the new country in laying out their public parks and private grounds. It was gratifying to hear of the very hearty reception accorded him upon landing on the other side of the herring pond, for the Government placed at his disposal many facilities, whereby he was enabled to do the trip in a quick and enjoyable manner, as also the leading horticulturists extended to him a hearty welcome to their nurseries. He was pleased to say that in almost all cases the responsible positions in private establishments were held by men from the Old Country, clearly exemplifying that the Britisher is still predominant in this profession. Mr. Cheal is a lecturer of exceptional lucidity and eloquence, and when the meeting expressed their unanimous thanks to him regrets were voiced from all sides that the time at his disposal was all too short. Mr. Baldock very kindly officiated with the lantern. The exhibits displayed were meritorious, and were contributed by the president (Mr. Frank Lloyd, Coombe House), whose head gardener (Mr. M. E. Mills) staged a collection of cut blooms of bush Chrysanthemums, Anemones, and Magnolia grandiflora, and from Mr. J. R. Ball, head gardener to Mr. A. D. Klaber, Northey, South Norwood, came cut blooms of Salvia Red Dragon and a seedling Helianthus.

SCOTTISH HORTICULTURAL ASSOCIATION.

The monthly meeting of the Scottish Horticultural Association was held on Tuesday evening the 6th inst., in Dowell's Rooms, Edinburgh. The attendance was large, and the meeting was presided over by the president of the

association, Mr. J. W. McHattie, superintendent of the Edinburgh Parks. The subject of the lecture was "Four Trees on Walls, &c.," and the lecturer was Mr. W. M. Macdonald, gardener to J. D. Fletcher, Esq., Rosehaugh, Rosneath. As was expected by those who had the pleasure of hearing Mr. Macdonald's lecture on Pears last year, the subject was most ably handled, and much valuable information conveyed in a lucid manner. The interest of the meeting was much enhanced by a number of specimens of Pears grown on walls, brought by Mr. Macdonald from Rosehaugh. The other exhibits were composed mainly of Chrysanthemums, and an award of merit was given by the committee to Messrs. James Grieve and Sons, Redbraes Nurseries, for a white sport from C. Marie Masse, named White Duchan. This should be a useful addition. The usual votes of thanks were awarded.

LIVERPOOL ROOT SHOW.

THE fourteenth exhibition of this society was held in Great Nelson Street, Liverpool, on Saturday last. The entries (upwards of 800) were a little under the average, but the quality throughout was well maintained. An improvement was made by increasing the size of the tent, so that all the exhibits were arranged under cover. The Potatoes, as usual, were of the first importance, and although some of the specimens showed the effects of bad weather the general condition of the tubers was excellent.

POTATOES.

White early kidney, six tubers: Mr. B. Ashton, Latham, won with finely-formed Sir John Llewelyn; second, Mr. James Johnson, Scarlebrick, with White Beauty; third, Mr. G. Ashley, Manchester, with Duke of York.

Early Sutton's Regent: The prize winners were Messrs. T. Guy, Edward Alty, Ormakirk, and H. Jenkins, Ashton. Early white round: Mr. G. Ashley (with Sutton's All) and Mr. J. Johnson (with Early Oxford), and Mr. E. Alty (with Best of All) were the successful exhibitors.

White second early kidney: Mr. J. Eccles, Almsdale, and with Crocus Kidney: Mr. J. Johnson, second, with Weststock Kidney; Mr. T. Almond, Magull, third, with Cross Kidney.

White round, second early: Mr. E. Davies, Partington, won with large Windsor Castle; Mr. J. Haycox, Rains, second, with the same variety; Mr. B. Ashton, third, with Carter's Snowball.

Early or second early, any other shape: First, Mr. J. Niven, Griffe, N.B., with clean tubers of World's Fair; Mr. D. Oldfield, Altrincham, second, with British Queen; Mr. J. Johnson, third, with Ideal.

Snowdrop or Lord of the Isles: Mr. J. Johnson won with Lord of the Isles; Colonel E. Ireland Blackburne, and Mr. B. Ashton won the remaining prizes with Snowdrop.

Reading Giant or Colossal: Mr. D. Oldfield, first, with Reading Giant; Mr. B. Ashton, second, with Colossal; and Mr. J. Parker, Irlam, third, with Reading Giant.

Sutton's Abundance: The winners were Messrs. G. Ashley, B. Ashton, and E. Harrison, Preston. Sutton's Satisfaction: The prize winners were Messrs. J. Johnson, B. Ashton, and G. Ashley.

Up-to-Date, General Roberts, or Scottish Triumph: Mr. E. Alty led with well-shaped tubers of the first-named; Mr. S. B. Croxton, Birkenhead, second; Mr. James Parker, with Up-to-Date, the remaining award.

Late Maincrop or Langworthy: Mr. B. Ashton led with clean specimens of the former; Mr. J. Johnson, second, with Langworthy; and Mr. J. R. Newton, Warburton, third, with the same variety.

Late kidney: First, Mr. J. Parker, with well-shaped Beak of England; second, Mr. J. Haycox, with Daniel's Jew Sensation; and Mr. D. Oldfield, third.

Late round, single variety: First, Mr. E. Davies, with large tubers of Industry; second, Mr. D. Oldfield, with Dumfries Model; third, Mr. J. R. Carter, with The Crocus.

Late, any other shape: First, Mr. D. Oldfield, with The Crocus; second, Mr. O. Roberts, with Scottish Chief; third, Mr. W. Stansbury, Hope-in-Dimmore, with Zion House.

Messrs. Sutton and Sons, Webb and Sons, W. L. Hutton, J. Niven, and John Shore and Son gave special prizes. There were many other single dish classes for vegetables.

FRUIT.

Six culinary Apples: Messrs. W. Mackerrall, B. Ashton, and Thomas Lunt, Halewood, were the winners. Six dessert Apples: Messrs. W. Mackerrall (with Ribston Pippin), B. Ashton, and Thomas Lunt.

Six culinary Pears: Mr. B. Ashton (with large Pittamston Duchesse), Messrs. T. Brocklebank, and W. Mackerrall. Six dessert: Messrs. B. Ashton (with Marie Louise), E. Rainford, and W. Mackerrall.

Any other variety of fruit: Mr. B. Ashton, first, with well-coloured Muscat of Alexandria Grapes; Colonel E. Ireland Blackburne, with Madresfield Court Grapes; and Mr. T. Guy, with Sea Eagle Peaches.

Messrs. Thomas Guy, W. Stansbury, J. Davies, B. Ashton, W. Mackerrall, Thomas Lunt, and T. Brocklebank were among the other chief prize winners in the fruit classes.

Exhibits not for competition included Potatoes, by Mr. J. Shore, Liverpool, and Mr. J. D. Rawline, Liverpool; and Messrs. Gartons, Warrington, roots and seeds.

Among the non-competitive exhibits Messrs. Dickson, Chester, had a good display of flowers in variety and Potatoes; Messrs. Gartons, Warrington, showed roots and seeds. Mr. J. Shore, Liverpool, and Mr. J. D. Rawline, Liverpool, also exhibited.

Mr. James Lunt successfully carried out his secretarial duties.

BECKENHAM HORTICULTURAL SOCIETY.

THE first lecture of the winter season was given by Mr. Cecil Hooper, F.R.H.S., M.R.A.C., F.S.I., on the 9th inst., on "Spraying Fruit Trees and Packing Apples as Practised in Canada." The chair was taken by Mr. A. J. Lane, chairman of the Urban District Council. The lecturer said

* "The Book of Herbs." By Lady Rosalind Northcote. (John Lane). Price 2s. 6d.

spraying was practised much more in Canada than in England, as insects were more numerous there on account of the large extent of orchards. There they did not plant mixed orchards as here, and he knew of Apple orchards 1,600 acres and Peach 2,000 acres; they gave their trees more space, planting Apples 30 feet and 40 feet apart, which gave ample room for spraying pumps and wagons to be taken between the rows. The trees should be sprayed three times during the summer for insects: First, when the buds are opening; second, just as petals have fallen; and again in a few weeks. For the destruction of insects that chew their food 1000s Paris green, 2000s lime to 100 gallons water; as a fungicide the Bordeaux Mixture; and as a winter dressing 1lb. canitic soda, 1lb. canitic potash to 10 gallons water.

Mr. M. Webster exhibited foliage, bloom, and ripe fruit of *Monarda deliciosa*, and Mr. Crowell three dishes of *Tomatoes Golden Jubilee*, *Perfection*, and a seedling, all fine fruit.

ROYAL HORTICULTURAL SOCIETY.

DRILL HALL MEETING.

THERE was a good display of flowers and fruit on Tuesday last in the Drill Hall. Dahlias, Michaelmas Daisies, and even Roses were prominent among hardy flowers, while Begonias and Orchids largely accounted for the display by exotics. Apple trees in pots were finely shown by Messrs. W. Paul and Son, and an award of merit was given to a Melon and an Apple respectively. Mr. A. H. Pearson, who acted as chairman, secretary, and reader of the paper, announced the names of sixty-four new Fellows, making a total for the year of 1,205. Mr. Pearson afterwards read a paper on "Autumn Strawberries and Raspberries," by Mr. James Heddon, who was unable to be present.

ORCHID COMMITTEE.

Present: Messrs. Harry J. Veitch (chairman), James O'Brien, de B. Crawshaw, Walter Cobb, H. M. Pollett, H. Ballantine, Jeremiah Coleman, Francis Wellesley, James Douglas, W. A. Binney, G. F. Moore, A. A. McBean, F. W. Ashton, E. Hill, M. Gleeson, W. H. White, W. Boxall, W. H. Young, H. A. Tracy, J. Wilson Potter, and H. Little.

Messrs. James Veitch and Sons, Limited, Chelsea, exhibited a splendid lot of *Cattleya labiata*, the plants flowering freely and the blooms of good form and colour. Several hybrid *Cattleyas* and *Laelio-Cattleyas* were also shown; for instance, C. Mantini, C. Wendlandiana, C. Mrs. J. W. Whiteley, L. Mrs. M. Gratrix, L.-C. Aphrodite, L.-C. haroldiana, L.-C. Antimachus var. carnea, L.-C. Norba superba, L.-C. dominiana langleyensis, C. Eald, and C. Empress Frederick var. Leonatis. Silver Flora medal.

H. T. Pitt, Esq., Stamford Hill, N. (gardener, Mr. F. W. Thurgood), exhibited a miscellaneous group of Orchids that contained many good things. *Cattleya* Mrs. J. Whiteley, C. labiata, L.-C. eximia, C. aurea, C. Mrs. Pitt, L.-C. Adolphus superba, Cypridipedium Brownii, Dendrobium Victoria Regina, Sophro-Cattleya eximia, Vanda kimbaliensis, and *Odontoglossum crispum* were the most notable. Silver Flora medal.

In the group set up by Messrs. Sander and Sons, St. Albans, were many good plants. *Laelio-Cattleya* Henry Greenwood (L.-C. schilleriana x C. hardyana), L.-C. blechleyensis, *Cattleya gauthieriana* (C. Schröderi x C. Leopoldii), L.-C. Normanii superba (L. pumila x C. dowiana), C. gaskelliana var. Helene, L.-C. blechleyensis Illuminator, L.-C. gottoliana (C. Warnerii x L. tenebrosa), L.-C. gottoliana giganteum, L.-C. luminosa, Vanda corulea, Cypridipedium cananthum superbum, Miltonia spectabilis marginata, and Cypridipedium Miss Louisa Fowler were among the best. Silver-gilt Flora medal.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, showed several well-flowered Orchids, including *Cattleya Mantini* nobilior, C. Maronii, Dendrobium formosum giganteum, Miltonia candida, *Odontoglossum grande*, L.-C. Intermedia Savas, *Oncidium orthothymum*, O. c. album, *Madevallis Crookii* (new, with small white sweet-scented flowers), and *Trichopilia nobilis*. Silver Banksian medal.

F. Wellesley, Esq., Westfield, Woking, showed *Laelia juvenilis superba*.

A cultural commendation was given to *Laelio-Cattleya* x *Nyssa superba* shown by Mr. E. Hill, gardener to Lord Rothschild, Tring.

De B. Crawshaw, Esq., Rosefield, Sevenoaks, showed an *Odontoglossum* hybrid, O. crispum crossed with O. wilkeanum (heavily blotched with brown upon yellow) had reverted to O. crispum pure and simple.

J. Forster Alcock, Esq., Northchurch, showed well-bloomed *Odontoglossum grande*.

NEW ORCHID.

An award of merit was given to *Laelio-Cattleya Norba superba*.—*Cattleya Mossae* and *Laelia xanthina* are the parents of this Orchid. The sepals and petals are a pale ochre yellow colour, while the front of the lip is lilac-rose, and the throat deep yellow. The marking on the lip is very pretty, the colouring consists of lilac-rose dots, almost merging into each other, upon a paler ground. This is a medium-sized flower, in which the soft tints of sepals, petals, and lip associate pleasingly. From Messrs. James Veitch and Sons, Limited, Chelsea.

FRUIT AND VEGETABLE COMMITTEE.

Present: Messrs. George Bunyard (chairman), Joseph Cheal, Henry Ealing, T. W. Bates, S. Mortimer, Alexander Dean, Edwin Beckett, Horace J. Wright, J. Jacques, G. Reynolds, C. G. A. Nix, F. L. Lane, J. Willard, G. Norman, George Wythes, A. H. Pearson, Owen Thomas, and George H. Mayoock.

Mr. William Howe (gardener to Lady Tate, Park Hill, Streatham Common, S.W.) exhibited a collection of Grapes. They included some excellent Alicantes, which were cut from a vine that has carried a crop of 100 bunches annually for the last twenty-five years. Twelve bunches of Alicante were shown, their aggregate weight being 46lb. Chasselas Napoleon was very well shown; Muscat of Alexandria and Gros Colmar were the other varieties. The Muscats were

somewhat lacking in colour, due no doubt to the sunless summer. Silver-gilt Knightian medal.

Messrs. William Paul and Son, Waltham Cross, Herts, exhibited a group of Apple trees in pots bearing very good crops of really fine fruit. Gasconne's Scarlet Seedling, Sandringham, Blenheim Orange, Collini Pippin, Alfriston, Peasegood's Nonsuch, Cox's Orange Pippin, Lane's Prince Albert, Cox's Pomona, Bramley's Seedling, Emperor Alexander, and Bismarck were perhaps the best among an excellent lot. Silver-gilt Knightian medal.

Mr. William Beale, gardener to E. C. Hambrough, Esq., Hayes Place, Hayes, Kent, showed ten bunches of Black Hambrough Grapes. The berries, of medium size, were splendidly coloured, and the bunches were large. Silver Knightian medal.

The new Grape, Melton Constable Seedling (Lady Hastings x Gros Colmar) and Apple Blenheim Orange were shown by Mr. Jabez Ambrose, nurseryman, Chessnut.

Strawberry St. Joseph, grown in the open, was well shown by Mr. Harris, The Gardens, Bucklebury Place. Vote of thanks.

Fruits of the Strawberry Raspberry (*Rubus roseifolius*) were exhibited by Mrs. Gladstone, 38, Ladbroke Grove, W. This is a very pretty fruit, but of poor flavour. It is not, as the name would imply, a hybrid between the Strawberry and the Raspberry, but is a *Rubus* species, whose fruit bears a resemblance to the Strawberry.

Mr. Charles Webster, Gordon Castle Gardens, Fochabers, N.B., showed Plum Gordon Castle, a late variety of Cox's Golden Drop shape, and much resembling the Kelsey Plum in colour.

Bottles of Elderberry wine were shown by Mrs. Sophia Miller, Marlow. The wine was excellent, and we are glad Mrs. Miller has taken the opportunity of bringing this neglected winter beverage to notice.

Messrs. Dobbie and Co., Rothesay, N.B., showed Cabbage Dobbie's Dwarf Blood Red and Shallot Dobbie's Large Red, some from seed sown in March, 1903, others from bulbs planted in February, 1903.

NEW FRUITS.

An award of merit was given to *Melon Barnes Fiscal Problem*.—This is a good-sized round, well-netted Melon of handsome appearance; in fact, one of the best-looking Melons sent to the Drill Hall this year. The skin is creamy yellow, and marked with a heavy netting; the flesh is scarlet, juicy, and of very good flavour. It seems a pity that so good a Melon should be burdened with so inappropriate a name. From Mr. W. Barnes, gardener to A. T. Walter, Esq., Bear Wood, Berkshire.

Apple Middle Green.—This new fruit is the result of a cross between Frogmore Prolific and Blenheim Orange, and appears to be an excellent Apple. It is at its best now, and should prove a valuable early variety. In appearance and in size it resembles Cox's Orange Pippin a good deal. It is beautifully coloured, the ground colour bright yellow, splashed and streaked on the sunny side with red. The flavour is first-rate. From Messrs. James Veitch and Sons, Limited, Chelsea.

FLORAL COMMITTEE.

Present: W. Marshall, Esq. (chairman), Messrs. H. B. May, C. T. Drury, George Nicholson, R. Dean, James Walker, Amos Perry, John Green, J. F. McLeod, William Howe, G. Reuthe, J. Jennings, Charles Dixon, J. A. Nix, Charles Jeffries, C. J. Salter, William Cuthbertson, Charles E. Pearson, E. C. Notcutt, Charles E. Shea, W. P. Thomson, E. H. Jenkins, Charles Blick, Edward Mawley, and George Paul.

A large, varied, and important grouping of Michaelmas Daisies came from Messrs. William Cuthbertson and Sons, Highgate, the group extending some 40 feet or more, included many good things, notably those of the A. ericoides and A. cordifolius groups. Of the latter, A. c. elegans is one of the best, a mass of light blue starry flowers, that renders it most pleasing; Esther, pink; Delight, white; Katie, a nice blue; Duchess of Albany, a bluish form of pinnatis; and Golden Spray, so named, we presume, from its golden disc, were among the more prominent. *Phytolacca decandra*, with Bamboos and Eulalias, assisted greatly in the arrangement. Silver Banksian medal.

Messrs. George Bunyard and Co., Maidstone, in addition to a large array of Michaelmas Daisies in the cut state, set up good examples of *Lobelia Queen Victoria*, *Helium autumnale*, *Tritoma grandis*, *Physalis Franchetii*, *Campanula Bourghatii*, *Tritoma Nelsoni*, *Aster Amellus Framfield*, A. turbinellus elegans, *Helium pumilum magnificum*, *Polygonum amplexicaule*, *Helipais B. Ladhami*, &c.

Frank Lloyd, Esq., Coombe House, Croydon, showed a nice batch of Begonias of the Lorraine type in pink and white forms.

Messrs. Ambrose and Son, Chessnut, Herts, set up a mixed group, in which cut Tree Carnations, Ferns, Roses, Lily of the Valley, and Lilies of the auratum and tigrinum section figured more conspicuously. Bronze Flora medal.

Messrs. T. S. Ware, Feltham, had an admirable arrangement of Dahlias, well disposed throughout. There were excellent groups of Alpha, Roogalli, orange-scarlet; H. J. Jones, yellow; Galliard, fiery scarlet; Kriemhilda, white and rose; J. A. Jackson, crimson-maroon; Zephyr, rose-carmine; Mrs. E. Mawley, yellow, &c. There were many other kinds in single flowers, and with Ferns and other things formed a most pleasing arrangement. Silver-gilt Banksian medal.

A capital lot of Dahlias of the Cactus type came from Messrs. Hobbles, Limited, Dereham. The best were Fred Cobbold, Aunt Chloe, Ida, yellow; Dainty, yellow, rose tinted, very charming; F. H. Chapman, orange; J. H. Jackson, maroon; Etna, rose-lilac and fawn base; Lord Roberts, white; Veauvius and Ibis, intense orange. Effective and Amos Perry were also well shown. The group was finely arranged. Silver Banksian medal.

A nice batch of Tree Carnations Godfrey's Pride, pink; Floriana, deep pink; and others were shown by Mr. Godfrey, Ermoth. The same exhibitor had many Chrysanthemums, as M. Mestruier, yellow; Le Pactole, orange and yellow;

Safeguard, deep pink; Harry Govie, orange; Pink Beauty and others. A few blooms of the large-flowered section were also staged. Bronze Banksian medal.

Veronics of the shrubby set, Begonias of the Lorraine group, with Tree Carnations and Bouvardias came from Mr. H. B. May, Edmonton. In the latter group we noted B. Jasmineflora, The Bride, Elegans, Priory Beauty, King of the Scarlets, Humboldt corymbiflora, Pride of Brooklyn, fine white, Vreelandi, Maiden's Blush, President Cleveland, Mrs. B. Green, pink, were all fine. It was a pretty group of choicely grown subjects.

Messrs. Crane and Clarke, March, Cambridgeshire, showed Tree Carnations Lord Rosebery, crimson; and Enchantress, pink; the latter of good size, and both free in flowering.

Messrs. J. Cheal and Sons, Crawley, showed a fine lot of single Dahlias that by their appearance had not seen much of the recent bad weather. Some good ones were William Parrott, Beauty's Eye, mauve; Polly Eccles, orange; Hilda, white and yellow; Northern Star, Paragon, Veauvius, scarlet; Eric, deep fawn and orange red; Princess of Wales, good mauve; Miss Roberts, yellow; The Bride, Demon, maroon, &c. Some nice Pompon sorts were also shown. Silver Flora medal.

A large group of *Draena Victoria*, consisting of some dozen admirably grown plants came from Messrs. W. Bull and Sons, Chelsea. Several of the examples were perfect and splendidly coloured. Cultural commendation.

Early-flowering Chrysanthemums were from Messrs. W. Wells and Co., Limited, Redhill. Carrie, gold; Polly, orange; Le Pactole; Keggio, white; Rosie, chestnut; Rubis, purple wine colour; and Nivette, white, were among those shown. Some good single seedlings were shown, also Merstham, yellow, and Mrs. Pockett, of the large flowered group. Bronze Banksian medal.

Mr. G. Reuthe, Keston, Kent, had a small basket in which *Crocuses*, *Cyclamen hederaefolium*, *Nerines*, *Shortia*, *Lobelia Queen Victoria*, with a few *Asters* of the A. ericoides and cordifolius group were seen.

A very effective and showy lot of zonal Pelargoniums were staged by Messrs. Veitch and Sons, Limited, Chelsea. Being dwarf and well-grown and flowered, the plants attracted a large number. We take Mary Seaton, scarlet, white eye; Dryden, scarlet and white; Nicholas II., crimson-scarlet; Rosy Morn; Mrs. Norman, pink; Enid, bright scarlet; St. Cecilia, fine pink; Wordsworth, intense scarlet; and Snowdrop as among the best, and all single flowered. *Gesnera oxoniensis*, with dark maroon leaves, is very fine as a foliage plant alone. Winter-flowered Begonias Mrs. Heal, the pretty Agatha (pink), Ideals, and B. Agatha compacta were also shown in goodly numbers.

Messrs. J. Jeffries and Son, Cirencester, had a large exhibit of Roses, and, regarded as open air flowers, were extremely good. We noted Ulrich Brunner, La France, Rainbow, Comte Raimbault (deep crimson-scarlet, of which there were many good flowers), Caroline Testout, and Mrs. Grant as among the best. White Maman Cochet and Mme. Pernet Ducher were both in good form. A most welcome October exhibit. Silver-gilt Banksian medal.

Mr. J. Russell, Richmond, staged a huge table of *Aucuba* Vera, dwarf and splendidly fruited, the small plants of 8 inches high bearing a dozen trusses of fruits. There were about 100 plants, and each was a perfect example of its kind. *Eurya latifolia variegata* and *Euonymus radicans variegata* were employed, the latter as a margin, the former in the background.

Mr. Amos Perry, Winchmore Hill, showed a few good *Asters*. *Aster Amellus* var. No. 2 is a superbly coloured form; A. amelloides is also good; A. versicolor nana is distinct in its variation; A. Amellus No. 1 is a larger flower, more starry than No. 2. *Geum Heldreichii superba* was very fine, and a never ceasing bloomer. *Polygonum molle* was in great array, making a fine display with its creamy white cymes. It is an effective tall plant for autumn work.

Tuberous Begonias from Mr. A. L. Gwillim, New Eltham, Kent, were in many shades of colour—yellow, salmon, pink, orange, white, and crimson, the flowers large and most effective.

Mr. E. Potten, Cranbrook, Kent, showed early-flowering Chrysanthemums in variety, the group including the best known of these useful plants now in commerce.

Messrs. James Veitch and Sons, Limited, Chelsea, staged a splendid group in some 100 varieties of Japanese Chrysanthemums, of which Mary Perkins, soft yellow, very large; Calvat's Sun, rich yellow; Miss Mildred Ware, terra cotta, very fine; Sensation, orange yellow, very fine; Miss R. Hunt, crimson and gold reverse; William Duckham, pink with satiny surface; Miss Cicely, gold, very narrow florets; Henry Perkins, mahogany red and yellow; Britannia, rich glistening yellow; Miss Eisle Fulton, pure white; Miss Olive Milner, pink, very beautiful; Donald McLeod, golden yellow; Mrs. Pockett, yellow; Godfrey's King, polished gold and red, a really fine lot for so early a date. Silver-gilt Flora medal.

A nicely arranged group of large-flowered Chrysanthemums arranged with Crotons and Palms came from Messrs. J. Peed and Sons, Norwood. We noted Mrs. Pockett, Miss Cicely, Lily Mountford, pink; E. Bettesworth, amaranth; Soleil d'Octobre, Mrs. Greenfield, Miss Stopford, white, and Baden Powell, chestnut, among the more prominent kinds. *Gloxinias*, *Streptocarpus*, the varying sports of *Begonia Gloire de Lorraine* were also largely shown by Messrs. Peed. Silver Flora medal.

A first-class certificate was awarded to *Nephrolepis Mayi*. As a novelty among Ferns this is one of the most distinct we have seen. It is not, however, easy to describe without technicalities. The habit generally is quite erect, the fronds upwards of 2 feet in length, and these appearing freely from the crown create a density that is most unusual among Ferns. As a distinct plant it is alone remarkable. Shown by Mr. H. B. May, Upper Edmonton.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

THE monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday

evening last, Mr. Charles H. Curtis in the chair. Four new members were elected and one nominated. The death certificates of two deceased members (Mr. John King and Mr. J. M. Young) were produced, and cheques were granted to their nominees for the amounts standing to their credit in the society's books, being £48 8s. 1d. and £17 9s. 4d. respectively. Seven members were reported on the sick fund. Members and friends requiring tickets for the annual dinner on the 27th inst. will please send to the secretary for them as early as possible. His address is 9, Martindale Road, Balham, S.W.

THE GARDEN CITY.

THE title of this enterprising project does not adequately express the industrial development the promoters have in view. The idea, as far as we understand it, is to endeavour to induce manufacturers to remove their manufactories and workshops from unwholesome and expensive surroundings in our crowded towns and cities to the open country, where land is cheap and the air is pure. The object is praiseworthy, and if it can be successfully accomplished, as its practical and energetic promoters think it can, it promises well for the improvement for the future of our industrial population. That aspect of the question, however, is not for us to discuss. It is because gardening is to be called in as an adjunct to help to make the scheme a success that our representative recently accepted an invitation, with upwards of 100 other Press representatives, to view the 3,800 acres of land recently purchased for the construction of the first garden city in England. Unfortunately the weather was wretched, heavy rain falling incessantly, with high winds, making a full tour of the estate, as had been intended, impossible. However, enough was seen to impress us favourably with the position of the land for the purposes intended. It is in Hertfordshire, near Hitchin, thirty-eight miles from London, Great Northern Railway. The estate consists (in addition to the land) of the pretty villages of Letchworth, Willian, Norton, and Radwell. The outskirt of the estate are beautifully wooded, and the woods it is proposed to preserve, and to build the city in the centre of the estate with good roads radiating in various directions.

To prevent overcrowding in the future each cottage built must have at least one-eighth of an acre of land. It is to this latter point we attach so much importance, believing as we do that in this little garden the workman in time will find salvation from the many ills and temptations which assail him in our crowded towns, and a rest, recreation, and pleasure in his leisure that no other art or craft can possibly give. We understand that this city is to be confined to 30,000 inhabitants, and granting five inhabitants to a house, we shall thus have 6,000 houses, with 6,000 gardens of one-eighth of an acre each, or an aggregate of 750 acres of cottage garden land. With the encouragement of a well-organised garden society, what opportunities are offered here by gardening and allied subjects, such as poultry, bees, &c., for the pleasurable and remunerative employment of the worker and his family in their leisure hours! The value of such gardens will depend greatly on the intelligence and knowledge brought to bear in their arrangement and planting, so that we hope when the time for planting arrives the authorities will exercise some supervision over this work, as well as provide an instructor in gardening to give advice to those who may wish to take advantage of his services and to learn how to make the best of their gardens.

The Horticultural Club.—A most interesting and instructive evening was passed at the club on Tuesday last, when Mr. Charles E. Pearson lectured on "Birds in Russian Lapland." The slides, made from photographs taken by Mr. Henry J. Pearson, were excellent. Mr. H. J. Veitch was in the chair. A report of the lecture will appear next week.

Gift to the Brussels Botanic Garden.—Count Kerchova de Denterghem, president of the Ghent Société Royale d'Agriculture et de Botanique, and recently elected president of council of the Brussels Botanic Garden, has just presented this establishment with

a splendid collection of Ferns, comprising more than 125 varieties. The botanic garden has much appreciated the gift of its new president.

A note from Crawley.—Recently, on the occasion of the home-coming of Mr. and Mrs. Ernest Cheal, and as a welcome to Mr. and Mrs. Annett on their return from Ceylon (Mr. Ernest Cheal being the eldest son and Mrs. Annett the eldest daughter of Mr. J. Cheal) the officials and employees of Messrs. Cheal and Sons, Crawley, were entertained by the firm. Sports were indulged in during the afternoon, and in the evening Mr. J. Cheal gave an account of a recent visit to America, and Mr. Annett of life in Ceylon. Both were illustrated by lantern slides.

Dundee Horticultural Association.—This association made a good beginning with its course of monthly meetings for the winter on the 6th inst. There was a good attendance, presided over by Mr. W. Beas. The subject for the evening was a lecture by the president, Mr. David Storrie, of Storrie Brothers, nurserymen, on Mr. William Watson's historical poem, "The Father of the Forest." It was exceedingly interesting, and the lecturer took occasion in the course of the lecture to point out how even such subjects of reading could be made of value to horticulturists. Mr. Storrie was warmly thanked for this inaugural address.

The new Glasgow park.—One of the most charming features of the new park just gifted to the citizens of Glasgow by Mr. A. Cameron Corbett, M.P., at Thornliebank, is what is known as the Rouken Glen. It has long been famed as one of the prettiest glens within easy reach of Glasgow. John Finlay, the Glasgow poet, who died in 1810, gave a graphic description of the Rouken Glen in one of his poems, and Christopher North speaks of the little waterfall at the upper end of the Capelrig Burn, which flows through it, as "the loneliest of linnas that ever sounded in the solitary silence of Nature." When thrown open to the public it will seem strange to think of the change which has taken place since the time of Christopher North. Some parts of the banks of the glen are very precipitous, and this portion might very easily be spoiled by inartistic treatment. Fortunately, there is no danger of this, since the place will be under the care of Mr. Whitton, the able superintendent of the city parks, whose treatment of the other parks has been so successful. There is an old water-mill in the glen, which, if retained, will add much to the interest of the park.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—W. M.—We cannot tell without a flower. Unfortunately the drawing is not sufficiently clear to enable one to judge. The best way will be to send a specimen. —K. B.—*Oxalis corniculata rubra*.

Carbolic acid as an insecticide (J. McDONALD). This is frequently made use of by gardeners as a wash to destroy garden parasites. It is one of the most effective we have. Of course, great care is needed to see that it is applied in a very weak and diluted form, otherwise harm will follow its use.

Creeper for arched doorway, &c. (ERIN).—Of climbing plants suitable for the purpose named you have the choice of the many beautiful forms of Clematis, of which the old and popular C. Jackmaul is one of the very best, while the large flowers of C. lanuginosa candida or Lady Caroline Neville, both of which are of lighter tints, may prove suitable. Some of the 'toneyuckles, again, are beautiful for this mode of treatment, one of the best being Lonicera japonica. We also know of an archway over a door facing west which is draped with the common Jessamine (Jasminum officinale), and very beautiful it is, being studded with its fragrant blossoms throughout the summer months. The different forms of Ceanothus are scarcely likely to give

satisfaction in the position you name, as sunshine is necessary for the production of flowers. Concerning the Lilies, the better way will be to leave them in the ground, just covering them during the winter with about 3 inches of partially decayed leaves, which will serve not only to keep out the frost, but also to supply nourishment next year.

Plants for Ireland (H. D. R.).—*Leptospermum scoparium*, being the tenderest of the three shrubs you name, should occupy the site facing south, sheltered from the north and east. We should advise you to plant *Pinus* *spora* *Tobira* in the spot facing south-west, and *Rhamnus* *ovata* in that facing the south-east. Of the Clematises you name C. coccinea is the least hardy. All the others, which belong to the large-flowered sections, are of easy culture, although they have a way of dying off suddenly sometimes for no apparent reason. They should flower well on a wall facing east, but cannot be expected to bloom freely if they get but little sun. It is well for their roots and the lower foot or two of their stems to be shaded, but the upper shoots should receive all the light possible to induce a floriferous habit.

TRADE NOTES.

A PRETTY CATALOGUE.

MESSRS. L. BOEHRER and CO. of Yokohama send their prettily illustrated catalogue of bulbs and other flowers of Japan. It is most daintily got up.

WEBBS' SEEDS.

In the large competition, open to the world, of the British Dairy Farmers' Association, held in the Agricultural Hall, London, last week, some of the most important prizes for roots were won by the produce of Webbs' seeds, viz.: First, second, and third prizes, Webbs' Mammoth Long Red Mangel; first prize, Webbs' Smithfield Yellow Globe Mangel; first prize, Webbs' Imperial Swede; and second prize, collection of Webbs' roots. There were 143 entries for these prizes, and, considering the strength of the classes, the remarkable success of Messrs. Webbs' seeds must be very gratifying to this firm.

BEETLECUTE.

MESSRS. VALLIS and CO., the proprietors of Beetlecute, an insecticide which is winning favour all over England and in the Colonies, have just been awarded a medal by the Royal Horticultural Society. The Journal of the society has already recorded the complete success which has attended the use of Beetlecute in their propagating frames and fruit houses at Chiswick. It is not poisonous.

CHANGE OF ADDRESS.

I beg to inform you that Chase's Beetle Poison, established over fifty years at 14, Holborn, London, E.C., and of recent years forwarded by Thomas Chase of 151, Broad Street, Birmingham, having upon the death of Mrs. Chase, sen., been purchased by me, will now be supplied from this address, from where all orders will have prompt despatch.—A. CHASE, 5, High View Terrace, West Norwood.

GARDENING APPOINTMENTS.

MR. WILLIAM H. MORTER has been appointed superintendent of the Birmingham City Parks, in succession to Mr. Samuel Hearn, who has retired after thirty years' service. Mr. Morter has had valuable and varied experience upon Lord Avebury's estate at Farnborough, where he has been head gardener for the past eleven years. In consequence of the retirement of Mr. James Smith, head gardener to the Marquis of Lifford at Hopetoun House, through ill-health, the appointment has been conferred upon Mr. Thomas Hay, at present foreman at Hopetoun. Mr. Hay is a comparatively young man for such an important charge, but in consequence of the ill-health of Mr. Smith for some time he has had practically the entire charge of the gardens. He is a native of Banffshire, and served his apprenticeship at Duff House, in that county, under Mr. Brander. After pursuing his calling and improving himself in several other places he was for three years foreman at Terregles, Dumfries, under Mr. John McKinnon. He then secured an appointment as foreman at Hopetoun House, where he has acquitted himself so as to earn the approbation and confidence of his noble employer. Mr. Hay's success will give great pleasure to his many horticultural friends.

PUBLICATIONS RECEIVED.

WE have received from Messrs. George Newnes, Southampton Street, the October number of the Strand Magazine, which has begun a new series of Dr. Conan Doyle's Sherlock Holmes, the Wide World Magazine, the Captain, and the last part of the "Century Book of Gardening." An appendix to this will appear in due course.

CATALOGUES RECEIVED.

General Nursery Stock.—Messrs. Peter Henderson and Co., 85 and 87, Cortlandt Street, New York; L. Späth, Baumchulenweg, Berlin.
Trees.—Messrs. W. and T. Sampson, Kilmarnock.
Roses.—Messrs. Frank Cant and Co., Braiswick Row Gardens, Colchester.
Hardy Plants.—Messrs. V. N. Gauntlett and Co., Redrath Novelties for 1905-6.—Ernest Benary, Erfurt, Germany.
Autumn Catalogue.—Messrs. H. Cannell and Sons, Swanley Kent.

* * The Yearly Subscription to THE GARDEN is: *Ireland* 15s.; *Foreign*, 17s. 6d.

THE GARDEN

No. 1666 — VOL. LXIV.]

[OCTOBER 24, 1903.]

PROPOSED AUTUMN ROSE SHOW.

WE hear with pleasure that the National Rose Society contemplate holding an autumn show in the new Hall of the Royal Horticultural Society next September. We have constantly urged that to confine the Rose shows to July is to follow the ways of generations ago, when the Hybrid Perpetuals enjoyed their brief summer season, and the beautiful Tea and Hybrid Tea Roses were yet unborn. And this autumn show will give an increased zest to the culture of the Rose in British gardens, and bring forward the great charm and variety that the garden can display when even September has departed, unless a series of frosts puts an end to open flowers and developing buds.

It will be interesting to see in what form the schedule of prizes will be presented. Of course a show flower is a thing of beauty; and then there is the pleasure of meeting in friendly rivalry to win prizes for exhibits that represent years of patient work and keen mastery of details. Exhibitions of Roses, of the Teas and Hybrid Teas in particular, are quite possible when the Michaelmas and Moon Daisies make clouds of blue and white in September days, and the shows of summer are almost forgotten.

We enjoyed a few hours in a garden chiefly of Tea Roses on October 17 last, and could have gathered several blooms that the exhibitor would not have passed by in July, and this in a year of rain and cloud. The garden was full of Rose blooms, which were warm in colouring, firm in texture, and richly fragrant.

The National Rose Society has acted wisely in making this new and striking departure. That such an event should be possible indicates the tremendous work that has been accomplished in hybridisation during recent years, and it will be interesting to compare the Rose flowers of July with those of September. The Marie van Houtte will have a deeper margin to its creamy petals and the Papa Gontiers a richer hue, but those who enjoy the autumn time of the year will be glad of an opportunity to see the flowers that bloom not sparingly but profusely, even when the first frosts have shattered the Dahlias and made dreary patches of summer exotics.

Those who are responsible for the management of the National Rose Society must

remember that the times have changed and are changing. It is no longer a society composed of members whose first thought is an exhibition of blooms in boxes, but during the past three years the remarkable list of new subscribers comprises for the most part Rose lovers who simply visit the exhibitions to see new and rare varieties that will make a brave show of colour in the garden over as long a season as possible. That is one aspect of the society's work, and, of course, the other is to continue the great competitive displays in which all keen rosarians are deeply interested.

We do not know what form the schedule of this proposed autumn show will take, but probably the competitive classes will be small and include the China and other classes which are in beauty during the first weeks of autumn. We predict a beautiful display. Many gardens are full of Roses even in this miserable year, and given a fine autumn the display should prove one of the most attractive of all the flower exhibitions of 1904. It will certainly possess an element of novelty, which is something in these days of flower shows which follow one another with almost wearisome persistency and have so much in common.

A NATIONAL POTATO SOCIETY.

THERE is a movement afloat the object of which is to form a national society for the improvement, classification, and general encouragement of the Potato and its culture. The promoters say, with a good deal of reason, if there be needful national societies for certain well-known flowers—Roses, Dahlias, Carnations, Sweet Peas, Chrysanthemums, &c.—that it seems strange that in the case of a garden product of such immense importance to the nation, both commercially and otherwise, as is the Potato, no body should exist that can in any way give it that assistance nationally that is now given to flowers that, however beautiful, are, after all, but inferior products. Next to Wheat we have no home-grown vegetable product that enters so largely into the people's food as does the famous esculent, and if any society can in any way help to make that esculent of greater value and usefulness to the people than it now is, real good service will be done. It is of some importance to know that so far the suggestion as to the formation of a society comes from impartial sources. Bodies of this kind—as we see, unfortunately, in connexion with some popular flowers—consist largely of raisers and traders, who have too much pecuniary interest in their products to render them quite impartial judges. It is not difficult to find plenty of people interested in

Potatoes that have no such pecuniary objects, whilst raisers of novelties are comparatively few. The reference to this proposal, which comes just now at a very appropriate moment, naturally carries one's thoughts back to the days of the old international Potato exhibitions, when, without doubt, through their agency very much was done to improve and popularise the Potato. Those exhibitions commanded wide interest, and were distinctly objects of beauty. It was to be deplored that those shows fell through, but they did so. They were managed by a committee that had no very primary objects. Still, they did great good.

The promoters of the present movement, however, have wider aims than those that existed some twenty years ago. Not only do they wish to see at least one great annual show of tubers in a central place, but they wish to see established several really practical well conducted trials of new and old varieties annually also. At present we see evidences of a desire to make outrageous prices for some new varieties, such as there can be no justification for. It is the outcome of a determined effort to boom novelties for the purpose of securing, whilst they are not yet plentiful, abnormal or fancy prices. This is not a thing which commends itself to high-class traders, but seems to be a favourite method of creating an artificial demand in other quarters. It is such things as this that the promoters of the proposed society hope to correct. Wonderful results in cropping obtained artificially are published far and wide, true or untrue, but there exists no public body to control assertions of this description. Now, were there say a dozen trial or testing stations in the kingdom, each one controlled by a responsible branch committee, each station so far as possible representing diverse soil, and in each case tubers of the same varieties were planted under the same conditions and treated alike throughout the season, it is obvious that the real merits of all the varieties planted must be in that way fully discovered. Not only would novelties show how far they were wonders or otherwise, but in the course of years it would be possible to determine how far any older varieties, their seed tubers being changed from plot to plot each year, would show evidence of that deterioration of which much is heard but is not always fully proved. In any case it is evident that the Potato society, if formed, would have no difficulty in finding a very wide field for its operations, and could in time render to the Potato very valuable service. A. D.

KEW NOTES.

INTERESTING PLANTS IN FLOWER.

Temperate House.

GREVILLEA ALPINA, G. Banksii var. Fosteri, G. thelemanniana, and Leonotis dubia.

Orchid Houses.

Acampe papillosa, *Bulbophyllum rufinum*, *B. sebellarum*, *Calanthe madagascariensis*, *C. vestita* varieties, *Catasetum fimbriatum*, *C. tridentatum*, *Cirrhopetalum gracillimum*, *Coelogyne fimbriata*, *Cymbidium gammieanum*, *Cynorchis lowiana*, *C. purpurascens*, *Cypripedium* (various species), *Dendrobium capituliflorum*, *D. Phalaenopsis*, *D. strongylanthum*, and others, *Eulophia pulchra*, *Lycaste Skinneri*, *L. xytriphora*, *Macradenia lutescens*, *Maedevallia bella*, *M. Chimera* var. *Wallisii*, *Maxillaria grandiflora*, *M. puncto-striata*, *Octomeria gracilis*, *Odontoglossum grande*, *O. madrense*, *Oncidium crispum*, *O. varicosum*, *Platyclinis cobbiana*, *Pleurothallis maculata*, *P. pulchella*, *Restrepia striata*, *Rodriguezia secunda*, and *Vanda kimballiana*.

T. Range.

Amasonia calycina, *Barleria cristata*, *Clerodendron speciosum*, *Hymenocallis macrostaphana*, *Nerine* (various species and varieties), and *Tetranema mexicana*.

Greenhouse.

Bouvardias in variety, *Calceolaria Burbidgei*, *Chrysanthemums* in variety, *Erica caffra*, *E. gracilis*, *Fuchsia simplicicaulis*, *Geraniums* in variety, *Jacobinia chrysostephana*, *Lantanas* in variety, *Salvia azurea*, *S. splendens*, and many other things.

Outdoors.

Colchicums in variety, *Asters* in variety, *Erica ciliaris*, *Erica maweana*, and other things.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

October 27.—Royal Horticultural Society's Drill Hall meeting, 1—4 p.m.; meeting of the committees at 12 noon; lecture at three o'clock; Annual Dinner of the United Horticultural Benefit and Provident Society, Holborn Restaurant, at 6.30 p.m., Mr. Peter Barr in the chair.

October 28.—Horticultural College, Swanley, meeting at 24, Park Lane (Indian Room) at 3.30 p.m., by kind permission of Lord and Lady Brassey.

October 30.—The Earl of Onslow, G.C.M.G., opens the new County Technical Laboratories, Chelmsford, at 3.30 p.m.

November 2.—Truro Chrysanthemum Show (two days).

November 3.—Southampton (two days) and West of England (two days) Horticultural Shows.

November 4.—Highgate (three days), Kent County (two days), Cardiff (two days), Hereford (two days), Ascot (two days), and Northampton (two days) Horticultural Shows.

November 9.—St. Neots Chrysanthemum Show.

November 10.—Royal Horticultural Society's Drill Hall Meeting; National Chrysanthemum Society's Exhibition at the Crystal Palace (three days); Devices and Oxford Chrysanthemum Shows.

November 11.—Buxton, Reading, Liverpool (two days), Hampton, Winchester (two days), and Banbury (two days) Chrysanthemum Shows; East Anglian Horticultural Club Meeting.

November 13.—Blackburn (two days), Leicester (two days), Sheffield (two days), and Leeds Paxton (two days) Chrysanthemum Shows.

November 18.—Hull (two days) and York (three days) Chrysanthemum Shows.

November 19.—Scottish Horticultural Association's Chrysanthemum Show.

Royal Horticultural Society.—Examinations in horticulture, 1904.

I. General Examination.—The society's annual examination in the principles and practice of horticulture will be held on Wednesday, April 20, 1904. The examination will be held simultaneously in as many different centres in Great Britain and Ireland as circumstances may demand, the society being willing to hold an examination wherever a magistrate, clergyman, schoolmaster, or other responsible person accustomed to examinations will consent to supervise on the society's behalf. A

copy of the syllabus may be obtained by sending a stamped and directed envelope to the secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W. Intending candidates should send in their names not later than March 1. Copies of the questions set at the examinations, 1893—1902, can be obtained at the Royal Horticultural Society's office, price 1s. *II. School Teachers' Examination.*—The society will also hold an examination in cottage gardening on Tuesday, June 21, 1904. The examination is intended for, and will be confined to, elementary school teachers. It has been undertaken in view of the increasing demand in country districts that the schoolmaster shall be competent to teach the elements of cottage gardening, and the existing absence of any test whatever of such competence. The general conduct of this examination will be on similar lines to that of the more general examination, save in obvious points on which they would not apply. Full particulars will be issued on and after January 1, 1904.

The next meeting of the fruit, floral, and Orchid committees of the above society will be held on Tuesday next in the Drill Hall, Buckingham Gate, Westminster, 1—4 p.m. A paper on "Pruning Roses," by M. Viviani Morel, will be read at three o'clock. At a general meeting held on Tuesday, the 13th inst., sixty-five new Fellows were elected, making a total of 1,206 elected since the beginning of the present year.

Scottish Chrysanthemum shows.

The following list of Scottish Chrysanthemum shows and the dates on which they open may be of value to Scottish readers: November 12, Stirling, two days; November 14, Beith; November 17, Dalry (Ayrshire); November 18, Ayr, Dumfries; November 19, Edinburgh, three days, Kilmarnock; November 20, Aberdeen, two days; November 27, Dundee, two days, and Dunfermline, two days.

The Horticultural College, Swanley.

A meeting will be held in the Indian Room at 24, Park Lane, on Wednesday, the 28th inst., at 3.30 p.m., by kind permission of Lord and Lady Brassey. An address will be given by Mr. A. D. Hall, M.A., Director of the Experimental Station, Rothamsted, on "Horticultural Instruction for Women." The speakers will be Viscountess Falmouth, Mrs. Garrett Anderson, M.D., the Hon. Sir John Cockburn, K.C.M.G., the Hon. Mrs. Lyttelton Gell, the Right Hon. Sir John Hibbert, K.C.B., Mr. J. C. Medd, and Mrs. Pember Reeves.

County Technical Laboratories, Chelmsford (Session 1903-4).

—The opening of the new buildings in connexion with these laboratories, under the control of the Essex Education Committee, will take place on the 30th inst. at 3.30 p.m. The new buildings are in King Edward's Avenue, and have just been completed at a cost of nearly £12,000. They comprise chemical, physical, and biological laboratories and class-rooms, together with agricultural and horticultural museums and libraries, and provide facilities for systematic instruction in agriculture and horticulture as well as in pure science. There is a large dairy for instruction in butter and cheese making and the treatment of milk, and within three-quarters of a mile is the school garden, three acres in extent, and provided with potting-shed and hot-houses. The laboratories are intended to be a centre for agricultural and horticultural information for the whole county, and they include rooms for the analysis of soils, manures, foods, seeds, &c., and for other scientific work carried on in the interest of these industries. Cards of invitation to the opening ceremony, which must be presented at the door to secure admission, can be obtained from the secretary, County Education Offices, Chelmsford. The laboratories will be open for public inspection from two to five in the afternoon and seven to nine in the evening of the same day.

Spring bulbs again in flower.—A year ago I planted some Holland-grown bulbs of *Polyanthus Narcissi* Newton and Grand Monarque; they bloomed well last spring, and are now, to my surprise, sending up well-developed clusters of bloom again. Some are already fully

out, and there are others to follow. The past summer has been very wet and cool, and we have had no frosts as yet, so that probably the bulbs have not ripened off in a normal manner; it would be interesting to know whether this is a frequent result of such seasons.—A. P. SAUNDERS, *Hamilton College, Clinton, New York.*

Potato trials at Aughton, Lancashire.

—The Potato trials which are annually carried out by Mr. W. L. Hutton of the *Ormakiri Advertiser* are in a season like this, when, owing to the excessive rainfall, disease is causing great havoc, of more than passing interest. The varieties under observation are the newest of the previous season exhibited at the Liverpool Grain, Root, and Fruit show for the special prizes offered by Mr. Hutton, and are carefully planted on strong land in Bold Lane, Aughton, the grower being Mr. Henry Jenkinson, who also lifts and weighs the tubers. It is by such means that a proper estimate of their marketable value can be gauged, and for this Mr. Hutton is deserving of very great thanks for his generous offers. The following results have been obtained:—

Name.	Weight of seed.		Weight produced.			
	lb.	oz.	lb.	small.	large.	total.
Coronation kidney	24	28	1	17		
Carltonians	24	21	2	6		
Enterprise	3	38	3	12		
Edward VII.	24	26	2	14		
Early May	2	14	2	8		
Fylde Wonder	3	41	24	13		
General Buller	24	17	2	9		
Maddock's Excelsior	24	39	3	7		
Niven's Table Talk	24	61	4	26		
New (no name)	24	29	2	5		
New Majestic	34	28	1	16		

* This was a good shape, cropper, and quality.

The growth in every case had been very strong.

Dried Cycas leaves.—The importation of dried *Cycas* leaves has reached fabulous proportions. But a few years ago an importation of 10,000 leaves was regarded as a stupendous transaction. Now millions upon millions are brought over without exciting surprise.—*American Florist.*

Strawberry Sensation.—This new Strawberry is illustrated in this month's *Bulletin d'Arboriculture* by a coloured plate. Messrs. Vilmoren Andrieux et Cie, Paris, have introduced this second early variety to commerce. The plant is vigorous, and produces bright red, shining fruit larger than the average size of most large varieties. The shape is bluntly oblong, flesh red, juicy, and of good quality. The plant is said to fruit very freely; it is already widely grown in gardens in France, and *Le Bulletin* is convinced that it will long be regarded as a valuable Strawberry.

Kniphofia modesta.—Although quite modest in appearance, this pretty little species justifies its culture in gardens by its distinct character as compared with the larger forms of the well-known Torch Lily. It is not suitable for use among coarse-growing plants, and requires a select position to itself, or it may be used in conjunction with other small species such as *K. rufa*, *K. Nelsoni*, *K. breviflora*, and others. It is one of the last to bloom, and the flowers are borne in dense spikes 9 inches to 1 foot long on stems 3 feet high, these springing from a tuft of long, narrow, grass-like leaves. The buds are of a reddish brown tint, while the fully-expanded flowers are pure white; from the mouth of these protrude the orange stamens. It was first discovered on the mountains of Grigalund East at an elevation of 6,000 feet by Mr. William Tyson in 1884, and soon after found in Natal by Mr. J. Medley Wood, curator of the Durban Botanic Garden, who sent it to Kew.—W. IRVING.

Rudbeckia subtomentosa.—This, to me, is one of the most charming of the late-flowering yellow composites, not only for its very prettily formed flowers, from which the black discs show out clearly and strikingly, but also for its always fresh and distinct leafage, which shows no sign of decay right up to the end of the season. Each plant forms a shapely, erect-growing bush, taking to the eye even when out of flower. I should place this among the best dozen of late-flowering herbaceous plants, and it strikes one as strange that it is so seldom seen in borders.—J. C. TALLACK.

Pomological Congress in 1904.—The Pomological Society of France has decided, in reply to an invitation from the Orleans Horticultural Society, to hold its congress at Orleans next year.

Mr. T. W. Brown who left the Royal Gardens, Kew, in 1899, to go as assistant curator at the Botanic Station, Gold Coast, and afterwards was engaged by the Sultan of Morocco to lay out the Palace Gardens at Fez, is now in charge of the laying out of the grounds around the British Pavilion, St. Louis World's Fair grounds. Mr. Brown, we understand, has been commissioned by the British Government to carry out this important work.

Phyllostachys nigra in flower.—It may perhaps be of interest to you to hear that *P. nigra* has flowered here this year. Have you any note of its doing so in other parts of the country? As it has been said that the Bamboo always dies after flowering, perhaps you would be able to say whether this is the invariable experience of English growers, or whether, on the other hand, the death of the plant can be stopped by preventive measures. I have cut off all flowering shoots.—H. E. BISHOP, *Middleton Vicarage, King's Lynn*. [Specimens of this Bamboo in flower were shown from Ireland at the recent exhibition at Chiswick. You should read the note about the flowering of Bamboos in THE GARDEN, page 74.]

Scarcity of fruit in France.—Loss of trade.—The fruit crop is poor this year, says *Le Jardin*, not only in England but also in France, and we, who formerly were large exporters, shall be obliged to have recourse to importation. Such is the result of methods which have not allowed our growers, with rare exceptions, to promote establishments capable of competing with those on the other side of the Atlantic. Thanks to the progress there in the matter of transportation (for instance the introduction of refrigerating cars and cold chambers on board ship) we have already lost to fruits from California and the Cape, the greater part of the English and American markets; and if one is to believe the *Feuille d'information de l'office du commerce extérieur* even the Californian preserved fruits have, by their low prices, less than half that of similar products from France, completely put an end to our trade in the Far East.

The first Daffodil show in South Africa.—The Metropolitan Hall, Burg Street, Cape Town, the scene of many a noisy public meeting, and of more than one political conference, was the Mecca early in September of a large number of horticultural enthusiasts, drawn thither by the Daffodil exhibition organised by the Sea Point Horticultural Society. The show of Daffodils was a fine one, both as regards number and quality of blooms, but there were only two competitors, due doubtless to the fact that the prizes offered were for "the largest and best collection," and not for any particular bloom or group of blooms. The two competitors were Messrs. H. M. Arderne, The Hill, Claremont, and Mr. T. Duncan, of Sea Point, the first prize being a silver Daffodil vase, presented by Messrs. Barr and Sons, of Covent Garden, London. Mr. Peter Barr, the head of the firm, who is known as the Daffodil King, paid a visit to the Colony a couple of years ago, and the vase will be a lasting memento of his brief stay in the Peninsula. The Daffodils were staged on two long tables running down the centre of the hall, and the sight of the golden Narcissi against a background of pale green was one which appealed strongly to all lovers of the beautiful. One table was exclusively occupied by the exhibit of Mr. Arderne, the winner of the vase, who sent no fewer than 1,200 blooms, containing ten varieties, the most conspicuous being the Emperor, Empress, and Barri conspicuus. Mr. Duncan, who has only recently gone in for the cultivation of the Narcissus, sent thirty varieties; Mr. Hutt, of Maitland, contributed nine varieties, while the gardens of Bishopscourt were represented by a large collection of blossoms. The judges were Mr. F. Cartwright and Mr. Chalwin, of the Botanical Gardens, with Mr. G. B. van Zyl, of Sea Point, as referee. They awarded the first prize to Mr. Arderne, and the second to Mr. Duncan, points having been awarded

as follows: Quality, Mr. Arderne, 30; Mr. Duncan, 10. Variety, Mr. Arderne, 10; Mr. Duncan, 30. Quantity, Mr. Arderne, 18; Mr. Duncan, 5. Total, Mr. Arderne, 58; Mr. Duncan, 45. The first prize—the Barr vase—will be offered for competition annually, and will become the property of the exhibitor who wins it twice in succession. The second prize was a silver medal, the gift of the Sea Point Horticultural Society.

The preceding was taken from a local newspaper, and the following comment, also from a South African journal, is interesting: "In the Metropolitan Hall, Burg Street, there is to-day (September 4) by far the finest collection of Daffodil blossoms ever brought together in South Africa—a veritable 'field of the cloth of gold'—and the result of this gathering is a focussing, as it were, of all the golden beauty which Daffodil cups may contain. We have to-day an exhibition of Daffodil blooms which have come to us for very love, an exhibition which proves that devotion to flora as a queen among us is as yet a living truth, and that around the hearts of all true gardeners there is woven 'a thread of twisted gold.' Fifty years ago Mr. Peter Barr, who has earned the sobriquet of the Daffodil King, commenced in earnest the cultivation of his favourite flower, the Daffodil or Narcissus. The bulbs could then be purchased for a penny each. Mr. Barr has lived long enough to see 600 varieties introduced into our gardens, the prices of which range from one penny to fifty guineas, and whilst on a visit here Mr. Barr lectured with so much enthusiasm on his favourite flower that he has largely helped towards the wonderful display of blooms, one amateur, Mr. H. M. Arderne, alone contributing over 1,000, in evidence at the Metropolitan Hall to-day."

Destructive fruit pests.—A paper on "Destructive Fruit Pests," read by Mr. W. Horne, of the firm of Messrs. Horne and Sons, of Cliffe, Rochester, before the Council of the National Fruit Growers' Federation, recently, has been issued in leaflet form. It is particularly interesting from the fact that it treats with Mr. Horne's recent discovery of capturing larvae of the Codlin moth before it changes into chrysalis. At the outset Mr. Horne enumerates five of the principal pests which, he says, they are now able to capture. They are the winter moth, mottled umber moth, March moth, Apple blossom weevil, and Codlin moth. Mr. Horne says it is clear that it is most important to the success of fruit growing that all fruit trees, including Apples, Pears, Plums, and Cherries, should be dressed from October to May, and he intimates that at some future time he hopes he may be able to say how to intercept another pest that is still at large, called tortrix moth.

Early-flowering Chrysanthemums and the weather.—During the fifteen years I have grown these plants outdoors I never remember such trying weather as that through which we have passed during the last three or four months. Throughout June and early July the plants were quite satisfactory, but though in the succeeding months they certainly developed into little bushes, the growth could not ripen owing to the absence of sunshine. When the flowering period came the weight of the flowers was too much for the stems. It was a pitiable sight each morning when an inspection of the collection was made. Before the flowers could free themselves from their soddened condition other heavy falls of rain followed, so that within a few days, or a week at most, the blooms began to damp and decay, until in the end many of them were absolutely rotten. There were occasional intervals of a day or two of fine weather, and in proof of the recuperative powers of the early-flowering border Chrysanthemums it is only necessary to point out how quickly the plants began to reassert themselves, so much so that in a comparatively short time the display was very bright. As an instance I may mention that splendid plants of Goacher's Crimson in the very wet weather were blooming in profusion, but the display was cut short by the flowers damping very badly. But during a spell of dry weather the decay had stopped, and the flowers soon recovered. This experience in a season unique in respect to its

trying climatic conditions should prove most conclusively the value of these plants in a normal season. Well-ripened wood is essential with plants intended for outdoor displays, in which case the flowers are easily maintained on strong and erect footstalks. Though the growths were somewhat green in early September the display made by a dozen to eighteen varieties then in full bloom was very fine indeed, and it was only as these varieties were attaining full development that rain and wind resulted in failure. This present season should not deter intending growers from embarking on their cultivation, as the early-flowering Chrysanthemums have been one of the brightest subjects in the hardy border during the past season, notwithstanding their premature failure.—D. B. CRANE, *Highgate, N.*

Lotus pelliorrhynchus.—There has, I think, always been considerable doubt about this plant growing out in the open, even in this favoured part of England. Here in my garden it grows freely, and during May is a beautiful sight with its Indian red flowers and grey green foliage. It is doing well on a sunny bank, and requires moisture for its roots. My plant has been growing out of doors in its present position for the last three years, and it is spreading extensively.—WILLIAM SICH, *Gunwalloe, Helston, Cornwall*.

Potato Northern Star.—It seems quite evident that those who purchased seed of this Potato at such a high price in the spring will have made a profitable investment, for it appears to have proved an extraordinary cropper. Though there will be large quantities on the market, the price has started high, and it is selling well. At £14 per cwt., which is the lowest price I have yet heard of its being disposed of, it leaves a good margin of profit beyond what would be obtained on an ordinary crop of Potatoes after making full allowance for cost of seed.

Yellow Tomatoes for market.—These are more appreciated than formerly, and I think the time has come when it would pay to grow them in quantity for market. My experience has been in a retail trade, and for the last three years the demand has steadily increased. The first season they sold very slowly, but this year though a much larger quantity was grown it was not equal to the demand, and there has been no difficulty in making 2d. per lb. more for them than for the best red varieties.—A. HEMSLEY.

A remarkable Epidendrum.—When visiting the gardens of Mrs. Loudon, at Allanshaw, Hamilton, N.B., recently, Mr. T. Finnie, the head gardener, drew my attention to a very fine plant of *Epidendrum vitellinum*, bearing some thirty-one racemes of flowers. It is some 2 feet high and 2 feet through. The plant was given to Mr. Finnie twenty years ago, when it had only four or five bulbs, and he has cultivated it with so much skill that it is now almost, possibly altogether, an unique specimen of this *Epidendrum*.—A. P. H.

A charming combination.—The long shoots of the common Virginian Creeper have twined themselves among the branches of a tall-growing Laurel, and it looks as if tongues of flame were thrusting themselves out from amid the deep green of the Laurel branches. In this way the dying year slowly burns itself out in shrubbery, woodland, and hedgerow, and those who seek for rich autumnal hues in vegetation can find them in abundance. In the case of this fiery Laurel Nature had done its work much more deftly than man could perform it, with the further advantage of heightened effect. I have seen bunches of Privet lit up in the same way, just as the festoons of Bryony variegata the russet hedgerows in country lanes.

Marigolds in pots.—African and French Marigolds are unusual subjects to cultivate in pots, but I have at the present time specimens of the former 3 feet or so in height in medium-sized pots which are literally laden with blossom. They are, of course, under glass. One African is of quite deep orange, another is pure deep gold, and no early Chrysanthemum I have seen supplies these colours to such a depth. They require plenty of water on a drying day, as the pots are full of roots, and once a week they have a slight

surface dressing of Clay's Fertilizer, the other of soot. They will no doubt go on blooming so long as the weather keeps mild. The striped French Marigold has formed a dense bush, and is laden with blossoms, with the rich markings belonging to the fine Scotch strains. The peculiar perfume of the Marigolds, being more pronounced in the foliage than in the flowers, is not perceptible unless it is touched; but even if it was apparent it is far more than compensated by the cheerfulness of the blooms in the waning autumn days.—R. DEAN.

Dædalacanthus parvus.—About two years ago this *Dædalacanthus* was given an award of merit by the Royal Horticultural Society under the name of *Dædalacanthus Wattii*. Since then it has made headway in popular favour, one great recommendation being the fact that it may be had in flower throughout the autumn and early winter months. The genus *Dædalacanthus* now includes many of the plants formerly grown under the head of *Eranthemum*, the most frequently met with of which is that formerly known as *Eranthemum nervosum*, but which is now *Dædalacanthus nervosus*. The newer form (*parvus*) bears a certain amount of resemblance to it, but differs in many well-marked features, flowering, as it does, when little more than a foot high, while the flowers, which are in short spikes, are about an inch across and of a deep bluish purple. A succession is kept up from one spike with its large bracts for some time, while frequently sufficient flowers are expanded at once to form quite a cluster. Like most of its class it is of easy propagation and culture, for cuttings strike root readily, and the plants thrive with the treatment given to the general run of stove or intermediate house subjects. During the height of summer it will succeed even in the greenhouse.—H. P.

THE ROSE GARDEN.

AUTUMN PLANTING.

ALL expert rosarians are agreed that autumn planting gives the best results, so that where the land has been prepared or can soon be cleared and trenched, there is no better time than late October and November to carry out the work. Where there is a choice of situations, select a place well away from other trees open to the south and west and even east, but sheltered from north. Do not attempt to plant Roses in shrubberies or near to large rooted trees or hedges, or failure must result. The more open the situation the less liability there is to mildew, orange fungus, and other pests. If amateur growers in a certain district could combine and rent a good piece of farm land, they would frequently be more successful, especially at exhibitions, than is possible in a small garden, but wherever the situation, let the ground be well trenched to a depth of 2 feet or more, taking care to keep the subsoil below, but incorporate with it some basic slag and farmyard manure.

Do not attempt to plant until the ground has been trenched some time to allow the soil to settle down. If the plants arrive in the meantime, strip them of all their foliage and heel in deeply under a north wall or hedge, and water the roots at the same time. In planting I like to give each plant a handful of bone-dust, mixing it well with the soil, and should the staple soil be very wet, it is better to prepare some compost consisting of fine loam or old pot-soil, burnt earth, or burnt garden refuse, leaf-soil, and spent hot-bed manure in equal parts; give each plant a peck of this when planting, allowing it to percolate well among the fine rootlets.

As to actual planting, the main point to remember is to spread out well the roots so that they are not cramped. Two can plant a Rose much better than one. Place the dwarfs or bushes just below where budded, and as most Teas and Hybrid Teas and even H.P.'s are budded on seedling Briar, it will be necessary to take out a deeper hole for these so that the Briar roots can strike down

straight. The Manetti stock and Briar cutting are more inclined to spread. A wider hole, therefore, and not so deep, is best in this case.

The roots of all plants should be gone over with a sharp knife, and the jagged ends cut clean and embryo suckers removed. It is not advisable to cut away the roots recklessly. Where they are of great length they may be shortened a little, but, generally speaking, the more roots a plant possesses, especially fibrous ones, the more successful will it be. Make the soil very firm excepting that on the surface. This I like to leave as rough as possible, especially if the ground is rather wet at the time of planting. As to arrangement, if possible plant in beds or borders that are not too wide, in order that one may cut and tend the plants without treading on the soil. The distance to plant must be somewhat regulated by the vigour of the varieties. Such sorts as White Lady would be none too close if planted 15 inches apart, whereas Margaret Dickson and Ulrich Brunner would benefit by 2 feet each way. Standards and half-standards should be planted about 2 feet 6 inches apart each way. For the latter, as soon as the hole is opened fasten a neat stake in the ground and attach the stem of the tree to it.

When one year old standards are obtained it is best to leave on the stake which is sent with the tree, as this prevents the head being blown out by the wind. After pruning this is not likely to occur. All long shoots on standards or dwarfs should be cut back to about 3 feet.

Climbing, pillar, or pergola Roses need special care as regards the soil. Being permanent they soon exhaust the soil unless a good hole is opened in the first place. One 2 feet wide and 2 feet 6 inches deep is none too much. Where soil is poor a few barrowfuls of good loam and manure will more than repay one for the trouble. We should not see such puny climbers on walls, pillars, and arches if better preparation were given in the matter of initial planting. Where soil is waterlogged give a few inches of rubble, or lay a few drain pipes to the nearest waterway. Borders or beds for Tea and Hybrid Tea Roses should be raised a few inches above the ordinary level, and to do this add plenty of gritty soil, such as clearings from brooks, burnt garden refuse, &c. Even in a wet season like the present Tea Roses in borders prepared in this way have grown marvellously.

As to covering the soil with manure after planting, I believe a more baneful practice was never advised, sun and air being as essential to the roots of plants as to ourselves. If manure be given to established plants let it be forked in at the same time. For protecting Tea and Hybrid Tea Roses in bush form nothing can surpass earthing up round the base to a depth of 3 inches or 4 inches, and if further protection is needed some Bracken Fern, Wheat straw, or Heather is very good. Standards should have some dry material stuffed into the tops, but in all cases remove the litter when the weather is mild. I would urge on planters the desirability of using every available bit of wall space, be it low or high, for the glorious Tea Roses. Get out some good large holes, fill with good compost, and one may grow specimens here equal to and surpassing those seen in pots at exhibitions. PHLOMEL.

ROSE DOROTHY PERKINS.

Of the numerous Roses styled garden Roses, at the present time none excels this American-raised variety for autumn flowering in the open. It is indeed a gem, and, as probably many well remember, it caused quite a sensation at the Royal Horticultural Society's Rose show at Holland House in 1902, when Messrs. W. Cutbush and Son had a gorgeous display of it there. As shown by them the colour was especially pleasing—a rich, soft rose. Thinking what a grand variety this should make for covering a pole in the open I procured from this firm a stout plant, furnished as it was with two shoots 12 feet long, which proved to me what a grand habit the plant has. I prepared a good station and put out my plant from the pot, tying the two shoots to a pole at once in

November. I might say from almost every eye on these two shoots growths were produced of about a foot long, which were terminated with a cluster of rich rose-coloured fragrant flowers. Especially during the month of September were the blooms a blaze of colour, and the length of time each one lasted surprised all who saw them. The growth, too, from the base is most promising. Instead of two shoots there are at least half a dozen. I look upon this Rose as one of the best introductions of recent years. E. MOLYNEUX.

THE FLOWER GARDEN.

AN HOUR WITH THE HOLLYHOCK.*

THE Hollyhock (*Althæa rosea*) belongs to the natural order Malvaceæ, and in the Linnæan classification of plants we find it in the class and order *Monadelphia polyandria*. In the botanical catalogues it is described as a hardy biennial with red flowers, blooming in August indigenous to China, first known in England in 1573. Dr. Turner, however, in a work published in 1564 (nine years earlier!) speaks of it as a well-known plant. According to these authorities, then, whichever may be correct, it is no new candidate for popular favour. But we think it may lay claim to a still higher antiquity. Pliny, in the fourth chapter of his twenty-first book, writes of a Rose with the stalks of a mallow and the leaves of a pot-herb. What can this be if not the flower now under discussion?

The old English writers spelt the word *Hollihocke*, *Holyoak*, and *Holyock*, whence it is supposed to have been derived from the Saxon "*Holihec*." Linnæus considered it a distinct genus, and named it *Alcea*, from the Greek word *Ἀλχῆ*, in allusion to its medical properties, on account of which it was formerly much valued.

In a work translated from the German,† and published in London nearly three centuries ago, we have the following particulars:

"There be divers sorts of Mallows, wherof some be of the garden and some be wild, the which also be of divers kinds. The garden mallow (*Hollyhock*), called the winter or beyond-sea Rose, is of divers sortes, not onely in leaves, stalkes, and growing, but in proposition, colour, and flowers; for some be single, some double, some white, some carnation, some of a cleere or light red, some of a darke red, some gray and speckled." Then follows a description, in which it is called "the Great Tame Mallow, with great round rough leaves, larger, whiter, and unevenner than the leaves of the other hockes or mallows. The stalks is rounde, and groweth sixe or seaven foote high or more. . . . The root is great and long, and continueth a long time, putting forth yerely newe leaves and stalks." It is there called *Malva sativa* and *Rosa ultramarina*.

It is evident that at the close of the sixteenth century the Hollyhock was much prized and generally cultivated; for Gerard, writing at that time, states that it was then sown in gardens almost everywhere. In Gerard's *Herbal* (edition 1636) are three plates of

* This excellent treatise on the Hollyhock is published by kind permission of the author, Mr. William Paul, F.L.S. It is the best history of the flower that has appeared, and we thought that its release in the pages of *THE GARDEN* would be instructive. We have taken this from Mr. Paul's "Contributions to Horticultural Literature" (1892), but it was originally published as a pamphlet, the second edition, in 1855. As it is nearly out of print, and will not be republished, we have ventured to introduce it here.

† "A New Herbal, or Historie of Plants." Translated from the German of Rembert Dodoens by Henry Lyte, Esq. London, 1598.

Hollyhocks: "The Single Garden Hollihocks," which we assume to be the type of the garden varieties of our day; "The Jagged Strange Hollihock," whence apparently have descended *Sulphurea palmata* and others of that strain; and "The Double Purple Hollihock." The writer also speaks of another "which bringeth forth a great stalke, of the height of ten or twelve feet, growing to the form of a small tree. The flowers are very great and double, as the greatest Rose or Double Peiony, of a deepe red color, tending to blackness."*

In Miller's "Gardeners' and Florists' Dictionary" (London, 1724), we find the Hollyhock described as "a plant of considerable variety, bearing red, white, purple, black, and other coloured flowers. They neither want beauty or stature, seldom bearing their flower-stems less than six foot from the ground, and are commonly garnished with their rose-like blossoms above half their height." . . . "Mr. Bradley directs to plant them out into a rich ground, in either September or March, and then they will begin to flower in July or August; and that in order to make their flowers large they should be frequently watered in the summer time; though they die to the ground every winter, they spring again, and will stand several years; and for their largeness and lastingness may very well be planted among the flowering kinds in wilderness walks, or in lines in avenues of trees." Miller informs us that he received seeds from Istria, gathered from plants growing spontaneously in the fields; the plants raised from them bore single red flowers; but other seeds received from Madras produced double flowers of various colours. Plants bearing single flowers might have been expected from seeds gathered in the fields, whereas the latter were probably selected from long-cultivated plants, whence the issue would as a consequence, be more varied and more highly organised.

It is scarcely necessary to say that the Hollyhock is not indigenous to Britain. Linnaeus assigns it to Siberia, but China is generally given as its native place. In the south of China it is found only in a cultivated state; the northern parts and Chinese Tartary are more correctly the districts it naturally adorns. It does not appear to extend to Japan, for in Thunberg's "Flora Japonica" it is spoken of thus: "*Crescit ubique culta. Floret Iunio Iulio. Variat floribus, albis, rubris, plenis et simplicibus.*" The French ascribe it to Syria, and plants bearing yellow flowers have been found wild among the rocks around Kurreechane.

We think, from the evidence afforded, we shall not exceed the bounds of truth in claiming for our flower a 300 years' naturalisation on British soil. We can imagine how much it would be cherished on its first introduction, though the flowers were but single and probably dingy in colour. It was a stately plant—tall, majestic, and not without a share of rude massive grandeur, which would well adapt it for the decoration of early British gardens. As with most flowers of long standing, we have no sources whence to draw the materials for a history of its early development. Such events were not chronicled in the olden times; and hence, for want of facts, we must be content to suggest probabilities, and drop the

early links in the chain of History. Starting from the period of its introduction, and allowing a few generations to be raised successively from seed in an improved soil, it is reasonable to suppose it would become varied in colour, and increase in size and fulness as the natural result of cultivation. This would likely obtain for it an enlarged circle of admirers, which would give fresh impulses to the cultivator, and thus hasten on its civilisation. This state of gradual improvement probably went on for a space of 250 years, and might have continued to this moment, had not one cultivator stepped out of the beaten track, and, working free from professional trammels, followed a course of culture dictated by his own observation and experience. This man was Mr. Charles Baron, a man unversed in garden literature, unused to move among the skilled in the hidden and mysterious art, and probably knowing little of the vegetable kingdom beyond what existed within the boundary of his own small garden plot. The Hollyhock was his favourite flower; to attend to it was his recreation; his labour

skill. As we look upon this flower in its improved condition, we cease to wonder at the rapid increase in the number of amateurs, for what other surpasses it in warmth of colouring, symmetry, and general magnificence? We do not know that we could do better than quote here the remarks of a contemporary writer: "The Hollyhock for several years past has had much to complain of from the undue neglect with which it has been treated. Here and there it has found a discerning patron, but, generally speaking, the floral world has been influenced by a Dahlia excitement, from which it is now subsiding in sober disposition to judge all flowers by their respective merits. The Rose is again the queen, and the Hollyhock is again at court."* It is true the Dahlia, the Pelargonium, and others, have each their peculiar beauties, and their absence would create an immeasurable void in Flora's throng; the only pity is that they are robbed of their gay attire by the first breath of frost, while the hardy nature of the Rose and the Hollyhock carries them forward fresh and beautiful

CALLISTEMON SALIGNUS AT MENABILLY.

was a labour of love. And thus a shoemaker of Walden, by concentrating his attention on a single species of plant, soon distanced all competitors, and originated those flowers which form one of the most striking and gorgeous feature of modern flower gardens. To rightly appreciate his labours, we must not compare his seedlings—known as *Magnum Bonum*, *Rosea grandiflora*, &c.—with those figured in Gerard's Herbal, in which the flowers, sparsely scattered along the stem, nod and droop at the bidding of every breeze—for they had long been numbered with the things that were—but with those of other cultivators of the same date. The distinguishing characters of the kinds he originated are their more perfect form, greater substance, closer arrangement of petals, and greater proximity of the flowers on the spike. Hence, they would appear an advance in every important point. But we must not suppose this improvement to have been the offspring of a single effort. From month to month, and from year to year, did this indefatigable cultivator toil, and the result is a monument of *perseverance* as well as of

throughout the chilly months of autumn. When others languish and decay, they fearlessly confront the blast, their many-coloured blossoms often enlivening for a long period the desolation caused by a single frosty night.

WILLIAM PAUL, F.L.S.

(To be continued.)

CALLISTEMON SALIGNUS.

GROWING in Mr. Jonathan Rashleigh's noted garden at Menabilly, Cornwall, is the subject of the accompanying illustration. It is about 12 feet in height and as much in diameter, and in July is literally covered with flower. It is known at Menabilly under the name of *Callistemon salignus*, and has pale yellow blossoms. This agrees with the account of *C. salignus* in "Nicholson's Dictionary of Gardening," where the flowers of this species are described as straw-coloured, but I believe that in the present day the authorities at Kew hold that

* This last description applies with remarkable accuracy to some of our finest modern varieties.

* "The Botanic Garden," by B. Maund, F.L.S., No. 977.

C. salignus has crimson flowers, and that it is synonymous with *Metrosideros floribunda* of nurserymen. The Bottle-brush trees, as they are popularly termed, are very attractive when in full bloom, the flowers forming dense cylindrical masses round the shoots 4 inches or so in length and 3 inches through, the closely packed stamens producing an appearance very like a bottle-brush. In the southwest these *Callistemon*s succeed well in the open ground and generally flower profusely, growing well in ordinary garden soil. Large specimens in perfect health are to be met with here and there, but I have never known such a fine example as the one at Menabilly here illustrated. I have seen plants with crimson and scarlet flowers in various gardens growing under the names of *C. linearis*, *C. rigidus*, and *C. lanceolatus*, but whether these titles agree with the present day nomenclature I am unable to say. The *Callistemon*s, with the *Beaufortias*, *Calothamn*i, *Metrosideros*, and *Melaleucas*, all handsome flowering trees, are members of the *Myrtle* family, and come from Australia.

S. W. FITZHERBERT.

INDOOR GARDEN.

THE BETEL NUT PALM.

(ARECA CATECHU.)

ONE of the most important and valuable amongst the many notable trees of this great and useful order is the Areca, or Betel Nut Palm. Widely distributed as it is throughout the East, it is also one of the best known species, some twenty or more of which have been described. Areca Catechu forms an erect slender stem, bearing at its summit a crown of graceful leaves, amongst which the spadices hang in great clusters of egg-shaped fruits, each one formed when ripe of a thick fibrous pericarp, enclosing one seed about the size and shape of an ordinary Nutmeg.

The species is a native of Cochin China and the islands of the Malay Archipelago, where, as also in India, it is largely cultivated, chiefly for the sake of the nuts or seeds. The plant does not succeed at any distance from the sea, nor at an elevation over 3,000 feet. Clumps or avenues of Betel Palms are to be seen in most villages in Burma, Bengal, and South India. Different forms or varieties of the Betel are grown in different parts of India. In Mysore, it is said, two distinct varieties are cultivated, distinguished by the size of the seeds, though both have a similar value and are produced in equal quantity. Though the method of cultivation differs somewhat in the various provinces, it is practically the same. Thus in Mysore the seeds ripen from the middle of January to February. They are sown in trenches half filled with sand, upon which is placed a row of ripe seeds, which are covered with sand and black mould, and are watered about every three days for the space of four

months. When of sufficient size the young plants are transplanted in rows between Plantain trees. In dry weather they require water about every third day, but in the rainy season it is necessary to dig a trench between every third row to carry off the superfluous water. At the end of three years the Plantains are taken out, and a row planted along the middle of each bed to preserve the necessary coolness to the Arecas, which, at the expiration of five years, have usually attained the height of 5 feet and begin to produce fruits. Most of the Betel Nut plantations in Mysore are interspersed with Coconut trees, Limes, Jack Fruit, and other trees to give shade and freshness to the soil.

THE BETEL NUT PALM (ARECA CATECHU) IN ZANZIBAR.

In Ceylon the Betel Nut is cultivated to some extent, and in several varieties, but the quality is of much less value than of those grown in India. The average yield of a Betel Nut Palm is estimated at 300 fruits, and as a fruit contains only one seed, the result is the same number of the so-called nuts. The chief trade in Betel Nuts is said to be centred around Bombay. Ceylon and Madras export their nuts to the Western capital, from which they are re-exported to the principal Asiatic centres and diffused by land all over India. Sumatra and Singapore also export large quantities of nuts to Bombay. Amongst other than Eastern countries that take large quantities from India may be mentioned Zanzibar, Mozambique,

Mauritius, and South America. The introduction and successful growth of the tree into any of these countries will, of course, have the effect of lessening the Indian imports, and that such a result is being effected is shown by the illustration, which represents a group of Areca Catechu trees in Zanzibar, with natives climbing their tall trunks to cut off the ripe fruits.

The chief use of the seed is as an ingredient in the preparation of *pān* for chewing, an universal practice among all classes. The seed or nut is found in all the bazaars, either whole, sliced, or cut into small pieces, the chewing of which is said to stimulate digestion and to prevent dysentery. In the preparation of *pān* Lime, Catechu, Cardamom, Cloves, and other ingredients are used, the lips and teeth being coloured red by its continued use. Besides being used as an article of luxury, it is a kind of ceremonial, which regulates the intercourse of the more polished classes of the East. When any person of consideration visits another, after the first salutations Betel is presented. To omit it on the one part would be considered neglect, and its rejection would be judged an affront to the other. Areca Nuts are also used in medicine on account of their astringent properties, and have long had a reputation as an anthelmintic for dogs. Reduced to charcoal and finely powdered, Areca Nuts are much used as a dentifrice. Finally, the young flower-spades are made into caps, dishes, plates, &c., for holding fruits and sweetmeats. JOHN R. JACKSON.

Lympstone, South Devon.

TREE CARNATIONS.

SEASONABLE NOTES.

IN connexion with this group there are two important matters at the present time of a seasonable nature. The first and most important is that of housing the plants intended for early winter flowering. This work should be taken in hand without delay. It is the more important, naturally, in the case of those plants already well forward in bud, as the earliest examples will now be. Unless the plants are housed some days in advance of the topmost or crown bud, showing its inclination to open, that good bud will in nearly every instance have to be sacrificed. This is more marked in the case of white-flowered varieties than in all other shades put together, for a small blemish on a white petal develops and disfigures the flower. Taking the batches all in all they are as good as it is possible to expect in so wet and sunless a season. Batches of different ages of the same variety treated in all respects alike as to soil, &c., display marked differences when brought together. Those that were well established or nearly so when the great rainfall of June was experienced are now markedly superior to others freshly potted and placed in the open just before that great flood time. This year the plants or varieties that are naturally not robust or vigorous in root action have suffered accordingly. Strong growing varieties, such as Mrs. Lawson, for example, appear, if well rooted, to be able to stand much in this direction. On the other hand, the more weakly white varieties, such as Mlle. Carle and

others not much more robust, display a strong dislike to wet with cold or abnormally low temperatures. Lucky the grower who can for all such sorts command frames, or at least lights to throw off the great bulk of the wet.

To dwell upon this phase of the subject now would perhaps appear rather late in the day. The object, however, now that housing is being done is to take some trouble in securing a dry condition of the soil before watering is begun under glass. This is not recommended for those in bud, for they may practically take care of themselves, but later batches may with advantage be allowed to dry up so as to sweeten the soil for the quickly forming new fibrous roots. Once the soil has been so sweetened the ordinary watering may be proceeded with. With the housing of the plants a good overhauling of the pots to free them of weeds, keeping a keen look out for slugs or caterpillars, are worthy of attention. Fumigation should not long be delayed, not so much to destroy aphides as to put an end to the small army of insects that usually infest these plants, and particularly the early opening flowers. To neglect putting an end to this pest would mean the loss of many flowers, or at least sadly mar their beauty. White-flowered varieties especially suffer quickly.

E. H. JENKINS.

DISEASE - RESISTING POTATOES.

READERS of THE GARDEN will no doubt be deeply interested in the discussion which is now taking place respecting the best disease-resisting varieties. A more disastrous season than the present one can hardly be imagined, and should prove to be a thorough test of those new varieties which are supposed to be proof against it. I have not grown Northern Star, consequently I am not able to give an opinion on that now famous variety, but out of a large number of varieties here on a wet, heavy land, all left in the ground after the middle of August were more or less affected, some, of course, more so than others. Varieties which only a few years ago were supposed to be disease resisting or practically so are now equally as bad as any. No doubt after a few seasons the constitution becomes weakened, hence the necessity for continually introducing new varieties, and in my opinion the chief aim of the raiser should be to endeavour to get those sorts which mature early. Very late sorts should certainly not be encouraged. I have for many years practised and advocated the lifting of the main crop very much earlier than is usually done, and by so doing the crop is generally ensured. As an illustration of this we lifted this year on August 12 a large piece of Windsor Castle, Snowdrop, Syon House, and Bountiful, leaving a few rows of each sort, which were taken up the first week in September. On the first date we saw no trace of disease, and none has developed since, but those left till the later date were so badly infested, each sort being equally bad, that they were scarcely worth the trouble of lifting. Even though the tubers may not be ripe and the skins become rubbed, except for appearance sake, they are none the worse either for cooking or keeping. The great secret in Potato culture is to select varieties of first-rate quality. Well prepare the sets before planting, which should be done as soon as it is safe to do so, the date depending on the position and locality in which one resides. Allow ample room between the plants and lift early. As a first-class all round variety I know of nothing to equal Windsor Castle. Up-to-Date is a great favourite, and probably unequalled for field culture. Snowdrop is still excellent, but must be lifted early. Carltonian is good. Sir John Llewelyn has done remarkably well this season; it is a very fine Potato. Bountiful and Cigarette are both good and of very handsome appearance. Goldfinder is a good crop, and there is little disease. Ideal is a very handsome Potato at its best, but both this season and last refused to grow well and was badly diseased, the crop being scarcely worth lifting. Satisfaction, a good crop, tubers fine, but

diseased. Syon House fully bears out what was claimed for it, being a grand Potato for any purpose. Among coloured varieties Edward VII. turned out well, and is fairly free from disease. Mr. Breese is still one of the most handsome; a good cropper but badly blighted. Reading Russet still holds its own as a good red round, as also does Vicar of Leham; these should be lifted early. Lord Rosebery is a very telling variety and fine for exhibition when seen at its best; it must be taken up early. Early varieties turned out remarkably well, and there were no signs of disease. Sharpe's Victor is much liked here, both for frame culture and in the open. Improved Ashleaf will maintain its position, being of high-class quality. Early Puritan is also good. Duke of York is one of the most handsome and of good table quality. Ringleader matures very quickly, and is well adapted for frame and pot culture.—E. BECKETT, Aldenham House Gardens, Elstree.

THE past season will surely convince the most conservative that to grow such varieties of Potatoes as Snowdrop, Beauty of Hebron, Puritan, and such like is only courting failure, when so many heavy cropping and disease-resisting varieties are on the market at reasonable prices. Royal Kidney and Empire Kidney are two very good varieties, much heavier croppers than Snowdrop, and do better on poorer soils, as I always found Snowdrop wanted higher cultivation than most varieties. Evergood has proved to be a great cropper of excellent quality here, and free from disease. I consider it one of the best varieties on the market within the reach of all. Northern Star will be another grand variety, but at its price it is not everybody's Potato yet. It has cropped well here, from 11b. of seed (only out) we lifted 92½lb. of handsome tubers. Discovery was a very poor crop grown side by side with Northern Star; with the same treatment from 2lb. of seed we only lifted 54lb. of very unsightly tubers. Empress Queen and British Queen are also good, and have always cropped well here.—A. FINDLAY, The Gardens, Maresfield Park, Uckfield.

I grow early Potatoes principally in the garden, and our late supply in the field; but I make a point of growing some late ones in the garden to change the seed in the field every year, for I find the crop is thereby much improved. Some years ago I used to grow over twenty varieties, but have given this up, and only grow about a dozen now. I can find nothing to excel Sharpe's Victor for the first crop, followed by Veitch's Improved Ashleaf. Duke of York with us is a fine cropper and good flavour, but more prone to the disease than the two former. Bovee is the best of the American sorts, and on warm light soil is grand. Cottagers grow it about here largely. Windsor Castle is still valuable; this year, on a dry piece of land, from fresh seed, the crop was excellent, and almost free from disease. Syon House has been grand, but last year and this has suffered badly from disease. Universal surpasses Schoolmaster in the field, but it is not disease proof. Up-to-Date gives a grand crop, and is a good disease resister, but is of poor quality when grown on wet soil. This year and last our best Potato has been Sir J. Llewelyn. I first obtained my stock from Hackwood Park two years ago. In the garden it gives an enormous crop. I have not seen a diseased tuber for some time, although I grow a lot of it, and should recommend all to grow it. This year I obtained seed of Evergood, and am much pleased with it, and have not had one diseased. I find burnt earth, wood ashes, &c., most helpful in garden culture. It keeps slugs, &c., from eating the tubers. The continued rain is much against lifting the crop.—JOHN CROOK, Forde Abbey, Chard.

PRACTICALLY I know very little about the Potatoes that have recently been introduced to cultivation or written about, therefore I do not feel justified in giving my opinion upon them. I only hope that they will prove to be as trustworthy as they are represented to be. I can, however, answer as to two of my own seedlings, Sutton's Ringleader (first early) and Early Regent (second early), with me they have proved the best disease resisters. They "come off" the ground before the disease

can attack them; they are of excellent quality, colour, and crop, and they keep to the end of the season.—ROBERT FENN.

I MAY say that only one variety this year has given me a crop, namely, Charles Fidler. Snowdrop and Early Rose were dead failures from disease, and even a late crop of Duke of York succumbed. The haulm of Charles Fidler looked bad towards the end, but the crop has been capital. Ours is a light gravel soil, and we have never had disease before. Up-to-Date has done well near here.—A. M. M., Berks.

THAT the very wet summer we have had has done a great deal to damage the Potato crop in this county can be seen from the look of the crop where not dug, and also from the complaints one hears all round. In the valleys and low-lying portions of course the crop is more affected, but we have been most fortunate. The soil in which the Potatoes are growing is light, and this spring in place of manure the gardener had a good deal of lime dug in, and the result has been most successful—a perfectly sound and abundant crop, a few specimens of which I send. The variety is Up-to-Date. [Very fine.—Ed.] Some much larger tubers were dug early in August.—A. H. TYRRELL, Peak Cottage, Sidmouth, Devon.

By far the most satisfactory Potato in this neighbourhood is Up-to-Date, in quality, cropping, and appearance, and last, but not least, freedom from disease. I have not attempted to grow the high-priced Potatoes up to the present, but contemplate giving them a trial. I am discarding several old favourites, such as Early Ashleaf, Early Puritan, Windsor Castle, and Satisfaction. This is the second season the last two have proved a failure.—WILLIAM FYFE, Lockinge, Berks.

THE condition of the Potato crops of this country is of the greatest national importance, and as this extremely unkind season has adversely affected the results in practically the same proportion as most other outdoor crops, it is well that we should compare notes to see if we are able to profit by such facts as come within our own observation. It is clear that varieties of Potatoes grown on or near the same ground year by year do wear out, hence the necessity for raisers to continue to raise new varieties, as far as possible from the best disease-resisting parents. It is varieties with stamina and healthy constitutions that are wanted; this and constant changing of seed will help to check disease to some extent, while early and persistent spraying of the growing plants will be found still further beneficial. Some twenty-five years ago a philanthropic gentleman took up the matter of gathering the pods of Potato seed, and sent a packet of this indiscriminately-saved seed to every member of the House of Lords, and as I was then in the service of the Duke of Marlborough at Blenheim, one of these packets was placed in my hands for cultivation, with the result that we had thousands of seedlings, short and tall haulm, early and late, white and coloured progeny, good, bad, and indifferent quality—in fact, the most heterogeneous sample imaginable, but very little disease in the tubers. Selections of the most promising were made, but other circumstances prevented the experiment in this case being completed; but doubtless with more skilful hybridisation of the flowers much better results may be expected. We have plenty of Potatoes of really good quality already, and we should aim at preserving these. I have seen crops lifted this season in cottage gardens and other Potato-sick ground that barely returned the seed weight of sound produce to the cultivator; of course, these were grown from tubers that had been grown on the same ground for several years, while in marked contrast to this, and growing by the side of the above, the variety Evergood, from Scotch-grown tubers, gave more than twelve times as much—thoroughly good Potatoes of best eating quality. Evergood has proved much the best main crop variety we possess, and although it has not been "boomed" to the same extent as Northern Star and others, there can be no doubt that it is a very valuable variety, and reasonably within reach of all. Up-to-Date,

British Queen, Magnum Bonum, and all the older sorts have deteriorated, and are so badly diseased as to be practically useless, especially on our heavy clay soil. For early work, where required in quantity, we know of nothing more reliable than Ringleader and Myatt's Ashleaf, the latter yellow flesh of best flavour. We prefer to obtain our seed tubers grown in Scotland, purchased fresh every season.—W. CRUMP, *Madresfield Court*.

NOTES ON HARDY PLANTS

THE EDELWEISS.

(*LEONTOPODIUM ALPINUM*.)

SEVERAL forms of this well-known plant are in cultivation under various names. Owing to its wide range, which extends over the mountains of Europe and ultra-topical Asia, one would naturally expect slight differences, which almost wholly disappear when

increased by division of the root, but better plants are produced from seed. Other species belonging to this genus in cultivation are *L. japonicum*, rather a stronger growing plant, still scarce and more difficult to keep than *L. alpinum*, and *L. sibiricum*, a plant very closely allied to the Edelweiss.

Kew.

W. IRVING.

NOTES ON THE AQUILEGIAS.

AQUILEGIA GLANDULOSA.—How sweet and pretty are your pictures of this lovely gem (pages 26, 27), and a happy reminder of my days long ago. Why in the early sixties I worked in Grigor's nurseries, Forres, and tended this Columbine and gathered its seed. The Forres nurseries then as now were headquarters for it; and we also grew *Aquilegia Skinneri* there, too, and made a speciality of it as well. With us in America *A. glandulosa* is only fairly well behaved; it is a trifle miffy and not very hardy, but if grown in a cold frame over winter it blooms beautifully in spring.

that is because they always keep the leaves on when they dig them; if before digging them they cut off all the leaves, then lift the roots and transplant them they'll grow without any difficulty."

THE LONGEST-SPURRED COLUMBINE (*AQUILEGIA LONGISSIMA*).—About twenty-two years ago, when at the Harvard Botanic Gardens, I grew a lot of these from seeds given me by my veteran friend Dr. Edward Palmer, who collected them in the mountains of Northern Mexico. The plants resembled *A. chrysanthra* somewhat, were yellow-flowered, very free-blooming, and of vigorous form. The flower-spurs were exceedingly long, 5 inches and over, and hung down about the stems of the plants like Dodder. I gave plants to several people at home and in Europe, but everybody lost them the following year. I then left Massachusetts for New York State, but unfortunately did not take any of the plants with me. They did not ripen any seeds with me or anyone else, and I believe the species was not quite hardy. My great success was in a cold frame. Dr. Palmer (who is still connected with the Agricultural Department at Washington) has *carte blanche* orders to refind this Columbine for me.

W. FALCONER.

Pittsburgh, Pa.

RUDBECKIA PINNATA

How seldom do we see this cone flower, yet it is a distinct plant and worthy of extended cultivation. It grows from 4 feet to 5 feet high, and each flower is formed of from seven to ten petals, about half an inch wide and 2 inches long, and quite drooping. In colour the flowers are the palest yellow.

E. MOLYNEUX.

ERYNGIUM PANDANIFOLIUM.

THIS is a remarkable umbellifer. From a casual glance in the spring and early summer, before the flower spike appears, one would be inclined to class it amongst succulents rather than in the natural order Umbelliferae. It is well named *pandanifolium*, for its leaves bear a striking resemblance to the Screw-Pine. In a well-grown clump the narrow, concave leaves, which are very glaucous and spiny at the margins, will measure fully 6 feet in length. Towards the end of the summer the giant flower spikes will reach a height of from 10 feet to 15 feet, presenting a noble and striking appearance. The individual flowers are purplish in colour, and are arranged in small, globose heads, which surmount large dichotomous panicles. Coming from Monte Video, it is probably none too hardy in the colder counties, but it is well worth the labour of protection in severe weather. As the spikes are so tall and brittle a thoroughly sheltered site is essential. Here in Cornwall it succeeds admirably in a moist, sheltered dell.

A. C. BARTLETT.

THE LILIES.

To thoroughly understand a Lily one must study, as far as possible, the way it grows in a wild state, and to thoroughly appreciate its beauty one must see it in similar surroundings to those which exist in its native home. Fortunately, these two conditions are quite possible. A careful study of the Lily in all its phases of growth shows that it seeks low-growing trees, scrub, and herbs. These latter plants play an important part in the preservation of the Lily, from the tiny seedling to the adult plant.

The bulbs, as many know to their cost, are liable to injury and decay from excessive moisture in the one part, and drying winds and heat in the other. Trees, shrubs, and herbs

EDELWEISS FROM SEED ON A ROCK GARDEN.

grown under identical conditions. Geographical names have been given to several varieties, indicating the district where they are found. *L. a. himalayanicum* is the form from the Himalayas, *L. a. altaicum* comes from the Altai Mountains, and *L. a. transylvanicum* is the name given to the variety from Transylvania.

The Edelweiss, with its hoary appearance and small yellow flowers, surrounded by star-like heads of leaves clothed with a dense white cottony substance, is a plant much sought after, probably more enquiries being made for it than any other plant in the rock garden. Notwithstanding its comparative scarcity in gardens its culture is not difficult in light soil, provided that this contains lime, but, if naturally deficient, lime should be added in the form of old mortar rubbish, which answers the purpose very well.

Damp is a great drawback to its well-being in winter, when a piece of glass placed over it is an advantage. It may be

A. CERULEA.—But we grow pretty nice ones of this species, and to have the stock genuine and pure raise it afresh every year from seed collected from the wild plants in the Rocky Mountains. We get them from Mr. D. M. Andrews, Boulder, Colorado. We treat it as a biennial. It is very free-blooming and perfectly hardy. A neighbour of ours and a great garden lover recently returned from a vacation trip in the mountains of Colorado, and he is loudly enthusiastic over the glory and vast profusion of the wild flowers there, more particularly of this Columbine. "Why, man!" he exclaimed, "your Columbines are fine, and I have measured them three inches across, but those out in Colorado beat them all to pieces. There were acres and hundreds of acres of them, and some of them had blooms as big as a tea-cup"—he really said saucer, but he was awfully enthusiastic—"and there were some pure white ones among them too." And he continued, "I'll let you see them some day, for I had a man out there mark some of the biggest flowered ones, and when they are out of bloom he is going to dig up the roots and send them here to Pittsburgh to me. They tell me out there that the wild plants are hard to transplant, but I told them

A LILY-LINED PERGOLA. (From a photograph taken in a Venice garden.)

by screening the soil about their stems, withdrawing excessive moisture by means of their fibrous roots from the scales of the bulbs, correct all these cultural defects, and if we wish to grow all Lilies well, we must adopt a similar scheme, wherein we associate Lilies with protective plants whose presence will not only enable us to grow them better, but will afford excellent opportunities for good effects which are possible in no other way. Even as the wilding Fern appears at its best in the country-side hedgerow, so the Lily charms us more artistically disposed amid leafy surroundings. We have, however, in the cup-flowered Lilies a type that would strike a jarring note in such places—their rigid outline associates better with the inhabitants of the plant border, where also their requirements would be more fully met.

A few Lilies, notably, Humboldti, washingtonianum, and in some cases giganteum, absolutely refuse to grow except amid natural surroundings resembling in all essential characters their native habitats, and it is worthy of note that all those Lilies which grow in woodland, on mountain sides, in ravines, and in peaty marshes prove the more difficult to satisfy under present cultivation. The reason for this cannot be sought in their lack of hardihood, for that is assured. Failure in cultivating these invariably follows disregard of the peculiar formation of their bulbs, whether or not their roots are shallow or deeply descending—produced from the base of the bulb only or the base of the stem also—and whether or not their leaves indicate association with scrub, in being mere bracts at the base of the stem and abnormally developed at the top, where they can get more air, as in Browni, auratum, Krameri, and most of the open-flowered Lilies, such as speciosum and others of its type; or whether the reverse conditions prevail, wherein the breadth of leaf below indicates a more open exposure, as in Martagon, longiflorum, and tigrinum.

These characteristics, though minute in themselves, and liable, therefore, to escape the notice of the casual student, are important as an unerring guide to the proper cultivation of each species, and we feel assured that a little attention to these points will not only reduce the number of failures in growing Lilies, but will also enable those who are moderately successful now to grow them better still.

As some guide to what we consider the more important characters, we have in the following notes described the methods of rooting, the disposition of the leaves, and in what way they should influence the culture of the plant described. These characters are of far more importance to the cultivator than the shape or colour of the flowers and non-essential details. Thus the plant that grows upon steep hill-sides liable to detrition will, in the course of years, elongate its bulbs sideways and provide itself with contractile roots, which will pull the growing point deeper into the soil every season, as in *L. Humboldti* and *washingtonianum*.

Again, the plant that grows amid scrub will find that its lower leaves cannot perform their functions properly, owing to the competition for light, hence it dispenses with them and develops those that are likely to be of more service. These assumed characters are the work of generations.

It has been an unfortunate omission in recent literature of the Lilies and of other bulbous plants that little or no reference has been made to that portion of the plant below the soil. There is plenty to study here, and

every peculiarity noticed in such parts has been rendered necessary by its surroundings as a wilding.

One cultural detail not described fully, because it is necessary for every species, is that every bulb should be enveloped in sand at planting. There is nothing quite so efficacious in warding off the attacks of slugs and ensuring ample drainage than this simple practice. Sites that harbour slugs should be dressed with a strong solution of Quassia chips prepared in the usual way by scalding. This preparation renders the soil and vegetation distasteful to any of their tribe for a long time.

We have purposely omitted in the following monograph of garden Lilies any reference to plants not known to cultivation. There are many species in China, and doubtless America, awaiting introduction, but until these are available in quantity in order that they may be fully studied as garden plants and their worth as such approximated, we can say but little about them. Similarly, there are other species introduced many years ago but now lost to cultivation. These must also be left until they are again restored to our gardens.

L. albanum (Griesbach) (the Albanian Turn-cap Lily).—A pretty Lily rarely found in cultivation, and considered by many to be a choice form of the variable *pyrenaicum*. Bulbs conical, yellowish, generally compound, and as large as a Lemon; roots very stout. Stems 2 feet to 3 feet high, clothed thickly below and sparsely above with narrowly lance-shaped leaves 6 inches long, rough to the touch on both surfaces, scarcely at all rooted at their bases. Flowers, two to six, in a loose umbel, reflexing, fully coloured a bright tint of yellow, sparsely dotted grey in the lower half, and measuring $2\frac{1}{2}$ inches across when fully reflexed. Sweetly fragrant. A rather curious plant in its botanical affinities. It has the bulb of *chalcidonicum*, the leaves of *carniolicum*, the flowers of *pyrenaicum*, and the fragrance of *washingtonianum*. It inhabits woodland in the mountains of Albania. Flowers in June—July. Like most of the Martagon race, this Lily prefers a fairly rich, well-tilled soil, an open exposure, despite its woodland habitat, and it may be well grown in the plant border. The bulbs should be planted in September in order that the basal roots—the only support—may make headway before winter, and they appear to thrive better if some low-growing herb is planted about their V roots. The bulbs make little growth in the first year after removal, but recover and flower grandly in the second year. It is long-lived under cultivation when once established. Quite unsuitable for pot culture.

L. Alexandre (Hort. Wallace).—See japonicum var.

L. angustifolium (Mill.).—See pomponium.

L. aurantiacum (Siebold).—See bulbiferum.

L. auratum (Lindley) (*L. speciosum imperiale*) (Siebold) (the golden-banded Lily).—A magnificent and variable species introduced to Europe from Japan in 1862. There are two types not generally separated (in addition to the recognised specific varieties) but which are so distinct in habit and duration under cultivation that we think it advisable to describe both types. The older type, which we describe first, is the best garden *L. auratum*; the newer one is the best type for pot culture. Bulbs from 6 inches to 15 inches in circumference, in shape resembling an Orange, but flatter, and the growing point is raised. Colour a dull white, dotted more or less freely with pink, the older scales showing a tint of bronze. Scales variable, but always broad below.

Stems 3 feet to 8 feet high, producing bulbs at the ground level only and masses of roots above the bulb. Leaves narrowly lance-shaped, the stalks alone closely pressed to the stem, rich green, under 10 inches long, those within 1 foot of the stem's base reduced to mere fugitive bracts, and those just below the inflorescence are longest and broadest. Flowers four to ten, in a loose spike borne on long, stout footstalks, poised horizontally, or but slightly drooping, very widely funnel-shaped when they first open, eventually becoming nearly flat, the tips of the petals only recurving. Petals 5 inches to 8 inches long, white, broadly lance-shaped, banded down the middle with pale yellow, sparsely dotted crimson elsewhere, the spots raised on slight processes, longest and most prominent near the base. External colouring a warm bronze red under full exposure to sun. Anthers very large, red.

A more recent type is fewer flowered, the petals are undulating, much recurved, often slightly sickle-shaped, and they expand fully. Its bulbs are pointed, the scales fewer, broader, and loosely compacted together. It is less certain of growth in the open than the older type, as its bulbs hold moisture at the bases of the loosely arranged scales, but it is the better plant for pot culture as it makes the greater quantity of stem roots. Natives of Japanese mountain slopes, growing in light, rich soil, and vegetable debris among low growing, shallow-rooting shrubs and herbs, and amid rocks; very fragrant. Flowers in August. Very common in cultivation.

G. B. MALLETT.

(To be continued.)

THE FRUIT GARDEN.

THE CHERRY.

THE county of Kent has long been celebrated for the quality of Cherries which it produces, and in all probability they were first planted in this part of England, of which Caesar speaks more favourably than of any other district which he visited. Some authors assure us that the Cherry, which was brought into this country by the Romans, was lost in the Saxon period, and only restored by Richard Harris, fruiterer to Henry VIII., who brought it from Flanders, and planted it at Sittingbourne in Kent. This appears to be an error, as Gerard says "the Flanders Cherry tree differeth not from our English Cherry tree in stature or in form." There is an account of a Cherry orchard of 32 acres in Kent, which in the year 1540 produced fruit that sold in those early days for £1,000, which seems an enormous sum, as at that period good land is stated to have let at one shilling per acre!

Few of our hardy fruit trees are more accommodating than the Cherry. The cottager in his little garden may have it in the form of a bush, pyramid, standard, or as a single cordon against a fence or wall, and the amateur may have it in these forms also, as well as on espaliers, as recommended for Pears. He may grow it successfully under glass, either planted out or in pots, and thus extend the season of this delicious fruit from early May to the middle of September by growing early, mid-season, and late varieties. As an orchard crop, where the soil and situation are favourable, few hardy fruits are capable of giving, on an average, a better cash return. As regards soil and situation, the sweet or dessert Cherry succeeds in the Southern and South Midland counties the best. It thrives well in rather an elevated position, where it has the advantage of light, good natural drainage, freedom from damp, immunity from frost when in flower, and the advantage of driving showers of rain in the early summer; these not

only refresh the trees, but keep the foliage healthy and clean. The above remarks refer more particularly to plantations or orchards. The soil in which the Cherry succeeds best is strong, somewhat marly loam, of a fair depth, resting on a substratum of gravel or chalk; where no chalk or lime is present in the soil, some must be added before success can be attained in the culture of the Cherry, or, we may say, of any orchard fruit.

The stock used for grafting all orchard Cherry trees upon should be the common or wild black Cherry. The Continental seedlings do not seem to be so hardy, but the British stock is suitable for all. We do not find any great advantage generally in using the Mahaleb stock for Cherries, although it suits the Duke and Morello Cherries admirably. On the other hand, for pot culture or restricted pyramidal trees, we find that trees on the Cherry stock regularly repotted or transplanted are equally as good as those on the Mahaleb.

Cordons and small trees when young must be root-pruned in any case, for when free growth ensues, and shoots are pruned hard, this is apt to cause gumming, which may injure or destroy the trees. And we find that where Cherries for orchards are budded low, the stems are more easily injured and liable to gum than when budded high on the wild Cherry stock named. On the other hand, where Cherries sometimes do not succeed on the Cherry stock, they may be grown on the Mahaleb. Cherries are very liable to be called after local places, and in this way names have been needlessly multiplied. Fruit well cultivated in orchards differs considerably from the same varieties in starved, poorly treated land.

CHERRIES FOR ORCHARDS.

For this purpose we have to choose comparatively few sorts, and such as will be profitable during a long series of years, for the life of a standard Cherry tree may be a hundred years, except in the case of the Flemish and Kentish Reds, May Dukes, and like sorts. In planting a profitable Cherry orchard place trees of the larger growing varieties at 36 feet apart, and plant between each either a Flemish, Morello, or May Duke variety; or, if the soil is suitable, a Plum or one of the smaller growing sorts of Apples.

PRUNING.—If the orchard is in grass land, and it is intended to run sheep or cattle among them, they should be cradled to protect them from injury, and then be allowed to grow one year without cutting back. We hold this to be very important. While admitting it to be true that with very careful attention they may be cut back when planted, we believe as a general rule it is far better to allow the trees one year's free growth. They then become established before any cutting back is done. Afterwards a yearly pruning to shape the trees is essential; but when well-disposed and regulated head and branches are formed, they may be left alone, merely removing any useless shoots and such as cross each other. The Flemish and Morello class require very little pruning. The Bigarreau and black Cherries will need attention for three years after planting; but the Rivers' Early, Elton, and any sorts that have long, pendent shoots, almost a weeping habit of growth, will require attention for five or six seasons in order that the boughs may not be so low as to be in reach of sheep or cattle. And to aid them they should be cut to a bud pointing inwards instead of to the usual outside bud, to form at first the desired basin-shaped tree.

VARIOUS POSITIONS.—In Kent it is usual to plant orchard Cherry trees in Hop fields, removing a hill of Hops and planting a Cherry. The Hop requires liberal culture, and we cannot at all recommend this system, because Cherry trees grow too freely, and they are not only liable to

A BRANCH OF WHITE HEART CHERRIES

injury from severe frost acting upon the unripe wood, but they make such slender growth that, when the Hop poles are removed, and the protection afforded by the growing Hop crop is suddenly withdrawn, they are apt to be damaged by the autumn gales. The long boughs are so bent by the wind that they are strained at the base, and then gum and decay. We prefer Cherry orchards to be formed on arable land which is not heavily manured, or in meadow land where the stems have 3 feet of ground around them clear of grass. In these positions a sturdy, hard growth is made, which can be well ripened before the winter, and when pruned produces such shoots as will form a sound tree. Again, when the trees are upon grass land, sheep should be kept in the orchards until the grass is quite short; then, if the sheep are fed on oil-cake or other rich food, the trees will benefit. Nothing is more injurious to orchard trees than to allow long rank grass to grow close to them, as it robs them of moisture and does much harm to the surface roots. Even old neglected Cherry orchards, when the grass is cleared from around the stems, will respond astonishingly, and a grand return will be had from trees that appeared to be worn out.

GEORGE BUNYARD.

(To be continued.)

LATE PEACH SEA EAGLE AND NECTARINE PEACH.

I HAVE bracketed these two late Peaches together, as probably they are two of the most valuable late varieties we have when quality is considered. Sea Eagle was raised at Sawbridgeworth many years ago, and if Messrs. Rivers had only given us this one variety it would be sufficient to make their name respected by fruit growers. It is a beautiful fruit and one of the best for outdoor cultivation. My reason for placing Sea Eagle first is that it is a much better grower with me than the Nectarine Peach. Sea Eagle thrives where others fail, but with regard to quality these two sorts are practically equal. As regards growth it may be a question of soil or position. Few late Peaches colour so well as the two named; indeed, as regards colour they are often superior to fruits grown under glass. Few varieties are more worthy of a glass coping in gardens where shelter is needed. I noticed at the late fruit show at Chiswick some finely coloured fruits of this variety, and in

the southern part of the kingdom it is surprising how well these colour, especially Sea Eagle. Those who have grown the older Early Silver Peach will remember what a delicate colour this fruit had; indeed, few were more beautiful, and the last named was Sea Eagle's parent. It has a better constitution than the older variety, as Early Silver is tender and needs more warmth. As regards size and colour Sea Eagle has few equals if the season is taken into account. I admit there are larger fruits as late, but not equal in quality. With us at Syon this variety is grown on three different aspects, and in each it is a success, thus proving its value for late September and early October. The Nectarine Peach is quite equal in size to the first-named, having, as its name implies, a smooth Nectarine-like skin, rich melting flesh, and remarkably sweet for a late variety. We can only grow this fruit well on a warm wall, and even then in cold spring it suffers badly from east winds, and should get as much shelter as possible. This was also one of the Sawbridgeworth seedlings and raised from a Nectarine. If given cool house culture it is a splendid fruit.

G. W. S.

MELON GOLDEN ORANGE.

YEAR by year it becomes increasingly difficult for gardeners to determine which are the best varieties of Melons to grow, especially if they obtain, as most gardeners like to do, the best new sorts that are annually sent out. Some, however, prefer to remain loyal to the old varieties, and there is much wisdom in doing so. One gets to understand the constitution of certain varieties, when to sow them to obtain the best results, and many other details, trifling in themselves, yet of much importance to the grower who wishes to obtain fruit of the finest quality. There are probably few fruits grown under glass that the average gardener considers less difficult to grow than the Melon, yet those who cultivate Melons so as to finish them perfectly, both as regards colour of skin and quality of flesh, are comparatively few. The Melon is a tender and capricious plant, and for its fruits to attain perfection very careful cultivation and a knowledge of those minor points that make all the difference between success and failure are necessary. Fluctuations in temperature, careless watering, and ventilation and other items may seem to have no effect upon the crop so far as outward appearances go; but when the fruit is cut the bad flavour tells a tale.

But I wish to draw attention to a Melon that is in danger of being lost sight of, namely, Golden Orange. It was, I believe, raised by the late Mr. Andrew Pettigrew, of Cardiff Castle Gardens, who also originated many other good Melons. It is a large oval white-fleshed fruit of very good flavour. It crops splendidly, and in this respect has an advantage over many new varieties which are the result of so much inter-breeding that their constitutions are weakened and their cropping qualities seriously impaired. Melon Golden Orange is a strong grower, as well as a good fruiting variety. I recently saw plants each carrying from five to six fruits, and all of good average size. Many new Melons are shown every year before the fruit committee of the Royal Horticultural Society, but a small number of them receive any award, simply because they are deficient in flavour. Flavour in Melons is everything. While a good Melon is a delicious fruit, an indifferent one is entirely the reverse. In few fruits does good or bad flavour make such a great difference. A. P. H.

GARDENING OF THE WEEK.

FLOWER GARDEN.

PLANTING SHRUBBERIES.

A MOST important operation is this, and all transplanting, to be successful, must be carefully performed. If immediate effect be aimed at then large specimens must be planted, but these, if not already in existence, will be both expensive and difficult to procure, and it is always hazardous to transplant large shrubs from a distance. It would be far better to choose smaller plants, and these, if planted in properly prepared soil, will in a few years outgrow those that may have been removed of a larger size.

Whatever style of planting may be adopted it is necessary that a correct plan of the ground be first made, and upon it should be marked the number and position of such groups or single specimens as are to form the main features of the shrubbery when it has attained its fullest degree of perfection. These positions should be accurately transferred to the ground and marked by a stake with the name or corresponding number to that on the plan written on each. When planting these points should be first filled in and the spaces between planted with such things as are from time to time to be removed. Unless this or some suitable guide be adopted the whole will go on at random and the object of the planter be completely defeated.

RHODODENDRONS.

These may be moved and planted any time when at rest, but now is the most desirable time. Plants with clear stems of 1 foot or 2 feet from the ground always flower better than low bushes, and in the northern and colder parts of the kingdom it is a mistake to plant in shaded situations. They set their buds and bloom much better when exposed to the sun. In hotter districts a dell not overhung with trees but having a north aspect is a suitable place for them. The first summer after planting the surface of the soil should be mulched with half-decayed litter, such as leaves, in order to prevent evaporation and to keep the roots cool and moist. During dry weather a heavy watering occasionally will be of great benefit. When plants show signs of weakness they should have a top-dressing of some rich compost spread over the beds, such as cow manure and loam in equal proportions, and as they bear lifting with impunity they can be lifted at intervals of years and some fresh, rich compost added to the soil and then be replanted. T. B. FIELD.

Ashwellthorpe Gardens, Norwich.

KITCHEN GARDEN.

CARROTS.

THE main crop of roots, if not already lifted, should be attended to without delay. Trim off the tops fairly close to the top of the root, and lightly

rub off the soil adhering to them, then store in the root shed. Young roots, the produce of seed sown in early August, should be protected where growing by covering lightly with Braeken or similar material. These are of inestimable value for use in the kitchen from this time onwards.

THE HERB BORDER.

Certain herbs are in request throughout the year, and no pains should be spared to keep the plants in a clean and healthy condition. Accumulation of weeds and other rubbish will cause decay of the stems of the plants, hence the necessity for cleansing at this season. Mint and Tarragon may now be introduced for forcing. Small pieces taken from the old roots with a few roots attached will quickly push forth new growth if inserted in pots or boxes of light soil and placed in a warm house or frame. This method is recommended in preference to lifting clumps. By lifting whole clumps from the permanent bed only a few green shoots appear here and there, whilst strong root cuttings invariably produce a vigorous shoot each.

RADISHES.

Where there is a demand for these during winter seed should now be sown on a warm border where some kind of rough protection can be afforded during spells of severe weather.

GARDEN FRAMES.

All available frames and hand-lights should be brought into use for protecting tender vegetables and salad plants. No matter if they are somewhat out of repair, they will answer the purpose for placing over plants that would otherwise be seriously damaged by the action of the weather upon them, such as Parsley, Lettuce, Endive, Spinach, Cauliflower, Chervil, and Radishes.

WINTER CUCUMBERS.

To maintain a supply of these throughout the dull, short days of winter a light house or pit, well heated, is absolutely essential. One of the chief factors to success is to have strong, short-jointed plants to start with, and, provided due attention to other details be exercised afterwards, a regular supply may be maintained. It is, however, a difficult matter to achieve this in old houses having small panes of glass and much wood-work as the light is obstructed. Plenty of light, combined with both top and bottom heat, kept as equable as possible, is very essential to the production of Cucumbers in winter.

Stoneleigh Abbey Gardens. H. T. MARTIN.

FRUIT GARDEN.

CHERRIES.

WHEN these are wanted very early the first set of trees may now be pruned and cleansed ready for tying in when opportunity serves. As these and Plums are often injured by a sudden outbreak of aphid when the trees are in flower, too much attention cannot be devoted to the washing and dressing of the stems and spurs, care being taken that the insecticide used is not strong enough to injure the buds. If, as is generally the case, these exorbitant trees have the benefit of a movable roof, the lights should be thoroughly washed, or, what is almost as cheap, painted inside at least before they are put on for the winter. Vigorous young trees which have been partially lifted or root-pruned will not require mulching or stimulating until after the fruit is set, but the borders occupied by the roots of old ones may be covered with a good layer of rotten manure as soon as they are tied, and to prevent the buds from dropping an occasional soaking with diluted liquid will be highly beneficial to these, as it is to all other kinds of stone fruit trees when grown under glass. When all is finished the house must be kept well ventilated and as cool as possible until the time arrives for forcing.

STRAWBERRIES IN POTS.

The heavy rainfall of the past week or two, combined with mild weather, has kept the plants growing rather more freely than is good for them, as it is now getting late for them to ripen up their crowns properly. Much, however, may be done to facilitate this process by moving the pots

occasionally to let in light and air and to prevent the roots from penetrating the bed of ashes upon which they are placed. If forward batches of early kinds are wanted for early forcing a more decided check may be given to vegetation by placing them on their sides, or setting the pots in cold pits where the lights can be pushed down and tilted in wet weather. As the general stock will continue growing for a considerable time yet, they may with advantage remain out of doors until severe weather approaches, when they must be placed in their winter quarters until wanted for forcing. When thoroughly at rest pot plants should not be allowed to become dry at the roots, neither should they be coddled by being kept in a close pit when the weather is mild. We prefer to leave all the plants out of doors until the middle of November, when they are removed to cold pits, and plunged up to or slightly over the rims in Oak leaves or tan to keep

THE ROOTS MOIST

and to protect the pots from frost. The lights are thrown off in fine weather and well tilted to shelter them from heavy rains. No attempt is made to keep out ordinary frost, as decided rest is highly important, but a thin layer of dry Fern is spread over the crowns when it is unusually severe. When Strawberry plants are wintered in houses they should be placed close together on a cool, damp floor in preference to elevating them on shelves. Keep all runners removed as soon as visible, but do not remove Nature's protection—the yellow leaves that are around the base of the plant; these are a healthy sign, and denote ripeness of the crowns.

Madresfield Court Gardens.

W. CRUMP.

CHRYSANTHEMUMS.

PREPARING FOR EXHIBITING.

MANY anxious moments will now be in store for the enthusiastic cultivator who intends in a few days to enter into friendly competition. Whether the prizes are large or small the ambition to secure the highest award is the first consideration, and to attain to this one's most strenuous efforts have to be put forth. I have known many cases when acting in the capacity as a judge, after the most careful investigation, only two or three points have divided the various awards, and this in very big classes, too. Though it is absolutely necessary to pay strict attention for practically twelve months, it is equally important to do so each day as the time approaches. The loss of one good flower may mean the loss of a first prize. The flowers possibly might have been preserved had a little more care been exercised.

Owing to the wood being in a somewhat unripened condition the flowers are opening much faster than usual this year, and it will require every effort to retard many varieties for those shows which are fixed at somewhat a late date. For instance, one could not fail to be struck with the fine group arranged by Messrs. J. Veitch and Sons at the meeting of the Royal Horticultural Society at the Drill Hall on the 13th inst., which included many varieties one would not have expected to see before next month; but the flowers were of excellent quality, large, and finely coloured. In nearly all cases which have come under my notice the blooms, though early, are promising well.

Large, massive blooms, when nearly out, may be kept several days in quite a fresh condition in a dry room where light and air can be given to them. These will need very carefully watering, and are best taken out in early morning, when they require it. Thoroughly soak them, and let them drain before taking back. Examine the blooms daily, and remove carefully any petals which have the slightest tendency to damp, and in the case of incurves much may be done by preparing the flowers as they unfold. Any deformed petals should be taken out with a suitable pair of forceps; hard centres should also be removed, and many of the larger varieties finish much better when the blooms can be hung in an almost perpendicular position. Except just warming the pipes to counteract damp and frost, no fire-heat whatever should be applied to this section, or the flowers will lack that high finish which is so essential in the

incurred. Consequently, these should always, if possible, be arranged in a separate structure to the Japanese, reflexed, and Anemone-centred varieties, which enjoy rather than otherwise a higher temperature.

In selecting the flowers for exhibition the first and most important consideration to observe is freshness. Stale flowers, it matters not how large, find no favour with good judges, and rightly so. Though, of course, one should always aim at showing flowers just when they are in perfection, it is much safer to err on the side of staging them when not quite out than when past their best. Evenness throughout, whether shown in the old-fashioned way on boards or now in the much more pleasing and popular style in vases, is also of the utmost importance, and blending the colours should also be taken into consideration.

Everything in the way of tubes, cases, &c., should be got in readiness several days before required, and endeavour to conform to the rules by having everything in readiness by the appointed time for the judges. Here a word or two may be in season to the secretaries and those responsible for the management of exhibitions. Have everything ready by the time mentioned, as by so doing the time of competent judges, who are generally very hard worked at this season, would be saved. They would be able to give more care and time in making the awards. What is more annoying to a business man than to receive a notice a day or two previous to the show stating that judging will commence punctually, say, at eleven o'clock, and he puts forth every effort to be there at the time, only to find that he will not be required for at least another hour.

E. BECKETT.

Aldenham House Gardens, Elstree.

THE KITCHEN GARDEN.

THE BROAD BEAN.

DURING the last thirty years or so this vegetable has been greatly improved both from an exhibition and table point of view, and the cultivation is so simple that it may be easily grown to perfection by the professional, amateur, and cottager alike. Nevertheless, Broad Beans well repay good cultivation, as indeed do all vegetables. At one time it was a general practice to sow the seed during autumn for the earliest supplies, but the most modern one of raising them in boxes in early spring and transplanting them into open quarters is much to be preferred, as it entails less labour and the results are more satisfactory. The slight check will induce the plants to begin to bear much earlier, with better and more shapely pods obtained and little damage result from slugs and other vermin. The middle of January will be quite early enough to make the first sowing. I recommend boxes about 2 feet in length, 12 inches in width, and 4½ inches deep; these can be made by any intelligent labourer on wet days. Place a good drainage in the bottom, mix up a compost of three parts fibrous loam, one part leaf soil, or old Mushroom bed manure, with a little road grit added. The boxes should be filled about three parts full and made moderately firm when the Beans should be placed regularly on the same about 1 inch apart all ways. Cover them with some of the finest of the soil, thoroughly water in, and place in a cool position to germinate, such as a greenhouse or even cold frame. The young plants should be encouraged to make a stout, sturdy growth, and gradually but thoroughly harden in the open before planting out.

Three sowings at the least should be made in this way, and the last two or three in the open. Trenches should be prepared much in the same way as for

Celery, and give an unstinting supply of half-decayed farmyard manure, and fill up nearly level with the surface. The Broad Bean enjoys a deep uninterrupted root run. Double rows should be placed in each trench, 3 feet apart at least, and the width of each 18 inches, the rows should be 10 inches apart and 8 inches between the plants. Lift with a good ball with a garden trowel, place plenty of finely-sifted cinder ashes between them to prevent the plants being ravaged with slugs, as these have a great liking for the young growths; give copious supplies of both clear and liquid farmyard manure water when in active growth during dry weather, and after the plants show plenty of bloom the points should be pinched out, and when extra fine pods are required remove all side growths. The plants should be supported by driving in a few good stakes and stretch two lines of stout tar cord along them to keep in an upright position. Should black aphid make its appearance thoroughly syringe the points with strong soft soap and water, a safe and sure insecticide for this.

The best strain that I am acquainted with is Carter's Leviathan. It is a fine exhibition variety, also very prolific, and of excellent quality. Sutton's Exhibition Longpod is also good, and for the latest supplies the Broad Windsor is best. The new green variety is a great improvement.

Broad Beans do well if grown in 8-inch pots. For very early crops the seed must be sown very early, and at no stage must any attempt at forcing be indulged in. Five Beans in each pot are ample. The pots should be filled about three parts full when sowing, and when the plants have reached the top of the pots earth up to within 1 inch of the top. Each plant should be staked separately, and the best position to grow them in is on shelves near the glass in a cool fruit house and plenty of air given, especially during the time they are in flower. They may be placed outside in a sheltered, sunny position to perfect their fruit, and plenty of manure water should be given. Good Beans treated in this way may be looked for about the middle of May, and these are generally much appreciated. I advise Leviathan for this treatment.

E. BECKETT.

SMITH'S ORNAMENTAL RUNNER BEAN.

THIS Bean evoked much interest at the recent Chiswick show, and doubtless many of your readers would be glad to hear more about it.

S. S.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

TYING PLANTS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The note by Mr. Wolley Dod (page 254) on tying plants deserves to be read and re-read, for on this subject most of us have, I think, much to learn, the great thing being to give the necessary support without an undue display of stakes. At the same time, as pointed out by Mr. Dod, position and other features must have due consideration. My experience of tying principally consists of plants grown in pots, and on this point a great change has taken place within recent years, for the average young gardener of the present day quite ignores the points that were at one time insisted upon as absolutely necessary. I do not refer to the tying of specimen plants in which the pot was in some cases stuck nearly as full of stakes as the spines in a hedgehog, but rather to the use of a single stake, absolutely necessary to the proper support of the plant. In this case the point insisted on was that the stake be carried nearly if not quite to the bottom of the pot, in order to ensure its stability, whereas now it is, in the majority of cases, simply stuck into the soil, so that if the plant be shifted a few times or stood out of doors it quickly becomes loosened, and then it is a case of the plant supporting the stake, instead of *vice versa*. My remarks are by no means founded on an isolated instance, but on dozens of young gardeners that have come under my observation. Numerous cases, too, have been noted in which plants so tied have been sent by rail, with the result that the sticks loosened and many plants were broken; whereas, if properly secured, they would bear the journey unscathed. For this reason I do not favour the use of Bamboo stakes, neat though they be, for the hardened glaze-like surface takes no grip of the soil, and the stem soon sways about.

T.

ARAUCARIA IMBRICATA FRUITING.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—To many of your readers records of the Araucaria producing fertile seeds from which

A ROW OF CARTER'S LEVIATHAN BROAD BEAN IN THE GARDENS OF ALDENHAM HOUSE, ELSTREE.

plants have been raised are interesting. In the grounds attached to Leighton House, Westbury, Wilts, are many fine trees of these and Wellingtonias, forming an avenue of considerable interest and development. Extending on either side of a fine broad gravelled walk some 300 yards in length they form a splendid picture. These noble trees have been planted from forty-five to fifty years, and many of them have attained noble proportions. For some years past fertile cones have developed, and young flourishing specimens, varying in age and height, have been raised and are planted in reserve grounds near the garden. These should, in course of years, be even more interesting than their parents, simply because they have been home-raised. Some of the finest trees tower upwards probably 40 feet, and the Wellingtonias, being equally luxurious, are furnished beautifully to the ground. The Araucarias, as these trees commonly do, have lost many of their lower branches. They are not so effective as single lawn specimens as in avenues. Iron minerals abound in the neighbourhood of Leighton, the furnaces for years past being a familiar landmark to the many who pass through the railway station of Westbury. Yet, though so many acres have this mineral close to the surface, Leighton itself partakes more of the nature of the adjacent Westbury Hills, in which is hewn the far-famed white horse in chalk.

The soil is fertile, porous, and dark in colour. Flowering deciduous and evergreen trees and shrubs grow luxuriantly in all parts of the Leighton grounds. Fierce gales sweep across from the hills in autumn and winter, but the Araucaria avenue has been so carefully protected by outer belts of shrubs that to this much of the success of their growth is undoubtedly due.

W. STRUGNELL.

NURSERY GARDENS.

W. B. ROWE AND SON, BARBOURNE
NURSERIES, WORCESTER.

NASH, the famous Worcestershire historian, wrote in 1781 that "an article of husbandry almost peculiar to Worcestershire is fruit," and adds, "the quantity of Cherries brought to Worcester market in a plentiful year is amazing; two or three tons are often sold on a Saturday before eight o'clock in the morning." It would be difficult to say how long the county has been famous for its fruit production, for history is silent on this point. As far as I am able to ascertain it must have been celebrated for many ages. Of late years the decrease in the area under cultivation for Hops has been met by a considerable increase in fruit plantations, Apples, Pears, and bush fruits being planted very largely. That there is a keen and ever-increasing demand for trees of all the really good market varieties is evidenced by the numerous important nurseries situated in and around the city of Worcester. One of these has become celebrated throughout the length and breadth of the United Kingdom by the introduction of the finest early market Apple in existence, Worcester Pearmain, which received a first-class certificate from the fruit committee of the Royal Horticultural Society as long ago as October, 1875. This variety, as everyone knows, has been enormously planted, and as a consequence there is not—in Worcestershire, at least—any likelihood of a dearth of early Apples in an average season. Unfortunately, this is by no means the case with late Apples, which, on the whole, have been sadly neglected by Worcestershire planters, even such a grand variety as Newton Wonder having been but little planted until the last year or two. Now, however, partly owing to the ungenial springs experienced of late years, the tide has turned, and on every side a demand for late-flowering, as well as late-keeping, Apples has sprung up. Until quite lately the difficulty which presented itself lay in the fact that not only are really good late varieties suitable for market work exceedingly few, but not one of

them is so late flowering as Court Pendu Plat. If I had been asked twelve months since whether anyone was endeavouring by systematic crossing to produce a race of late-blossoming Apples, my reply would have been that I had never heard of any efforts being made in that direction. The first intimation I received that this was actually being done was in September last year, when Mr. A. H. Pearson and myself went over to Madresfield to spend part of a day with Mr. Crump, and were then shown a fruit of

APPLE KING EDWARD VII.

raised by Messrs. W. B. Rowe and Son of Worcester. Since that time it has won unqualified praise from many of our leading fruit experts, and on March 24 last was exhibited in perfect condition before the fruit committee of the Royal Horticultural Society, who bestowed an unanimous award of merit upon it. Several members of the fruit committee were so favourably impressed by this variety that they proposed a first-class certificate for it, and it does not appear at all unlikely that the premier award will be granted at no very distant date.

Receiving quite recently an invitation from Messrs. Rowe to visit their nurseries, I chose a fine autumn day and gladly availed myself of the offer. The nurseries, which occupy about 45 acres of land and are situated to the north of the city on the main Droitwich Road, have been in the occupation of the Rowe family for almost two centuries, and are chiefly devoted to the culture of fruit trees and Dahlias—the two great specialties of the firm. On arriving at the nursery I was taken round by Mr. H. A. Rowe, who informed me that he entered into partnership with his father eight years ago, and has since devoted all his attention to the hybridising of hardy fruits, more particularly the Apple. The Cactus Dahlia is also receiving special attention, and Messrs. Rowe are endeavouring to raise a race of plants which will be more suited for garden decoration than are many of the varieties at present in commerce. Our first visit was to the

DAHLIA GROUNDS,

and, although the plants had been sorely tried by the severe gale scarcely a week previous to my visit, they afforded a most admirable display, many of the flowers being in perfect condition. I ought to say that most of the soil of this nursery is a good light sandy loam, and one that is therefore very easily worked. Almost the first variety to catch my attention was Mrs. Mawley, a magnificent yellow, with a larger flower and more substance than Mrs. J. J. Crowe, and remarkable for its early-flowering propensity. Next to this was Coronation, brilliant scarlet, of finest form and the flowers thrown well above the foliage. Two very lovely bicolor varieties were Columbia and Gabriel. The flowers of the former are very taking, being bright scarlet tipped with white, but unfortunately the stems do not hold them up enough to display their full beauty. Gabriel is superior in this respect, and thus produces a better effect. The flowers are a rich shade of velvety crimson, edged with a ring of white. Some of the older sorts are really splendid garden plants, and these are largely grown at Barbourne. J. W. Wilkinson, Mary Service, Britannia, Ruby, Capstan, Countess of Lonsdale, Lodestone, and Starfish were literally smothered with blossoms and fast expanding buds. One of the very finest of all for use in the garden is Floradora, a dark crimson sort with splendid stiff stems and very free flowering. I was next taken to see a plantation of seedlings, almost all of which were in full bloom. Three of these, as yet unnamed, were shown by Messrs. Rowe for the first time in their exhibit which gained the premier award at Shrewsbury. The habit of each seedling is being carefully studied by Messrs. Rowe, who are determined on no account to send out any variety with weak stems or bad growth. If only Dahlia raisers generally could be induced to take as much interest in the habit of a plant as they do in the individual flowers, we should not find useless varieties such as Lord Roberts (whose stems strongly remind one of a piece of tape) being distributed. But the Dahlias

had already absorbed too much time, and, as the real object of my visit was to make a closer acquaintance with Messrs. Rowe's new Apple, I had to leave the seedlings without examining them as closely as I could have wished. As previously mentioned, the culture of

FRUIT TREES

forms the leading feature at these nurseries, and it is impossible to speak too highly of the general excellence of the stock. Passing through some large plantations of such leading market Apples as Worcester Pearmain, Dumelow's Seedling, Cor's Orange Pippin, Warner's King, Ecklinville Seedling, and Stirling Castle, I was first shown the oldest plantation of this new variety, and was thus afforded the opportunity of seeing the trees in fruit. The most striking point about King Edward VII., undoubtedly, is the fact that it only blooms six or seven days in front of Court Pendu Plat, and is never in flower much before the third week in May. To this must be added that it spurs as freely as Worcester Pearmain, while the fruit keeps well and easily till April and May, and Messrs. Rowe have had it in good condition as late as June. A cross between Blenheim Orange and Golden Noble, it retains a good deal of the flavour of the former, while it greatly resembles Golden Noble in its yellow skin and general appearance. I noticed that the foliage of this variety is of an exceedingly dark green colour, and that the growth is short-jointed and erect. As a late culinary fruit it is destined to become extremely popular, because the fruit is solid and juicy and is not inclined to shrivel when kept. If any further recommendation is really necessary, I might add that both Mr. William Crump and Mr. James Udale have had the variety under observation for some time, and both these gentlemen have spoken of it to me in terms of the highest praise. Altogether I saw about 10,000 good trees of

THIS NEW APPLE,

all in the pink of perfection—bushes, upright cordons, and standards—and no less than 15,000 have been grafted this season. Market growers, for whom Messrs. Rowe especially cater, have been very much struck with this variety, and one large grower has recently purchased fifty trees. Space precludes my describing at length the other occupants of this nursery, which include a splendid selection of Pears, Plums, and Cherries, in addition to the smaller fruits. To anyone who takes an interest in the improvement of our hardy English fruits, I would strongly advise them to visit this well-managed nursery. King Edward VII. is but the forerunner of a new race of Apples, which will no doubt in the future assist English growers to combat the increasing foreign importations; or, to put it in Mr. H. Rowe's own words, "Our great aim is to supply the public with English Apples when the sorts now in commerce are past their season, and you may tell the readers of THE GARDEN that we have several more very promising Apples to place before the public."

A. R. GOODWILL.

MISCELLANEOUS.

CROTONS AT ALDENHAM.

FOR room or table decoration, or for adding colour to other plants of a sombre hue in groups of miscellaneous subjects, no plant can equal well grown Crotons. The finest batch of plants I have seen for a long time are now growing in the Aldenham House Gardens, where Mr. Beckett produces such wonderfully good results generally. The plants are not of specimen size, but really useful decorative plants, the tallest about 3 feet high and mainly growing with one stem, as when required for vase or room decoration plants with several stems are not so effective as those confined to one. The pots are small for such plants, none more than 7 inches in diameter. The remarkable point about these Crotons is the luxuriance of leaf combined with

the magnificent colouring of each variety. There are many plants about 1 foot high, with foliage down to and hiding the pots. Such as these are extremely useful.

Certainly the plants occupy an ideal site, the southern side of a low span-roof house, in which Cucumbers and Melons are also growing. Here the Crotons obtain the three essentials to good cultivation, full exposure to sunlight, abundance of moisture, and absolute freedom from insect pests, which too often seriously cripple the growth. The method of propagation so as to have full-sized perfect plants in the shortest time is that of "ringing" the plants in the autumn after they have completed their summer service. For smaller plants cuttings inserted in bottom-heat and carefully tended quickly grow into useful material. For guidance in the selection of suitable varieties I give the names of the most striking Crotons here grown, classing them into two sections—narrow and broad-leaved varieties.

In the former section the following are the best: Countess, Johannis superbus, Warrenii, elegantissimum, Golden Ring, Heathii elegans, gordonianum, majesticum, angustifolium, Aigburth Gem, picturatus, Prince of Wales, Sovitzianum, Weismannii, Cheloni, Mrs. Dorman, Vancasterii, Mortii, Youngii, Countess superba, caudatum tortile, massangana, rhodeckiana, and ruberrimus. Broad-leaved varieties: Baroness Rothschild, Lord Wolseley, Mortefontaine, Delight, Williamsii, Disraeli, Queen Victoria, Reedii, Etna, Flamingo, Victoria superba, Thomsonii (very rich), Princess Matilda, Hawkerii, and Undulatus.

E. MOLYNEUX.

GARDENS OF JAMAICA.

(Continued from page 254.)

THE BROAD LEAF

is a tree which is commonly used for this purpose. They also grow to an enormous size, so as to rival any of our largest and finest trees in England. It is very grand to see the trunk rising to such a vast height above the ground, spreading abroad its arms far above. The innumerable creepers and parasitical plants which abound in these regions love the companionship of the old Broad Leaf. They cluster around it, climbing up higher and higher every year, their own size increasing till they almost cover the trunk and raise their heads as high as that of their indulgent protector.

THE IRON WOOD

may be here noticed, not on account of any particular utility, but because it is so wonderfully hard as well to deserve its name. It is hardly ever used for cabinet work, for its close and tough fibre is almost proof against the best tools. Another tree that almost rivals it in hardness is

THE BRASILLITO.

This is, however, more frequently used, inasmuch as it is more easily worked up. Its toughness renders it admirably suited to the manufacture of cart wheels. The colour of the wood is very beautiful, being of a streaky red, which is capable of fine polish; if obtained in sufficient quantities it would be well suited for cabinet work. This might be also said of

THE YELLOW SANDERS,

the name of which will speak for its colour. What, however, constitutes the chief beauty of the wood is that which would render it most unlikely to be made use of. It is gnarled and knotted to a degree hardly equalled by the Walnut. The natural yellowness of the wood gives the most beautiful and delicate appearance to it when it is highly polished. But the carpenters are always unwilling to try their tools upon such a tough and cross-grained customer. The tree has something the appearance of the Mountain Ash, producing yellow instead of red berries. Of a similar kind is

THE PRICKLY YELLOW,

which derives its name from the rough large prickles which cover its trunk. In appearance and character, however, the trees are very much alike.

THE SATIN WOOD

may be placed under the same category. With this last our readers will be more familiar however, for although it is not common it is often met with. There is another wood which may be used for building purposes, but which is far more valuable for the dye which it contains. This is

THE FUSTICK.

The tree is rather small. Its trunk and branches are not regular or straight. There is nothing attractive about its appearance, but as a dye-wood the price of it is considerable. The dye is of a yellow colour, and is in very general use in our English manufactories.

THE LIGNUM VITÆ

is a very hard wood; on this account it is not easy to work up, and the tree being small carpenters make but little use of it. It is, however, good wood for cabinet work, and takes a beautiful polish. When the bark is punctured a fine clear gum exudes from the tree. This gum is considered to be very valuable for medicinal purposes, and it is in this way used by chemists in England. One of the most beautiful trees with which we meet is

THE POMEGRANATE.

This is more like a shrub than a tree, and although growing most freely in Jamaica is found in greater perfection in some countries of the East. The foliage of the Pomegranate is of a light green; many of the leaves, which, although longer, are not unlike the common Privet, have a yellow tinge, which, especially at certain seasons of the year, give it a very pretty variegated appearance. The blossoms are of a rich bright crimson colour, having something the form of an immense Fuschia, and clustering together on various parts of the tree. The ordinary size of the fruit is that of a small Orange, but in the East they are much larger. The fruit consists of a thick outer rind. When this is broken the inner part of the ripe Pomegranate is seen to consist of seeds each about the size of a Pea, lying closely together in irregular compartments. The colour of these is of the most beautiful red and carmine. This coloured part consists of a delicate pulp, which contains the juice. But while in Jamaica the seed within is large and woody, in Palestine it is very small, so that in the Pomegranates found there, when some fine sugar is sprinkled over the pulpy seeds they melt away into juice.

What is that large straggling tree which has here and there that peculiar blossom with something the appearance of the Passion Flower? That is

THE ROSE-APPLE,

so-called from the fruit which it produces having a pleasant Rose flavour. But they are, nevertheless, too insipid and too unwholesome to be much eaten. The Apples are very small, but when ripe they have the most beautiful rosy appearance. Instead of being compact and firm like the English Apple, the eatable part is very much like a thick rind, while the cavity within contains a large stone. It may be mentioned that common Apples are cultivated on the higher mountains of the island, and are very tolerable both in size and flavour.

THE PLUM

is a very different fruit to the one known in England by that name. It is something like a very large Damson, the great difference being that the stone of the Jamaica Plum is comparatively much larger and has somewhat the form of that of the Peach. Of these Plums there are two kinds. One is called the Hog Plum, and is of a red colour. They are the most palatable, but also the most uncommon. The Yellow Plum can never be eaten when it is perfectly ripe, for they are very attractive to maggots and insects, which greatly infest them. The tree has something the appearance of a small mis-shapen Oak with crooked branches and scanty foliage. That of

THE KENEF

is, however, quite the opposite. It is very thick and dark, and a fine tree of this kind is particularly attractive. The form of it is rounded and regular. The fruit grows in large clusters attached to a

stalk, so that forty or fifty may be found together. This fruit corresponds with many that are found in the West Indies, having a soft pulp which, however, adheres very closely to the stone. The acid flavour is very delightful, but it is too astringent to be wholesome. The skin which covers the whole is more like a shell, and is cracked or broken as such. It is of a green colour.

(To be continued.)

THE EDITOR'S TABLE.

DAMASK ROSE PERPETUAL.

Mr. T. Smith sends from the Daisy Hill Nursery, Newry, flowers of this beautiful garden Rose, so fragrant and so rich in colouring, a warm purple. In the rush for novelties we forget the existence of sweet old-world Roses such as this.

CARNATION MISS AUDREY CAMPBELL.

Mrs. Martineau sends from Hurst Lodge, Berke, flowers of this beautiful Carnation. We have never seen blooms so fresh and pure in colour and in such abundance at this season. None of the flowers were in the least degree split, in spite of the heavy rains and sunless weather. The following note which accompanied the flowers is useful: "I send you a small gathering of Carnation Miss Audrey Campbell from the open. I find it far and away the best outdoor variety there is, beating the much-praised George Maquay, though grown side by side and under similar conditions. My plants flowered profusely from June till the beginning of September, and are now blooming again splendidly in spite of the rain from which, in common with the rest of the Thames Valley, we are suffering. I counted on one plant last week forty-three buds and blooms. I have had them almost as large as Cecilia in fine weather. They are grown on borders in the kitchen garden. The ground was well trampled on before planting, and also in my Rose beds in a more exposed place. Raby Castle is sending up a few late blooms, but my bed of Audrey Campbell looks like July rather than October."

FLOWERS AND THE SEASON.

Sir Charles Wolseley, Wolseley, Stafford, writes: "I send you a few flowers, not as specimen blooms, but to show the effect of this extraordinary season on the rock and wall garden. Many of these have been in bloom for months in spite of the heavy rains, and these individual blooms were gathered after three days continuous rain. Primulas, Zauschneria californica, and Meconopsis cambrica fl. pl. have been in flower since the middle of June; Geum Heldreichii has bloomed continually since May 10; Achillea tomentosa on wall, Arenaria grandiflora, a mass of bloom ever since May 22; Polygala Chamaebuxus purpurea (flowering for second time), Gypsophila repens (flowering second time), Polygonum vacinifolium and Lithospermum prostratum, one plant has been continuously in bloom ever since the middle of March, and has been the most effective and satisfactory plant on the rockery; Saxifraga Cymbalaria has been flowering well all the summer; Androsace lanuginosa has been blooming most luxuriously with its branches hanging down over rocks ever since June 7; Linaria alpina has been continuously in flower on wall all the summer, by far the most satisfactory place I have tried it in; Hypericum repens on wall, Linum flavum and Erica vagans: Less than a week ago I counted forty-five different species in flower on the wall and rock garden, but the rain of the last week has spoilt many of them for the present. It seems that a wet season like we have had suits rock and wall plants if it suits nothing else."

We thank our correspondent for this excellent note. A box of flowers sent bear out the above remarks; there were Primroses and the rock plants named. We hope other correspondents will tell us of their experiences in this year of wet and absence of sun.

STRIPED ANTIRRHINUMS.

I enclose for your inspection a few spikes of striped Antirrhinums from a very fine strain. It is rather late to send the spikes, as the weather recently has not been conducive to the well-being of outdoor flowers. At the same time you will be able to see the delicate markings, and also get an idea of the size of flower and spike. We have picked up the strain in an old cottage garden. It has been grown and selected by the owner for years, who guarded it with great care, and whose pride it was that it had never been beaten wherever shown. The individual blooms were $1\frac{1}{2}$ inches deep and $1\frac{1}{2}$ inches across the front, the spikes bearing from 8 inches to 1 foot of expanded flowers. We have selected the best, and are saving them by cuttings to grow for seed purposes. It is a great wonder that the fine striped Antirrhinums are not grown as much in the south as the north, where they are in every flower show. We also enclose a few pieces of McDougal's Prize Parsley, an excellent curled variety from the famous old

the Isle of Wight, and goes on till November, and its delicate scent is quite as apparent now as it was in the summer.

Birds and flowers.—A somewhat unique exhibition was held in Norwich a short time ago by the promoters of the Ornithological Society there, who each year hold an exhibition for the Norwich canary and other song birds. In the schedule were classes for pot plants and cut flowers. A few entered for the former, and the latter were well filled. The combination of plants, flowers, and birds gave excellent results.—H. PERRY.

A new fruit—Apple Middle Green. This dessert fruit is a valuable introduction. All fruit lovers of late years have followed Mr. Seden's labours with considerable interest and attention, and he has certainly given us some valuable additions to our hardy fruits, especially Apples. This last is by no means the least, as it is a delicious fruit, and if a good cropper it will prove a valuable standard early dessert Apple. The name is evi-

dently taken from the locality where the Apple was raised. The fruits are not green (as one might be favoured for assuming), but rich yellow, except on the sunny side, which is reddish, and in this respect it resembles a Cox's Orange Pippin. The fruits are very shapely and of medium size, smooth, and very juicy. This new fruit was the result of crossing Frogmore Prolific and Blenheim Orange. Both varieties are well known, and the new fruit well supports their reputation. It received an award of merit at the last meeting of the Royal Horticultural Society—the 13th inst.

The Dahlia in America.—The Dahlia is very much to the front this year. The lay press devotes much space to the exploiting of this very popular flower. It is certainly a matter of gratification to observe the continued increasing popularity of this gorgeous autumn-flowering plant. As a result of the peculiar weather conditions of this year we have not heard so much of the "When to Plant"

question. Indeed, early planting seems to have given peculiarly satisfactory results this year.—*American Gardening.*

The Thomas Humphreys testimonial.—Mr. Richard Dean, the secretary of the testimonial fund, reports that the sum of £43 11s. was subscribed by seventy-four persons in sums varying from 2s. 6d. to £1 1s. The sum of £1 15s. was spent in printing, stationery, postage, &c., and the remainder, viz., £41 15s. 6d., was expended in preparing the illuminated address, and in purchasing the cabinet of outlery and tea service which was presented to Mr. Humphreys with the address. A letter has been received from him expressive of his deep thankfulness and of his appreciation of the excellent "send off" on the occasion of his leaving London for Edgbaston.

Opening of Gray's Inn Gardens.—The gardens of Gray's Inn, which stretch along the south side of Theobalds Road, will shortly be opened to the public view. For years they have

been hidden by a high, inartistic brick wall, and, consequently, what would have proved an additional oasis in a desert of bricks and mortar has been lost to the public. Now, however, the wall has been demolished, and in its stead handsome iron railings are being erected, through which the finely-timbered gardens will easily be seen. Gray's Inn Gardens—or, as they used to be called, Gray's Inn Walks—have many associations. In the reign of Charles II. the gardens formed a fashionable promenade. The reference to them of the late J. H. Jesse is well worth quotation. He says: "This spot was a favourite resort of the immortal Bacon during the period he resided in Gray's Inn. It appears by the books of the society that he planted the greater number of the Elm trees which still afford their refreshing shade; and also that he erected a summer-house on a small mound on the terrace, where it is not improbable that he often meditated, and passed his time in literary composition. . . . As late as the year 1754 there was standing in the gardens of Gray's Inn an octagonal seat covered with a roof, which had been erected by Lord Bacon to the memory of his friend Jeremiah Battenham. Pepys, the diarist, was an habitué of the spot, and in 1682 he is mentioned as taking his wife there to note the fashions of the ladies. Sir Roger de Coverley, Butler, Cleveland, and Palmer (the mechanician) are among the many notables who trod the broad walks of the gardens."—*City Press.*

Royal Caledonian Horticultural Society.—We have received an advance prize schedule of the spring show to be held on May 25 and 26, 1904. Special attention is directed to the change of date to May. Prizes are offered, to under gardeners only, for a plan, drawn to scale (32 feet to 1 inch), for laying out a piece of ground about 6 acres in extent, as shown in an accompanying plan. The first and second prizes are given by Sir John Gilmour, Bart., Montravel, and the third prize by the society. This society has an excellent rule that all exhibits shall be correctly and legibly named. All entries close May 18, and plans for the competition must be sent in by April. Mr. P. Murray Thompson, 5, York Place, Edinburgh, is the secretary.

Honours to horticulturists.—Following the Ghent Quinquennial exhibition the distinction of Chevalier de l'Ordre de Léopold has been conferred upon the following horticulturists among others: MM. Peters, Orchid grower at St. Gilles, Brussels; Louis de Smet-Duvivier, Mont-Saint-Amand; Armand de Meulenacre, secretary of the Ghent Agricultural and Botanical Society; and Adolphe Vanden Heede, vice-president of the Horticultural Society of the North of France. The Portuguese Government has recently conferred upon M. Viger, president of the Société Nationale d'Horticulture de France, the grand cross of the merite agricole of Portugal. M. Abel Chatenay, the distinguished secretary of this society, has been made a commander of the same order.

Crocus hermoneus.—This interesting species is now flowering freely at Kew. It was first discovered by Theo. Kotschy in the melting snow at an altitude of 9,000 feet, near the summit of Mount Hermon, during his Syrian journey in 1855. The flowers of this species were unknown when Maw's monograph of the genus was prepared, only the corm, leaves, and fruit being represented on Plate XLIV. Live corms were received from George Egger, a nurseryman at Jaffa in Palestine in 1901, and a few flowered the same year in the beginning of October. Belonging to the section of the genus called Fibro-Membranacei it has a corm somewhat similar to *C. hyemalis*. The flowers, which are produced two or three to a corm, are somewhat like some forms of *C. cancellatus*, with spatulate segments $1\frac{1}{2}$ inches in length and about one-third of an inch broad at the widest part. Pale lilac on the inner surface they are feathered on the outside with three to five darker lines. The orange-coloured stigma is divided into several long filiform branches, and the stamens are a light yellow. *C. hermoneus* is not so hardy as many other members of this genus, and needs protection in winter or a warm sheltered position.—W. IRVING.

NEW APPLE MIDDLE GREEN (NATURAL SIZE).

Kilbarchan strain, now almost extinct.—G. M., Benston, Johnstone, N.B.

An interesting contribution. The Antirrhinums were very fine, and we were glad to see so good a Parsley as McDougal's Prize.

ROSE MME. ALFRED CARRIÈRE.

Lady Thornycroft sends from her garden in the Isle of Wight blooms of the Rose Mme. Alfred Carrière, to show what a beautiful and hardy variety it is. Notwithstanding the recent gales and storms of rain several large plants, or rather bushes, of this Rose trained over some arches are still full of bloom and leaf, and apparently in the best of health, although this past summer has been a most trying one for Roses. All the flowers sent were cut from plants on their own roots; cuttings taken about nine years ago from a Mme. Alfred Carrière Rose, which grew in Lady Thornycroft's garden at Chiswick. This Rose begins to bloom early in

SOCIETIES.

THE HORTICULTURAL CLUB.

THE usual monthly meetings of this club at the Hotel Windsor, on Tuesday, the 13th inst., were resumed after the customary vacation interval, and subsequently to the house dinner under the genial presidency of Mr. Harry Veitch, a most interesting lecture was given by Mr. Charles E. Pearson entitled "Birds Nesting in Russian Lapland." The lecture was illustrated by a large number of beautiful lantern slides prepared from photographs of birds' nests and eggs of many kinds taken *in situ* and views of the scenery within the Arctic circle, together with a number of native plants and flowers. Mr. Pearson began by apologising for choosing a subject somewhat out of the horticultural line, but, in point of fact, apart from the intensely interesting pictures of eggs and nests, there were such charming examples of Arctic flowers and Arctic landscapes that an apology was utterly needless, especially in view of the lecturer's treatment of his subject, at once humorous and instructive.

Clutches of eggs of a great number of birds were shown exactly as they were found, the photographs, being taken from above, thus affording a full view, and it was really marvellous to note in many cases how the seemingly apocryphal blotchings and markings of the eggs masked them from prying eyes owing to the close imitation of their surroundings. In some cases, too, it was difficult to dispel the idea that the birds had not also selected a site amid rounded pebbles of similar outline and colour to the eggs in order to aid this masking, so exactly did they resemble each other. Eggs and nests, the latter in many cases being practically non-existent, the eggs lying among bare stones, were shown of the buzzard, redwing, eagle, gulls, eider-duck, wild swan, oyster-catcher, dotterel, and many others, each being accompanied by a vivid description of the habits of the birds, and the various adventures which attended the discovery of the carefully-hidden eggs.

Hours of motionless waiting, accompanied by myriads of industrious mosquitoes working their sweet will on every exposed portion of skin were sometimes needed ere the disturbed mother bird would settle down on the otherwise undisturbable nest. Long leagues of difficult travel over several feet of treacherous snow precluded many of the discoveries, and in this latter connexion a most laughable description was given of the difficulty of bargaining with a rapacious Jehu by the mediation first of an interpreter who translated the English into Norwegian, then another who did the Norsk into Finnish, and, finally, a Finn who knew some Russian, no little speculation resulting as to the form in which the original remarks reached their destination.

Some of the photographs gave a clear idea of the marvellous rapidity of Arctic vegetation during the brief summer. A dense and robust mass of *Calla palustris* (the Marsh Marigold) was, for instance, shown in full flower on a spot which three weeks previously was deep in snow and only fifteen days before had been observed as just evidencing growth. Barley is stated to be ripe within thirteen weeks from sowing. This the lecturer imputed to the long and continuous daylight, and a relative photograph showed the midnight sun fairly high in the sky. Some lovely specimens of *Myosotis alpestris*, *Silene acaulis*, Bog Cotton, and other flower plants evidenced also the beauty of the Arctic flora as well as its rapidity of development.

The lecture, indeed, was so replete with interesting facts and graphic description that we can do no more than briefly indicate the lines followed. A very hearty vote of thanks to Mr. Pearson for the great treat afforded by him, both pictorially and verbally, concluded decidedly one of the most pleasant and instructive meetings in the annals of the club.

EALING AND DISTRICT GARDENERS' SOCIETY.
LECTURE ON THE SWEET PEA.

THE local interest in the cultivation of this fragrant flower was shown when a few nights ago Mr. H. J. Jones, of Lewisham, addressed a large gathering of members of the above society at Ealing, Mr. Richard Dean occupying the chair by request. Dealing briefly with the history and development of the Sweet Pea, Mr. Jones passed on to describe three types of the flower: 1, With erect smooth standards; 2, with hooded standards; 3, the reflexed standard. Each of these types had their admirers, and some beautiful varieties were included in each division. Then dealing with the culture of the flower, the importance of plump, vital seeds was enforced; these to be sown in a good loam previously trenched, Mr. Jones recommending that at the bottom of a trench 2 feet in depth should be placed a layer of good farmyard manure, or some fertiliser of known virtue, as the roots of Sweet Peas travel a long way in search of nutriment, and especially so if the season proved a dry one. Crude manures should not be allowed to come into contact with the roots of young plants. Some sowed in pots and transplanted to the open to secure an early supply; some on favourable positions sowed in autumn, though certain risks had to be run; generally sowing was done in the open in early spring, according to the weather. The thick sowing usually resorted to was deprecated, as the plant naturally branched freely, and especially so if the leading shoot was pinched out when the plant had reached a certain height. A succession of bloom could be secured by successional sowings; also by keeping the seed pods picked off, and also by cutting back the plants at a height of 3 feet or so, when they would quickly break into growth and bloom abundantly, though the plants would not again reach their former height. Propagation by cuttings made of the young tops was advocated by Mr. Jones in order to increase the stock of a new or rare variety. Only the best varieties should be grown, and with few instances only those which produce three blooms at least on a stem. The lecturer described the process of fertilisation by human agency, stating that it had to be done when the blooms were quite young; and he recommended

careful selection, saving seed from the finest developed flowers. In the course of a cheery address, which was greatly appreciated, Mr. Jones threw out many most useful cultural hints, some of them of a novel character, and he was warmly applauded at its close. In the course of questioning which followed, the lecturer was invited to describe a spray of Sweet Peas, which he did by instancing the custom at all Sweet Pea shows, namely, a single stem with two or more flowers upon it. This is a matter which needs to be set forth more explicitly in schedules of prizes, as some exhibitors stage as sprays branches containing several stems with flowers. Another question put to Mr. Jones was, had the improvements made in the Sweet Pea by Henry Eckford and others resulted in robbing the flower of its perfume to any extent? Mr. Jones said he thought not, and instanced the fact that some of the latest additions to the varieties were remarkable for the abundance of their scent. Hearty vote of thanks were passed to Mr. Jones, and to the chairman for presiding.

SHEFFIELD CHRYSANTHEMUM SOCIETY.

THIS is one of the most go-ahead societies of its kind in the North. Its enterprise and enthusiasm are unbounded, and, in consequence, it maintains its position. Tempting prizes are provided in the open classes at its exhibition, no less a sum than £36 and two silver medals being offered in the two principal classes—one for twenty-four incurved, and another for twenty-four Japanese blooms. These competitions always bring together the best growers from the South and the Midlands, and blooms of the highest quality are freely displayed. Although there are good prizes in the open classes, those open to growers living within a radius of twenty miles of Sheffield are handsomely provided for in numerous classes. The competition in the amateurs' and cottagers' classes is not the least important feature in this fine show. It is really astonishing what some of these growers produce in the way of flowers. Incurved varieties are wonderfully well shown, and so keen is the rivalry in all classes for cut blooms that as many as eight prizes are awarded in each class. A pleasing feature in the display is the competition for two blooms each of the members of the "Rundle" family, viz., Mr. G. Glenny, Mrs. George Rundle, and Mrs. Dixon, truly a lovely trio. By these means these charming little flowers are kept to the front. As a rule a large number of good blooms are shown, and in several instances they are superbly finished. The well-known Cutlers' Hall has again been engaged for the exhibition, which with its smaller halls and ante-rooms may confidently be expected to be again well filled. Owing to the lamented death of the late Mr. W. Housley, who acted as secretary for so many years, the librarian, Mr. M. H. Willford, has accepted the secretaryship. Naturally he is anxious to make the forthcoming exhibition, which takes place on Friday and Saturday, November 13 and 14, a great success, and for this reason he will be glad to hear of anyone desirous of competing. His address is 96, Greenhow Street, Sheffield.

The monthly meeting took place on Wednesday evening, the 14th inst., and may be regarded as an unqualified success. Encouragement is given to the cultivation of the early-flowering Chrysanthemum, no less than eight exhibits of three bunches each being staged, making, indeed, a brave show in this special competition. Foliage plants were well shown, as may be imagined when it is stated there were seven grand exhibits. Tomatoes receive much attention here, and the ten exhibits in the class provided on this occasion is proof positive of their popularity. Mr. S. W. Seagrave, Norfolk Market Hall, Sheffield, staged a fine collection of zonal Pelargoniums in twenty-four varieties in bunches, and the display was generally considered a very good one. Mr. W. Smith set up eight dishes of Potatoes, his varieties being Lord Rosebery, Mr. Bessy, Waverley, Duke of York, Up-to-Date, Red Russet, Pride of Tonbridge, and Britannia. Another member exhibited a collection of Apples, Pears, and Tomatoes, in all about thirty-six dishes. It was a really grand display, the fruits being of fine size and good colour, the best of the Apples being Warner's King, Lord Grosvenor, Peasegood's Nonsuch, and Lane's Prince Albert. A pleasing evening was spent by the company present in looking at photographs of some prize medal slides of flowers that were enlarged on the lantern screen, and which were of considerable interest. A fine collection of South African slides belonging to the popular honorary treasurer, Mr. J. G. Newham, added very considerably to the pleasure of the evening as they were successively thrown on the screen.

ALEXANDRA PALACE CHRYSANTHEMUM SHOW.

THE Highgate Chrysanthemum Society were so well satisfied with their initial effort at the Alexandra Palace last year that they have decided without the least hesitation to hold an exhibition at this popular North London resort for the second time. Although their show is not the earliest fixture of its kind in the South of England, it is one of the earliest, and the executive feel confident that the show will be a good one, and that success will attend their efforts. November 4, 5, and 6 should be a convenient and suitable period for the exhibition, and there is good reason for believing that many blooms will be forthcoming in the many different classes. The Highgate Society has always given encouragement to the exhibition of large blooms in vases, and again this year they offer a silver cup and five guineas as a first prize for twelve vases of Japanese blooms, distinct, each vase to contain five flowers. There is a second prize of five guineas, and a third prize of three guineas. Several other classes are provided for blooms in vases, and one in which four pounds is offered as a first prize for six vases of incurved distinct, five blooms in each vase. There are in all some seventy-five classes, and assuming that the competition will be equal to that of other years—and it is reasonable to expect keener competition—the display should be one of the best efforts ever seen in North London. The Central Hall at the Alexandra Palace is an ideal place for a Chrysanthemum show. There is plenty of

room and a good light. The blooms keep wonderfully well at the Alexandra Palace, so that visitors to the show on the third day will find the display full of interest. The committee propose to hold their annual dinner on the evening of the first day of the show in the banqueting hall, Sir Francis Cory-Wright, Bart., J.P., the president, taking the chair. This was an innovation of last season, and, having answered so well, is to be repeated. Mr. W. E. Boyce, whose address is 20, Holmesdale Road, Highgate, N., is the secretary, and he is working very hard to repeat last season's success.

EAST ANGLIAN HORTICULTURAL CLUB.

OWING to the inclemency of the weather the members did not turn up quite so strongly at the October meeting of this club. Mr. J. Powley presided, supported in the vice-chair by Mr. T. B. Field, and Messrs. G. Davison, J. W. Church, J. E. Barnes, and other prominent local horticulturists. An essay competition for single-handed gardeners upon "Violet Culture and How to Obtain the Longest Supply" did not meet with much approbation, as only one member (Mr. C. Matthews, Thorpe) sent in a paper. This was somewhat brief, but, as the vice-chairman said, contained points which showed that the writer was better able to grow than to place his methods on paper. Mr. Field urged the young members present, whom he was sure knew something of Violet culture, to enter into the discussion. Mr. Love, of Dereham, gave an outline of the methods he saw being carried on at the nurseries of Messrs. House and Co., the Violet specialists, during his recent visit there. Other members also took part in the discussion. A humorous and somewhat interesting paper was read by Mr. E. Yeomans, Gunn's Court, St. Giles, Norwich, upon his experience in budding and grafting. These, he said, ever since he was taught how to do them had a fascination for him. He generally practised whip grafting. An interesting point was told of how not many years ago the Pear trees in a certain vicarage garden he had charge of began to show signs of dying. The vicar asked if it were possible to save the varieties; he was told yes, and Mr. Yeomans set to work and grafted the forty varieties on one tree. They nearly all took, for a year or so ago he had a splendid mixed crop of over thirty Pears. This latter remark brought out a very animated discussion as to the utility of such a practice. Mr. Field during his remarks said no doubt many of the remarks and methods given by Mr. Yeomans did very well a generation ago, but would not apply to present-day needs. Mr. Love also mentioned the system of double grafting and budding, and promised to give a paper at some future date upon the subject.

A vote of thanks was unanimously passed to Hobbies, Limited, for the splendid collection of new and choice Cactus Dahlias they had set up. This gave members a good idea of the forms and colours of the new varieties, especially as no Dahlia show is held locally. Mr. Robert Holmes, Tuckwood Farm, brought up a root of Northern Star Potato which scaled 15lb. Mr. George Davison, Westwick House Gardens, showed some charming sprays of Polygonum cynosymbium of the Knapweed family, which evoked much interest. Mr. George Daniels has started upon the improvement of a lacerated petal in single Dahlias he found in his garden, and this season's forms shows marked improvements in the desired direction. The competitive exhibition tables were rather thin, Mr. C. Hines securing first for Apples and Mr. C. H. Fox, Old Catton, first for Pears. Mr. W. Rush and Mr. R. Abel had a close fight for the best flowering plant; the latter eventually won with a good Cyclamen. Mr. F. Carrington, an amateur vegetable grower of local repute, had some grand heads of Celery.

READING GARDENERS' ASSOCIATION.

"TRENCHING and its Advantages" was the title of a paper read before the members on the 23rd ult. by Mr. W. Turnham, The Gardens, Culham Court, Henley-on-Thames. The subject was treated in a most practical manner under the following heading: Inversion of soil. Tentative deepening or mixing, and the usual way of keeping the top spit in a natural manner on the top, and breaking up the subsoil. Special attention was directed to the fact that trenching was one of the most important operations within the whole range of horticulture, and that the very germ and substance of good trenching was to add to the bulk of the cultivated earth and improve its quality by converting a certain amount of hard subsoil into porous surface soil. Needless to say that with such a subject a lively and interesting discussion followed, in which Messrs. Powell, Neve, Townsend, Hinton, Cox, Tunbridge, Bright, Martin, Wilson, Judd, Exler, Herridge, Dore, and Foster took part. The society's certificate was awarded to Mr. E. S. Pigg, Ropley Lodge Gardens, Alresford, Hants, for a group of splendidly grown plants of *Primula obconica* roses. The individual flowers were very fine and of a deep rose colour. Mr. J. L. Naah, of Bulmershe Court Gardens, staged a dish of splendid Tomatoes, Best of All; and Mr. Durrant, The Gardens, Preston, vases of Dahlias and Chrysanthemums. A hearty vote of thanks was accorded to Mr. Turnham for his excellent paper and to the exhibitors. Six new members were elected.

The fortnightly meeting was held on the 12th inst., and notwithstanding the exceedingly rough weather between seventy and eighty members assembled under the chairmanship of the president, Mr. Leonard Sutton, to hear a lecture by Mr. G. Wythes, V.M.H., of Syon House Gardens, Brentford, on "Strawberries and their Culture." As the lecturer was well known to the majority present as an authority with regard to the Strawberry, and also as a large grower, much was expected by the members, and it was a source of gratification to all that the expectations formed were more than realised. The subject was not only treated exhaustively, but in a plain and practical manner. The points touched upon were: The preparing of plants for forcing; varieties for forcing; the routine of culture; Strawberries in the open ground; prolonging the season; culture after planting out; alpine or small kinds; and last, but which proved the most interesting, Strawberries as annuals or yearlings. Great stress was laid upon the

that it was most desirable that plants should be grown purposely for runners and not allowed to fruit. As to varieties for forcing Royal Sovereign was recommended for early supplies, to be followed by *Vicomtesse Hélicart de Thury*, *La Grosse Sucrée*, and *President* for late use, while for the "annual" system of culture Royal Sovereign, *President*, *Dr. Hogg*, and *Guntton Park* were advised. The discussion which followed brought out several points of interest. Those taking part were the president, Messrs. Fry, Powell, Judd, Exler, Hinton, Turnham, Townsend, Gibson, and Tunbridge. For the reason stated above the exhibits were smaller and less numerous than usual, but the certificate of cultural merit was awarded to four especially fine fruits of Sutton's Royal Jubilee Melon, staged by Mr. G. Herridge.

The Gardens, St. Peter's Hill, Caversham. Mr. Durrant, The Gardens, Preston, exhibited a plant of *Begonia* with yellow flowers. A hearty vote of thanks was accorded to Mr. Wythes and the exhibitors. Seven new members were elected.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 80, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—W. P.—1, *Polemonium coruleum*; 2, *Sedum spectabile*; 3, probably *Pulmonaria montana*; 4, *Centaurea montana*; 5, *Aster Novi-Belgii* var. *laevigatus*; 6, *Centranthus ruber*; 7, *Tanacetum vulgare*; 8, *Chrysanthemum uliginosum*; 9, *Aster Robert Parker*.—F. Y.—1, *Pilea muscosa*; 2, *Selaginella Martensii*; 3, *Davallia filifolia* plumosa; 4, impossible to name positively from an immature frond; it may be *Polypodium Billiardieri*; 5, *Filix mas*; 6, *Polypodium pustulatum*; 7, *Pteris cretica albo-lineata*; 8, *Pteris serrulata cristata*.—J. M. D.—*Ophiopogon Jaburan* variegata.

Carnations (FIORE).—1. Stages for Carnations.—The best are those made of wooden laths, painted and open. 2. Temperature.—In winter for both *Malmalson* and *Tree Carnations* 55° as a minimum; except in severe frosts it might fall to 50°. If the *Malmalsons* are not to be forced merely keep the frost out. 3. *Picotees*.—These will flower about the middle of July if grown under glass. They would require a little forcing in Scotland.

Various questions (K.).—1. The less a *Gloire de Dijon* Rose is pruned the greater will be the yield of blossoms. The best results are obtained when pruning is limited to the removal of any old and exhausted shoots, and the long ones retained in their entirety. If planted against a wall or in any similar position this is easily done, and the same may be said if it is grown in bush form, while the most satisfactory way of treating a standard is to bend over these long shoots and tie them to the stem of the plant. So treated they will grow and flower from nearly every eye next summer. 2. The *Clematis* will in all probability partially die back in the winter, and all the cutting needed will be the removal of any dead shoots. 3. If the leaves of the Sea Kale Beet are gathered early others will be produced, but not to the same extent as at first. 4. The best time to plant *Ampelopsis Velchii* in your climate is in early spring before the buds push forth their new growth.

Pruning of Clematis Angelina and C. Mme. Edouard André (G. L. S. C.).—*Clematis* Mme.

Edouard André belongs to the Jackmanni section, and should therefore be cut back each spring close to the old wood. We cannot find the name of *Clematis Angelina* mentioned in any list; probably it is a very old sort that has gone out of cultivation, or the name may have been misread on an old label. From the description of it we should say that it requires the same treatment as Mme. E. André. As they are getting very tall and thin at the base they should be cut back in the early spring, not autumn, taking care to avoid cutting too hard back into the very old wood, or they will not start strongly again. When they have well started, a good top-dressing of manure should be given them. Generally speaking these *Clematis* that flower on the young wood and require cutting back each spring flower during July and August, while those that flower on the old wood bloom earlier in the year, between April and June.

Garden wall to cover with fruit trees (BALBUS).—Plums will succeed excellently on such a wall; Dessert Cherries also, and some varieties of Pears. We advise trained trees to be planted. Dessert Plums: Dennistons Superb Gage, Green Gage, Guthrie's Late Gage, Reine Claude de Bavay, Purple Gage, Transparent Golden, Jefferson's, Ickworth Impératrice, Kirke's, Coe's Golden Drop, Bryanston's Green Gage, and President, a new large purple Plum of great excellence. This is classed as a cooking Plum, but when grown on a wall it is good for dessert. Dessert Cherries (twelve): Frogmore Early Bigarreau, Early Red Bigarreau, Belle d'Orléans, Bigarreau Napoleon, Elton, Governor Wood, May Duke, Early Purple Gean, Bigarreau Jaboulay, White Heart, The Noble, and Black Eagle. Dessert Pears: Jargonelle, Williams' Bon Chrétien, Fondante d'Automne, Mme. Treve, Marie Louise, Louise Bonne de Jersey, Beurré Hardy, Doyenne du Comice, Glou Morceau, Thompson's Le Lectier, Nouvelle Fulvie, Josephine de Malines, Bergamotte d'Espérance, Easter Beurré, and Mme. Millet. The above Pears are arranged in the order of ripening.

Rust on Chrysanthemum foliage (JIM).—We have very carefully inspected the leaves of the *Chrysanthemum* that you sent to us, and regret to find, as you suspect, that they are attacked by the fungoid disease more commonly known as the *Chrysanthemum* rust. Mr. Massee of Kew attributes this pest to overcrowding, and if this is not so in your case the plants probably came to you with the disease upon them in the spring or when you acquired them. You had better isolate the infested plants and burn them, as the disease so quickly and easily perpetuates itself. The remaining plants in your collection should be sprayed with sulphide of potassium, mixing half an ounce of the latter in a gallon of clear water. Do not confound this remedy with sulphate of potassium, as is sometimes done by mistake. After flowering your plants should be cut down, and all the old wood and foliage burnt. The green leaf of the young growths should then be sprayed with the same solution. The glass house in which the plants are staged should also be sprayed with sulphate of iron when the plants have been removed. This drastic treatment is necessary, and is the only means of ridding your plants of the pest.

TRADE NOTES.

GARDEN ORNAMENT.

UNDER the title of "Garden Ornament" a well-nigh endless array of objects is comprehended—temples, pagodas, summer houses, bridges, roseries, pergolas, arches, fountains, seats, and sundials, ancient and modern art have been requisitioned, and almost every country laid under tribute to secure something new. We here present two pictures

of distinctly novel structures which appear to be very much in advance of ordinary summer houses. No. 1 (styled a "Resiance") provides amply on the ground floor and also on the balcony floor for social functions. Round the interior of the ground floor apartment there may be an annular water tank for fresh water or marine specimens. The main feature of this form of aquarium is that it affords the fish an endless swim. In the "Resiance" (No. 1) if with aquarium, admission is obtained by descending steps outside passage below tank, and ascending steps inside, the view of the aquarium being taken from the inner side of the annular tank. The ground floor chamber is also well adapted for a fernery. The balcony chamber is made to revolve upon a central perpendicular column. Thus it may be moved to keep its open side towards the sun (for sun bathing) or for viewing different prospects under varying conditions of light and shade. An astronomical telescope may be conveniently mounted in this chamber for night observations, without undue exposure. A "Resiance" of this description, surrounded with its circular pergola clothed with climbing

Roses and Ramblers, is a very charming retreat, and, when judiciously located, a very picturesque adjunct. The "Resiance" (Ladies' Bijou Summer House) is on a smaller scale, and may be either open or enclosed with canopy and curtains of suitable material. The floor being raised above ground is a valuable preventive of cold when the soil is damp. These new introductions (with others for similar use) emanate from the well-known firm of William Wood and Son, Limited, horticultural specialists to His Majesty, Wood Green, London.

MR. J. AMBROSE.

MR. AMBROSE, having resigned his position with Messrs. Paul and Son, The Old Nurseries, Chessington, in whose service he has been for twenty-nine years, is now commencing business on his own account as a nurseryman, seed, plant, and bulb merchant. Having had a long and varied experience, Mr. Ambrose will be glad to advise ladies and gentlemen who are laying out new gardens. Mr. Ambrose informs us that he has acquired the stock of Mr. Kingier's new Grape Melton Constable, the result of a cross between Gros Colmar and Lady Hastings.

VALL'S BEETLECUITE IN THE GARDEN.

MOST cultivators of plants and fruit under glass or against warm walls at some time or other have had to contend with ants, beetles, cockroaches, &c., and know how difficult they are to exterminate, especially when they locate themselves under hot-water pipes in mains leading from the boiler. In this case the tropical ant is a serious foe, as they often carry soil into positions and percolate into many things growing in pots. Added to this, I am inclined to believe that they carry many insects about, causing much trouble by introducing them on fresh things. Bad as this is, it is worse where they find a lodging near Peach houses, and it is no uncommon thing to see questions in THE GARDEN how to get rid of them from Peach houses when in bloom, as they destroy the reproductive organs and prevent the fruit from setting. Some years ago I had much trouble in this way, and sprinkled guano in the runs. Another temporary remedy was putting fresh meat bones down, and when the ants were on them to dip the bones in hot water. Soot, lime, and a host of other things have been recommended. I have never found anything effectual till this season, when I obtained a supply of Vall's Beetlecuite. I had some fine Peaches and Nectarines. When the wasps had made a hole or a slight crack in the fruit, then the ants followed on and did much damage, or when the fruit was very ripe they would attack them. But the worst thing was the damage they did to some choice Gage Plums. When Beetlecuite came to hand this was used according to instructions given on the tin, namely, to sprinkle it in the ants' runs. This was done two nights following, with the result that they all disappeared and caused no further trouble to the fruit. I have never seen anything approaching it in results. Added to this, it is so clean, causes no smell, and is harmless to animals. Those who are troubled with ants eating fruit or warm, dry, open walls should use it, and by keeping it in a dry place it is always ready for use. In many places cockroaches and beetles are troublesome. Here, again, it can be used. Frequently these have to be contended with in kitchens, &c., so that a box of this is always useful and should be kept with other things for garden use. I am glad to give my testimony to its beneficial effect.—JOHN COWE, Fords Abbey, Chard.

CATALOGUES RECEIVED.

Hardy American Plants.—Messrs. Kelsey, Boston, Mass., U.S.A.

Roses.—Mr. Charles Turner, Royal Nurseries, Slough.
Hardy Plants.—Mr. Amos Perry, Winchmore Hill, S.
Novelties.—M. Herb, Naples, Italy.

GARDENING APPOINTMENT.

LORD ROSEBURY'S NEW GARDENER.

MR. JAMES MACGREGOR, head gardener to the Duke of

Atholl, Dunkeld House, Dunkeld, Perth, has been appointed to take charge of Lord Rosebury's gardens at Mentmore, the position rendered vacant through the death of Mr. James Smith.

* * * The Yearly Subscription to THE GARDEN is: *Inner*, 10s.; *Foreign*, 17s. 6d.

THE GARDEN

No. 1667.—VOL. LXIV.]

[OCTOBER 31, 1903.]

PRUNING ROSES.

ROSE pruning is always an important and often a little-understood matter among amateur growers, and it is not surprising that a large audience assembled to hear the lecture given by M. Viviand Morel before the Royal Horticultural Society on Tuesday last. As M. Morel's remarks were the result of observations upon Rose culture in France, and also in many cases applied to Roses upon their own roots, instead of budded upon other stocks, they cannot be put into practice in this country without some consideration of our different climatic conditions. Nevertheless, some of M. Morel's remarks could not fail to be of value to those who heard them, if only by way of suggesting new methods that may or may not prove to be worth retaining.

M. Morel considered semi-dwarf bushes to be the best form of all; suckers were then not troublesome, the stems become woody, and the plants live to a good age. Splendid specimens of Teas and Noisettes might be grown in this form. Natural bushes were also recommended, but all varieties are not equally suitable, and from the point of view of most Rose growers it is a serious drawback to learn that four or five years are required to form a good specimen. M. Morel had a good word to say for weeping Roses; these he strongly recommended. Those varieties with long, pliant shoots should be chosen: Teas and Noisettes made excellent weeping Roses. Aimée Vibert, William Allen Richardson, Gloire de Dijon, and Reine Marie Henriette were mentioned as being particularly suitable for this purpose. They should be budded on the Briar stock some 2 mètres from the ground, and great care in planting is necessary. Budding is done in August, and in spring the shoots are pinched when about 15 centimetres long. They are then left untouched for the remainder of the season. In the following spring the shoots are thinned out to about a dozen, and the third year they are trained to a hoop so as to produce a head of the desired form. M. Morel said that the time of year for pruning Roses depends upon, firstly, the species or variety to be pruned; secondly, the object in view; and, thirdly, the climate. The non-Perpetual Roses, as Provence, Damask, &c., should be pruned after flowering in July, and again in February or March. The Perpetuals, as Teas, Noisettes, Hybrid Teas, &c., are generally pruned from February to March in the colder parts of France.

Around Lyons many of the Hybrid Perpetuals are pruned in August, covered with frames so as to encourage growth, and the plants bloom again in November.

One of the advantages of Rose pruning is that it enables the worker either to retard or advance the time of flowering, the Roses first pruned will, in the absence of unusual conditions, be the first to bloom.

Autumn-pruned Roses flower before those pruned in spring; this cannot, however, be safely practised on Roses grown out of doors in England on account of our late spring frosts, which would almost certainly cripple the young growths.

M. Morel described a large bed of Roses in his garden kept in almost perpetual bloom by adopting the following method of pruning. The plants forming the outside row of the bed were pruned close to the ground, those in the next row were pruned less closely, and so on with each row until the plants in the centre of the bed were reached; upon these one or two shoots were left unpruned, and simply bent down to the height of those in the highest row. Thus the Roses in the centre flowered first, and were followed in succession by the other rows, the outside plants that were cut down almost to the ground being the last to bloom. M. Morel mentioned that a succession of bloom might be obtained from a single plant by following the same method of treatment.

KEW NOTES.

TWO LATE-FLOWERING SAXIFRAGAS.

ALTHOUGH an extensive family with a wide distribution, this genus does not exhibit much variation in the time of flowering of the different species, most of which bloom in the spring. The two following are exceptions to the general rule, and do not produce their flowers till the autumn, thus helping to prolong the flowering season in a dull time when most things are decaying.

S. Fortunei.—A pretty half-hardy perennial with large panicles of white flowers borne on stout reddish stems, which rise in profusion from rosettes of green leaves. These leaves are reniform cordate in shape, lobed and laciniately toothed. The flowers are peculiar on account of the unequal length of the narrow petals, some being two or three times the length of the others. Some of the petals are also irregularly toothed. A native of China, it was introduced into cultivation in 1863.

S. cortusaeifolia.—Somewhat similar to the above, with rather smaller flowers and entire petals. The branches of the panicle are more slender, and, with the leaves, are more or less covered with coarse cellular hairs. Of the two this is the more floriferous, but both are desirable

plants. Seeds of this species were collected on the central mountains of Japan in 1880 by Mr. Mariée, who sent it to Messrs. Veitch, in whose nursery it flowered in 1883. Also a native of China, it is found in the province of Yunnan growing on rocks at an elevation of 6,000 feet above sea level.

COLCHICUM PROCURENS.

This useful little plant, with flowers somewhat similar to those of the common Meadow Saffron *C. autumnale*, but rather smaller in size, is now in full beauty, doing its best to brighten the rock garden or border, and extending the period during which we are indebted to members of this genus for an autumn display. It was introduced from Asia Minor, where it grows in the neighbourhood of Smyrna several years ago under the name of *Merendera sobolifera*, the corms of which have the same branching form but differ from it in time of blooming, the *Merendera* being a spring-flowering plant, its leaves appearing concurrently with the flowers. It is also offered this year by Continental nurserymen under the name of *C. montanum*, the well-known spring-flowering species.

ARTEMISIA LACTIFLORA.

This genus does not contain many ornamental plants amongst the stronger-growing section, those finding most favour belonging to the smaller silvery-leaved alpine species. The above species, however, is an exception to the general rule, being quite a handsome plant, with its loosely branching stems attaining a height of 6 feet or 7 feet, terminating in large compound panicles of white flowers not unlike a giant *Spiraea* in appearance. Without the strong smell which is characteristic of many members of this family, its leaves are somewhat like those of our native Mugwort *A. vulgaris*, to which species it is evidently wrongly referred to as a synonym in the "Index Kewensis." The leaves, however, are much thinner in texture and without the white tomentum on the under side of the leaf, while the flowers and inflorescence are quite distinct from those of that species. Dr. Henry, who found it in the province of Hupeh in China, says that it grows in very moist places, generally on the margins of streams. The present plant was raised from seeds collected by Messrs. James Veitch and Son's collector, Mr. H. Wilson, in Western China, and its late-flowering habit should make it a useful plant for grouping near water for autumn effect.

W. IRVING.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

November 2.—Truro Chrysanthemum Show (two days).

November 3.—Southampton (two days) and West of England (two days) Horticultural Shows.

November 4.—Highgate (three days), Kent County (two days), Cardiff (two days), Hereford (two days), Ascot (two days), and Northampton (two days) Horticultural Shows.

November 9.—St. Neots Chrysanthemum Show.

November 10.—Royal Horticultural Society's Drill Hall Meeting; meeting of committees at 12 noon; lecture upon merit and demerit of size in flowers, fruits, and vegetables; National Chrysanthemum

themum Society's Exhibition at the Crystal Palace (three days); Devizes and Oxford Chrysanthemum Shows.

November 11.—Buxton, Reading, Liverpool (two days), Hampton, Winchester (two days), and Banbury (two days) Chrysanthemum Shows; East Anglian Horticultural Club Meeting.

November 13.—Blackburn (two days), Leicester (two days), Sheffield (two days), and Leeds Paxton (two days) Chrysanthemum Shows.

A National Potato Society.—I was pleased to read in *THE GARDEN* last week that an effort is being made to form a National Potato Society, which, if carried out on the lines suggested, would be of great practical value to cultivators and to the public generally. Trials conducted in various parts of the country would not only be a test of varieties, but would enable growers to discover those sorts best suited for that particular locality; also a great show annually in London of such an important subject as the Potato would greatly increase the interest in its cultivation. Those of us who from year to year visited and exhibited at the old International Potato show gained many an object-lesson.—J. H. RIDGEWELL, *The Gardens, near Histon, Cambridge.*

National Chrysanthemum Society's catalogue.—We have received the supplement to the Jubilee edition of this catalogue. It contains selected lists of the best Chrysanthemums of all types, viz., incurved, Japanese, Japanese incurved, Japanese hairy, reflexed, large Anemone, Japanese Anemone, Pompons, Pompon Anemones, singles, earlies, epidermy, plumed, feathery, fantastic, decorative, and market. The colour of each variety is given. There is also an alphabetical list of new Chrysanthemums raised and sent out since the spring of 1898.

Linnean Society—Opening of the session.—The papers to be read at the first meeting of the session 1903-4 on Thursday next, at 8 p.m., will be the following:—"The Structure of the Leaves of the Bracken (*Pteris aquilina*) in Relation to Environment," by Mr. L. A. Boodle, F.L.S.; "On the Life History of a new Monophlebous from India, with a Note on that of a *Vedalia* predaceous upon it, with Remarks on the Monophlebinae of the Indian Region," by Mr. E. P. Stebbing, F.L.S., F.E.S. Exhibitions:—The frontal bones of a horse, showing a pair of rudimentary horns, by Dr. W. G. Ride-wood, F.L.S.; Preparations and slides illustrating the occurrence of *Mycorhiza* in Coal-Measure plants, by Professor F. E. Weiss, B.Sc., F.L.S.; Photographs illustrating the pollination of flowers, by Mr. B. H. Bentley, F.L.S. The chair will be taken at eight o'clock.

Presentation to Mr. Latham.—Personal friends to the number of upwards of sixty attended a complimentary dinner given to Mr. Latham at the Colonnade Hotel on the evening of the 22nd inst., when he was the recipient of a beautifully illuminated address and a purse of gold on his retirement from the Birmingham Botanical Gardens after a service of thirty years. The chair was taken by an old friend, Mr. Owen Thomas, V.M.H., who was supported on his right by the guest of the evening and Mr. Humphreys, the new curator, and on his left by E. Martineau, Esq., and Professor Hillhouse. Mr. Martineau, a city councillor, had known Mr. Latham all his life, and in presenting him with the address and purse of gold, bore eloquent testimony to Mr. Latham's personal worth, and mentioned the way he had endeared himself to all with whom he came in contact by his unassuming manner and courteous and kindly ways. He mentioned the many-sidedness of his character as an expert gardener, botanist, hybridist, and of his love and knowledge of British plants, and Ferns more especially. Professor Hillhouse, who had been associated with Mr. Latham in the management of the garden as honorary secretary for twenty-one years, also spoke in kindly and eulogistic terms of Mr. Latham's services to horticulture at the gardens, as well as in connexion with the Gardeners' Mutual Improvement Society and the great autumn fruit and Chrysanthemum show and other societies in

the neighbourhood of Birmingham. Others present spoke in the same terms of Mr. Latham's worth as a friend, always on the look out for an opportunity of doing a kind action or saying a kind word to those he came in contact with. A pleasant illustration of this side of his character was instanced by a letter the chairman had received from the head of the Parks Department of the City of Boston, America, which he read to the meeting. He had been Mr. Latham's pupil many years ago in the North of England. The letter is worth reproducing as indicating faithfully the spirit which has actuated Mr. Latham throughout his life in dealing with those with whom he has come in contact. Many are those now filling honourable and good positions in the gardening world who owe their success entirely to his kindness and encouragement: "Dear Sir,—I learn from the English horticultural papers that it is proposed to give a complimentary dinner and testimonial to Mr. W. B. Latham, in recognition of his long and valuable services to horticulture and as a tribute to his fine personal qualities. I am most heartily in sympathy with this movement to do honour to Mr. Latham. It is about forty years since I last saw him, yet I have never forgotten when, as a raw garden lad, I was led by his enthusiasm and by his kindly interest in me to feel that there was something more in gardening than the drudgery I had hitherto found. By making me his occasional companion on botanical excursions he awoke in me a love for the wild plants of the woods and fields. Since then, in renewing and extending their acquaintance, some of the pleasantest hours of my life have been spent. Thus a feeling of gratitude is mingled with my desire to see Mr. Latham honoured, and I hope that he will yet long enjoy the esteem and good wishes of his many friends.—Yours sincerely, J. A. PETTIGREW." Mr. Latham expressed his acknowledgments in very feeling terms to all his friends for their kindness. An excellent programme of music was provided, and a thoroughly enjoyable evening spent.

Four Sweet Peas, 1903.—Of all Sweet Peas of recent date I need hardly mention Dorothy Eckford, which was seen this year, despite all the wet and frost, quite fulfilling everything one could expect. Agnes Johnstone, a very lovely variety and strong grower, was rather spoilt by wet, but next season it ought to stand well. Lord Rosebery, a Pea of 1902, did well, and is worth growing. Mrs. W. Wright, a grand and most beautiful variety, but hardly substantiated yet, and apt to sport in a bad year, should make a mark in 1904. Of full giant size and of exquisite colouring, it has hardly been seen on the exhibition table; but I am sure all who try the same in the coming spring will be most pleased with the result.—CHARLES WILLIAM CROSBY, *Dorking.*

The Lady Warwick College.—On Saturday, October 24, the first council meeting was held at the new home of the college, Studley Castle, near Birmingham, and the college formally opened. The Countess of Warwick presided, and was supported by Lord Coventry, Lord and Lady Hertford, and others. Studley Castle, with its well wooded gardens and grounds and extensive farm lands, is much more suitable to the needs of the college than were the hostels at Reading. There are now some forty students, who appear thoroughly to enjoy their new home. There is scope at Studley for the very best gardening, and Lady Warwick and the college authorities are to be congratulated upon the acquisition of such a delightful estate. A full report of the meeting, &c., appears elsewhere.

Slaughter of British birds.—It is distressing to find that the slaughter of British birds continues with unabated energy, in spite of close seasons and Acts of Parliament. A bird-seller in Shaftesbury Avenue, London, was recently fined 40s. and costs for keeping sixty linnets in a cage measuring about 12 inches by 9 inches by 6 inches, four of the birds being found dead, two with legs broken, and most of the others in a dazed condition. The case is a revelation for thousands of people who live in the country, especially in those districts within a twenty-mile radius of London,

who are mourning the steady decrease in number of all sorts of wild birds and the threatened annihilation of many species. The county council should wake up to a sense of their duties. As the Duke of Bedford pointed out in his last address to the Society for the Protection of Birds: "Unless the county councils utilise their powers of all-the-year-round protection, and the police enforce the law, bird-catchers will continue to pursue their trade with profit to themselves." Without the active support of these local bodies the work of the society's watchers is almost useless.

Mr. Robert Sydenham.—It is a great pleasure to hear from this well-known horticulturist that the journey to Cape Town has completely restored his health. Mr. Sydenham returns shortly to Birmingham.

Lilium auratum at Chorley Wood. Mrs. Gilliat, Chorley Wood Cedars, Rickmansworth, writes: "A *Lilium auratum* planted at the edge of a small clump of Rhododendrons is now flowering (September 28) for the second season and bearing thirty-four magnificent blooms on one stalk."

Culture of hardy tree and bush fruits.—Mr. E. Kemp Toogood, F.L.S., of Southampton is the author of this booklet, which contains plain and practical information upon an important subject. There are chapters upon grafting, pruning, diseases, tree surgery, and spraying, in addition to cultural notes, and many useful illustrations are given throughout the book.

Continental Chrysanthemum shows.—The following are announced for November: Paris, 4th to 11th; Lille, 6th to 9th; Fontainebleau, 7th, 8th, and 9th; Bordeaux, 5th to 12th; Troyes, 6th to 9th; Orléans, 12th to 17th; Toulouse, 12th to 16th; Blois, 5th to 8th; Chaumont, 14th to 16th; Valenciennes, 14th; Pau, 7th to 9th; Geneva, October 29 to November 1; Cologne, 6th to 13th.

The recent gardeners' dinner.—Mr. A. Dean, the hon. secretary, writes: "Kindly permit me to trespass once more on your space to mention that at a meeting of the dinner committee held at the Horticultural Club on Tuesday last a financial statement was presented, showing that the income reached £121 15s. and the expenditure £109 10s. 1d.; that left as balance in the hands of the treasurer the sum of £12 4s. 11d. That amount it was agreed should be given as donations—to the Gardeners' Benevolent Fund £8 2s. and £4 to the Orphan Fund, the committee subscribing the deficiency. The work of the promoters was absolutely voluntary. Very cordial votes of thanks were given to the Horticultural Club for kindly accommodation, to Leopold de Rothschild, Esq., for his munificent liberality, to Viscount De-cannon for so genially presiding at the dinner, to Messrs. James Veitch and Sons for their splendid table decorations, to the Horticultural Press for many kind notices, and to the officers. A sample picture of the dinner, taken by flashlight by Fradelle and Young, was regarded by all as presenting a splendid pictorial memento of a singularly interesting gathering."

Aberdeen Royal Horticultural Society.—The annual business meeting of the Royal Horticultural Society of Aberdeen was held in that city on the 19th inst., and was presided over by the Earl of Aberdeen. The report of the treasurer was not of such a favourable nature as in former years, there being an adverse balance of £79 11s. 9d. on the year's working. This was mainly due to a reduction in the number of the members and in the attendance at the show. The Earl of Aberdeen was re-elected chairman and Mr. J. Leith vice-chairman. Mr. J. B. Rennot, Union Street, was also reappointed secretary and treasurer, and the following gentlemen were elected as acting directors:—Professional gardeners: Messrs. A. Duncan, J. M'Kay, S. Robertson, and J. Sim. Market gardeners: Messrs. W. Anderson, A. Paterson, J. Paterson, and J. Smith. Nurserymen and florists: Messrs. W. Adam, A. M. Cocker, W. Cumming, and W. A. Dustan. Amateurs: Messrs. A. Gillespie, J. Lennie, G. Maitland, and D. Simpson. Working classes: Messrs. A. Begg, J. Duncan, J. M'Laren, and W. Taggart.

Heliopsis laevis and B. Ladhams.—I cannot agree with recent notes which have appeared in praise of H. B. Ladhams, and I see nothing of the grace of form of which Mr. Molyneux writes. Side by side with the older *H. laevis*, the newer form is decidedly coarser. Soil and situation may make a difference, of course, but as grown here I infinitely prefer *H. laevis*, though both have grown well enough. If I had to discard one or the other it certainly would not be the last-named.—J. C. T., *Shipley Hall Gardens*.

Marigolds in pots.—Some plants of African and also of the striped French Marigolds now in full bloom in my cold house are the admiration of all who see them. They were late seedlings, and, as they were not likely to get into bloom until the frost came, I put them into 6-inch pots, which they have filled with roots and are blooming with remarkable freedom. The stiff, rigid, and erect character of the African Marigold renders them best adapted for pot culture. They are about 3 feet in height. The French striped varieties make large bushes, but the weight of the blooms cause the stems to bend down. A few plants of the orange African Marigold would go well with *Chrysanthemums* in a conservatory.

Angelonia grandiflora alba.—What I recently saw growing at the Norfolk nurseries of Messrs. Hobbies and Co., Dereham, under the above name is a white-flowered form of the South American *Angelonia grandiflora*, a pretty stove herbaceous perennial of easy cultivation. I find in the catalogue of Mr. E. Benary a *grandiflora* (lilac) and the pure white form which has been obtained by Mr. Benary. The white form makes a graceful greenhouse plant, and it is one of those subjects an amateur on the look out for novelties would find it satisfying to cultivate. There are a few species or sub-species forming the genus, but the new large-flowered white form appears to be the best.—R. D.

Bonninghausenia albiflora.—Although in cultivation in 1832 when a figure was published in "Hooker's Exotic Flora" under the name of *Ruta albiflora*, this plant is comparatively rare in gardens. At the present time (in mid-October) it is in full beauty with its light graceful habit and numerous small white flowers. It is a monotypic genus closely allied to the common Rue, distributed over the temperate Himalayas from Marri to Sikkim, common in China, and also found on the central mountains of Japan. It is a perennial herb attaining the height of 3 feet or more, with bipinnate glaucous alternate leaves and flowers in compound terminal leafy panicle cymes. The individual flowers are small, a quarter of an inch to half an inch in diameter, but this is compensated for by the great number produced. Perfectly hardy in suitable positions, which should be in partial shade, as it is an inhabitant of woods, it is a plant worthy of more extended cultivation. The crushed leaves have a strong disagreeable smell, and the late Colonel Sir Henry Collet states in his "Flora of Simla" that the plant is known among the hillmen as "Pissu mar," the flea killer.—W. LIVING.

A new Lettuce—The Staghorn.—Those who saw the splendid exhibit of Lettuces at Westminster on the 15th ult. from Messrs. Dickson and Robinson of Manchester will remember that some of the sorts staged were both novel and good. In particular the Staghorn was a distinct Cabbage variety, and well worth special notice. This variety was also staged at the recent Chiswick show, but not in the best possible position, as with so many exhibits it is difficult to see all. Though on this occasion the Staghorn received an award of merit it will certainly be worth a higher award if it is as hardy as it appears to be. In appearance it is not unlike an Endive, and the leaves, being much cut, will make it the more valuable for the salad bowl. The plants heart freely, and are by no means coarse; indeed, this Lettuce may be termed shapely, and the quality is excellent, not unlike a well-grown Green Curled Endive, but not so bitter. In my opinion the Staghorn will be largely grown in private gardens as a salad, both for its good quality and appearance. Other new sorts were worth notice, but none were so distinct as the Staghorn. Of excellent quality was the new

Lord Kitchener, a Cabbage variety of very compact growth and of splendid quality. I consider that this and the one noted above are excellent additions.—G. WYTHES.

Cockscomb Glasgow prize.—Replying to "A. P. H." (page 246, October 10), who asks by whom the strain of Glasgow Prize Cockscomb was originated, I believe Mr. A. McLachlan, gardener to Mr. C. S. Caird of Dungourly, near Greenock, was the recognised introducer, and it was in the eighties (and before) known in Glasgow and the West of Scotland as McLachlan's Glasgow Prize Cockscomb. Combs of 36 inches to 39 inches, tip to tip, were often staged at the Glasgow flower show, and of fine colour and form as well.—A. HOPE, *Exeter*.

Midlothian Potato inspection.—A very interesting inspection of the Potatoes grown in the neighbourhood of Hawthornden, Midlothian, for Mr. Thomas W. Scarlett of Edinburgh, took place on the 10th inst., when a party of about sixty took advantage of Mr. Scarlett's kind invitation, going by rail to Hawthornden Station, and proceeding to two of the farms. The members of the party were much interested in the results obtained, there being, as a rule, an increase in the crop over last year, while there was less disease visible than was expected. The party had also an opportunity of seeing specimens from the crops growing on other farms for Mr. Scarlett, which were displayed in a hall, while boiled Potatoes were also provided to test the cooking qualities. Mr. Davie, of Messrs. Davie and Co., of Haddington, thanked Mr. Scarlett on behalf of the company for his kindness, and Mr. Scarlett briefly replied.—S. ARNOTT.

Rhus cotinoides in autumn.—Among other things the year 1903 will be remembered as one in which the autumn tints of trees and shrubs were conspicuously absent. A walk through a park or garden now will reveal none of the lovely tints, whose colour descriptions a pen cannot usually adequately convey, that make autumn the favourite season of many. All around the leaves of both forest trees and garden shrubs are hardly less green than in summer time. Less attractive they certainly are, for while the autumnal tints have not developed, the green has everywhere lost its freshness, and in some cases has turned to a dull and dirty brown. So they will remain until the first frost brings them fluttering to the ground. Surrounded by such a monotone of colour it is pleasant to turn to a plant which, even in this unparalleled season, can still burst forth in its full autumn beauty, namely, *Rhus cotinoides*, the Chittam Wood of Southern United States. It makes a brilliant bit of colour in an otherwise dull and sombre shrubbery. Some of the leaves are rich yellow, others are margined with red, while most are margined and veined with a delightful blending of all their colours. A plant some 12 feet high is a striking object at this season, and in Kew Gardens there are several such.

Cyphomandra fragrans.—The Tree Tomato (*Cyphomandra betacea*) is occasionally referred to in THE GARDEN, but to judge from the scarcity of notes concerning another species, *C. fragrans*, this is not nearly so well known. To some extent probably this is accounted for by its not fruiting under cultivation in this country as *C. betacea* does. Repeated attempts have been made to fertilise the flowers, and also to cross-fertilise them with the Tree Tomato, but so far no successful result has been recorded. Notwithstanding the non-production of fruit, *C. fragrans* is a plant that is well worth space in a large greenhouse or conservatory. It needs to be planted in a border, for, like *C. betacea*, it makes vigorous growth. The leathery leaves are ovate-lanceolate in shape, rich dark green above, and pale green below. The curious drooping flowers which are freely produced are perhaps best described as inverted urn-shaped. The perianth segments recurve at the end, and are violet-coloured. The flowers possess a distinct and pleasing scent. Although when young their colour is violet, with age they become dull yellow. There is a plant in the temperate house at Kew some 12 feet or more high, forming, in fact, a large bush. The long vigorous shoots are pruned hard

back annually; in fact, the cultural treatment advised on several occasions in THE GARDEN suite *C. fragrans* also.

The Sea Buckthorn as a tree.—Near the large temperate house in the Royal Gardens, Kew, there is a specimen of the Sea Buckthorn (*Hippophae rhamnoides*) growing at the end of a shrubby border that may rightly be termed a tree. It is of symmetrical, pyramidal shape, and from 12 feet to 15 feet high. At the present time it is as attractive as anything in the Kew collections. The pretty grey leaves alone assure the Hippophae a pleasing appearance, but with the bright orange-coloured berries clustering thickly around the shoots as they do now the tree referred to makes a charming picture. Grey leaves and orange berries intermingle from top to base, for this untoward year has, curiously enough, been favourable to the Sea Buckthorn so far as the production of fruit is concerned. The stem of this Tree Hippophae is about 7 inches in diameter, and the branches reach almost to the ground. As a tree it is unique. The value of Hippophae rhamnoides as a bush is well known, and now its value in the garden can be fully appreciated. There are several clumps at Kew by the lakeside and elsewhere that are aglow with clusters of the brilliant orange-coloured fruits, and they make rare bits of colour in the garden landscape, more than ever appreciated now that sombre tints predominate in border and shrubbery. Because the Sea Buckthorn is a seaside plant many have the idea that it will not grow inland. Such a fallacy should at once be dispelled, and a visit to Kew would be an excellent means to this end. It does not even require to be near water at all, as is evidenced by the tree specimen just mentioned, which is growing in ordinary soil, far away from lake or pond. Berried shrubs are of great value to the gardener, and they are not taken advantage of to the extent they might be.—A. P. H.

Some new Roses.—M. A. Schwartz, 238, Grande Rue de Monplaisir, Lyon, announces some new Roses obtained from seed sown in the nursery, and which will be placed on the market on November 1 next. *Tea Rose Mme. Berthe de Bary de Zahony*, habit vigorous, foliage purplish green, flowers large, full, opening well, colour a fine nankeen yellow shaded with salmon and coppery orange; fine variety. *Hybrid Tea Rose Chateau de Flechères*, habit vigorous, foliage light green tinged with purple, flowers large, full, colour nankeen yellow, turning to straw colour in the early flowers, creamy white with nankeen yellow centre in autumn; very free flowering. *Comte de Wallis*, habit vigorous, foliage brilliant dark green, flowers large, full, well shaped and opening well, petals imbricated, colour light flesh tinted and bordered with bright pink, centre a whitish flesh colour tinged with salmon, reverse of the petals pink, shaded and striped with carmine; fine variety. *Hybrid Bengal Rose M. Pétrus Donzel*, vigorous, bushy, foliage light green, flower medium sized, full, colour velvety purplish crimson tinged with bright red; very free flowering and sweet scented.

Roses in 1903.—I regret to say that I am unable to echo Mr. Arthur Goodwin's remark that "Roses have come out of the ordeal of the past season very well," for with me they have proved most disappointing. In the light, stony soil at the mouth of the River Dart neither of Mr. Goodwin's favourites, *Narcissi* and *Roses*, are satisfactory. This is doubtless chiefly owing to the nature of the soil, though in addition to this the *Narcissus* fly does a great deal of damage to the first. Being convinced that success with Hybrid Perpetuals was not to be dreamt of, I confined my selection almost entirely to *Chinas* and *Teas*, and procured a few plants of *Irene Watts*, *Queen Mab*, *Laurette Messimy*, *Mme. Eugene Reesal*, *Souvenir de Catherine Guillot*, *Corallina*, *G. Nabonnand*, *Camoens*, *Mme. Pernet Ducher*, *Beryl*, *Marquise de Salisbury*, *Bardou Job*, *Grüss an Teplitz*, and *Leonie Lamesch*, while two plants of *Caroline Testout* were sent to me gratis. The soil, which is about 2 feet deep, was richly manured previous to planting three seasons ago. The bushes stand 2 feet apart each way, and have been well mulched with farmyard manure

each autumn, while as the ground is merely a reserve garden nothing has been grown among the Roses. I fully expected that the unusual amount of moisture acting on the light soil would induce strong growth, but the result has been the exact opposite, the growths having been very weak and spindly and the flowers not a third of their proper size. Caroline Testout, the gratis Rose, has done well, and Grüss an Teplitz and Leonie Lamesch have been fairly good. The flowers of the last-named, though always small, are wonderful in their colouring, their rich crimson and orange on their first opening being, as far as I know, unique amongst Roses. With the exception of the three varieties named, I have not out a single fair-sized flower through the entire season, though after the first disappointment I severely disabbed. I shall give them another year's trial, after which, if the experience of this season is renewed, they will be cleared away and replaced either by more Caroline Testouts or by other flowers. I confess to being surprised at the failure, as I fully expected Chinaz, at least, would do well. I can only hope that the result was due to the season, though I own to grave doubts as to this being the case.—S. W. FITZHERBERT.

A new Strawberry—The Roydon.—In the bustle of a large show, such as the last great display at Chiswick, the best things are not always seen by the general public. This new variety was given an award of merit. Now any Strawberry, if at all presentable on September 29, must be valuable, and The Roydon, both as regards crop and quality, was excellent, and its late fruiting should make it an acquisition. Certainly the plants were splendid, bearing a grand crop of fruit, both ripe and in a green state, and the growth was stronger than is usual with the autumn or perpetual varieties, fruits larger, and of a deep crimson colour. I failed to get any notes as to its parentage, but doubtless the raiser, who is to be congratulated on such a valuable addition to the late Strawberries, will later on supply the particulars. Another point not to be lost sight of was that this late fruit was not grown in the north, but at Camberley, Surrey, and the flavour was excellent when the season is taken into account. The fruits were firm and the growth compact.—G. WYTHES.

THE LILIES.

(Continued from page 286.)

LILIUM AURATUM VAR. PICTUM (the painted auratum Lily) is a slender growing form, apparently a wilding, very beautifully coloured, representing a stepping stone in colour development toward the entirely red-banded *rubro-vittatum*. Bulbs small, narrow scales. Leaves and stems as in *auratum*. Flowers four to eight, the petals lance-shaped, undulating, banded crimson near the tips, yellowish below; often suffused pale crimson on either side of the crimson stripe in the upper half of the inner petals. The spotting is heavy, regular, and a richer crimson near the tips. Fairly common in cultivation.

Var. platyphyllum (the broad-leaved auratum Lily), also known as *macranthum*. A magnificent variety, often reaching a height of 10 feet, and we have known examples bearing twenty or more flowers 15 inches across. Bulbs as large as *Auratum*, the scales markedly broad and stout two or three outer ones enclosing the whole bulb in some cases; yellow, scarcely at all dotted. Stems 4 feet to 10 feet high, very stout, slightly glaucous, forming enormous masses of roots at their bases, and two to six bulbils amidst the masses. Leaves twice the width of *auratum*, generally six to ten, nerved; those nearest the inflorescence nearly oval, often curved and blistered. Flowers in a loose spike of three to ten or more, borne on stout foot-stalks of varying length, and generally slightly drooping.

Petals deeply keeled, the inner ones narrowly ovate, the outer lance-shaped, the margins undulating, and the tips reflex slightly. Colour greenish white when they first open, changing to a pale cream on expansion; the inner surfaces dotted very pale red on wart-like processes, which become claw-like near the base. A band of pale yellow traverses the whole length of each petal. Anthers orange red, very large, borne on filaments which reach halfway down the petal.

Var. virginale is the white form of *platyphyllum*, and a very beautiful chaste coloured Lily. It is quite unspotted, and the median band is a pale shade of green.

Var. shirleyense is a glorified *virginale*, very strong in growth. Flowers massive, striped down the middle of each petal with yellowish grey, and spangled with broad dots of buff elsewhere. Habit of *platyphyllum*. Evidently a very desirable form, for which we are indebted to the Rev. W. Wilks, who has raised a large stock of plants from a single bulb selected several years ago. Rare in cultivation.

Var. rubro-vittatum (the red-banded *auratum* Lily).—A slender-growing, richly coloured variety, apparently of garden origin. Bulbs as in *auratum*, generally small. Stems dark green, 3 feet to 5 feet high, slender. Leaves dark green, nearly all confined to the upper half of the stems. Flowers three to eight, narrow petalled, 10 inches long, generally drooping, white, margined with a faint edging of crimson, heavily dotted on the face of each petal with large blood-red dots, and broadly banded crimson from tip to base. Anthers red. Very variable. *Crimson Queen* is a very rare form almost wholly coloured crimson, the petal margins alone being white. Fairly common in cultivation.

Var. Wittei is a dwarf-growing plant, the albino of *L. auratum*, *virginale* being the white form of *platyphyllum*. Bulbs small, as large as a Tangerine Orange, scales numerous, lance-shaped, with slender tips. Stems rarely exceeding 3 feet to 4 feet in height, slender. Flowers three to six on short foot-stalks, arranged in a closely compact raceme so that the petals interlock, white, unspotted, banded deep yellow down the middle of each petal, crimped and undulating at the margins, and the tips gracefully recurve. Anthers reddish. A very chaste variety, but rather difficult to grow in the open for any considerable length of time. Common in cultivation. *Cruentum*, *Melpomene*, *Emperor*, and *Parkmanii*—this latter of hybrid origin—are now lost to cultivation.

Fasciated forms with flat, ribbon-like stems of great breadth, bearing 50 to 100 small and generally imperfectly formed flowers, often occur. The freak is generally a result of injury to the preceding season's flower-stem or excess of plant food in the soil, and is often permanent in duration. *Speciosum*, *candidum*, *monadelphum*, and *Henryi* often produce monstrous stems under good cultivation.

Var. Tashiroi, a dwarf, large-flowered form introduced in 1903, requires further study.

CULTURE AND USES.—The *auratum* group of Lilies has two distinct types of roots—one set produced from the base of the bulbs, whose numbers cannot be abnormally increased, and which are produced late in the year; and another set at the base of the stems, and it is upon the best development of these that success in their cultivation mainly depends. Under normal conditions, where the bulbs are but slightly buried, the lowest inch or so of the stems alone produces roots, but if the situation is cool, moderately moist, and the surface of the soil is covered by low-growing border plants or screened by dwarf shrubs, and if the

bulbs are buried 6 inches to 9 inches deep every inch of the stems will produce roots and do thrice the work of those normally developed. *L. auratum* is not a plant of the plains, but an inhabitant of cool hillsides covered with abundant leaf-soil, in which grows a veritable tangle of other plants. One can grow and flower large bulbs well once without consideration of their natural associations, but if one wishes to establish this fine Lily or any of its forms thoroughly in the open in Britain a low-growing carpet must be provided, the roots of which will withdraw excessive moisture from the bulbs and keep them cool; and, further, a wind screen of shrubs, not necessarily high, must be provided that will temper cold and frosty winds as the young shoots pierce the ground. The cultivation of *L. auratum* is purely and simply association with protective plants; without such, it is not too much to say it cannot be grown in Britain in the open garden for a term of years. Soils for this type of Lily should be light, yet full of nutriment, and we have found that any natural staple free from lime will grow this Lily well if a liberal dressing of peat or leaf-soil be added. Of these two ingredients leaf-soil is the better, particularly if it consists of the upper stratum of semi-decayed leaves found in all Beech and Oak woods. It is necessary that all diseased portions of the scales or those that are quite withered should be cut away before planting, even if but little more than the growing point remains, for many of the failures to grow *L. auratum* have origin in planting the bulbs as received. October and November are the best months for planting operations.

POT CULTURE in the greenhouse is a popular way of growing *L. auratum*, and it is a good way, for the conditions are under control of the cultivator at all times, and there is nothing exceptional in the treatment of *L. auratum* under glass. A moist yet buoyant atmosphere, frequent syringing on the mornings of warm days, occasional fumigation, and a steady warm temperature are practically all that is necessary. Bulbs should be started in pots just large enough to contain them, and when the growth is 1 foot high the plant should be lifted out and placed at the bottom of a pot 1 foot in diameter, adding soil incorporated with old manure inch by inch as the stem roots develop. Small bulbs less than 8 inches in circumference will be satisfied with smaller receptacles, but in any case half the soil should be at the disposal of the stem roots alone. As the flower-spike develops the assistance of weak manure water will prevent undue strain upon the bulbs, and when the inflorescence has died the plant will require just as much assistance as it did before so long as a good leafage remains, then drier conditions should be maintained, the bulbs finally shaken free of soil and restarted as before. For indoor cultivation we recommend the largest bulbs obtainable; for outdoor cultivation those about 10 inches in circumference are best, as they have a year or two ahead of them in which to reach their fullest development. Our experience leads us to recommend that instead of the usual drainage a small inverted pot be used and the bulbs placed immediately upon this, and for outdoor cultivation a similar practice is advisable in wet, retentive soils. It is remarkable how this simple precaution helps the bulbs.

A peculiar mishap, popularly known as sunstroke, caused sometimes by long sojourn in a warehouse or by the drying of the stem roots in the early stages of their growth, has been a source of great trouble to Lily cultivators. Deep planting obviates this in a

measure, and when the plants are grown in pots they should be placed where the sun cannot reach the roots. The mishap is simply a natural result of growing a shade-loving plant in an open exposure. No fungoid or other disease is found upon such specimens.

A disease which originated in Japanese warehouses, where quantities of bulbs are stored for shipment, does considerable damage to the scales in a dry state. It takes the form of slender silk-like threads, and it speedily reduces the bulbs to soft pulpy tissue. Badly infected bulbs are hopeless; those slightly affected recover if the decayed portions are cut clean away and the bulbs rubbed with common flowers of sulphur and planted forthwith in the best of all sterilisers—Mother Earth.

G. B. MALLETT.

(To be continued.)

NOTES ON HARDY PLANTS

THE FUNKIAS.

THE "Plantain Lilies" form a group of hardy ornamental plants, valuable alike for their handsome foliage and flowers. They are admirably adapted for use among other plants in mixed or shrubby borders, or for planting as isolated specimens on lawns. Although they thrive in almost any soil, they benefit greatly by good cultivation, deeply-dug loam, with the addition of manure, producing fine plants which prove very effective. In the "Kew Index" seven distinct species are enumerated, all natives of China and Japan, and six of which are now in cultivation. They show a great range in the form and colour of the leaves, *F. ovata* and *F. lancifolia* especially having numerous varieties.

F. Fortunei, sometimes known by the name of *F. cucullata*, is like a small sieboldiana, with very glaucous, cucullate, leathery leaves, the blades of which are cordate-ovate in shape. The flowers, which appear in July, are pale lilac in colour, produced in racemes on stems 1½ feet high; a native of Japan, whence it was introduced into cultivation in 1876.

F. glauca.—This is recognised as a true species in the "Kew Index," but the plants which have up to now been grown under that name are merely forms of *F. sieboldiana*. No authentic specimens of this are in the Kew Herbarium, and probably the true plant has yet to be introduced from Japan.

F. lancifolia.—A very variable species, with lance-shaped leaves tapering at both ends, and light purple or white flowers borne in lax racemes on slender stems 1 foot to 2 feet high. This and its numerous varieties are very useful as edgings for beds or borders, the compact, tufted habit rendering them peculiarly suitable for this purpose. The most marked varieties are: *F. l. alba*, with white flowers; *F. l. albo-marginata*, with green leaves, edged along the margin with white; *F. l. undulata*, with undulated leaves; and *F. l. variegata*, with beautifully variegated foliage.

F. longipes.—Seeds of this plant were received at Kew from the botanic garden of Tokio, Japan, in 1897, and several germinated, producing plants which flowered some four years later. It is evidently closely allied to the preceding species, only that the leaves are broader and the blade of the leaf is decurrent along the petiole. The bracts of the inflorescence are also much smaller, but the flowers are like those of *F. lancifolia*.

F. ovata, the common Plantain Lily, is one of the strongest-growing species, with large

tufts of broad, deep green, shining leaves. The flower-stems attain a height of 2 feet, terminating in a raceme of pretty lilac-blue flowers in July. A native of China, it was introduced into cultivation in or about 1790. There are two well-marked forms of this plant—var. *aurea*, with golden yellow leaves; and var. *marginata*, with green leaves edged with white. Also known as *F. cerulea*.

F. subcordata (syn. *F. grandiflora* and *F. japonica*), the Corfu Lily, is a very handsome plant, having the largest flowers of the genus. These are pure white and very fragrant, frequently attaining 6 inches in length; not so free flowering as its fellows, it is more particular as to situation, which should be a warm, sunny place in well-drained soil. The leaves are numerous, light green, and from 4 inches to 6 inches broad. A native of China and Japan. It is stated by collectors that it is found growing on the tops of cliffs in almost inaccessible places. Introduced in 1790.

F. sieboldiana (syn. *F. cordata*, *F. sinensis*, *F. Aokii*).—The most ornamental species of the group with its bold foliage, the large, glaucous leaves often reaching the width of 1 foot. It is the most suitable for massing in groups on lawns for effect or for planting as isolated specimens. The flowers bear a considerable resemblance to those of the Corfu Lily, although much smaller. They vary in colour, some being white while others are of a creamy lilac shade, and are borne on stems attaining a height of 3 feet. Native of Japan. Introduced in 1830.

F. tardiflora.—This new plant, which the illustration shows growing in an open border, is undoubtedly in close affinity with *F. lancifolia*, of which it may be considered by some a mere variety. It is certainly distinct enough for garden purposes, its chief difference to the foregoing being in the time of flowering. *F. lancifolia* flowers in July, while the present plant does not bloom till the end of September or beginning of October. The dark green leaves are firmer in texture and have shorter petioles, giving the plant a very tufted appearance. Freely produced on rather stout, purplish stems 12 inches to 18 inches high, the light purple flowers are borne in dense racemes often numbering fifty, another point of difference from *F. lancifolia*, in which the racemes are lax and comparatively few flowered. The

purple colour of the flowers also pervades the bracts, giving the whole a charming appearance and making it a really valuable plant for the decoration of the herbaceous border. Grown in pots it is exceedingly useful for furnishing the conservatory at a time when the choice of plants is limited. This species was introduced into this country in 1895, when plants were obtained from Herr Max Leichtlin of Baden-Baden, flowering at Kew the following October. It may be rapidly increased by division of the root, as all other members of this genus, and is a plant of great promise worthy of a place in the smallest garden. W. IRVING.

PLUMBAGO LARPENTÆ.

Of the great number of persons who passed into the large vinery at Chiswick on the occasion of the recent fruit show, how few probably paused at

FUNKIA TARDIFLORA (THE LATE-FLOWERING FUNKIA) AT KEW.

(The photograph was taken on the 16th inst.)

the rockwork near the entrance to admire the blue-violet blossoms of Lady Larpent's Plumbago, the blue-flowered Leadwort. It was introduced from Shanghai in 1846, and distributed by Messrs. Knight and Perry, the then proprietors of the Exotic Nursery at Chelsea. When first distributed it was treated as a greenhouse plant, though with scant success, but it soon began to be credited with greater hardihood of constitution than was generally supposed the plant possessed. It early came under the notice of Mr. Edward Beck of Isleworth, then the conductor of the *Florist and Garden Miscellany*, and was figured in the May number from a drawing made at Chelsea. Mr. George Nicholson informs us in the "Dictionary of Gardening" that the correct name of the plant is *Ceratostigma plumbaginoides*! The older name will be generally preferred. The rockwork at Chiswick appeared to be an ideal place for this plant. It was by placing it in such a spot at Worton Cottage that Mr. E. Beck became impressed with its value, and I well remember seeing

Mr. Beck's specimen when in the full flush of its beauty; it had spread itself in the soil just as it has done at Chiswick, and it appeared to be perfectly at home in each place. At Chiswick the specimen occupies a place on the rockwork, where it is raised about a foot or so above the ground level, and here it is extending itself and covers a good space of the surface facing the south, but where it can have some shade at midday. If planted on the ground level it is found to do best in a warm, sandy loam or light soil in a sunny position. A raised position is an ideal one. The flowers resemble those of a Phlox, and are produced in clusters from the leaf axils. It is a plant which can be propagated by division of the roots in autumn and spring, but modern authorities recommend the spring in preference to autumn.

R. D.

DIANTHUS CALLIZONUS.

In response to an enquiry about this pretty Dianthus we give the following note from Herr Max Leichtlin, which appeared in *THE GARDEN*, July 28, 1900, page 68: "Dianthus callizonus is a native of the Transylvanian Alps, and one of the most showy alpine we have. It is a well-established plant, which throws up hundreds of flowers over an inch in width during three or four weeks in May. They are of a bright rose colour, with a zone of paler rose towards the centre, which is beautifully speckled with crimson; they are borne on short stalks just above the dwarf deep green foliage, which by breaking the monotony of the sheet of rose even helps to increase the plant's beauty. It is of easy cultivation, and prefers a peaty soil with the addition of a little loam."

HIBISCUS MOSCHEUTOS.

It is surprising that this fine, if rather coarse, plant does not flower freely in our islands, seeing that it does so in its native habitats in the United States, including such parts as New Jersey, where it blooms in profusion in July and August. Its abundance along the coast there has been remarked by those who have seen it, and writers have depicted in attractive language the effect of its wide, gay flowers, and of its large foliage among the Grasses and Sedges of the marshy lands. Unfortunately, our cooler summers seem against its blooming in good time, so that its usefulness for British gardens is largely neutralised. Yet there are gardens in warm localities where an effective plant like this might be utilised, and where it would be well in bloom before frost cut it down or spoil its showy flowers. It is an old plant to cultivation, and "Salmon's Herbal," published about 1710, gives a quaint description of it under the name of the "Rose Marsh Mallow of America," and tells us that it "has a root which is thick, white, and fleshy, which abides safe in the earth all winter, tho' the Stalks die away and perish every year. This plant shoots forth about May, several round, greenish, soft, branched Stalks like to the Marsh Mallow, beset with several soft green leaves which are gray underneath. At the tops of the Stalks and Branches stand several white Flowers, made of five large leaves a piece, somewhat like a Hollyhock, with a tuft of white threads, compassing a middle Umbone or Pointell, issuing out of a great Button or Husk, which is as it were Ribbed, and broad at the bottom, narrowing to the top, before the flower blows, and without any smell."

Although Salmon says the flowers are white, they are sometimes a deep rose or purplish hue, having a lighter centre, but, when white, having a rosy tinge towards the centre. The flowers are from 4 inches to 7 inches broad, while the leaves are ovate or ovate-lanceolate, white and pubescent beneath, and generally glabrous on the upper surface. Its stature is variable, ranging from 3 feet to 7 feet; it is quite herbaceous in habit.

It prefers rather marshy soil, especially if of a brackish character, and its habitats in North America even extend inland to places where the soil is of a saline character. It is, however, capable of cultivation elsewhere, and its main requirements appear to be plenty of moisture and full sun. It is easily raised from seeds, and is suitable for places where wild gardening is followed and where groups of this plant would produce a good effect. It has been known as *Ketmia* and *Hibiscus palustris*, its popular name in North America being the Swamp Rose Mallow or Mallow Rose.

Carselhorn, by Dumfries, N.B. S. ARNOTT.

THE FLOWER GARDEN.

AN HOUR WITH THE HOLLYHOCK.

(Continued from page 281.)

IT has been said that fine Hollyhocks are originated in Scotland and France. In the autumn of 1850 I saw the most celebrated collections in both countries, as well growing as on the exhibition tables. There are two distinct strains in Scotland. The varieties of the one strain, although superior to the common

DIANTHUS CALLIZONUS.

English kinds, are inferior to those of Mr. Baron; those of the other have sprung from Mr. Baron's stock. Some of them, while bearing different names, appear identical with the English kinds, which appearance is supported by the fact that certain kinds are reproduced true from seed. But if not identical—a point difficult to pronounce upon when we consider the variation of soil and climate—they certainly bear a close resemblance. It is not my wish to depreciate the varieties of Scotch origin. I have seen large and handsome flowers in Scotland, remarkable for smoothness and brilliancy; but it must be told that northern and southern florists do not altogether coincide in their ideas of a perfect flower, and each judges according to his own standard. Moreover, the Scotch flowers do not improve in an English climate, and our flowers are probably better here than there.

Much has been said of the beauty of the French Hollyhocks (*Rose tremières*). We have taken considerable pains to visit the principal collections, to ascertain whether they were worthy of introduction to British gardens. Those of MM. Pélé and Bacot, both in the neighbourhood of Paris, are the best. They are superior to the old English varieties, but

inferior to the modern ones. In conversing with the French growers, it was evident that the Hollyhock had not yet taken a very high standing in their country; they had not learned to view it critically; it had not, so to speak, become a Florist's flower; and hence any variety the *tout ensemble* of which produced a pleasing effect was cherished, without much regard to the individual points of form, colour, substance, &c. Some of the mottled or variegated kinds were pretty and distinct; but we could not discover any that would stand the test to which they would be submitted by the English florist.

It may be some gratification to the lover of this flower, in a utilitarian age like this, to be able to assert a claim for his favourite on the ground of utility. In the "Flora Historica" we find the following: "The Hollyhock is likely to hold a higher rank in rural economy than that of feeding bees. For some years past it has been known that a good strong cloth may be made from the fibrous bark of the flower-stalks of this plant, and in the year 1821 about 280 acres of land near Flint in Wales, were planted with the common Hollyhock, with the view of converting the fibres of this plant into thread, similar to that of hemp or flax. In the process of manufacture it was discovered that the plant yields a fine blue dye, equal in beauty and permanence to the best indigo."

This historical notice will, perhaps, be thought sufficiently extended, and we proceed to lay before our readers a brief account of the culture of this flower. In passing, we may, perhaps, be allowed to state our views of the purposes to which the Hollyhock may be applied in garden-decorating, and the positions it is best suited to occupy.

We do not remember that we were ever more struck with the value of this flower for producing effect in garden scenery than by the sight of a round clump planted among groups of trees, shrubs, and dwarf-flowering plants, at Haddo House, Aberdeenshire, a seat of the Earl of Aberdeen. It was in October, and the foliage of the trees

was surpassingly beautiful; the leaves had assumed the tints peculiar to that season, and, "touched by autumn, seemed as if they were blossoming hues of fire and gold." The flower-beds beneath were in dazzling glow, scattered like so many pictures over the lawn, whose verdant and smoothly-shaven surface grouped them in a neat but agreeable frame. Beautiful as were these features, viewed individually, we felt a want of continuity, a sense of incompleteness, until the eye fell upon a group of Hollyhocks which, towering aloft, blended harmoniously with trees and flowers, producing a perfect whole. In this instance various colours were placed in the same bed, which was in good taste; but we can conceive of circumstances in which several small clumps, slightly dispersed, each filled with a single colour, would be more striking and equally effective.

The Hollyhock is a capital plant for the borders of plantations or shrubby walks; it forms a finer distant object in such situations than the Dahlia, is less lumpish, and continues blooming to a later period of the year. Again, it may be planted to advantage in the background of an herbaceous border, so that the

lower part of the stem is hidden from view by the plants in front. In both these situations it may be planted singly, in irregular lines, or in groups of three or five. And here, perhaps, the less choice kinds are more in character than the finest, as a high state of culture is neither convenient nor expected. To be effective *en masse* is all that is looked for, and the showiest should be chosen, the hardy kinds of brilliant colours, and left to assume their natural form of growth.

It is sometimes said that it is not a suitable plant for small gardens. We think, however, it may be agreeably disposed there in avenues, or in groups of three or five near the boundary, filling up in front with dwarf shrubs, herbaceous, or summer-flowering plants. It appears to us anything but difficult to effect such an arrangement with this plant as shall relieve the flatness often so tiresome in small gardens.

The amateur, who cultivates with the view of producing the flowers or spikes in the highest state of perfection, will probably prefer planting in square beds or rows. This is convenient for shading, and places the whole under the eye at one time. If planted in beds, set them 3 feet apart; if in rows, 3 feet from plant to plant, and 4 feet from row to row, that one may walk conveniently between them.

In regard to the soil suitable for the *Hollyhock*, it happily is not over-fastidious in this respect. It is a gross feeder, as its fleshy porous roots and large soft leaves, with high perspiratory powers, abundantly testify. It is found to thrive well in common garden soil, although, if a choice is at hand, a rich moist loam may be preferred. We need, perhaps, scarcely say that a situation airy and freely exposed to the sun is indispensable if we wish to carry culture to the highest pitch of success.

As our remarks are intended for the guidance of the beginner, we will suppose him to have obtained a supply of plants in October or March, and from that period we will trace their culture. First let us ask, "Have these plants been raised from grafts, cuttings, or from seed?" Cuttings or seedlings we think preferable, where the correctness of the latter can be guaranteed by the raiser having previously bloomed them; but as some kinds only are reproduced true from seed it is likely the stock will consist partly of plants raised from cuttings or grafts. One thing is certain, the stock should be renewed every year, either by purchasing or propagating. However abundantly old plants may bloom, they will not produce such large handsome spikes of flowers as young ones. Whether obtained in autumn or spring, they should be at once transferred from the small pots, in which they have been kept for convenience in removal, to larger ones, using a compost of turfy loam, sand, and decomposed manure, placing them in a cold pit until they may be safely planted in the open ground in May.

WILLIAM PAUL, F.L.S.

(To be continued.)

THE BELLADONNA LILY.

AUTUMN provides few more useful or beautiful flowers than the *Belladonna Lily*, and what a delightful picture can be made by a good planting of this bulb our illustration shows. This border of *Amaryllis Belladonna* is at the foot of the Aroid House at Kew and has a southern aspect, and annually at this season is a picture worth going far to see. From one end to the other it is a mass of lovely pink flowers. Without exaggeration it may be said to be the most striking bit of flower gardening in Kew at the present time. The *Belladonna*

Lily is a plant that should receive extended culture, for, although its flowers would be valuable at any time of year, they are doubly so now when hardy flowers get scarcer every week. Provided the bulbs are planted in a warm, well-drained border in fairly light soil, they invariably grow well.

SOME OF THE NEWER EARLY-FLOWERING CHRYSANTHEMUMS.

THERE have been many additions to the list of first-rate sorts during the present year. Last spring many were distributed for the first time, and all interested in the varieties have every reason to be pleased with most of the novelties. There are several specialists who are now devoting their attention to the raising of good new early-flowering sorts. The fifteen seedlings of Mr. Goacher's, which were distributed last spring, have proved of sterling merit. Almost without exception his plants flower in September and give a most attractive display. The habit of the plants is all that could be desired, their growth in the majority of instances being bushy and sturdy. It is very gratifying to be able to record such distinct advance, and, while this is so, it is safe to anticipate an increasing demand for these autumn flowers.

Mr. H. J. Jones has also distributed many excellent seedlings, and in his case the well-known early-flowering Japanese *Mme. Marie Masse* and its sports have been used as seed-bearers and pollen-bearers too. The result of this progeny is seen in plants possessing many of the characteristics of the parent plants. It is curious to note how distinct are the methods adopted by these two raisers, judging by what is seen in their respective seedlings. I was unable to secure plants this season of these novelties, much to my regret. Fortunately, I have seen them growing in different trade collections, and on the occasion of the Tamworth Chrysanthemum "feast," when Mr. William Sydenham had all the novelties planted and a large proportion of them in flower at the time, I was able to take copious notes of each one. The varieties described below are not necessarily of the present year's introduction; as a matter of fact, some were distributed early last year, and a few others possibly earlier.

JAPANESE.

Rosie.—An exceptionally fine flower, being large and full, and of a rich terracotta colour, tipped gold, with a golden centre. The blooms retain their colour till the end. Their value is enhanced because of the long, erect flower-stems, making them valuable for decoration. Fine branching habit, height 2½ feet. Period of flowering, September.

Kitty.—This is a pretty little decorative sort, with pleasing soft pink blossoms in useful sprays. Some may regard the flowers as rather stiff. The plant is of bushy habit, height 1½ feet. A useful September variety.

Muggie.—An effective plant for the border. The flowers are bright yellow with recurving florets, making a full bloom. Each bloom is borne on a useful length of foot-stalk without disbudding, and the plant is a profuse bloomer. Good bushy habit, height 2½ feet. In flower during September.

Cactus.—Another charming variety. The dainty little Cactus-like blossoms, on long foot-stalks, are of a fiery crimson colour, shaded red, with a bronze reverse to the narrow florets. The plant is very free, and has a desirable branching habit. Height 3 feet. In fine form throughout September.

Maggie McLeod.—This is a capital plant that produces handsome sprays of pretty little Japanese blossoms quite freely. Their colour is particularly attractive, orange terra-cotta aptly describing them. Height about 3 feet. In flower in early October.

Polly.—This is one of the best of the present season's introductions. The flowers are large, with broad florets, and very full, even without disbudding. They are borne on long foot-stalks, and are also developed quite freely. The colour may be described as amber-yellow, sometimes suffused bronze. Height about 2½ feet. In flower during September.

Mrs. F. W. Wescott.—A novelty of a distinct and pleasing shade of rich glowing lake, with bronze

THE BELLADONNA LILY (*AMARYLLIS BELLADONNA*) AT KEW.

reverse. There are too few Japanese sorts of this colour. The flowers are borne in profusion in useful sprays. Branching habit, height about 3 feet. Period of flowering, the earlier half of October.

Cranford White.—From what was seen of this plant when exhibited last season it seemed hardly possible that it would prove to be so good. The flowers are large and full, on good, erect flower-stems. Colour white, tinted pale pink on younger blooms. Free flowering, bushy habit, height about 1½ feet. At its best during the latter part of September and early October.

Nellie.—A large, fairly good flower on long, fairly strong, erect foot-stalks. It should be disbudded to some extent to be seen at its best, as it is not very free. Colour yellow. Height 2½ feet. In flower, September.

Mrs. A. Willis.—This is a valuable sport from Japanese Mme. Casimir Perier, and partakes of all the good points of the parent variety. The colour may be described as deep yellow, shaded

and striped with red. The plant is a most profuse bloomer, possessing a bushy habit. Height about 2½ feet. A mass of flowers is developed in late August and throughout September.

Mabel.—A charming little free-flowering plant. The blossoms are certainly pleasing and dainty, the colour being a lovely shade of cerise-pink, with a golden buff centre. Habit dwarf, though not so sturdy as one would desire. Height about 2½ feet. Period of flowering, September.

Carrie.—In this instance we have a plant that may be regarded as a most persistent bloomer. The colour is a rich bright yellow, of good form, and the flowers do not lose their beauty in wet weather. It is free-flowering and of a good bushy habit. Its constitution is also robust. For border culture it is an ideal sort. Height about 2½ feet. In flower from August onwards.

Several other good sorts will be described in a subsequent issue.

Highgate, N.

D. B. CRANE.

GARDEN ORNAMENT.

LEADWORK.

WE are apt to consider the plumber rather as a working man than as an artist, and, indeed, at the present time leadwork has lost much of the dignity lent to it by the admirable designs used in bygone times, when even a pump-head was often made so beautifully as to be worthy of preservation in a museum. The ease with which lead can be manipulated is probably the reason that even in remote antiquity it was employed not only for useful but also for ornamental purposes. It has the rare merit of durability, although, owing to its pliable nature, very large pieces of Greek and Roman leadwork have not come down to us. The writer remembers many years ago attending an excavation in Rome at which several big specimens of leadwork were discovered, but they had been flattened in the course of ages to the consistency of pancakes, though still retaining evidences of having once upon a time been either fair-sized busts or vases.

In remote antiquity lead was used for the reproduction of small images of the gods, which, judging by those preserved in the National Museum of Naples and of the Lateran at Rome, were coated with paint. At Nineveh, and among the ruins of famous classical cities in various parts of Asia Minor, leaden images, jars, and pieces of elaborately decorated water pipes have been found in great quantities. It seems, however, according to Sir G. Wilkinson, that lead was not greatly used in Egypt, excepting for the inlaying of temple doors, coffins, and furniture, and as small statues of the popular gods Osiris and Anubis.

At a very early age the plumber's trade included that of coffin-making, and there is scarcely an ancient people which did not employ this metal in the manufacture of "man's last home." Many of these leaden coffins were superbly decorated with intricate patterns; indeed, even the effigy of the dead and various pagan or Christian emblems figured upon the lid. Among the finest specimens is one in the Temple Church, and there are two others at Lewes, in Sussex, with exquisite crosswork patterns on them. One relating to Sir William de Warren is dated 1088, and the other to his wife, a daughter of the Conqueror, bears a date three years earlier. At the heads are the two names of their ancient inmates, Wilhelm and Gondrada. In Italy there are a great number of elaborate lead coffins, and a few years back I remember to have seen in the Church of Santa Maria di Monserrato, Rome, the two fine leaden coffins containing the remains of the famous Borgian Popes, Calixtus III. and Alexander VI. They had rested in the vestibule since their removal from the old Basilica of St. Peter's, in the beginning of the sixteenth century, but were, at the expense of the Spanish Government, encased in a suitable monument some ten or fifteen years ago.

Greek and Roman gardens differed in most respects from our own. Almost every house in Ancient Greece had its garden, that is to say, a sort of terrace on which Cypresses and Oleanders grew in artificial beds, containing a sufficiency of earth to give them nourishment. The Greeks, however, seem to have had no idea of flower-beds, in our sense of the term, but cultivated their bulbs, Rose bushes, and other decorative and flowering plants in pots, many of which undoubtedly were made of lead

FLOWER VASE (LEAD) AT DRAYTON MANOR

and highly decorated. Homer gives us in the "Odyssey" a fine description of the gardens of Alcinoüs, which seem to have been a combination of orchard and flower garden, together with the usual architectural garden which the Greeks considered perfection. But the Romans, who evidently derived the arrangement of their gardens from the Greeks and Etruscans, enlarged upon the original scheme, and in classical times Italy might well have been described as one vast garden, extending over the whole of the civilised part of the Peninsula. Some of the Roman gardens, those of Pompey, Lucullus, and Mæcenas, were of enormous size, and included meadows through which artificial rivulets were made to flow, and important and well-organised vegetable and fruit gardens. But the decoration of a classical garden was probably much too artificially elaborate for our taste.

In some of these old Roman gardens there were as many as 4,000 or 5,000 statues, mostly of white marble or bronze, and the finest works of ancient sculpture now preserved in the Vatican and other museums originally formed part of the marble Olympus of some classical garden. Leadwork was plentifully used by the Romans for vases, water troughs, and also, occasionally, for statuary purposes, but marble and bronze, being then, as now, comparatively cheap in Italy, were naturally preferred to the inferior material, which does not produce the same effect in a brilliant southern atmosphere that it does in our own, which, with all its faults of changeableness, is nevertheless exceptionally soft and silvery.

At the time of the Italian Renaissance, that is to say, about the beginning of the fifteenth century, the Italians were seized with a rage for building villas after classical models, and leadwork reappears in their long and stately walks and formal alleys. Ficoroni, in his book "De Piombi Antichi," mentions some important leadworks modelled after the antique as having been set up in the sixteenth century in the gardens of the Villa Ludovisi, and of other celebrated villas in and near Rome, as well as at Florence and Genoa, but very few of them are now in existence.

France took up ornamental gardening some fifty years before we began to turn our attention to the subject on a large scale. Outdoor gardens, however, were, in those times of almost incessant civil war, very small. Caylus, in his curious book on leadwork, tells us of the existence in France of leaden statues at an early period, but observes that they were exceedingly rare, and it is doubtful whether leaden statues were ever introduced into French gardening on any considerable scale until quite the reign of Louis XIV., when reproductions of celebrated statues in the Italian museums and galleries, and some fine original works were manufactured, and thus began to make their appearance even in the suburban villa gardens of Paris. It was unquestionably the abundant use of lead in the gardens at Versailles which set the fashion of the employment of this material for garden decoration in this country. Under Louis XIV. François Girardon designed and executed the enormous fountain of the Pyramid, which is altogether the most elaborate composition ever executed in lead, and consists of a basin in which sport three life-sized tritons, rising from a pedestal. Above these is a circular basin, and above it again three others, diminishing in size, each supported from the one below round the rim by little tritons and dolphins, whereas the last is entrusted to a group of lobsters. In the Versailles Gardens are, it seems, many

THE SILVER HOLLY (ILEX AQUIFOLIUM ARGENTEUM) IN THE GARDENS OF SHIPLEY HALL, DERBY.

other leaden statues, but most of them have been painted over.

There is a figure of Mercury at Melbourne, which is very suggestive in its pose of Gilbert's Eros on the fountain at Piccadilly Circus, and is in all probability a leaden replica of a statue of Mercury by Giovanni da Bologna, which is mentioned among the collection of statues which for some twenty years in the first half of the seventeenth century adorned York Terrace, Strand, and which were included among the art treasures belonging to Steenie, Duke of Buckingham. The original statue is lost, but there are several drawings of it extant.

Drayton House, with its quaint old English garden by way of foreground, forms a scene which can only be enjoyed in England. It may not possess the architectural magnificence or the luxuriance of an Italian villa and garden, but where can anything comparable to it be found in its reposeful air of comfort? The Italian villa is altogether too romantic for our matter-of-fact days, and is better suited to an age and climate where serenades are possible, and stately pavones can be danced by

the light of the moon. So, too, the leaden vases which ornament the terraces of Drayton, exquisite in design, their silvery hues blend with the soft English atmospheric effects far better than would the cold garishness of marble, and prove once more that leadwork should find its place in every well arranged English garden.

(To be continued.)

TREES AND SHRUBS.

TWO GOOD HOLLIES.

THE following notes, to accompany illustrations of Hollies in the pleasure grounds at Shipley Hall, may be taken as supplementary to those published in the issue of THE GARDEN for June 20 last (pages 423-4), in which the general conditions of soil, planting, selection, and culture necessary to grow good, healthy, and shapely specimens were discussed. In referring readers back to these notes I may add that extensive planting operations carried out this spring add further

proof, if such is necessary, that late spring planting is by far the best. We commenced planting quite large specimens, running up to 13 feet and over in height, when the cold snap at the latter end of April was over, and continued throughout the whole of May, and, I think, into the first week in June. All the trees dealt with have done well, but the growth made has been in inverse ratio to the time of planting. The last specimen dealt with was a plant of *Ilex Whittingtoniensis*, a by no means vigorous grower generally, but it has made shoots considerably over 1 foot in length, and scarcely lost a leaf. The period of planting can be traced by the growth made, and by the loss of leaf which occurred, those first planted losing most leaves, probably from the fact that the soil was then cold and the roots not fully active.

In my June notes I alluded also to the "feathering down" of the trees, well exemplified in the Silver Holly here illustrated, and attributed it to the clean soil surface kept round the plants, which are growing on the lawns. To keep this clear space open without showing too much bare soil it is advisable to take off turves from 6 inches to 1 foot wide about twice a year; first, in spring, at the commencement of growth, and again just when the second growth starts. This keeps the mowing machine quite clear of the lower growths, and the turf raised comes in very useful for repairs to bad patches in the grass elsewhere. Going back to the planting I may say that from May 18 to July 27 this year our rainfall amounted only to a little over 2½ inches, so that the season was not an ideal one for newly planted evergreens.

Turning to the two subjects immediately at hand, I may say that I consider *I. argentea marginata* to be by far the best and most effective of the Silver Hollies. It is a very healthy and good grower, and very little affected by the leaf-mining grub which defaces so badly many Hollies, an important point worth noting by planters in badly affected districts. In its spring garb, when the new growths are tinged with pink, it is very beautiful; and later, when the pink changes to white, no Silver Holly has a better defined or whiter margin to the leaves, though that of Silver Queen is broader. The leaves of *I. argentea marginata* are rather small, and are particularly well armed. The habit is dense, and the tree is not disposed to lose the top of its leading stem as many of the variegated Hollies do, so that, given a good start, a shapely tree is practically assured. Before leaving the silver-leaved Hollies I may say that the variety known as Handsworth Silver, sent out many years ago by Messrs. Fisher, Son, and Sibray, is an excellent companion to *I. argentea marginata*. It is a quick grower, with a well marked, much elongated leaf, and makes a very healthy and good specimen. *I. crenata*, which will be illustrated next week, is so distinct from all other Hollies that it is frequently not recognised as belonging to the genus. The leaves are smaller than those of the common Box, without spines, but with crenated edges, and are very dark green in colour. It bears myriads of tiny blossoms, but I have never yet seen a berried form of the plant. Its habit is that of a dense spreading bush, that cannot by any manipulation be grown to one leading stem, but a glance at a good plant will show that in its way it develops into a shapely specimen, suitable either for growing singly on the lawn or for use as a frontage to a shrubbery. It has been described as "a pretty species for dwarf bedding," but the specimen at Shipley

is at least 8 feet high and over 12 feet in diameter. Judging from this plant and others that have been grown here, there is no reason why it should not double its present size. There is a form of *I. crenata* in which the leaves are more or less splashed with yellow, but in this case variegation seems to be wedded to a stubborn habit of growth, and those specimens which really grow away freely go back to the green type.

J. C. TALLACK.

NEW TREES AND SHRUBS.

NOTES FROM THE AUTUMN CATALOGUES.

THE autumn catalogue of M.M. Lemoine and Sons of Nancy contains, as usual, the announcement of some new flowering shrubs, most of which have been raised from seed at their establishment. The novelties, with a brief description from the catalogue, are:—

Deutzia gracilis multiflora.—Plant extremely tufted, with the growth like that of *D. gracilis*. The many upright branches are covered throughout their length with innumerable white, round-petalled flowers, while the stamens are scarcely noticeable. It is the result of crossing *D. gracilis* with *D. discolor purpurascens*.

Philadelphus Lemoinei Bouquet blanc.—The foliage of this is in general appearance midway between that of *P. Lemoinei* and *P. coronarius*. The flowers, which are borne in clusters of about ten together, are double or semi-double, and so closely packed that each cluster presents the appearance of one large double flower. Established specimens of this shrub are very beautiful, and distinct from any other form of *Philadelphus*.

Philadelphus Lemoinei Conquete.—The slender branches of this are arched over with the weight of flowers, which are borne three to five together. They are very large and double, the petals arranged in the form of a Tulip, and with the perfume of the hybrids of *P. microphyllus*.

Syringa vulgaris Pasteur.—A single Lilac, with long, erect, pyramidal-shaped inflorescences, while the flowers, which are the largest of all, are of a wine colour, changing to Mulberry red.

Syringa vulgaris Miss Ellen Willmott.—One of the double Lilacs of which M. Lemoine has raised so many within the last twenty years. In this the inflorescences are large, the flowers well formed, the petals spreading and of a snow white tint.

Syringa Giraldis (S. villosa, Sprenger).—A new species from Northern China with leaves soft in texture. It has not yet flowered in Europe.

A glance through the extensive catalogue issued by M.M. Barbier and Co., of Orleans, more generally known by the previous title of the firm as Transon Frères, resulted in a few novelties being particularly noted. Chief among them are:—

Ailanthus glandulosa pendulifolia.—A handsome tree, with leaves 4 feet long, gracefully drooping, and without any unpleasant odour.

Cornus sanguinea variegata Moseri.—The price of this, 10fr., would suggest a very superior variety. It is described as bearing quadri-coloured foliage, the leaves of the young shoots being margined with yellow, which changes to creamy white, tinted and bordered with carmine-pink, which with age increases in intensity. Whether this *Cornus* will ever become so universally popular as *C. Spæthii* remains to be seen.

Prunus spinosa purpurea.—Less prickly than the type, with leaves as highly coloured as those of *P. pissardi*. It is naturally of a bushy habit, and is very hardy. The flowers are small, pink in colour, and borne in great profusion.

Wistaria multijuga rosea.—A form of this long racemed *Wistaria*, whose flowers are of a lilac-rose colour with the standard of a lighter tint. The buds are of a beautiful clear rose.

Messrs. Veitch announce among various novelties for the present year two new shrubs, both of which have been exhibited by them, and a particularly interesting tree from Central China. The three subjects are:—

Buddleia variabilis veitchiana.—A very fine form of this variable species of *Buddleia*, whose

flowers are borne in great profusion. They are disposed in long racemes, and are individually bright violet-mauve in colour, with an orange-yellow centre. This was given a first-class certificate by the Royal Horticultural Society on August 19 last year.

Jasminum primulinum.—A beautiful *Jasminum* from Western China, which attracted much attention on March 10 last when exhibited at the Drill Hall and given a first-class certificate. Its nearest relative is *J. nudiflorum*, but it differs in many features from that well-known species. Firstly, it flowers in spring and not in winter as *J. nudiflorum* does; next, it is almost if not quite evergreen; and, thirdly, the flowers greatly exceed in size those of the older species, being fully 1½ inches across. The colour is a clear bright yellow, with a slight orange pencilling at the throat. Some of the flowers show a tendency to become semi-double.

Davidia involucrata.—Concerning this interesting tree Messrs. Veitch say: "The special object of our traveller's (E. H. Wilson) last journey to Central China was to obtain seeds of this strikingly handsome tree, which was first discovered by l'Abbé David, after whom it was named. In this undertaking Wilson was successful, and we are glad to be in a position to offer it to planters. Only young plants of *Davidia* at present exist in Europe, and all purchasers may have the honour of flowering it for the first time. In the whole vegetable kingdom there is not a more striking object than a tree of *Davidia* when covered with its pure white bracts, in which state it is conspicuous at a great distance. The tree attains a height of 20 feet to 30 feet, and there is little doubt of its hardiness in Great Britain, as it is found only in high elevations, where the winters surpass in severity those experienced in these islands. In our Coombe Wood Nursery plants have withstood 15° of frost unprotected." In THE GARDEN for January 4, 1902, Dr. Henry writes: "*Davidia*, a large tree bearing thousands of flowers, which are most peculiar. Inside a pair of white bracts about the size of the hand is a head of red-anthered stamens, out of which projects a champagne bottle-shaped gynoecium. This tree in full flower is a marvellous sight, owing to the alternate white and green, caused by the large white bracts intermingling with the leaves." It is to be hoped that such a desirable tree as this will prove hardy in British gardens. H.

NOTABLE GARDENS.

SANDRINGHAM.

A VISIT to Sandringham at any time cannot fail to be of interest, as in a garden of this description crops, &c., are grown on a large scale. As far as hardy fruit and flowers are concerned this has been a bad season for these gardens, spring frosts and a continuance of cold showery weather having been quite against a full crop of hardy fruit and blossom in the hags parterres. Growth there has been in abundance, but, as was to be expected, flowers were scarce. The magnificent centre path through the kitchen garden on the way to the dairy affords a grand opportunity for a blaze of colour, a border on each side—7 feet wide—being planted mainly with perennials and annuals, all arranged in a sloping bank. The borders are flanked with a row of cordon Apple trees of leading varieties. In spite of the weather many of the trees were carrying good crops of fruit. The path and borders cannot be less than 600 yards long. Some idea, then, can be gained of the effect produced with choice annuals in galore, and herbaceous plants carefully chosen.

In the small sunken flower garden close to the dairy are some exceptionally appropriate topiary work—Box and Yew—deftly formed and carefully clipped to retain the correct ideas of the various subjects. In the flower garden in front of the house tuberous Begonias were making a gorgeous display in spite of the dripping weather, proving once more, if it were necessary, how valuable are these plants for the outdoor garden.

Roses apparently had done good service; a long border in the kitchen garden planted with the finest varieties, especially Teas, in groups of half a dozen of one sort, were making satisfactory growth for a full crop of late and useful blossoms. The border in question is at the foot of a Pear wall, the border ranging in height from 2 feet to 4 feet from the path. What must be a very effective display during the spring and summer months is a rock garden, arranged to keep the border soil in its proper position and flanking the path. It is planted with *Aubrietas* in quantity, *Campanulas*, *Cotoneasters*, &c., for both winter and summer effect.

One could not fail to appreciate the master-hand at work when within the immense range of glass houses with which Sandringham is furnished. In spite of an indifferent season in this part, even for under glass occupants, the various departments left nothing in the matter of culture to be desired.

The Vines were especially noteworthy. In a narrow lean-to structure was growing the finest crop of Lady Downe's Grape I have seen for many a long day. Large were the bunches and berries, while that dense "bloom" on the berries which renders this late Grape so attractive, yet not always to be found, was here in perfect condition, proving once more, if it were required, that this Grape cannot be excelled for use during the early days of the year and onwards until Black Hamburg Grapes are ripe in May.

Two houses of Muscat of Alexandria were worth going a long journey to see, so even were the bunches; loaded as they were they are not always seen with that amber tint of colouring so pleasing, and which denotes exceptional flavour also. Speaking broadly the vineries were pictures of health and future promise, and such as even the exacting chief here, Mr. Cook, may well feel proud of.

It was too late to see a crop of Peaches; the appearance of the trees was sufficient to denote the kind of crops secured—that dark green ample leafage so necessary to success was here to its fullest extent. Melons for late use were in a most promising condition. In the plant department, too, there was evidence of perfect knowledge and care bestowed. One of the finest batches—1,000 plants—of *Begonia Gloire de Lorraine* that one could wish for were to be seen. The difficulty was to find a pale coloured leaf, let alone an unhealthy plant, among the lot. Carnations, too, are produced in huge quantities, and from the appearance of the plants they will be more so during the coming season. There are not many private gardens where such a collection of *Crotone*s is to be found. True, they are accommodated in a magnificent house for the purpose; no expense or labour is spared with them, as this is such a useful subject for decoration.

This is not intended as an exhaustive report of the many items of interest here to be found, but just a few jottings from memory made during a walk round the garden in early September. A good garden of fruit, such as exists at Sandringham, is always a pleasure to see, especially when the trees are thoroughly well grown. It is seldom that one sees the Muscat of Alexandria Grape so finely coloured.

E. MOLYNEUX.

[The publication of these notes has, unfortunately, been delayed.—Ed.]

ORCHIDS.

LÆLIA HELEN.

RAISED by Messrs. Charlesworth of the Heaton Nurseries, Bradford, was the above, its parents being *L. digbyana* and *L. tenebrosa*. Undoubtedly it is in the front rank of artificially-raised Orchids, and, as shown in the accompanying illustration, is very handsome. The sepals and petals are bronzy rose, the large beautifully-fringed lip being of a pale rosy lilac colour. As with the majority of *Lælia* and *Lælio-Cattleya* hybrids, its constitution is robust, and, given an

Some of the species have delicate white flowers—for instance, *G. discolor*, which proves very useful for bouquets, as well as for other purposes. Some are easy to grow and others rather difficult, but with care and proper treatment all may be had in perfection. When grown well they amply repay for any trouble that may have been bestowed upon them. They do not require the same treatment as *Anæctochilus*, as they will grow in any house where there is a temperature varying from 55° to 60°. The compost used for potting should be peat and sand, with a little loam. Always give a liberal supply of water to the roots during the growing season. *Goodyeras* are propagated by cutting up the plant so as to have a piece of root attached to each piece. Many growers of this beautiful plant pot six plants in a 5-inch pot; these, when grown strongly, will produce an abundance of flower during the winter season.

JOHN R. MORGAN.

Waddesdon Gardens.

LÆLIA HELEN IN THE GARDEN OF SIR TREVOR LAWRENCE, BART.,
BURFORD, DORSET.

ordinary *Cattleya* house treatment, its cultivation is easy. *L. Helen* received an award of merit from the Royal Horticultural Society on May 28, 1902.

THE GOODYERAS.

THIS is a very interesting class of plants belonging to the section of variegated Orchids. Many of the *Goodyeras* have beautiful foliage. Some have dark velvety leaves marked with gold and silver lines down the centres of the leaves, and others have gold and silver markings spread over the entire surface like the *Anæctochilus*. The plants have thick fleshy roots, and push from underground stems, forming a compact habit of growth. The flower-spikes which issue from the centre of the foliage attain a height of from 6 inches to 10 inches.

ANÆCTOCHILUS.

THE genus *Anæctochilus* is one of the most remarkable of the variegated-leaved Orchids. They are rather difficult to grow except under proper treatment, and are rarely seen except in large collections of Orchids. All are remarkable for a compact dwarf habit, perfect form, and great beauty; they vary in height from 3 inches to 6 inches, and their leaves vary from 2 inches to 5 inches in length, including the stalks, which, like the stems of the plant, are short and fleshy. The foliage of all the species is beautiful; in some of the varieties it resembles a purple velvet, regularly interspersed with a network of gold. In others the leaf is bright green, covered with silver tracery. The temperature required is 60° by night and 65° by day. From March to October is the season of growth, when they require plenty of water; in fact they should never be allowed to become dry at the roots or they will perish; but from October to March they should only have enough water to keep the compost moist. For potting use sphagnum chopped into small pieces, mixed with a little good peat and silver sand. These plants require small pots as they do not make many roots, and in placing the roots in the pot raise the stem above the rim of the pot. Well established plants may be repotted once a year, and the end of February or the beginning of March is the best time for doing this. They succeed best under bell-glasses or in a glass case, with a little air always on to keep them healthy and prevent damping off.

If bell-glasses are used plunge the small pot into a larger one, so that the bell-glass will fit the outer one. If grown in cases put them in small pots, and arrange them in the case, placing good drainage at the bottom, a layer of sphagnum on the top of the drainage, with some sand on the top of the sphagnum to set the pots on. The bell-glass or case in which they are grown should be kept perfectly clean in order that the plants may have plenty of light but no sun, for this is injurious to them. I have also seen *Anæctochilus* grown with bottom-heat, but with this I do not agree. In most cases the plants grow very fast for a time, but become so weak that they eventually die. The flowers are small and unattractive, and often injure the plants, so it is best to pinch them off as soon as they appear; this induces the plant to make lateral shoots freely. Propagation is effected

by taking cuttings with roots attached. The *Anæctochili* are subject to different kinds of insects, and these must be destroyed as soon as noticed or they will soon cause a lot of injury. Red spider is very destructive, and unless constantly kept in check soon disfigures the foliage. Upon the first appearance of this take the plants out of the case and rub the undersides of the leaves with a sponge. The thrip is another enemy which must be kept under in the same way or by fumigation, taking the glasses off for a short time. In smoking great care should be taken not to give too strong a dose. The safest plan is to fumigate three times, with an interval of one night between each operation, when both red spider and thrip will be destroyed. Cockroaches should never be allowed to get near the plants, as they do great mischief by eating the young stems. They must be sought after by lamp-light, or killed by placing some beetle poison in different parts of the house.

Waddesdon.

JOHN R. MORGAN.

(To be continued.)

GARDENING OF THE WEEK.

INDOOR GARDEN.

WINTER VIOLETS.

VIOLETS in pits for winter blooming should have attention at once. A gentle bottom-heat produced by fermenting materials is best. The materials should be well prepared before being placed in the pit, so that no violent heat occurs afterwards; 4 inches or 5 inches of good light loam, with a fourth part of leaf-soil added, will be suitable for planting them in. See that the soil is laid evenly over the fermenting material, and when planting keep the crowns of the plants slightly raised above the soil. Press the soil tightly around the roots, and, unless room is limited, place the plants 1 foot apart each way; give the pit a good watering with tepid water after the planting is completed, and ventilate freely during mild weather.

PLANTS FOR FORCING.

Where a regular succession of flowering plants is in demand, Ghent or American Azaleas embrace a large variety of seedling plants, having flowers of all shades of orange, yellow, and pink to almost white; they are hardy, force well, and are excellent for cuttings. *A. indica* varieties are the choicest section of the genus; they also force well, and produce flowers of every shade of red and white, but are not absolutely hardy. Plants of the *A. mollis* or *sinensis* section are very free blooming and of the greatest use for forcing. Selections may be made from the catalogues of any of the large nursery firms. *Spiræa japonica* var. *multiflora* and *compacta*, *Deutzia crenata*, *D. c. flore-pleno*, and *D. gracilis* are the most useful. Lilacs are indispensable for forcing. Marie Legraye is largely used for this purpose, but the finest pure white form is one supplied by Messrs. Veitch of Chelsea named *virginialis alba*, and for a deep purple *Souvenir de S. A. Spath*. *Staphylea colchica* is a very free-blooming plant. *Cytisus* in variety, including *C. scoparius andreanus*, *Dielytra spectabilis*, *Salomon's Seal*, *Rhododendrons* in pots, and *Roses* also grown in pots all require one or two year's preparation for forcing, and for this reason I recommend, as being in every way the most satisfactory, that they should be purchased from any of our large nursery firms who devote a department to this branch of the trade. As soon as the plants arrive they should be potted up into the smallest pots they can be got into without mutilating the roots, and for the Azaleas and *Rhododendrons* a little peat should be mixed with the soil; for the others any light soil will do.

POT THEM FIRMLY

and afterwards plunge them deeply in coal ashes out of doors until the time for starting them arrives. With the exception of Azalea *indica*, which must be placed in a cold pit, in all cases it is desirable that the forcing process should be

gradual and progressive, or the result will be an excess of foliage.

For the general stove and greenhouse the question of temperature and general treatment for the winter months will now engage the attention of the gardener. The temperatures should now rule considerably lower, and should be allowed to range from 4° to 6° between 10 p.m. and 6 a.m. in any house requiring fire-heat. The temperatures at 10 p.m. in the Croton house should be 70°; in the ordinary stove, 66°; *Pelargonium* house, for the show and fancy section, 54°; *Carnations*, 45°; *Cinerarias* and *Calceolarias*, 40°; *Ericas* and ordinary greenhouse plants, 40°. Admit a little air to all houses during the night by the side ventilators arranged under the stage, and to the cooler houses by the top ventilators as well. Avoid anything approaching a dry, burning atmosphere, but rather resort to damping the paths once in the evening.

Wendover.

J. JAQUES.

KITCHEN GARDEN.

CELERY.

MANY would imagine this to have been an ideal year for Celery growing, as it revels in abundance of moisture at the roots and overhead, but there has not been sufficient warmth, and all the crops that have come under my notice are far below the average quality, including our own. The Celery leaf-miner is in strong evidence; as a matter of fact I have never seen it so numerous as it is this year. Generally speaking this pest can be kept in check and often extirpated by timely applications of suitable insecticides or soot, but not so this year. The private grower has to maintain a supply throughout the winter and on into the spring, and he must afford some extra protection to the tops of the plants to ward off snow and severe frosts. Fresh cut Bracken is unsurpassed for the purpose, as it is light, and I know of nothing so suitable for gardens where large breadths of Celery are grown.

AUTUMN-SOWN ONIONS.

There are two methods of growing these, viz., by transplanting now on to prepared ground where they are to complete growth, and by leaving the plants where sown until March and then transplanting. I cannot say that there is much to choose between the two methods, at least I have grown them well by both. The nature of the soil and the locality has, of course, to be considered as to which is the best.

BEANS IN POTS.

It is now of little use sowing these, for before the plants could become strong the days would be so short, and the artificial conditions necessary for keeping them growing would be prejudicial to the free setting of the flowers. Plants in various stages of growth that require it should be top-dressed with rich, light soil, adding to it and well incorporating a few handfuls of an approved plant manure. Keep quite near the roof glass in a structure that is kept at about 60° by night and 70° by day.

RHUBARB.

Owing to the scarcity of Apples and other fruits there will be a greater demand for forced Rhubarb over as long a period as possible. A few roots should be lifted, and if possible subject them to a few degrees of frost, then place on the floor of the Mushroom house and shake some leaf-soil among them. Turn on a little fire-heat, and keep the crowns syringed several times a day. Of course the structure must be kept quite close and dark, and of an equable temperature. Successional batches should be brought in according to the demand, and as the winter advances and the roots become more matured the produce from them will naturally improve.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

FRUIT GARDEN.

VINES.

WHEN the leaves are off the Vines steady attention to cleanliness, gentle warmth, and ventilation will carry all the late-keeping sorts on to Christmas, when they may be cut, bottled, and the Vines

pruned and rested. If not already done, the inside borders in the Lady Downe's house may be well covered with loose, dry Bracken, for the twofold purpose of keeping down dust and absorbing moisture. Outside borders may also be covered with shelters to throw off cold rain and snow from the time the leaves fall until the Grapes are cut, when exposure will again be preferable to getting the roots too dry. Where late Muscats are wanted to keep as long as possible, the houses will require very careful management during the fall of the leaf. Let the temperature decline to 50° in mild weather, and give no more fire-heat than is necessary to the maintenance of a dry, cool atmosphere and safety from frost. Remove all plants and evaporating pans, cover the floor with Fern, and dry out or cover up the water cistern to prevent the absorption of moisture by the atmosphere, which must now be dry and buoyant. As thoroughly ripened Muscats are easily caught by the sun, it is a good plan to strain a piece of Nottingham netting or thin canvas across the roof of modern houses to protect the shoulders and to secure an equal temperature through the night. If any late Hamburgs are still hanging on the Vines in houses which are retarded in the spring they will now keep better in the Lady Downe's house or Grape room, and in order to thoroughly ripen up the wood the house may be subjected to a period of sharp dry firing, with plenty of air on fine days.

EARLY VINERIES.

from which the first crop of fruit is to be gathered in May, may be closed at once. If fermenting material is applied to the internal borders a temperature ranging from 45° to 55° may be maintained without the aid of much fire-heat, but in the event of the weather becoming very cold the pipes must be made warm every morning and the swelling of the buds aided by frequent syringing with warm water. The best material for producing gentle warmth is fresh Oak leaves and short stable manure, thoroughly worked and fermented before it is taken into the house. The outside borders hitherto exposed to the elements may be protected with litter or shutters, but no artificial warmth must be applied to them until the buds begin to swell. After the house has been closed for a week or two the temperature may range about 55°, with a rise of 5° to 10° on sunny days. If the Vines are young they may be slung in a horizontal position, as more time and attention will be needed to secure an even break, while old ones will break equally well if tied up to the wires as soon as they are pruned and dressed and exposed to a few degrees more heat by day. But in all cases, from the beginning to the end, a low or resting night temperature will be found one of the main features of success in the cultivation of Grapes.

Madresfield Court.

W. CRUMP.

FLOWER GARDEN.

THE CLEMATIS.

No flower garden, however small, is really complete without some of the numerous varieties of this beautiful climber; the ease and rapidity with which it grows makes it one of the most popular of all our climbing plants. It gracefully trails over arches and covers bare places where it would be difficult to get things of a more tender nature to grow, and when a judicious selection is made clouds of blossom may be had from the end of July until quite late in the autumn. Now is the best time to plant, and it is well to make a good start and do the work thoroughly, for in all probability climbers of this character will remain in the same position for years. In planting dig a hole about 2 feet square, place a good layer of rotten manure at the bottom, and fill in with a compost of loam, leaf-mould, and road grit to make it porous. Great care should be taken not to injure the roots when planting. A little protection should be given on the approach of frost until they get established, after which they are capable of taking care of themselves. Good plants in 5-inch pots can be obtained cheap at the present time from any well-known nurseryman, and the following are a few good varieties: Albert Victor, Blue Gem, Duchess of Edinburgh, Lord Nevill, and Gipsy

Queen, and for covering rough unsightly places nothing can be more beautiful than *Clematis montana* and *C. Flammula*.

BRITISH ORCHIDS.

Those who are interested in this class of plants will find this to be the best time for transplanting most of the native species, and those who marked where the finest plants grew will now see the advantage of so doing. Where the soil is not suitable for them, it must be made so if success is to follow. Some kinds do best in a fairly sound loam with which lime has been freely impregnated, most of the Orchids and Ophry species liking this treatment. Others, such as *Habenaria bifolia*, grow as a rule in the shade of trees, where the soil is moist and consisting often more largely of decayed vegetable matter, as leaves, than of loam. For these equal parts of peat, light sandy loam, and leaf soil will be found a suitable mixture. They should be planted where moisture is abundant yet where the roots are not standing in water. A suitable place may be found in most gardens for wild Orchids in shrubberies, on the borders of woodland walks or drives, under the shade of large trees where few other things would thrive, in the rock garden or hardy fernery, or even in the herbaceous border, if not too much exposed to the sun. To the beginner I would say try only those known to be of easy cultivation. *Orchis maculata* (partial shade is best for this) will grow like a weed in a rather adhesive, moist loam. *Orchis pyramidalis* is one of the best for massing, the pretty heads of rosy pink flowers having an elegant and effective appearance when planted in any semi-shaded position; it delights in a good sound loam, inclined to be heavy rather than light. The Bee Orchis (*Orchis apifera*) when suitably placed is very pretty, but is more difficult to grow than those named above. The most likely place for it to succeed is on the rockery. *Ashwellthorpe, Norwich.* T. B. FIELD.

THE FRUIT GARDEN.

CORDON PEAR TREES.

WHERE a wall is available, say, 12 feet high, the single cordon answers admirably, and a wall surface can be covered in less time by this system of training than by any other. It also has the advantage—and an important one where space is limited—of giving the grower an opportunity of cultivating a selection of varieties, whereas it would not be possible to do so if horizontal or fan-trained trees were planted. But where the walls available are comparatively low the double or triple upright cordon is to be preferred. It is comparatively seldom that one comes across cordon-trained trees in the open. I should recommend that advantage be taken more frequently of this form of training for the culture of the Apple and the Pear, especially in small gardens, as they occupy so small a space and are of decorative value also, whether trained as an espalier by the side of a walk or to cover an arched trellis.

OWEN THOMAS.

PREPARING FOR STRAWBERRY FORCING.

In the culture of most plants the secret of success lies in making an early start and giving the plants a long season of growth, so that when their season of flowering and fruiting arrives they may already be strong and of mature growth, and therefore well rooted. When plants are forced into bloom out of their natural season the precaution of having them strong and well rooted becomes all the more necessary, and this is essentially the case with forced Strawberries. The earlier the runners are taken the better will be the resulting plants, and the earlier the plants are prepared for forcing so much more satisfactory can they be forced.

It is a great mistake to remove Strawberry plants directly from their outside quarters into the forcing house, for under such treatment leaf growth is excited before root action has properly commenced, and the result is a weakly growth quite unable to produce strong-flowering scapes. The process of forcing should be gradual; in fact, the more gradual it is the more successful will it be. Forcing is an artificial practice, and the more one can mitigate the artificial conditions of course so much better will the plants thrive.

The preparation for forcing will altogether depend upon the season at which ripe fruits are required. To obtain these in the month of February necessitates much more work than the production of fruit a month or two later. During the spring months the plants make much quicker progress than is possible in the dull, sunless days of November and December, and their culture then is not such an expensive matter as the very early forcing of Strawberries. Most Strawberries grown under glass for market are not forced early, but just sufficiently so to ripen them during the six or eight weeks immediately preceding the ripening of the outdoor crop. This is evidently found to be the most profitable method. Strawberries forced so as to be ripe in February and March command very high prices, but the demand for them is strictly limited. Although such good prices are not obtained later in the season, the quantities disposed of are so much greater, and the cost of production so considerably less, that growers realise a better profit upon their outlay. Exclusive of the high price of very early forced Strawberries, another reason of their limited consumption lies, doubtless, in the fact that the flavour is not of the best. We speak now of fruits that are ripe in February. The quality of forced Strawberries depends greatly upon the late winter and early spring. Cold and sunless weather will necessitate much artificial heat, and fruits produced under such conditions are naturally deficient in flavour. Given comparatively mild and sunny weather, however, Strawberries in February and March should compare not unfavourably with those grown out of doors and ripening in June. If ripe Strawberries are required in April they may be had by commencing to force the plants eight weeks before, but if ripe fruits were wanted in February it would be necessary to commence forcing quite twelve weeks previously. Cold weather and the absence of sun are, of course, responsible for the extra time involved.

VERY EARLY FORCING.

To have ripe Strawberries towards the end of February the plants must be taken under cover not later than the middle of November, and the best method is to plunge them in a mild, hot bed,

preferably composed of leaves and made up in a frame. A better place for the plants during the first few weeks could not be wished for. The bed of leaves should be made so high that the plants when plunged therein are within 6 inches or 8 inches of the glass. The bottom heat will encourage root growth, and this is of great advantage, for once the roots begin to make progress the leaf growth of the plant will soon follow. For the first week or ten days the pit or frame should be quite cold so far as the use of artificial heat is concerned; afterwards, until the plants come into flower, the temperature at night may be kept at 50° Fahr. Do not open the lights to admit air during cold, damp, or foggy weather, but only when the frame would become too hot by reason of sun heat or exceptionally mild weather. Then

AN EXAMPLE OF A TRIPLE CORDON PEAR TREE.

admit just enough air (the lights need only be pushed down an inch or two) to prevent the temperature rising too quickly, and not with the object of lowering it. Close the frame early in the afternoon, and syringe the plants at the same time. By so doing a moist atmosphere conducive to growth is produced. It will not be found necessary to give much water to the roots during the first few weeks.

A. P. H.

EFFECT OF GRASS ON TREES.

THE following note on this subject occurs in the third report by the Duke of Bedford and Mr. Spencer Pickering, F.R.S., of the Woburn Experimental Fruit Farm:—

"Our first experiment on growing grass round dwarf Apple trees was one numbered seventeen in a series of sixty experiments, each of which was made on eighteen trees, six of them being Bramley's Seedling, six Cox's Orange Pippin, and six Potts' Seedling, planted as three year old bushes in 1894. In the case of No. 17 grass was sown in 1895 to a distance of 5½ feet from the stems (5½ feet by 6½ feet in the case of Bramley), the grassed area forming a continuous strip for the six trees of each variety. The open spaces between the different varieties were grassed over in 1899, so that the whole eighteen trees are now included in one continuous strip of grassed land. The trees are dressed annually with mixed mineral manures, including nitrate of soda, in quantities estimated to be equivalent to a dressing of 12 tons of manure to the acre, and the actual area thus manured has been increased year by year, till it now amounts to the 121 square feet of ground allotted to each tree. Except as regards growing grass round them, these trees are treated in exactly the same way as those in the normal plots with which they are compared. The grass is cut two or three times in the season, and is left to rot on the ground.

"Corresponding experiments with standard Apple trees on Crab stock were started at the same time, the trees being four years old when planted and the varieties being Bramley's Seedling, Cox's Orange Pippin, and Lane's Prince Albert—six trees of each variety. The areas grassed were 6 feet by 6 feet in the case of Bramley and 3 feet by 3 feet in the other cases, there being open spaces of ground between each tree. As to the general effect produced by grass on young Apple trees the results of the last few years have brought forward nothing which can in any way modify our previous conclusions as to the intensely deleterious nature of this effect, and we can only repeat that no ordinary form of ill-treatment—including even the combination of bad planting, growth of weeds, and total neglect—is so harmful to the trees as growing grass round them; indeed, the 'neglected' trees in plot 44, which up to 1900 showed only a slight advantage over the grass-grown trees, are now decidedly superior to them both in size and vigour, whilst in the similarly 'neglected' plots of standards the trees are but little less vigorous than the normal ones.

"For a detailed numerical estimate of the deleterious effect of grass we must refer to our former reports, especially our second report, 1900, page 160. Some photographs which are there reproduced will, perhaps, give even a better idea of the magnitude of the evil effect of grass than will be obtained by the study of any numerical data. It will be sufficient to repeat here that the results of weighing some of these trees in 1898 showed that the grass-grown trees had not increased by more than about two-thirds of their original weight since they were planted in 1894, whilst their neighbours, which had been kept free from grass, had increased in weight from ten to thirteenfold. Judging by the appearance of the trees, we believe that a similar comparison at the present time would show a still greater difference, but as such a comparison cannot be made without spoiling some of the trees for further experimental purposes we have not thought fit to repeat it."

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

DISEASE-RESISTING POTATOES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—It is with pleasure I give my experience concerning the best disease-resisting Potatoes I have grown during this very bad season. The following I have found quite free from disease:—Evergood (very fine), Northern Star, Sutton's Satisfaction, and The Factor. In addition, and the finest of all, is Sir John Llewelyn, a first early variety, splendid cropper, disease-resister, and grand in every way. This variety started low in price, but

very soon proved its sterling merit, and at the end of the first season's growth I was selling at five times the price per ton I gave for the stock seed obtained direct from the raiser. This, you will know well, is in direct contrast to the general state of things, as in all other cases within my knowledge a new variety has started very high and quickly dropped in value. I have now grown it for three years, and this season the demand is keener than ever. I have no hesitation in saying it is the finest Potato of its class grown. I have had some twenty-two years' experience of Potato growing, and, to please my numerous customers, grow from thirty to forty of the leading varieties on every description of soil, from strong loam to pure silt, and each season sell some hundreds of tons of each of the leading sorts; but I am glad to say I do not remember such a bad season before. It has certainly put to the test all varieties of Potatoes, and has clearly proved which are the best sorts to grow, and I shall be pleased to read the experience of other growers during this disastrous season.

Wisbech.

R. W. GREEN.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I have this season grown thirty-six different varieties in the gardens here in order to test their merits. Many of them failed to yield a remunerative crop, and may therefore be dismissed without further consideration. Among those which cropped well, and were free or almost free from disease, were Sutton's Seedling, Flourball, Favourite, Epicure, Satisfaction, Abundance, Windsor Castle, Supreme, and Adirondac. The best flavoured kind was Sutton's Seedling, a white-skinned pebble-shaped variety, which is somewhat yellow when cooked, but is not objected to on that account. My favourite—after the Ashleaf varieties are finished—is Snowdrop, which crops well, cooks like the proverbial ball of flour, and is of fair flavour; but this season it has suffered much from disease after the tubers were stored. For use during August I do not know of a variety to equal it. The soil here is a cold clay, badly drained, therefore one of the worst for Potatoes.

Belvoir Castle Gardens.

W. H. DIVERS.

CYPRIPEDIUM INSIGNE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The *Cypripedium insigne* figured in THE GARDEN of the 17th inst. was from a photograph of a plant grown in my house, taken and sent to you by my nephew. You state in your notes that you would welcome any remarks as to the treatment the plant had received. It was repotted in the spring of 1902 in a mixture of loam, peat, and sand, and during growing time received a little artificial manure once or twice a week. At the time it was photographed it was bearing some fifty-three flowers.

Mundham Vicarage, Chichester.

H. D. F.

THE ROSE GARDEN.

JOTTINGS ABOUT ROSES.

THE EVIL OF PLANTING SOME FRENCH-GROWN ROSES.

I WAS asked the other day to visit a large garden in order to see some beds of Tea Roses which, the owner assured me, "had not been a success." It was a garden, too, where several men were employed. Peaches, Grapes, and Figs grown to perfection under glass, and stove and greenhouse plants, as well as Chrysanthemums, all looked the picture of health. I only wish I could have said the same of the Roses.

On enquiry it appeared that the plants had been obtained from a French firm who had advertised 100 Tea and Noisette Roses at a very low price. To begin with, the selection was a most incongruous mixture, for in one bed I found side by side *Reine Marie Henriette*, with long 6-feet shoots, sprawling on the top of *Marie d'Orleans*,

whilst a poor miserable *Maréchal Niel* was growing over *Amabilis*, a very third-rate Tea, sent out by M. Lartay as long ago as 1857, with poor flimsy little pink blossoms. In the corner of another bed *Mme. Jules Grolez* and *Céline Forestier* were contesting for supremacy, but as the latter had been knifed down almost to the ground ever since it had been planted, its appearance was anything but happy. I have used the word knifed intentionally, because it would be misleading to say that such a thing as scientific pruning had ever been attempted. The head gardener, who was himself responsible for this operation, had simply gone over the plants and cut all of them down to a uniform level, regardless of habit, size, or growth, which easily accounted for the strong, flowerless shoots of *Reine Marie Henriette* and the crippled appearance of *Céline Forestier*. Of course, it was quite impossible to expect beds so unsuitably planted to be anything but ineffective, even if the individual plants had been skilfully pruned and attended to; but when the variations of habit and manner of growth are alike disregarded, as in this case, nothing but a dismal failure could be looked for. And this is by no means an unusual result with those who commence growing Roses. The first and fatal error made is in buying a collection of cheap mixed Roses from an unreliable source. Almost the first thing for an amateur or gardener to do after deciding to start Rose growing is to visit some private garden or nursery where many of the best varieties are grown, and study carefully the habit of growth of those which most strike his fancy. My experience when visiting the nurseries of the best trade growers goes to prove that the owners are always most willing to give all the information which lies within their power. If only both amateur and professional gardeners could be persuaded to go to a good nursery instead of a Rose show in order to make their selections of varieties, how much better the inestimable worth of the Rose for bedding would be revealed and appreciated.

NAMING ROSES.

Frequently I have been struck when visiting some gardens with the care and neatness displayed in labelling the Orchids, Chrysanthemums, and such like plants, whilst among the whole of a large collection of Roses not a label was to be seen. This is yet another instance of the shameful way in which the queen of the garden is treated. The question I invariably ask on seeing a collection of nameless Roses is, "How can these be properly pruned?" because it is manifestly impossible for anyone to prune Roses well unless he actually knows what variety he is dealing with. I will not deny that it is quite easy to tell many of the varieties from their habit of growth, but even this is not always to be depended upon, and one often sees deplorable results caused by ignorance in pruning. The old Hybrid Perpetuals could stand being cut hard to the ground, but if such Roses as *Grace Darling* and *Marie d'Orleans* have this treatment meted out to them each year they are never likely to be a success. Serviceable labels—both inconspicuous and imperishable—may now be had at such a very reasonable rate that it is nothing less than sheer folly to omit them.

THE WICHURAIANA HYBRIDS.

We are getting such a number of these that planters will have to exercise discrimination, because many of the sorts are too much alike. Three new varieties are being distributed this autumn by Messrs. Barbier, who have produced most of the best varieties so far. The raiser's descriptions are as follow:—

Alexandre Trimouillet.—A very strong grower, with dark green, glossy leaves. Flowers in large panicles, rosy white, with a light salmon tint. (*Wichuraiana* × *Souvenir de Catherine Guillot*).

Emile Fortepaule.—Vigorous, with long, glossy leaves; large panicles of very double flowers, measuring 2 inches to 3 inches in diameter, white, and sulphur-yellow in the middle. Parentage same as the preceding variety.

Ferdinand Roussel.—Dark green leaves of medium size; vinous red flowers, 3 inches to 4 inches across. A very good variety, and most floriferous.

Then, in addition to these, we have a host of new American varieties—The Farquhar, Edwin Mondale, Professor C. S. Sargent, W. F. Dreer, William K. Harris, Robert Craig, and John Burton. As yet I have not heard any details as to these varieties, but they are scarcely likely to be improvements upon that magnificent climber worthy Perkins. It is in standard form, that think these wichuriana Roses really excel, and everyone should most certainly try some of them in this way. The beautiful weeping standards exhibited by Messrs. Turner of Slough at the Holland House show this year were a perfect revelation to Rose lovers. I am planting Albéric Barbier, René André, Paul Transon, Adelaide Isabelle, Edmond Proust, and Elise Robichon all standards this autumn, and, in conjunction with *lagoa repens alba*, they will make quite a new feature in this garden.

CLIMBING TEA AND HYBRID TEA SPORTS.

These are some of the most valuable additions to roses of late years, though by no means always a success in every garden. I find they require most liberal treatment, and on dry soils such as mine certainly need more looking after than the regular climbers. For moderately low walls they are useful, but the best way to grow them in order to encourage floriferousness is to train them down a low wooden trellis, fixed parallel with the ground and about 18 inches above it. When trained in this manner they can be most easily protected with mats. Here is a list of the best climbing sports, all of which are well worth growing:—

Climbing Belle Siebrecht (William Paul, 1900).—A grand climber, but gets very mildewed against a wall, and is not nearly so free as its dwarf form.

Climbing Captain Christy (Ducher, 1881).—A good old hardy variety.

Climbing Caroline Testout (Chauvry, 1902).—This appears to be constant and likely to prove valuable.

Climbing Devoniensis (Pavitt, 1858).—A great grower, but tender and shy blooming.

Climbing Papa Gontier (Chevrier, 1903).—This is quite a novelty, but is so well spoken of that I am induced to include it in this list. The raiser describes it as an immense grower, with long flexible branches like those of *Reine Marie Henriette*, the flowers being the same size, shape, and colour as the type.

Climbing Niphelot (Keynes, 1890).—Magnificent on a warm wall.

Climbing Perle des Jardins (P. Henderson and Co., 1891).—An exquisite flower; requires a warm dry place against a wall.

Climbing Mme. de Watteville (Fauque Laurent, 1902).—A really splendid novelty; wall.

Climbing K. A. Victoria (synonymous with Mrs. Robert Reary, under which name it was distributed by the Dingee and Conard Company, U.S.A.).—This variety appeared simultaneously in America and Ireland, and was distributed by the well-known firm of Messrs. A. Dickson and Sons in 1898.

I have purposely omitted *Climbing La France* from the above list as it is inconstant and unsatisfactory.

TEA ROSE MRS. BERKELEY.

I cannot close these notes without referring to this exquisite variety, in order to call attention to its great freedom in autumn, as well as to the fact that it is mildew and weather-proof. Its huge shell-shaped petals and lovely fragrance entitle it to a leading position amongst bedding Roses, and throughout the month of October it has given bounteous masses of flowers. To look at them on the plants from a distance you would scarcely believe that they are only semi-double, but the petals are so firm in texture that each flower endures in beauty a considerable period. It is a good, sturdy, but not a strong grower, upright in habit, and beautiful in leaf. M. P. Bernaix of Villembanne, near Lyons, has given us many delightful varieties, but none more precious than this.

ARTHUR R. GOODWIN.

The Elms, Kidderminster.

ROSE MARIE PAVIC.

IN reply to Mr. Molyneux in THE GARDEN of the 17th inst., page 266, the correct name of this Rose is *Marie Pavic*. M. Alégaire describes it in his catalogue as "*Dédié à une dame Agrammienne*."

A. R. G.

[The lady after whom the Rose is named is a Rose amateur living at Agram in Croatia.—ED.]

A HINT TO ROSE GROWERS.

WINTER PROTECTION.

I THINK growers of Roses will do well to provide plenty of Bracken for protection this autumn. There is much sappy growth, and if, as often happens after a wet summer, a hard winter follows, a good deal of mischief will be done.

Herts.

C.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

SALVIA AZUREUS GRANDIFLORUS.

Mr. Amos Perry sends from his Hardy Plant Farm, Winchmore Hill, London, flowers of this beautiful plant. It is strong in growth, and the clear blue flowers are thickly produced on the erect leafy stems. It is an interesting garden flower.

POMEGRANATE AND BIGNONIA FLOWERS FROM HAMPSHIRE.

Mr. Ellwood sends from The Gardens, Swanmore Park, Bishop's Waltham, flowers of two most interesting plants, the Pomegranate and *Tecoma radicans* with the following note: "I enclose for your table flowers of *Bignonia radicans* (*Tecoma*) and *Punica granatum*, two interesting plants when they succeed in the open air. The *Bignonia* is flourishing on one of the pergolas here, and indeed makes a grand plant for that purpose. The foliage alone forms a distinct feature, and the plant flowers in September and October. With its trumpet-shaped flowers borne in clusters, which are orange-coloured, it makes a conspicuous feature in the dull autumn days. In spring the flowering shoots should be pruned back to good plump buds, thereby encouraging a vigorous growth for next season's flowers, which form on the extreme points of the young wood. Propagation is done by shoots or pieces of the root. *Punica granatum* (Pomegranate) flowers very well here from August till damaged by frosts, the bright red flowers crowning the dense Myrtle-like foliage. It should be planted against a wall and encouraged to form bushy growths, which produce the blooms more freely. It can be increased by seed, cuttings, or layers, in light, rich soil."

FORTY-THREE DISTINCT FLOWERS FROM AN ISLE OF WIGHT GARDEN.

We have received from Mrs. M. Guytherne-Williams, Belvedere, St. Laurence, Isle of Wight, specimens of forty-three distinct flowers with the following note: "I send the following flowers in the hope that they may interest some of your readers. The garden is in a rather exposed sunny situation, consisting of slopes of loamy soil on and between rocks. In many places there is scarcely any depth of soil, and a wet season seems to suit the plants better than a dry one. I allow no watering, even in dry seasons, except where

regularly given to individual plants which specially require it. None of the plants sent have been protected in winter." Our correspondent sends the following most interesting list, with a brief description of each flower:—

Lythrum alatum.—A really good garden plant.

Choisya ternata.—It is unusual for this shrub to be in full flower at this time of year.

Lasiandra macrantha.—I fear these buds will scarcely open before the middle of November, and may probably be checked by frost before flowering, as they are rather late this year.

Coronilla glauca.—A very profuse flowerer.

Polygonum baldschuanicum.—Still flowering at this late period.

Camellia Sasanqua.—Very pretty.

Plumbago capensis has been out several years in a sheltered corner facing east, but has not flowered freely before this season.

Manettia bicolor continues flowering often during the winter months.

Asparagus Sprengeri.—Quite hardy in an exposed sunny situation; very healthy and free growing.

Mimulus, established and self sown in the edges of a small stream, which it frequently threatens to block with excessive growth.

Swainsonia galegifolia.—Very free flowering in a dry, sunny place.

Bignonia grandiflora.—I should be grateful to any of your correspondents who can explain why the majority of buds of this plant fall before opening.

Salvia angustifolia.—One of the very prettiest species of this extensive genus.

Primula japonica.—An instance of the eccentricities of this unusual season.

Nerine Manselli.—This species flowers regularly every year, and is far more reliable than *N. Fothergilli*, which has frequently failed to bloom.

Nerine undulata has also flowered regularly.

Sparmannia africana always grows well, but has sometimes missed flowering; the wet season seems to have improved the plant.

Chorizema Chandleri.—This old shrub seems to be failing after four years of constant and excessive flowering.

Exogonum purga.—A very free growing and free flowering species of easy culture.

Bouvardia triphylla.—Three bushes on a hot exposed dry ledge are regularly covered with flowers during the whole summer—*B. President Garfield*, *B. flavesces fl.-pl.*, and *B. corymbiflora*; these have not been subjected to so long a trial, having only been planted out one year in the case of the first mentioned and the others for two years, but after the wet season they have made much progress and promise to establish themselves as strongly as *triphylla*.

Putoria calabrica.—A trailing plant brought from Southern Spain and quite hardy here in rock crevices; a persistent bloomer.

Mesembryanthemum tigrinum.—Like some fifteen other species here, this promises to be quite hardy on rocks.

Cassia corymbosa.—Breaks up from the roots after every winter, and flowers profusely in a sunny situation.

Tulbaghia violacea flowers throughout summer and autumn.

Agathaea colensis.—It is not safe to trust to unprotected plants for stock, although they frequently survive the winters.

Leucanthemum nipponicum.—A most robust free flowering and useful plant.

Diplacus glutinosus.—Quite hardy and often self sown.

Lagunaria Patersoni.—Now about 6 feet high, growing rapidly, and flowering very freely from August to November.

Myrtus communis.—The Myrtles have flowered more than ever abundantly this summer.

Cyclamen persicum.—Just coming out, a few samples enclosed.

Kniphofia multiflora.—Spikes too large for the box and scarcely yet out; one sent as a sample.

Morina longifolia.—A very late flower sent; seed ripened and already sown.

Polygala oppositifolia.—This shrub is never without flowers in winter or summer.

Abelia rupestris.—Doing very well after two years out.

Boukera triphylla.—A scrophulariaceous shrub, the last of many flowers fell a few days ago.

Sollya heterophylla, *Genista racemosa*, *Eleagnus macrophyllus*, *Rosa bracteata*, and *Amaryllis belladonna*.—Very late.

[We hope some one will explain the cause of the *Bignonia* buds dropping.—ED.]

LA FRANCE AND AUGUSTINE GUINOISSEAU ROSES.—THE SPORT.

"C." (Herts) sends flowers of these beautiful Roses, and the following letter which accompanied them will interest rosarians: "I send you two Roses, both from the same plant, and you will see that one is distinctly La France and the other one Augustine Guinoisseau. The plant is on its own roots, and in summer the flowers are always of the latter type, but in autumn it has frequently thrown both. I believe Augustine Guinoisseau was a sport from the former, so it is a case of throwing back to the original. I have seen with surprise in two or three instances where lists of autumn Roses have been given that Augustine Guinoisseau has not been included. Here it is the autumn bloom *par excellence*, and never fails, though we have by no means ideal conditions for Rose growing—rather shallow soil on chalk, and on exposed situation nearly 400 feet above sea level."

SWEET PEAS IN LATE OCTOBER.

Mr. Hugh Aldersey sends from Aldersey Hall, Chester, a remarkable gathering of Sweet Peas for the season; the flowers were exceptionally beautiful in colouring and very large, a bunch that brought a ray of summer into a gloomy October day. It is interesting to know that the flowers were raised at Aldersey Hall. We well remember the previous flowers, and thought them finer than any other Sweet Peas we have either seen or received this summer. Mr. Aldersey's note is as follows: "On June 9 last I sent you some bunches of Sweet Peas, the result of cross-fertilisation. I now send some flowers from the same plants, which have been in bloom since May, in spite of the fact that I allowed them to run to seed. Cross-fertilisation certainly adds vigour to the plants and apparently lengthens their period of flowering, as the named varieties, though sown later, have been over for a long time. Plants from pots sown in autumn may be planted out early with safety and bloom earlier than those sown in spring."

FICUS REPENS FRUITING.

Mr. Strugnell sends from the Gardens, Rood Ashton, Trowbridge, fruits of *Ficus repens*, which we hope to illustrate shortly, with the following note: "For furnishing the walls of stove or greenhouse, and particularly those inclined to dampness, and, therefore, difficult to maintain in a clean and presentable state, this creeping Fig is a really serviceable plant. Though so familiar for such purposes, it would seem that few have seen its fruits. It is kept regularly sheared, which is a much-needed necessity, and therefore the plants cannot fruit. The actual fruiting growth assumes quite another character, being so much larger and coarser in leaf and branch. That from which the fruit sent was gathered has been growing for two or three years and kept restricted only by pruning, so as to confine it within reasonable limits, and trained to wires separated from the wall. It required two years before it produced a fruit crop from the first issue of the fruiting shoot, and even now few are given. Though many have seen this during the past three years only one among the interested visitors can recall an instance of its fruit-bearing character, so that it cannot be regarded as anything less than of rare occurrence. It is only useful when a strong shoot appears to retain it and allow it to grow unchecked for a time—perhaps two years—to give the desired result."

[Notes upon several interesting contributions to the "Editor's Table" have been left over until next week owing to pressure upon space.—ED.]

OBITUARY.

WILLIAM BEALE.

We much regret to announce the death of Mr. William Beale, gardener to E. A. Hambro, Esq., Hayes Place, Hayes, Kent. The death of Mr. Beale will come as a surprise to those who knew him, for at the last Drill Hall meeting, on October 13, he had an exhibit of Black Hamburg Grapes, to which a silver medal was awarded. Mr. Beale was at the Drill Hall and apparently in his usual health. He recently took cold, however, and pneumonia supervened, with the result that Mr. Beale died on Sunday last. Mr. Beale's father was formerly head gardener at Hayes Place, and Mr. William Beale worked there for some years. He was formerly in Baron Rothschild's garden in Vienna. Mr. Beale was only thirty-eight years of age, and leaves a widow and one child. The funeral took place on Tuesday.

It is with great regret that I record the death of my excellent friend Mr. W. Beale, who died after a very short illness (only a few days' duration) on the morning of Sunday, the 25th inst., at the early age of thirty-eight years. Mr. Beale was well known and much respected by high and

THE LATE MR. WILLIAM BEALE.

low, not only in the neighbourhood in which he lived, but in the horticultural world here and on the Continent. His cheerful disposition and great professional knowledge, which he was always glad to impart to all who cared to know, made him many friends, and, speaking from my own experience, I have rarely found a man more genuine and so ready to help. Mr. Beale gained his extensive knowledge as an apprentice and journeyman in some of the principal English nurseries. After that he went for four years to the famous establishment at Ferrières, near Paris, and thence to Baron Rothschild's garden at Vienna for seven years, where he spent some of the most happy years of his life. About four years ago he succeeded his father at Hayes Place, Hayes, Kent, under E. A. Hambro, Esq., serving this gentleman faithfully till the time of his death. He was well known at the Royal Horticultural Society's Drill Hall meetings and shows, and took many prizes as a grower of Grapes and fruit generally (taking his last medal only on the 13th inst. for a fine lot of Grapes), also hardy flowers and stove and greenhouse plants. Under his appreciative and kind employer he formed one of the most

unique collections of alpine, Primulas, and other hardy plants. His success was due to his untiring energy, thoroughness, and conscientiousness. His loss is deeply mourned by his young wife, as well as by his parents, sisters, and many friends. He was buried in the churchyard of Hayes on Tuesday last.

G. RUTHER.

NOTES FROM THE MARKETS.

BEGONIA GLOIRE DE LORRAINE.—Several market growers are now growing this useful Begonia, and already it may be seen in the market. It is rather early for there to be any great demand for it, and the prices are consequently rather low. The Turnford Hall variety may also be seen, and the price has come down to quite a reasonable figure.

Verbena Miss E. Willmott.—Several growers have grown this well in pots this season, and even on October 20 some good plants were in the market. It is certainly a most effective plant for decorations, and private growers should follow the example of the market growers. It is very pretty in the conservatory.

Chrysanthemums.—Mr. G. Shawyer of Cranford who grows for Covent Garden Market, has been cutting some good early varieties. Although exclusively a market nursery, Mr. Shawyer has given some attention to raising new varieties, and has been very successful, those that he has been growing this season being chiefly sorts raised by himself. Some of these received certificates from the National Chrysanthemum Society last season, and as grown this year they have proved fully worthy of the distinction. Of those noted Black Prince was one of the best, being of a rich crimson, with gold reverse, and flowers of good size and substance; Murillo, soft rosy pink; Miss E. Miller, deep yellow; Nellie Blake, a bronzy red, something after the old favourite Source d'Or, but a little deeper in colour and much earlier; Autumn Sun, yellow, with a bronzy red shading; and some yet unnamed seedlings were very promising. Mr. Shawyer disbuds and gets from six to nine good blooms on a plant. He has been sending about 300 dozen blooms to Covent Garden Market daily, and these have made from 1s. to 2s. 6d. per dozen.—A. H.

Proposed flower market for Dundee.—A proposal of considerable importance to the florists of the Dundee district is at present under consideration, and is likely to meet with acceptance. It is that a portion of the Craig Street Market should be set apart as a flower market. The question has been under the consideration of the market sub-committee, and a meeting has taken place between them and the florists. The latter generally approved of the plan submitted for their consideration, but a decision is not likely to be taken for some time.

SOCIETIES.

CROYDON HORTICULTURAL SOCIETY.

At their rooms on Tuesday, the 20th inst., a large assembly of members listened to a highly practical paper on "A Year's Work in the Vinery," read by Mr. W. Taylor, Tisbury Lodge Gardens, Forest Hill, who is a grower of considerable eminence in the horticultural world. To illustrate his paper he brought a collection of Grapes, including what he considered to be the best twelve varieties grown, and the splendid clusters created admiration and appreciation from all present, which showed the master hand of a skilled cultivator in producing such specimens. The lecture commenced with the operation of making up the vine border, details of which he gave most fully, as also the different modes of structure each vine might be, together with the heating apparatus required. Following the establishment of Vines in the vinery, he passed on to the treatment required in each month of the year, so that from the commencement of January to the end of December the methods he adopted were expounded by him most fully for his audience to profit by. A discussion by some of the members followed, and to questions asked Mr. Taylor replied fully. At the conclusion, the chairman (Mr. W. J. Simpson) proposed a very hearty vote of thanks to Mr. Taylor, which was carried with applause.

The next meeting is on Friday next, November 4, when Mr. R. B. Leech, Wood Hall Gardens, Dulwich, will lecture on "Fruit Bottling," and to this lecture the lady friends of members are invited.

ROYAL HORTICULTURAL SOCIETY.

THERE was an excellent display of flowers at the Drill Hall on Tuesday last, and Orchids contributed most largely; these were shown extensively, and many choice ones were to be seen. Chrysanthemums, stove plants, Pelargoniums, tuberous Begonias, and Asters were all well shown, making an unusually fine display for so late in the season.

ORCHID COMMITTEE.

Present: Harry J. Veitch, Esq. (chairman), Messrs. James O'Brien, J. G. Fowler, H. Little, J. Wilson Putter, W. H. White, H. A. Tracy, W. H. Young, W. Boxall, J. W. Odell, F. J. Thorne, M. Gleeson, G. F. Moore, F. G. Ashton, A. A. McBean, Francis Wellalee, E. Hill, James Douglas, Norman Cookson, Jeremiah Colman, Walter Cobb, H. M. Pollett, & B. Crawshaw, H. Ballantine, and W. A. Blinay.

Messrs. Charlesworth and Co., Heaton, Bradford, Yorks, showed an admirable lot of Orchids, all well grown and amply flowered. *Oncidium Fortesii* and *O. varicosum* made a showy background. *Cattleya labiata* was largely shown, and other Orchids included were varieties of *Odontoglossum crispum*, *Laelio-Cattleya lundiana aurifera*, *L.-C. haroldiana*, *Cattleya Iris*, *Laelia prestans*, *C. Fernand Denis*, *C. Mrs. Pitt*, *C. chamberlainiana*, *C. Nestor*, *C. Lottie*, and *L.-C. leucomela*, making a charming display of hybrids of beautiful coloring. *Miltonia bleasana grandiflora*, *Brassia lawrenceana longissima*, *Cypripedium Charlesworthii*, *C. insignis Dorothy*, *C. Hitchinsii* (Charlesworthii x *insigne*), *C. Ulton* (*varicosum* x *sanderianum*), and others were also shown; indeed, the display was full of really good things. Silver-gilt Flora medal.

Messrs. James Veitch and Sons, Limited, Chelsea, exhibited an excellent display of *Cattleyas*, *Laelias*, and *Laelio-Cattleyas*. *Cattleya labiata* was largely shown, and others prominent were *C. Mrs. J. W. Whiteley*, *L. digbyana purpurata*, *L.-C. Hermes*, *C. Bactia*, *L.-C. Nyas*, *L.-C. Decia*, *C. Chloe*, *L.-C. blancheyensis* var., *C. Mantlinii*, and *L.-C. Bryan*, altogether a very fine display of hybrid Orchids. Silver-gilt Flora medal.

Baron Schröder, The Dell, Egham (gardener, Mr. Ballantine), exhibited a collection of very fine Orchids, the plants splendidly flowered. *Dendrobium schröderianum* (original variety), *D. s. alba*, *D. farinosum*, *Odontoglossum crispum sanderianum*, *Cattleya labiata Dell* variety, *L.-C. Mme. Chas. Maron*, *C. bowringiana* (one plant bearing six racemes), *L.-C. haroldiana*, *C. vigeriana*, and *L.-C. Tiresias* were among the best. Silver-gilt Flora medal.

The group from Jeremiah Colman, Esq., Gatton Park, Epsom (gardener, Mr. W. P. Bond), contained numerous very good *Cattleyas*, for instance, *C. labiata*, *C. l. corulea*, *C. bowringiana*, *L. Macina*, *C. labiata illustre*, *C. l. Master J. Colman*, *C. l. venosa*, *C. Mantlinii*, and *C. aurea*. *Laelia Fernand*, *Odontoglossum Mutus*, *Maderavallia Daviellii*, *M. leucata*, *Lycaste Skinneri* alba; some good *Cypripediums* were also shown in this interesting display. Silver-gilt Flora medal.

Mr. James Cypher, Cheltenham, showed a group of Orchids that contained some very good *Cypripediums*, notably *C. insignis Sanderse*, *C. l. Balle*, *C. l. Ernestii*, *C. l. aureum*, *C. l. sylhetense*, *C. l. Harefield Hall* variety, *C. leucanum virginale*, *C. T. B. Haywood*, and others. *Cattleya Mantlinii*, *C. labiata*, *Odontoglossum grande*, *Oncidium kramerianum*, and *Dendrobium Phalenopsis schröderianum* were also very well shown. Silver Flora medal.

Messrs. Hugh Low and Co., Enfield, N., showed fine *Phalenopsis Aphrodite* (amabilis) and *P. leucarrhoda*. The plants bore splendid leaves and racemes. Other notable Orchids in Mr. Low's group were *Cypripedium Deadmonia* (*G. Goweri* x *C. niveum*), *C. insignis Laura Kimball*, *Cattleya Labia Pride* of Southgate, *Cymbidium affine*, *Oncidium venosum*, *O. Rogeri*, *Burlingtonia venusta*, *Cattleya bowringiana*, *L. Macina*, and *Oncidium ornithorhynchum*. Silver Flora medal.

Captain Holford, C.S.I., Tetbury, Gloucester (Orchid grower, Mr. Alexander), was given a silver Flora medal for a group of choice Orchids. *Cattleya Mantlinii nobilior*, *C. aurea*, *C. Mrs. J. W. Whiteley*, *C. Fernand Davis*, *Laelio-Cattleya Swartzii*, *Cypripedium laurencianum* x *calicum*, *C. Milo Weston* var., *C. Charles Richman*, *C. Niohe*, *C. Barrades*, *Vanda corulea*, *Odontoglossum crispum-harryanum*, and *Zygocotax wiganianus superbus* were among the best. Silver Flora medal.

Messrs. Sander and Sons, St. Albans, in their group of Orchids exhibited numerous good *Cypripediums*, such as *C. actens*, *C. arthurianum*, *C. triumphans*, *C. lamontanum*, *C. Miss Louise Fowler*, and *C. Almosa*. *Laelia elegans schilleriana*, *Laelio-Cattleya blancheyensis*, *L.-C. Acis*, *L.-C. lunulosa*, *L.-C. illustre*, *Cattleya Miss Williams*, *Zygocotax maculatus*, and *Cymbidium affine* were also well shown. Silver Flora medal.

H. S. Goodson, Esq., Fairlawn, West Hill, Putney, exhibited a group of Orchids that included *Vanda corulea*, *Dendrobium formosum*, various *Cypripediums*, *Cattleya labiata*, *Oncidium varicosum*, and others. Silver Banksian medal. *Cattleya labiata Fieldenii*, a supposed natural hybrid, flowered from a small importation sent from South America in 1903, was shown by Mrs. Thomas Fielden, Tadcaster (gardener, Mr. H. J. Clayton). A flower of *Cattleya granulosa aurea* was also sent by Mr. Clayton.

Cattleya Fabia var. *Peetersii* was finely shown by M. A. A. Peeters, Brussels. It is a hybrid between *C. aurea* and *C. labiata* Peetersii.

Mr. H. A. Tracy, Twickenham, showed *Cattleya labiata* *R. Rider Haggard*.

Cypripedium insignis montanum magnificum and *C. l. The Queen* were well shown by G. F. Moore, Esq., Bourton-on-the-Water (gardener, Mr. Page).

H. J. Elwes, Esq., Colebourne (gardener, Mr. Walters), showed racemes of *Habenaria carnea*, cut from a plant with eight racemes. *Calanthe veratrifolia* x *Stevensii*, *Burbridgea nida*, and *Arundina chinensis* with reed-like growth and smaller flowers than *A. bambusifolia* were also shown by Mr. Elwes.

Sir Trevor Lawrence, Bart., Burford, Dorset (Orchid grower, Mr. White), sent *Dendrobium amplum*, *Gomesa* (sp.)

and *Celogyne fuscens*, also *Cattleya Mrs. Endicott* and *Cattleya Ella*.

In a miscellaneous group of stove plants Messrs. B. S. Williams, Holloway, showed *Cattleyas*, *Cypripediums*, and other Orchids.

Cut racemes of *Renanthera (Vanda) Lowii* were well shown by Gurney Fowler, Esq., South Woodford.

NEW ORCHIDS.

A first-class certificate was given to *Laelio-Cattleya gottiana regale*.—This is a handsome and finely coloured variety, although some experts were inclined to think it hardly sufficiently distinct to merit a first-class certificate. The broad, frilled lip is rich purple-crimson, and the long throat is partly lined with yellow; sepals and petals are buff and purple, buff predominating in the sepals. From Sir Trevor Lawrence, Bart., Burford, Dorset (Orchid grower, Mr. White).

Phaio-Cymbidium Chardwarense.—This is a remarkable flower, in that it is a new bi-generic hybrid, between *Cymbidium giganteum* and *Phaius grandifolius*. So far as can be judged from the appearance of the flower it differs little from *Phaius*. The colour of petals and sepals is yellow, tinged with brown. The lip is heavily lined with deep reddish-brown upon a yellow ground. The plant is vigorous and of *Phaius*-like growth. From G. F. Moore, Esq., Chardware, Bourton-on-the-Water (gardener, Mr. Page).

Laelio-Cattleya haroldiana John Bradshaw.—One of the most handsome *Laelio-Cattleyas* yet shown. Not only is the lip richly coloured but the petals also. *Laelia tenebrosa* and *Cattleya hardyana* are the parents. The lip is large, a rich deep velvet purple. The petals are beautifully tinged with purple upon a buff yellow ground; the yellow sepals are faintly tinged with purple also. From John Bradshaw, Esq., The Grange, Southgate (gardener, Mr. G. Whitelegge).

Awards of merit were given to

Cattleya Gauthierii.—This is a very attractive flower of unusually delicate colouring. The sepals and petals are pale lilac, tinged with buff in the centre, and the flat, broad lip is purple, creamy white at the base and in the throat. The parents are *C. leopoldiana* and *C. Schröders*. From Baron Schröder, The Dell, Egham (gardener, Mr. Ballantine).

Cattleya Fabia var. *Mary de Warrin*.—*C. labiata* alba and *C. aurea* are the parents of this remarkably pretty hybrid. The sepals and petals are pure white, and the lip is a blending of rich pale purple and white, with the yellow of the throat running into it. The flower is of splendid form. From M. A. A. Peeters, Brussels.

Cattleya F. W. Wigan Peeters variety.—*C. schilleriana* and *C. aurea* are the parents of this variety, a distinct and handsome flower, with stiff buff sepals and petals tinged with purple, and a large, handsome lip, rich purple, marked with brown and yellow at the base of the throat. From M. Peeters. Award of merit.

A botanical certificate was awarded to *Celogyne fuscens*, shown by Sir Trevor Lawrence, Bart., Burford, Dorset (Orchid grower, Mr. W. H. White).

FRUIT AND VEGETABLE COMMITTEE.

Present: George Bunyard, Esq. (chairman), Messrs. J. Cheal, George Woodward, T. W. Bates, S. Mortimer, Alex. Dean, Henry Ealing, George Keif, Horace J. Wright, G. T. Miles, C. G. A. Nix, J. Jaques, G. Reynolds, F. Q. Lane, J. Willard, G. Norman, George Wythes, and A. H. Pearson.

Mr. J. Ambrose, Cheshunt, exhibited the new Grape Melton Constable Seedling in excellent form. Cut bunches and also fruiting pot Vines were shown. The two bunches cut from the mother Vine weighed 7½ lb; the berries were very large, well coloured, and the bunches splendidly filled. This new Grape is not yet ripe, so it was not shown before the committee. This Mr. Ambrose hopes to do later; he considers it to be at its best about Christmas. It certainly appears to improve by keeping; the flavour is very sweet, skin firm, and the Grape travels well. As previously stated, the parents are Lady Hastings and Gros Colmar. Mr. Ambrose also showed some fine Blenheim Orange Apples, cut Roses, and cut Carnations.

A vote of thanks was given to Apples Colonel Vaughan and Blenheim Orange from Tulise Hill.

A cultural commendation was given to some fine Celeriac from Mr. J. Chamberlain, gardener to S. Hellbut, Esq., The Lodge, Holyport.

Mr. J. Fritchard, Westgate Street, Gloucester, showed Marrows, and Mr. E. J. Vokes, King's Worthy, Winchester, seedling Apples.

FLORAL COMMITTEE.

Present: W. Marshall, Esq. (chairman), and Messrs. C. T. Drury, H. B. May, James Walker, E. Dean, John Green, J. F. McLeod, J. Jennings, William Howe, C. R. Fielder, Charles Dixon, J. A. Nix, Charles Jeffries, R. C. Nutcutt, H. J. Cuthbush, Charles E. Pearson, William Cuthbertson, H. J. Jones, E. H. Jenkins, W. J. James, Charles E. Shea, George Nicholson, J. Fraser, Edward Mawley, R. W. Wallace, and E. T. Cook.

Probably one of the most sumptuous and attractive of exhibits was that of cut zonal Pelargoniums from Messrs. Cannell and Son, Swanley. Trusses, tips, and colour, each and all were superb, and to this we add that with a half-dozen trusses to each vase the table of these valuable winter flowers constituted both an attraction and a feast. Well known as are Messrs. Cannell as growers of this class, it is only in justice that we say they have rarely, if ever, set up so fine a lot. We take a few of the finest of this fine lot: The Si-dar, crimson-scarlet; Princess of Wales, cerise-scarlet; Barbara Hope, pink; Mrs. Charles Pearson, deep pink, scarlet shaded; The Mikado, cerise-scarlet; Prince of Orange, very fine; Mark Twain, pink-scarlet, with whitish spots; Lord Strathcona, crimson, white eye; and Chaucer, rosy pink, with salmon eye. Mrs. George Cadbury, a fine pink; Lady Roscoe, soft rosy pink; and Countess of Dudley, crimson, with white eye and lines radiating therefrom, were other good kinds. The same firm set up boxes and vases of Chrysanthemums in variety. Of those in the large-flowered class *Alfriston* is fine in crimson and gold; *Miss M. Ware*, terra-cotta; and S. T. Wright, maroon and

gold. Some single kinds were also shown, and of these *Mary Anderson* and *Paris Daisy* were the best. Silver Flora medal.

Messrs. Barr and Son, Covent Garden, exhibited *Kniphofia parviflora*, with pale yellow flowers, and *K. Clota*, a red-scarlet kind with long protruding anthers.

Messrs. William Cuthbush and Son, Highgate, showed a mixed group of *Crotons*, *Dracenas*, *Cordylines*, *Palms*, *Aralia elegantissima*, small Orange trees in fruit in pots, *Dracena Victoria*, and Tree Carnations Mrs. Brooks and William Cuthbush, cerise-scarlet. An effective group of useful material.

Mr. Norman Davis, Framfield, Sussex, showed *Chrysanthemums* in his own inimitable way. Not many kinds, but those shown were fine characteristic examples. Bold vases occupied the centre, and with huge blossoms overhanging had a fine effect. Boxes of such as *Miss Mildred Ware*, a terra-cotta shade, very fine; J. R. Upton, rich golden; Mme. P. Radaelli, white; General Hutton, bronzy gold; Mrs. W. Mease, softest yellow or cream, very beautiful; Beauty of Leigh, deep golden yellow; Lady Pearce, a novelty for 1904, ivory white with greenish eye, very fine; Mme. Carnot, pure white and of fine size; F. S. Vallis, a finely-formed drooping Japanese of rich yellow colour, with *Miss Olive Miller*, pink, were among the best. *Enallias*, *Palms*, *Crotons*, and *Ferns* interspersed here and there materially assisted the grouping of a really meritorious lot of flowers. Silver-gilt Flora medal.

Mr. H. B. May, Edmonton, showed a group of *Dracenas* in many kinds, arranging them on the floor. We take *Monarch*, *Lord Roberts*, *Diadem splendens*, *Perfection*, *Alsace Lorraine*, and *Triumph* as among the best of the coloured forms, while *Lindenii cannelifolia* represented the green and striped forms. Dr. Hanell is also a green-leaved sort in the way of *D. congesta*, but with broader foliage and a more compact growth. Silver Banksian medal.

Mr. D. C. Guthrie, East Haddon Hall, Northampton, exhibited *Begonia Mrs. Mary Guthrie*, a tuberous kind apparently of a low compact growth, and with large salmon-pink flowers in profusion. A large basket was shown.

Mr. W. J. Godfrey, Exmouth, Devon, had a large exhibit of *Chrysanthemums*, many very fine. Making Hero, *Miss Mildred Ware*, fawn or terra-cotta; Queen Alexandra, bronzy orange; H. E. Hayman, orange; Lord Alverstone, deep maroon and gold; *Miss Olive Miller*, lilac-pink; F. S. Vallis, yellow; Exmouth Rival, rich velvety maroon, intense colour; and Mrs. J. P. Bryce, white incurved. A basket of Carnations also came from Mr. Godfrey. Silver Banksian medal.

Some scarlet Tree Carnations were shown by S. Morris, Esq., Writam Hall, Norfolk (gardener, Mr. Henley). *Adelaide* and *Elizabeth*, the former of a rather bushy habit, the latter tall and thin.

A fine batch of *Begonia Gloire de Lorraine* and *G. de Lorraine* alba came from Mr. G. Lange, Hampton, Middlesex. Of the white there were some two dozen large specimens, and rather less of the original form. A really fine exhibit. Silver Banksian medal.

Mr. H. J. Jones, Lewisham, staged an admirable lot of *Chrysanthemums*, both in large vases with foliage and on boards. There were large and small-flowered kinds; the arrangement admirable. Some good ones are *Lady Acland*, gold; M. M. Ware, very fine; Maude du Cros, soft yellow (see awards); Lady M. Conyers, deep pink; Master Seymour, crimson and gold; Hon. Mrs. Acland, fine incurved yellow; Henry Perkins, chestnut; Edith Smith, ivory-white; George Lawrence, red-orange; and M. Waldeck Roussau, crimson and buff. Baskets of decorative kinds, vases of singles, and other articles were filled with capital material. A large collection of *Michaelmas Daisies* was also shown by Mr. Jones. Silver Flora medal.

Messrs. W. Cuthbush and Sons, Highgate, showed a fine group of hardy things such as *Anemones*, *Pentstemons*, *Asters* in variety, *Polygonum amplexicaule*, *Lobelia*, *Phloxia frutescens*, *Polygonum vacinifolium*, *Crocus hyemalis*, white; *C. vitellina*, palest mauve; *Primula megalophylla*, *Leucolium autumnale*, very charming; *Romneya Coulteri*, *Tricoma*, *Oxalis lobata*, yellow; *Moraea longifolia*, and a large variety of outdoor *Chrysanthemums*. Silver-gilt Flora medal.

Messrs. J. Ambrose and Son, Cheshunt, Herts, set up a beautiful exhibit of *Roses*, *Tea* and *Hybrid Tea* largely. These, interspersed with *Lilies*, *Lily of the Valley*, *Spiraeas*, and *Ferns*, made a goodly show. In another direction Mr. Ambrose had stands adorned with *Roses* and *Carnations*, and with *Heaths*, *Cyclamens*, and the like a good effect was secured.

A large assortment of *Lobelias* of the *L. syphililitica* group was shown by Mr. Ladhams, Southampton. Some twenty-three varieties were staged in colours varying from blue and purple to white, scarlet, crimson, pink, &c.

Messrs. William Bull and Sons, Chelsea, showed *Begonias* of the foliage group, with *Davidsonia pruriens*, *Diffrachias*, *Dracena goldiana*, and similar plants.

Mr. J. Russell, Richmond, contributed a large group of shrubs in pots. *Veroniceas*, *Bamboos*, *Osmanthus*, variegated *Privets*, *Aucubas* in variety and in fruit, *Skimmia Formanii* in excellent fruit, and many more, a capital group of useful hardy plants. Silver Banksian medal.

Messrs. W. Wells and Co., Redhill, had arranged on the left hand side of the entrance a remarkable exhibit of *Chrysanthemums*, in which large and medium sized flowers were freely interspersed. Of the exhibition kind *Maynell*, a fine maroon-crimson with old gold reverse is superb; G. H. Kerslake, white; Mrs. Pockett; Mr. T. Carrington, deep mauve; Exmouth Rival, crimson; S. T. Wright, maroon; *Pantia Ralli*, bronze; Lord Alverstone, crimson; Mme. L. Chevrant, beautiful pink; Mrs. W. Duckham, rich yellow; *Mary Ingils*, bronzy; and *Vivand Morel*, very fine. Many beautiful pot-grown singles and light decorative kinds completed a really splendid bank of these attractive flowers. Silver-gilt Banksian medal.

Messrs. Veitch and Sons, Chelsea, staged a nice lot of winter-flowering *Pelargoniums* in pots. The more showy are *Chaucer*, *Dryden*, *Charles Maison*, fine crimson; Mrs. Charles Pearson, Mrs. Brown Potter, rose; Mrs. G. Cadbury,

pink; Mary E. Wilkins, white; E. Bidwell, intense scarlet. A fine blue-flowered plant of dwarf habit is *Dedalacanthus parvus*, and a charming bit of blue is *Salvia Pitcheri*. The winter-flowering *Begonias* *Agatha*, *Ideale*, *Julius*, and *Mrs. Heal* were in great force, forming a rare bank of colour. Silver Flora medal.

Tree Carnations from Messrs. H. Low and Co. included *Ethel Crooker*, pink; *Norway*, white; *Floriana*, pink; and *Mrs. T. W. Lawson*. *Fairmaid* is a soft pink flower, very pleasing.

Griffonia hyacinthina was shown by Mr. E. Kromer, Bandon Hill, Croydon, the inflorescence containing some dozen flowers, the blue and white in great contrast.

Aphelandra blanchetiana is a distinct plant from Messrs. William Bull and Sons, Chelsea.

Begonia manicata variegata cristata was shown by Messrs. Sander, St. Albans.

In spite of the torrential rains and other impediments to good open-air flowers, Messrs. T. S. Ware, Limited, Feltham, Middlesex, staged a remarkable lot of Dahlias, these embracing excellent Cactus flowers in many varieties, quite good in colour, and in a large degree characteristic. Pompoms and good single-flowered kinds also were in plenty, while the imposing character of the arrangement combined with the plenitude of blossoms made up a most worthy display of these things for so late a date as October 27. Light Bamboos, Grasses, and Palms, with here and there sprays of autumn foliage, gave a finish to the whole.

NEW PLANTS.

Begonia His Majesty.—A fine variety that rightly may belong to the fine foliage section of *Begonias*, of which B. Rex is typical of many. We are not sure, however, that the sort now referred to really belongs to the latter section, though it is certainly a well-marked kind. The handsome leaves are about 6 inches broad and 9 inches long, green starred to the centre, the remainder of a bronzy red with green body colour to a full margin of a reddish hue. Exhibited by Messrs. Sander and Co., St. Albans. Award of merit.

Begonia Our Queen.—A most fascinating variety, the colour combination remarkable. The ovate heart-shaped leaves are acutely pointed, the chief colour an olive green distinctly bordered with irregular rows of pinkish dots, outside which a sea green band is noted, the outer margin of a dark velvety shade, and over all a lustrous hue such as is rarely seen. The tone of colour varies with the age of the leaf individually; it is therefore difficult to accurately describe the charm that prevails. From Messrs. Sander and Co., St. Albans. Award of merit.

Erica gracilis nivalis.—This is a white form of E. g. autumnalis, and as such distinct from that other white form known as E. g. a. alba. In other respects the plant is identical with the type, and will therefore form a useful addition to this small-flowered group. Shown by Messrs. Gregory and Evans, Sidcup, Kent. Award of merit.

Chrysanthemum Miss E. Holding (incurred).—The colour is of a soft lilac-pink tone, the flower moderate in size and compact. From Mr. Seward, Hanwell. Award of merit.

Chrysanthemum F. S. Vallis.—A flower of fine proportions and beautiful finish. It is of the Japanese type, having slightly drooping florets, the clear rich yellow of the petals of a glistening character. The florets are rather narrow and very numerous. Exhibited by Mr. W. J. Godfrey, Exmouth; and by Mr. Norman Davis, Framfield, Sussex.

Chrysanthemum Maude du Cros.—If size is an item for satisfaction in the show *Chrysanthemum*, it is undoubtedly contained in this kind in no small degree. The huge heads of flowers are of the largest size, the florets soft, clear yellow in colour, very long and overlapping. Obviously the variety is strong. It is worthy of remark that this self yellow kind and *Miss Mildred Ware*, a shade between pale fawn and terra-cotta, were raised from the same head of seed. Mme. Carnot being one of the parents. The above was shown by Mr. H. J. Jones, Lewisham, on behalf of the raiser Mr. A. du Cros (gardener, Mr. A. Bullimore), the stock passing to Mr. Jones for distribution. Award of merit.

Nephrolepis Westonii.—A very beautiful and useful addition to this class. The slightly arching fronds are of a plumose character, the pinnae some 3 inches long and strongly crested at the tips. A feature of the plant is the remarkable way it is furnished at the base by means of the small shoots or runners. In this way a pot of 5-inch diameter is ample for a plant of large size. It will in all probability make an invaluable pot plant for market use. Shown by Messrs. Cragg, Harrison, and Cragg, Heaton. Award of merit.

THE LADY WARWICK COLLEGE.

On the 24th inst. the Lady Warwick College, which now has its headquarters at Studley Castle in Warwickshire, was opened by the Countess of Warwick, who also presided at the council meeting held the same day. The new home of the college is much more suited to its needs than were the hostels at Reading, where the work was much hampered by want of proper accommodation, restricted space, and the heavy rates and taxes. Studley Castle has been acquired by the college authorities, together with some 340 acres of land, most of which, however, is at present let off as farm land, some 30 acres to 40 acres being reserved for college purposes. Fresh land can, of course, always be taken in as required. Studley Castle is delightfully situated upon rising ground about two miles from Studley Station, on the line between Birmingham and Evesham, and midway between Redditch and Alcester. The grounds are finely wooded, and, on the occasion of our visit there on Saturday last, we had an opportunity of noting the conifers, of which the pinetum contains some fine specimens, and the general collection of trees and shrubs in the arboretum, all of which are legibly and correctly labelled, and cannot fail to be of great teaching value to the students. There is a good walled-in fruit and kitchen garden, where, however, the fruit trees are suffering from several years of neglect. These it is proposed to graft with good varieties, and we may

confidently hope before long to see them bearing satisfactory crops of fruit. As the term only commenced about a month ago there has not yet been time to do very much towards putting the neglected gardens in order, and especially as the continual rains have made the clay soil at Studley practically unworkable.

Much, however, has been done to the houses; they have been repaired, painted, glazed, &c., old fruit trees rooted out, and the borders prepared for new ones. The houses devoted to plant culture were full of seasonable flowers, among which *Chrysanthemums* figured largely. There were several hundreds of these, bush plants, bearing a profusion of bloom, and those restricted to a few stems with blooms that would have done credit to an exhibition board. The stove house was particularly bright and well kept, foliage and flowering plants in great variety showing skilful culture. The conservatory, too, was gay with *Salvias*, *Pelargoniums*, and other plants in flower. That the students enter thoroughly into the work of a garden and do not shirk the practical part was made evident to us by a number of Peach trees in large pots. These had just been repotted, and the work, carried out by the students, would hardly have been found fault with by the most exacting of head gardeners. Here we might mention that the duties of head gardener are carried out by Miss May Crooke, who is also sub-warden of the college. Miss Crooke is imbued with so much enthusiasm for her work that, combined with the practical instruction imparted by Mr. W. Igoulden, who visits the college weekly, the best results are almost a certainty. The warden of the college is Miss Bradley, and she is ably assisted by instructors in the various branches of horticulture and agriculture included in the curriculum. Several of them are old students of the college.

COUNCIL MEETING.

The council meeting was held at 3 p.m. The Countess of Warwick presided, and was supported by Lord Coventry, Lord and Lady Hertford, and others. After a few opening remarks by the Countess of Warwick, the warden, Miss Edith Bradley, read the following report:

"Lady Warwick, my lords, ladies, and gentlemen.—It is a matter of profound satisfaction and honour to me to be in the position of presenting a report here at Studley Castle upon the work of the closing months of the hostel at Reading and the commencement of the new Lady Warwick College at Studley. Only those who have followed the agricultural scheme from the start will understand what it means to it to be in its present surroundings, and only those again can at all appreciate the enormous debt of gratitude women, educated women, owe to our most generous founder. Here, then, is our chance, our opportunity of 'extending to others what we so richly enjoy,' and if at Reading we were hampered for want of space, hampered by enormous rates and taxes (living in a Royal borough), hampered by urban surroundings, and, above all, hampered by being spread over four different houses, here we have unlimited scope and opportunity of development in every department, we have room for everyone under one roof, which means so much in the way of consolidation, and that one roof situated in the most beautiful surroundings possible. I should like here to make a few remarks on the last term's work at Reading. After our students discontinued attending the classes at Reading College in July, 1902, we had our own lecturers and examiners, and a certificate was given by the Lady Warwick Hostel to those successful and fully-trained students who won them. The best testimony of the practical nature of our work can be found in the examiners' reports. During August the hostel was moved to Studley; one might say the move is still going on. The work of repair and adaptation in this huge house has been enormous. In beginning of August it seemed as if prophecy would be fulfilled, so we came and lived here, one room out of about fifty was habitable. Little by little we ousted the workmen, but it was impossible to open term and house the students at all comfortably until September 30. That day a large party arrived, and has been added to since, so we now number forty-one students, and I am expecting three more at least at the half term. Two new ones have already entered for the next term.

"A word as to the various departments. Horticulture has always been the largest, perhaps because it presents the best openings. In poultry Mr. George A. Palmer is the instructor; he also lectures on dairy farming. Miss La Mothe, N.D.D., also an old student, is manager. The manager of the dairy is Miss Hoare, N.D.D., an old student. Botany is taught by Miss Sharples, also an old student, who enjoys the privilege of a day a week with Professor Hillhouse at Birmingham. Miss La Mothe deals with soils and manures, and Miss Hughes Jones with entomology and insect pests. Mr. Herrod is bee expert, assisted by Miss La Mothe, and book-keeping and business training is taught by Mr. Long, Birmingham accountant. Miss Crooke and myself have invented a fruit stiller. She did the bottling, and gained two silver Banknotes and a gold medal at the Royal Horticultural Society, Chiswick, beating the trade."

In her address Lady Warwick emphasized the need for some scheme to enable women to earn their own living, and stated that by a training in gardening and the lighter branches of agriculture such was made possible to them. In taking up this work they must overcome the prejudices of farmers and gardeners. Lord Coventry, Lord Hertford, Professor Hillhouse, Mr. T. W. Sanders, Mr. Herrod, and others also addressed the meeting.

NATIONAL CHRYSANTHEMUM SOCIETY.

FLORAL COMMITTEE.

A WELL attended meeting was held at Essex Hall, Essex Street, Strand, W.C., on Monday afternoon last, 26th inst., at three o'clock, Mr. D. B. Craus being in the chair. An excellent collection of novelties was staged, and a high standard being observed, but few were recipients of the coveted distinctions. Japan varieties, as novel, predominated,

and several of them were large and of good form and colour. The following were the more conspicuous:—

Maude du Cros.—A very large and handsome Japan bloom of exhibition standard, it has long and broad pointed and slightly twisted and curled, and building a bloom of great depth. Colour pale sulphur yellow on inside of the florets, with a much paler reverse. First certificate to Mr. T. Bullimore, Canon's Park Garden, Edgware, Herts.

Mrs. T. P. Bryce.—This is a very large and handsome incurved flower of good form and compact build. It is fairly broad and pointed. First-class certificate awarded Mr. W. J. Godfrey, Exmouth, Devon.

Miss E. Holding.—Another incurved of large size globular form; the petals are broad and pointed. This very full flower, and when finished is deep and solid. On silvery pink. First-class certificate to Mr. W. Seward, Firs, Hanwell.

Exmouth Rival.—This is a splendid type of Japan reflexed; the flowers are of moderate size and quite distinct. The petals are fairly broad, and the flower of good form. The colour, the chief point of excellence, may be described as a rich shade of crimson, with a beautiful golden bronze reverse. Commendation awarded to Mr. W. J. Godfrey.

Several other novelties deserving notice were shown, the best of which were *Mrs. George Judge*, a lovely rose-pink sport from Master C. Seymour, having broad petals, making a desirable flower; *Wilfred H. Godfrey*, a pretty Japanese bloom with long petals of a reddish crimson colour and deep golden bronze reverse, curling at the ends; *Mrs. Bachelshelm*, a glorious sport from Lily Mountford, colour rosy crimson on the lower petals with a rich golden yellow centre; *Colonel Weatherall*, a striking rich and deep yellow Japanese, with long and broad petals of spreading form; *Lady Pearce*, a chaste and lovely rich creamy white with a greenish centre, petal long, broad, and slightly twisted; *Thornycroft*, which the committee desired to see again, is a fairly large flower of refined appearance; the petals are long and of medium width, and the colour is a pleasing shade of silvery rose-pink on a cream ground. There was a capital attendance of members.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

THE seventeenth anniversary dinner of this society was held on Tuesday last at the Holborn Restaurant, Mr. Peter Barr, V.M.H., being in the chair. The company numbered about 100, and among those present were Messrs. E. Sherwood, Thomas Cox, G. J. Ingram, James Hudson (hon. treasurer), W. V. Baker, George Barr, Dawkins, Dawson, Cowell, Mrs. Brown, D. B. Craus, W. P. Thomson, C. H. Curtis, L. Heal, Cuthbert, Bevan, and others.

After the usual loyal toasts, the chairman gave that of "The United Horticultural Benefit and Provident Society." After eulogizing the good work done by the society, Mr. Barr said he thought some of the rules were rather cumbersome, but he understood that these were about to be rewritten. He was not aware until recently that seedsmen were entitled to the benefits of this society. He had made the matter known in Messrs. Barr's warehouses, and thought it would be a good thing if other seed houses would do the same. He hoped all present would assist towards obtaining the 10,000 members he hoped to see enrolled within a few years. He would suggest that a leaflet be prepared to circulate among young gardeners, one among nurseries, and still another among seedsmen; also that clergymen should be written to asking them to draw the attention of their parishioners to the society. He suggested that a branch of the society should be established in Scotland. He met with no self-help gardening associations either in the United States, Australia, New Zealand, or South Africa, except in Sydney, N.S.W., where there is an excellent gardeners' society. Mr. Barr asked what there was to prevent lady gardeners becoming members of the society, as they had evidently come to the front. Mr. James Hudson (treasurer), in replying to this point, thought that Scotchmen would rather join a society already established rather than form a new one. They were never so sound as at the present time—they had £22,000 invested. He acknowledged the good work done by the Press in making the society known. He hoped their society might long continue to carry on its good work.

Mr. A. J. Brown proposed "The Honorary and Life Members." He thought that one of the best features of this society was that it provided for old age without in any way being a charity. He hoped that the alteration of rules would induce more gardeners to join. He thought Mr. N. N. Sherwood did a grand thing when he inaugurated the convalescent fund. Mr. Thomas Cox briefly replied.

Mr. C. H. Curtis proposed the toast of "The Chairman and Mr. Barr," in replying, said he hoped soon to visit all the chief gardens of Britain, but before doing so intended going to Egypt, Palestine, and Greece.

Mr. W. Woods proposed "The Visitors," and Mr. J. Bevan replied in an interesting speech, in which he strongly upheld the great educational value of travelling, and said that it was not possible to stay at home and be a good gardener.

Mr. Thomas Winter proposed "The Press," and Mr. J. Hooper Pearson responded, mentioning that Professor Wagh had taken back to America a copy of this society's rules, and that it was not improbable that before long a similar society would be established over there.

Mr. Collins (secretary) proposed a vote of thanks to the donors of flowers and fruits, and took the opportunity of thanking the society for its continued confidence in him.

It was announced that Messrs. Barr and Sons had become honorary members of the society and had subscribed ten guineas. Mr. Peter Barr gave five guineas.

To His Majesty The King.
By Royal Warrant of Appointment.

37 Medals and Awards for Excellence.

ESTATE DEVELOPMENT. HORTICULTURAL BUILDING. ENGINEERING & CONTRACTING. LANDSCAPE GARDENING ON NATURAL PRINCIPLES.

K GARDENS, FOUNTAINS, STATUARY, PEDESTALS, SUN-DIALS, AQUARIA, WINTER GARDENS, &c.

All orders accompanied by remittance will be sent Package Free when not less than 1 doz. are ordered. Guaranteed to be the finest grown Plants in the Country.

AMBROSE'S GRAND NEW BLACK GRAPES.

MELTON CONSTABLE SEEDLING, "Lady Hastings" x "Gros Colmar."

Raiser, W. SHINGLER, Head Gardener to Lord Hastings, Melton Constable.

The entire Stock of this New Seedling Grape was purchased by me on September 29th, 1903, and will be ready for distribution July, 1904.

PRICES OF CANES.

FRUITING CANES, 31/6 each. A Few Extra Strong (Fruiting this year), in 12 size pots, 42/-. For description, see Daily Mail Report, October 1st, and Gardening Papers, October 3rd and 10th, Reports of Chiswick Fruit Show. ORDERS WILL BE EXECUTED STRICTLY IN ROTATION.

AMBROSE, F.R.H.S. (For 29 years with Messrs. Paul & Son, 23 years of which the Sole Representative),
NURSEYMAN, SEED, TREE, BULB, AND PLANT MERCHANT,

Telegraphic Address: "Ambrose, Cheshunt."

THE NURSERIES, CHESHUNT, HERTS

CARDIFF GARDENERS' ASSOCIATION.

THE second meeting of the season took place at the Grand Hotel on Tuesday, the 20th inst., when Mr. H. R. Farmer presided over a large attendance. Mr. F. W. E. Shrivell, F.L.S., F.R.H.S., Thompson's Farm, Tunbridge, delivered an instructive lecture, entitled "The Use of Chemical and other Manures in Horticulture," illustrated with a series of lantern slides, showing the actual plots on his experimental farm containing crops grown from various proportions of chemicals put on the land with and without the aid of organic manures. The illustrations produced were clearly a proof of what can be done with care, and served as an object-lesson for future trials. Mr. Shrivell also brought a series of slides showing the method of Hop growing on his own farm, embracing the starting into growth, fixing poles, gathering the crops, measuring the kiln for drying, and the produce on the way to market, also Hop-pickers, and their mode of living during the season. The best thanks of the meeting were accorded Mr. Shrivell for his most interesting lecture, to which he briefly responded. It was announced that Mr. H. R. Farmer, Cardiff Castle Gardens, would lecture on "Vines" on November 10.—J. JULIAN, Hon. Sec.

BRISTOL GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

THE opening meeting of the winter season of this society was held at St. John's Rooms, Redland, on the 15th inst. The chair was taken by Dr. Barclay J. Barron. A most instructive lecture was given by Mr. J. C. House, of Coombe Nurseries, Westbury-on-Trym, his subject being "Hardy Perennials." Mr. House, who makes a special study of hardy perennials, was accorded an enthusiastic reception, and his lecture was listened to with great interest. He remarked on the renewed interest taken in these gems of our gardens, the cultivation of which was increasing every year. He gave an exhaustive list of the favourite varieties, with cultural directions for each, in such a manner that his audience were able to carry away with them a host of most valuable hints. A special feature of the evening was a magnificent collection of fifty perennials grown at Messrs. Isaac House and Sons, Coombe Nurseries, which, notwithstanding the inclement weather, were most remarkable. *Pyrethrums*, *Pentstemons*, and *Michaelmas Daisies* were beautiful in the extreme, showing the amount of care and attention bestowed upon them. The society unanimously awarded them a certificate of special merit for this praiseworthy display, with which they had taken so much trouble. Dr. Barclay J. Barron, on passing a vote of thanks, said what an interesting lecture Mr. House had given, and how pleased he was to have been able to preside over such a meeting which had been of so profitable a nature to himself and the members present. He hoped the society would continue to maintain the steady progress it had made during its formation, and expressed the hope that more of the Clifton gentry would interest themselves in the good, sound, and useful work being done for the benefit of the horticultural world. Mr. House replied. Prizes for six bunches of perennials were awarded to Mr. A. Baker (gardener, Mr. Orchard), Lady Cave (gardener, Mr. Poole), and Mr. J. C. Aiken (gardener, Mr. Clarke). For a basket of autumn foliage and berries the prizes went to Mr. R. Ambrose, Mr. Cary, and Mr. R. Poole. Certificates of merit went to Mr. A. Cole (gardener, Mr. Bird) for six vases of *Begonias*, Mr. H. Daniel (gardener, Mr. Quick) for one Orchid, and for two Orchids to Mr. F. C. Fisher (gardener, Mr. Shelton).

Zonal Pelargoniums at Arbigland, Dumfries.—The wet season we have experienced has brought home to many the value of some flowers under glass. In many gardens the glass structures are small compared to the demands made upon them, and it is desirable to use them for only free-flowering subjects. At Arbigland, Dumfries, the seat of Colonel C. E. Blackett, a feature is made of zonal Pelargoniums, and these as cultivated there are of inestimable value for cutting for the houses, as well as for the conservatory. A large number of the most modern type are grown and flower freely, giving large trusses with splendid pips of various colours. The plants are as a rule in 6-inch and 8-inch pots, on the stage of one of the greenhouses, and the treatment of these differs little from that ordinarily followed. There are, in addition, a number in the same house which are old plants grown in 12-inch pots and trained to wires on the rafters and also to the wall at the back of the house. Some of these plants are of considerable age, but it is surprising the quantity of bloom they give almost continuously. They make short joints and bloom very profusely, while the trusses are much finer than many would expect from old plants. These zonals are watered with liquid manure twice a week, and in this and the top-dressing they receive is the main secret of their flower display. As the pots are filled with roots a ring of zinc is placed on the top of the soil, and this is filled with fresh compost. No one who has not seen these plants frequently for a long period can have any idea of their value for cutting. The foliage is limited and small, but the flowers are good and freely produced. Mr. W. Houlston, Colonel Blackett's gardener, finds them exceedingly valuable.—S. A.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 80, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHERS. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—Thorn.—*Griffinia hyacinthina*.—*Tempany* July.—1, *Atlantis glandulosa*; 2, *Catalpa bignonioides*; 3, *Crataegus crus-galli ovalifolia*; 4, *Vaccinium corymbosum*.—W. H. Cox.—The name of the enclosed specimen is *Pitcairnia albucifolia*, a native of the West Indies, and belonging to the natural order Bromeliaceae, an extensive class of plants but little grown in this country. The best known of them all is the Pine-apple (*Ananas sativus*). To succeed in its culture this *Pitcairnia* needs stove treatment, with (in order to induce it to flower) comparatively light shading during the summer months. Plenty of water throughout the growing season is necessary to its well doing, yet at the same time stagnant moisture is decidedly injurious. To prevent this the drainage must be effectual, and a potting compost made up of equal parts of loam, peat, leaf-mould, and sand is very suitable to the requirements of this plant. Should the peat and loam be of a very sandy nature a lesser amount of pure sand must be added. During the winter the plant will not need so much water as in the summer months, but at no time must the roots be allowed to get quite dry. As you suggest, it is certainly a very pretty pot plant, and so are some of the other members of the genus. *Pitcairnia alba*, of which a nice specimen may be grown in a pot 6 inches in diameter, pushes up a slender branching spike to a height of 3 feet to 4 feet, and bears a great profusion of scarlet blossoms, much like those sent but rather smaller. *Pitcairnia corallina* is a large growing plant with palm-like leaves 4 feet long and a dense spike of large red flowers, which is pushed out horizontally from the base of the plant in early spring.

Salvia patens (E. C. CLOUGH).—*Salvia patens* is almost hardy; indeed, it will in many places pass safely through a mild winter without any protection or simply a few leaves scattered over the crown of the plant. To be thoroughly safe, however, the tuberous roots should be lifted, laid in boxes, and covered with dry soil, then placed in a cellar, shed, or cool house, where they are just safe from frost, but nothing more, for if kept too warm they start (as yours did) prematurely into growth and then perish.

Prolonging the season of single Roses (W. H.).—Having had occasion to plant back in April some of the summer-flowering single Roses, such as *Anderssonii*, *Macrantha*, *Leuchstern*, *Penzance Briars*, &c., I was much gratified to find them blossom much later than the established plants. Whereas these latter will flower in June, those alluded to did not unfold their blossoms until towards the end of July. I think it is a phase of Rose culture worth remembering. If we cannot have perpetual-flowering forms of all Roses, we may at least assist Nature to prolong the display by such late planting as noted above. This applies in like degree to many Hybrid Perpetuals and other types.—P.

Grubs on Brussels Sprouts (T. C. H.).—The grubs you sent were very much dried up and shrivelled when they reached me, but I have no doubt they are the grubs of the Cabbage fly (*Anthomyia brassicae*), a fly very much like a small house fly. One of the best means of destroying this insect is by taking up the diseased plants with as much earth about the roots as possible, putting them into a basket or box from which the grubs cannot drop out, and carrying them away and burning them. Then fill the holes caused by their removal with fresh lime or strong brine to kill any grubs which may have been left behind. Watering with any insecticide which was strong enough to injure the grubs would probably do more harm to the plants than the grubs would. Ground which has borne an infested crop should be well fallowed and dressed with gas-lime.—G. S. S.

Retinospora growth (W. M.).—A very interesting specimen, which well illustrates a fact long recognised by botanists, viz., that several of the plants grown in gardens as distinct species of *Retinospora* are in reality but forms of two or three species. The tree 10 feet high is *Retinospora plumosa* of gardens and nurseries, but really it is a form originated from the Japanese *R. pislifera*, and the growth referred to by you as abnormal is an instance of the original species again asserting itself, for the branch which stands out in such a conspicuous manner is *Retinospora pislifera*, pure and simple. Examples such as yours, though decidedly uncommon, have been observed before; even the plant known as *Retinospora squarrosa*, which is in general appearance much further removed from *R. pislifera* than *plumosa* is, has been known to push out a branch identical with the typical *R. pislifera*, from whence it has sprung. Though the generic name of *Retinospora* holds good in many cases, our botanical authorities have now merged it in the genus *Cupressus*, so that the correct appellation of the tree referred to by you is *Cupressus pislifera* var. *plumosa*.

TRADE NOTES.

MUSHROOM GROWING.

MR. JOHN F. BARTER, LIMITED, Napier Road, Wembley, Middlesex, has issued an interesting booklet upon the sub-

ject of Mushroom growing and spawn making. Mr. Barter commenced his business in 1973. In the first year 3,000 bushels of spawn were made and one ton of Mushrooms was grown. In 1932 the output of spawn was 10,000 bushels and ten tons of Mushrooms. This year it is expected that the total output will be nearly twenty tons. Mr. Barter says the production of the Mushroom is a profitable business when good spawn is secured. Customers are always welcome to visit the grounds at any time to see for themselves the art of Mushroom growing for market, and hints are willingly given.

PORTABLE STREAM FRUIT AND HOP-WASHING APPARATUS. THE long spells of dry weather from which agriculturists have suffered during the past few years have caused many farmers to go in for pumping plant to water their vegetables and root crops, and where such apparatus has been adopted crops have been saved, and, as the markets have been ill supplied, have fetched better prices than usual. In repaying the grower for the expense of watering. The engine supplied with Messrs. Merryweathers' patent Hop-washing plant is particularly suitable, without any addition except hose-piping to convey the water and sprayers to distribute the liquid for watering work in time of drought, and can thus be employed practically all the year round as follows: In spring and summer for Hop-washing, spraying fruit trees and shrubs, root and vegetable crops, &c., watering Hops, plants, trees, and crops; in autumn for watering vegetable and root crops, supplying farm and stables with water, &c., and tree moving; in winter for sheep-washing, watering cattle, pumping out ponds and ditches, &c., for driving sawing, churning, separating, grinding, chaff cutting, and other farm machinery. With Messrs. Merryweathers' apparatus six men can thoroughly spray 12 acres of large Cherry or Apple trees, taking 100 tons to the acre, in six hours, or 6 acres of Hops in the same time. The plant can also be used for spraying Potatoes and root crops, Tea plantations, Vines, Tobacco plants, &c. The plant is extremely portable, and can be shifted and re-laid in half an hour. One of the many advantages of this apparatus is the economy with which it distributes the insecticide, so that every drop reaches whatever is being sprayed.

HAREFIELD HALL ORCHIDS.

ON Wednesday and Thursday, November 4 and 5, Mr. John Cowan, Gateacre Nurseries, near Liverpool, will conduct a sale of duplicate Orchids from the Harefield Hall collection of Orchids, the property of Elijah Ashworth, Esq., Harefield Hall, Wilmshole, Cheshire.

A NEW RAFFIA.

MESSRS. JAMES T. ANDERSON AND SONS, LIMITED, 15, W. and 155, Commercial Street, E., have sent us samples of an excellent new Raffia. It is very white and broad, long and of a silky nature. Messrs. Anderson consider it to be the finest imported into this country for many years. It is greatly sought after owing to its good quality.

NEW TYPE OF DAHLIA.

MM. RIVOIRE PERE ET FILS send a box of their new Dahlias a collarette, but the Post Office regulations did not permit of their being forwarded. They have therefore sent us illustrations of two new varieties, *Maurice Rivoire* and *Gallia*, both of which have an inner row of small petals in addition to the ordinary ones. The older variety, *Frédéric Vigor*, shows this second row of petals, but much less developed.

CATALOGUES RECEIVED.

Fruit Trees and Roses.—Messrs. Thomas Rivers and Son, Sawbridgeworth, Herts; Messrs. George Banyard and Co., Maidstone, Kent; Messrs. John Jefferies and Son, Cirencester.

Hardy Plants.—Mr. Amos Perry, Winchmore Hill, I. **Novelties for 1904.**—Messrs. J. C. Schmidt, Erfurt.

PUBLICATIONS AND BOOKS RECEIVED.

The Studio for October is the best number that has been produced. One of the reasons is that the magazine has been permanently and considerably enlarged, and the present part forms the beginning of a new volume. It is, as usual, full of excellent illustrations, coloured and otherwise, and articles; but perhaps the brightest contribution is concerned with the London Sketch Club, which was started a few years ago on the lines of the Lingham, and has for members such well-known artists as Dudley Hardy, Hannall, Cecil Albie, Tom Browne, and G. C. Halé. The reproductions of the artists' two-hour sketches are extremely good, and the portraits of some of the members are remarkably lifelike. Those who are personally acquainted with the men represented will enjoy these sketches and portraits.

Great Masters.—We have nothing but praise for a new publication being issued by William Heinemann of London called "Great Masters." The series contains superb photographic reproductions, by an improved method, of the best works of famous painters from 1400 to 1800, with an introduction and descriptive text by Sir Martin Conway. The plates are 15 inches by 20 inches, and are on the finest art paper. The first part contains photographs of William II., Prince of Orange-Nassau (Van Dyck), Mrs. Carnarvon (Reynolds), portrait of Jan Steen, by himself, and The Ash Tree (Van der Meer). Each part is 5s. net.

Messrs. George Newnes, Southampton Street, Strand, send us the *Captain and Wide World Magazine* for October, both of extreme interest, and the last part of the "Century Book of Gardening," which is now completed. We shall review the release of the whole work shortly.

* * The Yearly Subscription to THE GARDEN is: *Island*, 15s.; *Foreign*, 17s. 6d.

THE GARDEN

No. 1668.—VOL. LXIV.]

[NOVEMBER 7, 1903.

FLAVOUR IN FRUIT.

WE asked perhaps the greatest raiser of new fruits and flowers of the present day whether there was an honest desire among hybridists to think of flavour as an attribute worthy of serious consideration, and the answer was an emphatic "Yes." This is comforting to those who despair of convincing growers that if ruddy cheeks and heavy weight are in their degree of some importance, flavour appeals more strongly to the palate of the public, who know what is most wholesome and pleasant but is not always able to get it.

A big Beurré Clairgeau Pear or a Peasgood's Nonpareil Apple have no value in the eyes of those who set flavour and wholesomeness before bulk, and those unacquainted with the best varieties for flavour among the many fruits should at this planting season, when the lists are being drawn up, make a wise selection to secure the varieties that possess what is usually described as "quality." It is satisfactory to find that the fruit and vegetable committee of the Royal Horticultural Society, before which body the majority of the novelties are placed for their approval or otherwise, are not forgetful of the great importance of flavour in a fruit and the finest quality in a vegetable, and this praiseworthy judgment has had a most beneficial influence upon the men who bring forward novelties for the good of the public.

Some may declare we have sufficient fruits already, but this is an absurd answer, when we remember that many known sorts fall short of an ideal standard. There is ample room for improvement, whether by hybridisation or selection, and it is a simple matter to replace an old variety for a novelty of greater merit. We value too highly the work of the hybridist to write a single disparaging word against his efforts to add to the pleasures of the table; it is for the public to accept or reject the outcome of his skill and labour. Many fruits raised within recent years are already established favourites, and we can mention one with special approval, the Loganberry, which is being planted largely both in private and market gardens.

Raisers of new fruits should also think of the seasons which are not blessed with much variety in this way. A glut in October does not compensate for a dearth in January, and therefore the work of the hybridist must be

watched with interest and encouraged by all who wish well the great horticultural industry of these isles. The work of the hybridist *who thinks* is never finished.

KEW NOTES.

INTERESTING PLANTS IN FLOWER.

Temperate House.

BEAUFORTIA SPARSA, *Cytisus filipes*, *Leonotis dubia*, and *Veronica speciosa* varieties. In the two octagons a nice collection of *Chrysanthemums* is now in flower, including many large bush plants, with a sprinkling of plants grown for large blooms.

Palm House.

Sterculia mexicana.

Arboretum.

Arbutus Unedo and varieties, *Colletia cruciata*, and *Laburnum caramanicum*.

Orchid Houses.

Catasetum Hookeri, *Cœlogyne lagenaria*, *Cymbidium gammieanum*, *C. traceyanum*, *Cynorchis purpurascens*, *Cypripedium fitchianum*, *C. pitcherianum*, and others, *Dendrobium Phalaenopsis*, *D. strongylanthum*, *Epidendrum Armstrongi*, *E. vitellinum*, *Listrostachys pellucida*, *Masdevallia inflata*, *Miltonia spectabilis* var. *moreliana*, *Odontoglossum andersonianum*, *Oncidium cheiroporum*, *O. crispum*, *Phalaenopsis Esmeralda*, *Restrepia maculata*, *Spathoglottis hardingiana*, and *Vanda cœrulea*.

T Range.

Echmea candida, *Allamanda violacea*, *Aphelandra tetragona*, *Begonias* (winter-flowering) as follows—Ideals, Julius, John Heal, Mrs. Heal, and Venus, *Billbergia Moreli* var. *paucifolia*, *B. porteana*, *Cleome heptaphylla*, *Coleus Mahoni*, *Dyschoriste Hildebrandtii*, *Eranthemum albidiflorum*, *Jacobinia chrysostephana*, and *Tillandsia Lindenii*.

Greenhouse.

Chrysanthemums form the chief attraction in this house now. There are about 100 varieties in the house, and all are now at their best. The majority are grown as bush plants, but there are a few plants here and there which have been grown for large blooms. The show of *Chrysanthemums* is one of the best there has been for many years, and of the many varieties the following are conspicuous: Mrs. G. Mileham, H. J. Jones, Lady Byron, Mme. Ferlat, Mme. E. Rogers, Mrs. Coombes, Lady Smith, and Mrs. Thorneycroft.

ROUND ABOUT A GARDEN.

THE SEASON OF THE DEAD LEAF.

THIS is the dolorous untidy season of the dead leaf. Where the gardener swept yesterday, there is a new rustling carpet for him to sweep threadbare again to-day; or, as he says, the leaves will "smother everything." There is wonder no doubt in the annual miracle of the falling leaf. A forest, or even a park landscape

or any well-wooded garden, is a solid thing to look at in summer; and when one thinks that all those tons upon tons of greenery were manufactured by the trees for summer use and are dropped when the time for rest from work arrives, one cannot help recognising the marvel and the beauty of the change. Leaves die beautifully, too; and the older one grows the more one values the sad splendour of autumn tints of Nature. Perhaps you appreciate the consolations of autumn more when you feel the autumn in your blood.

THIS YEAR'S MISSED GLORIES.

This year, however, it has been a favoured place indeed when the many hues of autumn have reached their proper excellence. For most of us the flying Beech leaves came in brown and twisted showers, where in other years the trees have been sheeted with coppery red, with shades of actual carmine between the folds. Tennyson's Maple that "burns itself away" in autumn's golden blaze, this year stood draggled and tattered and bare almost before a shade of yellow had crept into any leaf. Where, too, can we hope to see the Larches this year standing like soft pyramids of pale gold against the blue-black Pines? One afternoon last November I sat writing in a room which was flooded with amber light reflected from the Larches in the shrubbery opposite. Now, I am sitting at the same window and see the Larches standing like untidy scaffold poles with hardly a cobweb film of brown leafage upon their branches. How can trees that went threadbare before "summer" be ended by lavish of golden tissue in late autumn?

THE LEAVES' DANCE OF DEATH.

For the wind—worst of the long list of wicked things that waste a garden and begin with "W"—has had its shattering way with us this year; and the equinoctial gales of spring had not died away before those of autumn began to hustle the weary trees. And now that the leaves are littering the ground, the wind, like a cat with a dead mouse, plays all sorts of weird pranks with the wreckage it has made. At night they come pattering on the window, often like ghostly finger-taps; and when you open the door they come whirling and rustling in, whisking round like the skirts of some invisible fairy dancer. Over the lawn they lie thick as bread-crumbs on a fried sole, and wherever there is a wet angle of a path there they collect in sodden, wind-swept heaps, under which long lob-worms and fat slugs find a sludgy asylum. Many writers of fame have written with ecstasy of the dancing of the wind-borne leaves. To me it seems always a dance of death—forced merriment of shrivelled corpses playing with their enemy, the wind, who picks them up and flings them down wherever he pleases, and usually where their remains will be most unsightly and will most vex the gardener.

BRACKEN AND IVY.

There is no reason, of course, why some should not be predisposed to admire one phenomenon of late autumn as much as another: to see as much beauty in the dance of wind-driven leaves as in the flickering snowstorm of white-winged gulls over the plough. All of our notions of beauty are based upon connexions of ideas. "Some is born Rooshians, and some is born Prooshians, and them as is born different thinks different." To many people, for instance, the high waving sea of green Bracken in summer, or its golden-brown fronds in autumn, amid which the silver-stemmed Birches stand knee-deep, is one of the most grateful sights of English woodland; and another is the rich green carpet of Ivy which softly covers all the ground in many coppices. Though one cannot fail to see the real beauty of the Bracken and the Ivy, both, when growing thus, fill me with a sense of discomfort and disappointment.

Analysing the feeling, when I first noticed its incongruity, I found that it dated from boyhood's butterfly-hunting days in the Cotswolds, where there was rare collecting in most of the woods, but none to speak of in woods full of Bracken and carpeted with Ivy. These plants, growing in battalions and spreading like the plague, help the rabbits to crowd out the other woodland plants upon which caterpillars feed and whose flowers the butterflies seek. Many years afterwards I chanced to hear another man make a disparaging remark about a wood vista of Bracken which others were admiring. "Another thing you do not like," I said to him, "is a carpet of Ivy covering the ground in a coppice." "Quite true," he said, "it always worries me." "Then," I triumphantly replied, "you collected butterflies as a boy." He admitted the fact, and we fell to reviving the joys of those days of long ago, and it was almost absurd to find that our ideas of perfect woodland beauty almost exactly coincided in every detail of herbage and undergrowth. Similarly, there exist reasons, if we could only find them, for every detail of our likes and dislikes, our preferences for certain shapes of flowers or shades of colour.

E. K. R.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

November 9.—St. Neots Chrysanthemum Show.
November 10.—Royal Horticultural Society's Drill Hall Meeting; meeting of committees at 12 noon; lecture upon advantages and disadvantages of size in flowers, fruits, and vegetables at 3 p.m.; National Chrysanthemum Society's Exhibition at the Crystal Palace (three days); Devizes and Oxford Chrysanthemum Shows.

November 11.—Buxton, Reading, Liverpool (two days), Hampton, Winchester (two days), and Banbury (two days) Chrysanthemum Shows; East Anglian Horticultural Club Meeting.

November 13.—Blackburn (two days), Leicester (two days), Sheffield (two days), and Leeds Paxton (two days) Chrysanthemum Shows.

November 25.—National Chrysanthemum Society's dinner at the Holborn Restaurant.

Note on *Nymphaea gigantea*.—About two months ago I received some small tubers of the above-named Water Lily from a friend in Sydney. They were in very good condition, though only about the size of large Hazel Nuts. I potted them in small Orchid pans in loam and placed them in my warm tank. In about a week they began to form very small leaves, which in a month were about 8 inches in diameter, rather elongate ovate in form, and with nearly even outline,

not scalloped as in *Nymphaea scutifolia*. About a fortnight ago, to my great surprise, a bud appeared. It was more nearly globular than in the South African species, and as it grew showed a somewhat pink colour at the edges of the sepals. Another bud soon followed, and both are now open, and, though small, as are the first flowers of most Water Lilies, are quite distinct from any others I have seen. They are 4 inches in diameter and open fully, floating on the water, whereas those of *N. scutifolia* rise a foot or more above it. The petals are about twenty in number, rather broad and rounded, not pointed as in the other blue Water Lilies, and they are of a very delicate blue with a tinge of lilac, quite distinct from those of the African species. But perhaps the most distinctive feature is in the central mass of stamens, which is large for the size of the flower, very compact, and almost globular, and of a clear sulphur yellow. They are quite free from the petals, and sharply defined both in form and colour, presenting a very beautiful contrast. Should this species grow to its full size next year, as I hope it will do, it will afford a beautiful picture with the bold deep blue *N. scutifolia*, the pure yellow *N. mexicana*, and the lovely pink *N. odorata rosea*, which I have growing in the same tank.—ALFRED R. WALLACE, Broadstone, Wimborne.

Broughty Ferry Horticultural Association.—In connexion with this association's course of lectures a very interesting one was given recently in the Grove Academy, Broughty Ferry, by Mr. Robert Don, Longforgan. The subject was "Our Native Grasses," and Mr. Don dealt with it in a most instructive manner. The value of the lecture was largely enhanced by a series of lime-light illustrations. Mr. Don was heartily thanked.—S.

Wrong terms.—May I enter a respectful protest against the growing practice of speaking of a plant's "hardihood?" The word is really not a synonym of hardiness so far as meaning a power of withstanding cold, as a glance at a dictionary will show. They are only used indifferently to express bravery, or boldness, or audacity, meanings entirely distinct. To put it another way, while hardiness bears the two meanings, hardihood is strictly confined to the others, of boldness and the rest of the like qualities.—T. J. WEAVER.

Potatoes in 1903.—We get such wonderful new Potatoes now with regard to their cost and other details that in a season when disease is so bad it is refreshing to poor growers to read "A. D.'s" excellent note at page 262, and to get such practical remarks from that splendid grower Mr. Beckett, at page 283, though we always expect such from him at a time like this; when excellent varieties are condemned wholesale, it is refreshing to get at the facts from experienced men. I have carefully read the correspondence in THE GARDEN, and I am not quite sure if the Editor, when he invited notes on the Potato, expected such a boom of some sorts and others that have for many years stood in the front rank to receive wholesale condemnation. In most cases growers have not taken soils or situation into account, and in others no particulars as to culture are given, but Mr. Beckett kindly gives full particulars. This season our best standard varieties have failed—I mean the early tubers mostly, and second earlies. I will not name varieties, but I do not mean yet to discard those which have served us so well previously. I am in a similar position to Mr. Fyfe as regards some sorts, but till these have had another trial I should be sorry to place them on one side for novelties.—A LARGE GROWER.

The weather in South Hampshire. Now that the rain has intermitted it seems worth while to put an experience on record. We have had rain here for thirty-six consecutive days, from September 26 till November 1, so that rain fell every day in the month of October. Of course, upon some few days the rain was only light, but on far the greater number it fell in tropical torrents, tempestuous storms of rain of almost unexampled

fury blew up hourly from the Channel, day after day and week after week. Gilbert White, who lived in the northern part of the county, records 50 inches of rain as having fallen in 1782 and 39½ inches in 1786. We seem to have lighted on a fellow year. I regret I have no rain gauge, but when our Chrysanthemums were housed on September 25 and 26 the zinc water-barrow was scoured and stood on a by path in the garden; it now contains 15½ inches of rain water.—R. P. S., near Winchester.

New Apples and their keeping qualities.—I read recently in THE GARDEN, page 290, that we may soon expect some very interesting introductions in the shape of long-keeping sorts that will be superior to those in commerce. These will undoubtedly be a great gain if they come up to the standard described. As, however, we now have so many fine Apples, new sorts that surpass them must be indeed good. It will be a great advantage if they bloom later in the season, as this year the only fruits we have are on the trees that flower late and were sheltered. As all growers are aware, there is no want of variety; indeed, there are too many sorts. In giving awards to new Apples the fruit committees are often in a difficulty, as, though the fruits sent may be excellent in some cases out of ten, the members are ignorant as to keeping and general keeping, two important points, as fruits may be shown late, but given special storage. For instance, at the Temple we see October Apples six or seven months later, well staged, but it is questionable if such Apples are profitable when cost of storage is considered. If we can get a Blenheim as good in May as in November it will be an acquisition.—FRUIT GROWER.

Swanley Horticultural College.—On the 28th ult., through the kindness of Lord and Lady Brassey, a meeting was held at 24, Park Lane, to hear an address from Mr. A. D. Hall, M.A., director of the Rothamsted Experimental Farm, on "Horticultural Instruction for Women." Lady Brassey presided, and there were also present Sir John Cockburn, K.C.M.G., Sir John Hibbert, K.C.B., Sir E. Verney, the Hon. Mrs. Lyttelton Gell, Lady Lennard, Colonel Sir Herbert and Lady Perrott, Professor Boulger, Miss Williams (principal), and Miss Sieveking (secretary of the Swanley College). Mr. Hall said there had been many exaggerated statements about the opening for women in commercial gardening; this was a matter for very careful consideration. He thought that the propagation of new and rare plants, for which there is a market demand, or raising new hybrids, offered a field for women workers. He thought that a collegiate instruction would do more to make a woman work intelligently than the old system of apprenticeship. He thought that women were far keener to take up instruction and work better at the scientific side of a subject than men. The great value of the instruction given at Swanley is that it is practical. Whether women ever turned to practical use the knowledge gained at Swanley or not, the course of instruction there could not fail to be of great value. Sir John Hibbert proposed the following resolution: "That this meeting respectfully presses upon the Government the claim which colleges for the horticultural instruction of women have to some share in the funds placed at the disposal of the Board of Agriculture for educational purposes, provided they submit to inspection by the Board and attain the required standard of efficiency, and therefore urges the Government so to increase these funds that all secondary institutions, agricultural and horticultural, may be treated upon terms of equality." Mr. J. C. Medd supported this resolution, which was carried unanimously. Sir John Cockburn thought that gardening was eminently suitable for women, and that women possessed infinite skill in tending plants. Miss Sieveking had received a letter offering £250, if this amount is made up to £1,000, to wipe off the college's liability, and Sir John Cockburn mentioned the present as a good opportunity to clear the college from debt. Mrs. Lyttelton Gell addressed the meeting with reference to the Colonial branch attached to the college, designed specially to meet the needs of women going to the Colonies.

Geum Heldreichii superba.—Among the Geums this stands out prominently on account of its rich colouring. It has been shown by Mr. James Perry, Winchmore Hill, on several occasions during the summer months, and has never failed to attract attention and to elicit praise. The flowers, each of which is usually $1\frac{1}{2}$ inches across, are a rich orange-red, a brilliant colour, and their beauty is accentuated by the bunch of yellow stamens. This Geum obtained an award of merit at the Temple show this year when exhibited by Mr. Perry, and it has, I was informed by Mr. Perry, been in flower in the open from the end of April until a few weeks ago, when a splendid specimen was shown from the Winchmore Hill Hardy Plant Nurseries. This variety originated at Winchmore Hill, and is really the result of a selection from Geum Heldreichii. Mr. Perry deserves to be congratulated upon having introduced such a valuable plant. It is particularly easy of cultivation, and may be propagated by division without difficulty. It grows from 18 inches to 2 feet high.

Cassia corymbosa in Ireland.—This plant is no stranger to our greenhouses and conservatories, and when planted out in a suitably-prepared border it is not unusual to find it covering a large space, and even on occasions making its growths through the ventilators at the top of the house and bearing a profusion of its showy yellow flowers. Those who know its value when well grown under glass will probably all the better appreciate the display made by a large plant covering a considerable wall space out of doors. It was my good fortune to meet with such a plant a short time ago when visiting Lady Ardilaun's garden at Clontarf, near Dublin. It was the middle of October, and the plant was simply smothered with flowers, a mass of yellow almost from top to bottom. The great clusters of yellow flowers, produced over an area of some 8 feet square, to judge from memory, produced an effect that those who have seen it well grown indoors can well imagine to be striking. Mr. Campbell, the head gardener at Clontarf, has evidently taken great care of this Cassia, and doubtless a note from him as to its history and treatment would be found interesting.

Cynoches maculata.—In the group of Orchids exhibited by Messrs. Charlesworth and Co., Heaton, Bradford, at the Drill Hall, Westminster, on the 27th ult., there were many rare and valuable plants. Among the former must be classed Cynoches maculata, a plant that is very rarely seen, for few have ever been imported. The sepals and petals are splashed with chocolate upon a pale green ground, and the curious arching column which has given rise to the name of Swan's-neck Orchids, as the Cynoches are popularly known, is well developed. These Orchids are sometimes referred to as the cobra-headed Orchids, and such an appellation, though by no means so attractive as the other, yet seems better to describe the appearance of the curious column which has given rise to these popular names. The Cynoches thrive well in teak baskets, and a compost of peat and sphagnum moss, used in the proportion of three parts of the former to one of the latter, suits them well.—A. P. H.

Aster salicifolius Tresserve and others.—A note on this plant appeared in THE GARDEN about this time last year by Mr. Wolley-Dod. I have four plants of this Aster which have been in flower since the 10th ult., and it is difficult

to praise their beauty and floriferousness too highly. The incessant rain, which has ruined all the tall-growing Asters, seems merely to have improved A. salicifolius. The total length of one specimen is 2 feet 3 inches, and the part covered with flowers is 2 feet by 19 inches. After flowering I dig up and divide the root. The divisions are potted and kept in a cold frame till April. Good rich soil covered with broken slate suits their requirements; north-east or east aspect in full sun. Other Asters particularly fine this season are A. Amellus Riverslea and A. Amellus Perry's Favourite.—E. C. Buxton, *Coed Dero, Bettws-y-Coed.*

Akebia lobata in fruit at Newstead Abbey.—The Akebias are not very widely known in private gardens, though there are a few

The flowers, which appear in April and May, are small, brown in colour, and very profusely produced. The fruits, which are generally in pairs, are a pinky mauve shade, and, while a little lurid off the plant, look attractive against the large, handsome, dark green leaves. Miss Webb has kindly forwarded me an extract from the Japanese work entitled "Useful Plants of Japan," in which A. lobata is described as "Japanese Mitsuba-akebi, a deciduous climber of the order Lardizabalaceæ, growing wild in mountains. The leaves are triphyllous, and the flowers, opening in early summer, are monœcious, and are succeeded with edible fruits. In Midsuguchi of Omi and Tsuguru of Mutsu the young Vines are bleached and used to make baskets, &c., which are the famous product of Midsuguchi in Omi." The young leaves, like those of A. quinata, are gathered, steamed, and dried up and used as a substitute for tea. Although the fruits are said to be edible and are certainly sweet, they are not of sufficient flavour to recommend them to an ordinary palate, but on the plant they are very ornamental and are untouched by the birds until frost comes, when they fall to the ground and burst open, and the birds soon clear out the contents. The skin is bitter. The plant at Newstead Abbey is in very sandy soil mixed with peat and leaf-mould and against a south wall, on which it has attained a height of 12 feet, and where it does better than A. quinata, which has not fruited there. It is to be hoped that this interesting climbing plant will soon become better known.—S. ARNOTT, *Carse-thorn, by Dumfries, N.B.*

The Tangerine Orange. There are numerous well-marked varieties of the Orange (*Citrus Aurantium*) in commerce, and of this number the Tangerine is very distinct, differing, as it does, from other varieties by its small, uniform size, thin skin, very juicy flesh, and rather peculiar flavour. In addition to being distinct it is also very popular, and usually obtains a fair price in the market. The accompanying illustration shows a plant of this variety growing in a Californian garden, and bearing a good crop of fruit. In British gardens Oranges are not grown now to any extent, but in a few places they still form a feature indoors, and in places where Oranges are grown the Tangerine should be in evidence. In Orange plantations the trees are planted about 15 feet apart, and in some places bushes such as the one shown are more popular than trees. Two, and sometimes three, crops of fruit are gathered in one season, that from the first flowering being considered the best.—D.

THE TANGERINE ORANGE IN CALIFORNIA.

in which A. quinata is cultivated for the sake of its neat foliage and its curious, sweet-scented flowers. Still less known is A. lobata, a species introduced much later and hardly to be met with except in botanic gardens. It is a very ornamental plant for a wall or trellis, and it appears to be much hardier than was at first supposed. I am led to mention it now through having received a couple of its fruits from Miss Webb, Newstead Abbey, Nottingham, who, knowing the interest I take in climbing plants, very kindly sent them for my inspection, with full details of the plant which produced them. Although A. lobata, according to works of reference, was not introduced until 1895, it really appears to have come to Newstead Abbey in 1893, when Miss Webb had an importation of Japanese plants direct from that country. It flowered and fruited about the third year after it was imported.

Saxifraga Fortunei.—Referring to Mr. Irving's note (page 293) on this pretty Saxifrage, I do not think anyone need treat this as half hardy only. I have grown it for quite a dozen years, and find it flourishes perfectly well out of doors all the year round. Give it a shady position where it can be damp, not wet, and it is quite safe. Mine is now (October 30) in flower.—T. J. WEAVER, *Woodside Park, London.*

Royal Horticultural Society.—The next fruit and flower show will be held on Tuesday next in the Drill Hall, Buckingham Gate, Westminster, 1—4 p.m. A lecture on "The Advantages and Evils of Size in Flowers, Fruits, and Vegetables" will be given by Mr. E. T. Cook at three o'clock. At a general meeting held on Tuesday, the 27th ult., thirty new Fellows were elected, making a total of 1,236 elected since the beginning of the present year.

Rubus rossifolius.—Under the name of the Strawberry Raspberry much mystery has at times been connected with this plant, but, as stated in a recent issue of THE GARDEN, page 275, it is not by any means a hybrid between these two fruits just mentioned. It is simply an old and well-known species of *Rubus*, which, according to the *Botanical Magazine*, is a native of the Himalayas, Burma, and Java. It was first described in 1791 by Sir J. E. Smith from specimens from Mauritius, where, according to Mr. Baker, it was introduced by Commerson about 1790. The fruits, which are much like those of the Raspberry, but of a bright red colour, are sold in some of the West Indian Islands under the name of Framboisier. There is a variety with double blossoms which about a quarter of a century ago attracted a good deal of attention, particularly after it was shown at a meeting of the Royal Horticultural Society and awarded a first-class certificate. Nowadays it is very rarely seen. Neat little bushy plants may be grown in pots 5 inches or 6 inches in diameter, and when crowded by clusters of semi-double pure white blossoms it is very pretty. This *Rubus* will thrive with ordinary greenhouse treatment, provided the leaves are kept free from red spider, which cause them to turn yellow and drop.—T.

Aronia floribunda for its foliage. This is without doubt one of the most ornamental of all the *Pyrus* family, and considering the great beauty of the foliage at this season it is surprising that it is not more generally grown. It forms a somewhat upright, branching shrub between 4 feet and 8 feet in height, with numerous clusters of white flowers, which are very conspicuous during May and June. They are succeeded by quantities of almost black berries, which are also very ornamental. As a flowering shrub it is of great value in the mixed border, but when used for massing in the pleasure grounds or wilderness I know of no other shrub more beautiful during October. To see the effect of the brilliant crimson and yellow colouring to the best advantage a good-sized bed in an open position, where no large trees will give shade, should be devoted entirely to its culture, and before planting the ground should be well prepared by giving a good trenching and adding some well-decayed manure. Few shrubs require less attention, little or no pruning being required, and it will succeed in most soils, whether heavy or light. The bark, too, has a very distinct hue in winter, thus making *Aronia floribunda* a beautiful shrub throughout the year.—A. E. THATCHER, *Elstree*.

The Edinburgh School of Gardening for Women.—The progress made by the School of Gardening for Women, opened a year or two ago near Inveresk, has been such as to justify the principals in securing more permanent and more convenient gardens for their enterprise. Ground was secured near Corstorphine, suitable glass houses erected, and everything arranged for the purpose of giving students ample opportunities of pursuing the practical study of horticulture. Although the new establishment has been occupied for a short time, the formal opening only took place on October 23, when the Countess of Aberdeen declared the school open in the presence of a large attendance of ladies and gentlemen. Mr. John Cowan, J.P., Master of the Merchant Company, presided, making an interesting little speech, in which he commended the enterprise, and then called upon the Countess of Aberdeen to open the school, which she did in a graceful speech, in which she pointed out that there were many departments of horticulture in which not physical strength alone, but also education, culture, and brains were required, and that there was thus an opening in gardening for cultured women. Professor Bayley-Balfour, in proposing a vote of thanks to Lady Aberdeen, expressed the hope that the school would carry out the intentions of its initiators, not only by giving an insight into the practice of gardening, but also into the scientific principles which are at the basis of the craft. The gardens have been laid out, and the course of two years planned in such a manner as to secure full instruction in market gardening and florists' work, and also in such branches of horticulture as are

more especially valuable in private establishments. The principals—Miss Barker and Miss Morison—hold diplomas of the Swanley College, and are also certificated gardeners of the Royal Botanic Gardens, Edinburgh.

Single Chrysanthemums.—From what we can learn there appears to be a revival of interest in these pretty decorative varieties of the autumn queen. Many of them are free-flowering and very graceful in appearance, and will at this season of the year always be useful in a variety of ways. Messrs. Henry Cannell and Sons of Swanley have a very choice collection of these, and among a batch of recent novelties we noticed on the occasion of our annual autumn visit the following, which certainly are destined to meet with a generous appreciation. **Eureka.**—A very large-flowered Japanese single; colour pure white, with yellow disc. **Grace.**—Large blooms, flat florets of good length; colour pure white, small yellow centre. **Progress.**—Flat, starry flowers, golden-yellow, with the greater part of the floret tinted terracotta. **Mrs. J. Ferguson.**—Sport from that well-known variety *Mary Anderson*, same form, but the colour is a deep rose. **Paris Daisy.**—Light in build, but very pretty; colour pure white, small yellow centre. **Mrs. Jewry.**—Starry, flat-petalled blooms; colour crimson-red, yellow centre. **G. W. Forbes.**—Large size, florets rather broad; colour beautiful shade of darkest velvety maroon. **Kate Runchman.**—Large-sized blooms, rather flat, stiff florets; colour pure pale primrose. **Sunbeam.**—Rather smaller than the preceding; colour pure bright yellow. **Pigmy.**—Very free, florets flat; colour reddish terracotta.—C. H. P.

Curcuma roscoeana.—The *Curcumas* belong to the Ginger Wort family, having for their immediate allies the *Cannas*, *Calatheas*, *Hedychiums*, *Kamperias*, *Marantas*, *Mueas*, and the different members of other lesser-known genera. The species under notice, and, in fact, nearly all the *Curcumas*, are natives of the West Indies, and consequently require stove treatment in this country. They are rarely seen in gardens, and there is a good deal of confusion about their nomenclature, but as far as I know that at the head of this note is one of the best, and withal a very beautiful flowering plant. It forms a stout tuber-like root-stock, from where are pushed up leaves not unlike those of a *Canna*, while the flower-spike is produced independently of the foliage. The flowers are in a cone-like head on the upper part of the flower-spikes, and are bright red in colour. As far, however, as the decorative value of the plant is concerned the flowers themselves play but a minor part, as each is accompanied and partly hidden by a large lip-like bract of a pleasing reddish orange tint, which retains its beauty for a considerable time. The usual period of blooming is during the late summer and autumn months, but flowers are occasionally produced earlier in the year. Like many of its allies, this *Curcuma* passes the winter in a dormant state, during which period it should be kept dry without being actually parched up, and about the end of February shaken clear of the old soil and repotted in a mixture of loam, peat, well-decayed cow manure, and sand. After this a little water must be given, to be increased in quantity as the plants grow.—H. P.

Cold house Peaches at Woodlands Vale, Ryde.—Having visited these well-kept gardens annually for the past three seasons, I have always been struck by the magnificent crop of Peaches and Nectarines obtained there. The narrow case in which they are growing is 100 yards long, simply a cold house. It is to this simple protection that we see the inestimable value of such structures over uncovered walls in the inclement seasons we have experienced of late years. The fruit is very highly coloured and in plenty, when trees less fortunate have lost almost their entire crop on open walls. In the culture of the Peach, Mr. Farr, the gardener here, does not advocate a very rich soil when planting, so as to gain a too strong growth, but rather feeds with surface waterings, according to age and crop, using farmyard drainings and an occasional sprinkling of artificial manure when the

fruit is swelling. The border in spring is top-dressed with short manure. After the fruit is gathered the trees are carefully gone over and old fruiting and useless wood cut away, giving full light and air, and thus concentrating all the energy into the next season's fruiting wood. The varieties, some two dozen in number, are carefully selected, so as to carry over as long a period as possible. A few of the best I will mention—*Early Alexander*, *Grosse Mignonne*, *Stirling Castle*, very fine; *Barrington*, *Goshawk*, *Royal George*, very heavy crop; *Noblesse*, grand fruits; *Dymond*, *Vanguard*, *Bellegarde*, *Nectarine Peach*, finely coloured; *Salway* and *Princess of Wales Peaches*, with *Nectarines*, *Early Rivers*, very fine in size and colour; *Rivers' Orange*, very heavy cropper; *Humboldt*, and very fine *Dryden*. To utilise every bit of space in this narrow case, *Black Hamburgh Grapes* are planted in the front and trained on wires running horizontally, 3 feet from the ground level, and so not shading the Peaches on the wall. Very serviceable bunches are usually produced. In another case, though smaller, *Figs* carry heavy crops on the same principle.—G. ELLWOOD, *Seamore Gardens*.

A note on Tufted Pansies.—The wet weather of the last two months has been trying to many hardy plants, but it has had the effect, in some instances at least, of encouraging the production of first-class material for propagation. Readers of THE GARDEN will remember that for some years, owing to the abnormally hot summer and long drought, many of the better tufted Pansies could not show their true value. When propagation time by cuttings came round there was often insufficient stock for our purpose, and what there was available at the time was often shrivelled and weak. Last year the stock generally was in much better condition than it had been for some years past, and the cooler climatic conditions, together with continuous moisture this season, have provided most promising stock. A profusion of young growths have developed, and the earliest batches of cuttings have rooted quickly and are now doing well. Cuttings inserted in raised cutting beds in the open are doing remarkably well.—D. K. CRANE.

Crocus asturicus.—Though not quite so ornamental, perhaps, as *C. nudiflorus*, the little *Crocus asturicus* is pretty. It is very hardy and stands more bad weather than some of the other autumn-flowering species. This latter merit is due to the short tube and general sturdiness of the plant, while the substance is such that it will stand more rain even than some others which are more effective. It has been in bloom here for a considerable time, and has stood well in bud during one of the worst autumns we have had, and has been ever ready to open with a brief spell of sunshine. Such a sturdy little flower deserves consideration, especially as it is comparatively cheap. This little Spanish species, which is very plentiful in the North of Spain, where it is found from the sea-level to as high as 4,000 feet to 5,000 feet, is variable in colour. The type is violet-purple, but in some varieties it is considerably deeper than others, and there are white forms met with occasionally. I am not, however, aware of anyone in Britain who has any of these white forms. There are in the hands of some of the trade and private growers varieties such as *azureus*, almost blue in tint; *atro-purpureus*, one of the best, and a fine dark purple; *pallidus*, pale mauve; and *purpureus*, a fine purple, while Mr. E. A. Bowles has in his splendid collection a robust variety from Gijon. Of those procurable I prefer *atro-purpureus* and *azureus*, but one would be unwilling to part with any of the varieties of this pretty and valuable little *Crocus*. As Mr. George Maw pointed out, it is closely allied to *C. Salzmanni* and *C. serotinus*, but it is readily distinguished by the short development of the leaves at the time of flowering, while those of *C. Salzmanni* and *C. serotinus* come before the blooms, and are nearly fully developed and almost as tall as these at the time they open. *C. asturicus* requires no special treatment, and generally flowers here early in October, though sometimes it opens in September.—S. ARNOTT, *Carsethorn, by Dumfries, N.B.*

The proposed Potato Society.—A rious comment on the proposal to establish a tional Potato society with trial stations in rere parts of the kingdom is seen in the different inious respecting the value or otherwise of early rieties shown in the communications just printed Mr. E. Beckett and Mr. A. Findlay. The mer favours much wider culture of early varie- a, the latter states that to depend on them is to rt failure. Both are in earnest, and both are n whose opinions merit the fullest respect. Still re is such a wide diversity of view that no nary person can tell which is the safer to low, and only trials simultaneously conducted a wide area, and in diverse soils, can give a rect line to follow. I have read elsewhere, as ll as in *THE GARDEN*, various opinions as to the rite of Northern Star and Sutton's Discovery. hen opinions thus expressed in the horticultural pers so seriously conflict, what is an intending rehaser to do, and whom is he to believe? Pro- bly all are right so far, but not one season's alalone, especially such a disastrously cold wet een as is the present, justifies an opinion on y one variety. Certainly a series of well- raged trials as suggested would, during such a eon as the present one, help to show what rieties best withstand wet and cold; but those rieties again might be by no means the best to p in ordinary warm, dry seasons. I have nured to suggest to the promoters of the Potato iety proposal that they fly at high game, and e not content with securing the active co-opera- n of the Royal Horticultural Society. The help, possible, of the Board of Agriculture and the rious county councils of the kingdom should also ad. To conduct a series of well-arranged trials ch as is desired would need considerable outlay. nably the trade would be willing to help, but tually the chief support should come from her sources. Both the market garden and the ruing interest should be associated also. It not be too clearly understood that the Potato , without exception, a food of the highest eable importance. It is of chiefly insular trest, and is outside the much-vexed question r tariffs. Probably with no one food can such ot be done to secure from home resources so uch of value and importance as through Potato itara. I hope the proposals as to the formation a national society will be so broad and so ranced as to secure the widest support. A small iety will command little respect, a strong ational society will compel respect.—A. D.

The Aldenham Crotons.—It has never my good fortune to see the Aldenham Crotons rferred to on page 290) at home, but I did see em at the Holland House show last June, and nately admired them, for not only were they niful examples of plant culture, but to my mind e least no other group in the entire show could e one moment compare with them for effect. The ante, all springing from a Maiden-hair bank, were raged sufficiently far apart for the individual aracteristics of each to be plainly seen, which as far more than could be said of most of the her exhibits, for the great aim of many exhibitors ems to be to cram as large a number of plants as eable in the space allotted to them; in fact, rking rather than arranging would best describe me of the groups. Cramping is so much the der of the day at our great exhibitions that I ntire to think if the number of plants at either e Temple or Holland House were reduced by e-half the show would be far more pleasing to e majority of visitors, providing, of course, that e weeding out was done in a systematic manner, eing principally aimed at what might be called e stuffing of the show. That Ferns and such- e foliage plants are useful as a ground work I e fully aware, but these can be lightly though effectively arranged instead of being so close egether that the pots almost if not quite touch.—T.

A new Carrot — Veitch's Inter- mediate.—The well-known Exeter firm at the ecent great vegetable show at the Royal Horti- cultural Society's gardens at Chiswick staged a ery shapely Carrot of the Intermediate type, and a new Celery called the Pink Plume, which is of

excellent quality and of taking appearance. The new Carrot alluded to received an award of merit for its shape, colour, clear skin, and good appear- ance. It was a very shapely root and a splendid colour; just the size for a private garden, with a short top and no waste. Carrots of late years, especially the small and medium roots, have been improved upon greatly, and there is now a splendid choice. Veitch's Intermediate will be a most valuable introduction for shallow soils or early supplies, and in addition it keeps splendidly. I prefer them to the longer roots for winter supplies, as, being smaller, the seed need not be sown early when the roots are grown for winter and early spring.—G. WYTHES.

Polygonum amplexicaule var. oxyphyllum.—This is a fine autumn-flowering plant. When seen in a mass by the side of a stream or lake it is very beautiful. The handsome stems, which are thrown up to a height of 3 feet or 4 feet, terminate in large, feathery racemes of tiny white flowers, which stand heavy rain. Once well planted it takes care of itself for several years. When naturalised near the walks of a thin wood in company with a few bushes of *Viburnum Opulus* (which takes on rich tints at this time of year) it gives a beautiful effect.—F. C. TRIBBLE, *Apperley Court Gardens, Tewkesbury.*

A COX'S ORANGE PIPPIN ORCHARD.

I N 1895 and 1896 two contributions of mine were published in *THE GARDEN* concerning a plantation, consisting chiefly of Cox's Orange Pippin Apple, in East Devon. A short time ago I visited the spot again, and think that perhaps the result of my inspection may not be without interest. The plantation is situated on the side of a hill facing east, and is about 500 feet above sea-level and five miles from the sea. The staple may be described as a sandy moor- land soil with an average depth of 10 inches. It is light and porous, and contains a large proportion of siliceous sand and a considerable quantity of water-worn pebbles, of which many cartloads were removed when the trees were planted. The subsoil consists of a ferruginous sand, into which the roots show no disposition to enter.

In 1895 eight acres were in Apples, now there are fourteen, about eleven of which are devoted to Cox's Orange Pippin. The oldest trees are thirteen years from the graft. At the time my former notes appeared it was the practice to keep the surface of the ground continually stirred with a hoe, chickens were allowed to run in the plantations, and every care taken of the trees, including systematic spraying, which was carried out by means of a garden engine drawn by a pony and four hands. The first spraying was given in the early spring while the trees were dormant, and consisted of a solution of sulphate of copper. The second, of Paris Green and Bordeaux Mixture, the former as a destroyer of the winter moth caterpillar by poisoning its food, and the latter as a fungicide, was given as soon as the rosettes of leaves unfolded and disclosed the buds within. The third spraying was applied directly the fruit had set, and the fourth a fortnight later, the two last being intended to compass the destruction of the codlin moth. If aphids appeared a spraying of "Killmright" was given, followed a little later by Bordeaux Mixture and sulphate of iron. It was found that if sufficient lime was incorporated with the mix- ture not the slightest harm was done to the foliage. The trees were at that time looking and bearing well. They were bush trees on the broad-leaved Paradise stock, and were planted 12 feet apart each way.

At my late visit, on taking a casual look at the trees I was at first somewhat disappointed that the interval of seven years had not resulted in a greater increase in size, and was naturally interested in the proprietor's history of that period. For the first few years after planting the trees made good growth, which was attrib- uted, by the light of subsequent events, to the upper spit of turf that was worked into the soil at the time. Subsequently little growth was made, this at first being considered the result of dry seasons, but later on this con- clusion was modified, and it was decided that the main cause of poor growth was that all the sustenance provided by the upper spit having been appropriated by the roots the trees were suffering from lack of humus in the hot, shallow soil. A heavy dressing of farmyard manure would doubtless have afforded this requisite, but manure of this description was, unfortunately, unprocureable in the neighbour- hood.

Various artificial fertilisers were tried on different rows of trees without result, and it was at length decided to let the grass grow. This, according to the third report of the Woburn Experimental Fruit Farm, is a fatal method of procedure, for it reads: "No ordi- nary form of ill-treatment—including even the combination of bad planting, growth of weeds, and total neglect—is so harmful to trees as growing grass around them." This, however, was written of a heavy soil, whereas this East Devon soil is light and hot. At any rate, as far as can be seen the experiment here appears likely to be successful.

In January the grass is given a dressing of three parts of superphosphate to two parts of kainit, the 144 square feet between the trees standing 12 feet apart each way receiving 2½lb. In April 12oz. of nitrate of soda is applied to the same space. These dressings will not necessarily be continued annually. The grass is not cut until the end of July, when it is quite dry, and is then allowed to remain where it falls. This forms a springy mat like a thick Turkey carpet, and effectually prevents damage to falling fruit, none of the Apples that were blown off in the severe gale of September 10 being injured. Sheep are turned into the plantations in the winter, and doubtless a proportion of the dead grass is drawn into the soil by worms. The trees, I understand, are looking far better than they did four years ago, and certain poor rows have greatly improved since the surrounding ground has been heavily mulched with grass cut from the edges of the plantations, though it is, of course, too early as yet to predict what the ultimate result of the experiment will be. Two years ago the lower branches were cut off the trees, leaving them with about 18 inches of clear stem, and last year the leading branches were shortened back.

The majority of Cox's Orange are sturdy bush trees with six or seven main branches, and are about 5 feet in height, now that they have been shortened back, and rather more through. A few on the Crab stock are larger, but have not borne so well. The wood is exceptionally clean and shining, the only tree out of many hundreds that I saw bearing Lichen being a solitary example of Cornish Gilliflower. Taking one season with another Cox's Orange has borne fairly well, the best fruits being of fine quality those that won the first prize at Exeter a few years ago, since which time they have not been exhibited, averaging 9oz. apiece. The fruit is marketed in London in non-returnable boxes containing 5lb. weight, and fetches remunerative prices, the supply being always unequal to the demand. During the present year the crop, as is the case

throughout the whole of the south-west, has been poor, only about 15 bushels of good fruit having been secured. At the time of my visit the leaves, as well as the foliage of the hedge-rows and deciduous trees, appeared as if seared by fire owing to the effect of the gale a fortnight previous. Many other varieties of Apples have been tried, but few with success. Cox's Pomona cankers and does not bear, King of Tompkins County is useless, as are Mannington's Pearmain, American Mother, and Scarlet Nonpareil. Bramley's Seedling has also proved disappointing, it being found easier to obtain a bushel of good Cox's Orange than of that variety, while the fruit never comes of good size.

Five trees of Ribston Pippin have, however, done well, showing no sign of canker and bearing satisfactorily. These trees are well sheltered, but one tree of the same variety in an exposed position has failed to bear. Lane's Prince Albert has done well, but by far the best variety has proved to be Duke of Devonshire, a dessert Apple of fair quality that is at its best in February. This grows so well and fruits so consistently that all trees making poor growth are grafted with it. The Nonsuch Paradise has not turned out well, and the majority of trees on that stock are now grafted with Duke of Devonshire, the parent tree of this variety, from which all the grafts have been taken, being a sturdy bush 9 feet in height by 10 feet in diameter. To show the respective growths of conifers in this soil I may mention that, of trees of the same size planted at the same time, Pinus insignis is 30 feet in height, the Douglas Fir 18 feet, and the Spruce 5 feet. S. W. F.

APPLES FOR SMALL GARDENS.

INFLUENCE OF STOCKS.

THE Apple is so valuable an article of food for all classes that no apology is needed in calling attention to some of the many points in its successful cultivation; that experience alone can teach. It goes without saying that every man, woman, and child in England loves an Apple, either as dessert or in a cooked condition. This being the case, one would naturally expect to find a collection of up-to-date varieties in every garden attached to every home, whether large or small. The neglect of the growth of this great English fruit, especially amongst our country working population having gardens, is difficult to understand. We have special societies instituted to promote the improved growth and to extend and popularise many of our well-known flowers, such as Roses, Dahlias, Chrysanthemums, Sweet Peas, &c., but so far no society has been established to promote the growth of any special fruit or vegetable, although we hear it is now proposed to form a society for the purpose of protecting the interests and popularising the growth of the Potato. Let us hope that before long some body of men will consider the Apple. It is a subject that deserves strong support in order to bring its supreme merits more prominently before the British public.

It is difficult to account for the neglect in the matter of Apple planting in England. Many causes no doubt are responsible, but not one, I venture to say, having any solid ground to rest upon. The most common complaint is that the trees are a long time in giving profitable returns after planting. This is really not the fault of the Apple, but is the fault of those

who plant the trees. Either the wrong varieties have been planted, or they have been planted by inexperienced hands in poor, unsuitable soils and without proper preparation previously. It may be that the trees have been worked on the wrong stock. This latter is more often the cause of failure than many imagine. It is so much the custom to recommend the Apple to be worked on the Paradise stock indiscriminately without reference to varieties, resulting in much disappointment in many cases; for instance, those varieties which are known to be heavy and consistent croppers, such as Lane's Prince Albert, Worcester Pearmain, Allington Pippin, Frogmore Prolific, &c., should be worked on the free stock. By free stock is meant stock raised from the pips of English Apples, and the best and strongest of the produce of these only should be grown, all the weakly ones being discarded. The result of working these free-bearing sorts on a dwarfing stock like the Paradise results in the tree making little or no wood growth, or of its ever developing into a large and robust specimen. The fact of many varieties being consistent heavy croppers is a safeguard against over leaf or wood growth, for where this is the case over luxuriance of growth is obviated by constant cropping, although grown on the free stock. In recommending varieties of Apples for planting in small gardens I do not think that the quality of the free-bearing properties of the varieties receive the consideration due to them, especially in relation to cottage gardens. It is, of course, desirable to possess the best quality and flavoured sorts, but it is of greater importance to the labourer to possess sorts which are sure bearers, even if not of the highest excellence as regards quality and flavour. Another point worth noticing amongst Apple trees, especially in regard to their suitability for planting in small and moderate-sized gardens, is the precociousness of many varieties in bearing fruit over others.

I am not saying that there is any particular virtue in this tendency, as young trees which bear heavy crops soon after planting do so at the expense of the development and strong growth of the tree, still in some cases it is useful to know that there are some sorts better adapted for giving quick returns after planting than others.

The best I know in this respect is Allington Pippin, one of the most useful and fruitful of recently introduced Apples; Christmas Pearmain is another. A very handsome Apple is Lane's Prince Albert. Other good sorts are James Grieve (a Scotch Apple of great excellence), Lord Derby, Sandringham, and Newton Wonder. I have often drawn attention to the latter remarkable Apple as being, in my opinion, the very best late cooking Apple in the market at the present time. The tree is a robust grower, crops freely even in a young stage, and it is certainly one of the most distinguished and handsome Apples we have. It is a cross between the Wellington and Blenheim, and when better known I predict a great future for this Apple.

Those ordering Apples for cottage gardens should stipulate for heavy and constant croppers, also that the trees have been worked on the free stock. Amongst them are the following:—

DESSERT.—Devonshire Quarrenden, Early Harvest, Beauty of Bath, Duchess of Oldenburg, Irish Peach, James Grieve, King of the Pippins, Scarlet Pearmain, Worcester Pearmain, American Mother, Christmas Pearmain, Court Pendu Plat, Cox's Orange Pippin, King of Tompkins County, Lord Burghley, Margil,

Northern Spy, Rosemary Russet, Scarlet Nonpareil, and Sturmer Pippin.

COOKING APPLES THAT ARE GOOD BEARERS.—Keswick Codlin, Lord Grosvenor, Stirling Castle, Frogmore Prolific, Beauty of Kent, Ecklinville Seedling, Grenadier, Stone's Seedling, Lane's Prince Albert, Gascoigne's Seedling, Petty Geeson, Sandringham, Allington, Newton Wonder, Dumelow's Seedling, Royal Late Cooking, Winter Hawthornden, New Northern Greening, Royal Russet, Baxter's Pearmain, Seaton House, and a new variety of great promise King Edward VII.

OWEN THOMAS.

THE CHERRY.

(Continued from page 278.)

VARIETIES.—It is always advisable to have a few varieties as possible. The cultivator will be able to determine whether early, mid-season, or late fruits are most suitable, and act accordingly. Generally, the White Heart or Bigarreau Cherries are most profitable. Some variety, however, is advisable; each row or set of rows should be of one sort, so arranged in their order of ripening that the picking can begin at one end of the orchard and finish at the other, to save unnecessary removal of tent, ladders, and other accessories. The Flemish, May Duke, and Morello are useful for short rows in corners; also as shelter from the wind in exposed positions, where they can be planted twice as thickly as the larger growing sorts.

EARLY CHERRIES.—Black: Early Rivers, Black Heart, Knight's Early Black. White: Frogmore Bigarreau, Ludwig's Bigarreau, Black Heart. Red: May Duke.

MID-SEASON.—White: Kent Bigarreau, Black Eagle. Red: Royal Duke.

LATE.—White: Napoleon Bigarreau, Clerice Bigarreau, Bigarreau de Mezel, Emperor Francis Florence, Windsor. Black: Waterloo, Black Tartarian, The Noble, Turkey Heart. Red: Late Duke, Flemish, Kentish, Morello.

N.B.—"White" is but a general term, the colour of these Cherries varies from pink to dark crimson. They are, however, known as white Cherries in contradistinction to the black and red varieties.

GARDEN CHERRIES.

There are two ways in which these can be successfully grown: first, under a permanent protection of wire netting as bushes or pyramids, to be kept low and pruned, for instance, as dwarf Apple trees. They should be planted 12 feet apart. Trees two or three years old are the most suitable, with the branches disposed in a bushy form. When such a plantation is made with permanent wire netting, until the space is filled by the Cherry trees, bushes of Gooseberries, Currants, or Strawberries may be grown between them for some six or eight years, thus utilising both the land and the structure before the Cherries come into full bearing.

It is advisable to prune garden Cherries in the winter, as they are then much less liable to gum. Some training is needful to bring them to the requisite shape. When once this is done, a shortening of the side shoots and the thinning of the leaders is all the pruning necessary. Very well-ripened fruit can thus be grown, fit for the most select dessert, and no trouble need be apprehended from birds if the netting is properly put and secured.

In making a selection for this purpose, a variety should be planted between each tree, stronger or Heart varieties; both the very early and latest sorts should be included. As the pruned bushes are liable to gum and die from attacks as well as from other causes, it is well to have a small stock of young trees, so that a vacancy can be filled at once by a developed tree. Such reserve trees being transplanted every two years will be prepared for permanent planting in the

rotected area without any risk or loss of crop the first year, but the removal should be made in November.

BERRIES FOR BUSH TREES, PLACED IN THEIR ORDER OF RIPENING.

VERY EARLY.—*Guigne de Louvain, *Guigne Annonay, *Belle d'Orléans, Bigarreau Jabaulay, Early Rivers, *Ludwig's Bigarreau, Baumann's Jay.

EARLY.—*Knight's Early Black, Frogmore Bigarreau, Bigarreau de Schreken, *Governor Food, *May Duke (Old), *Reine Hortense, *Foster's Black, *Belle de Choisy, Elton Heart.

MID-SEASON.—Waterloo Heart, *Royal Duke, *Flemish Bigarreau, *Black Eagle, Flemish and *Flemish Red, *Emperor Francis, *Archduke, *Mon Oliva.

LATE.—*Cleveland Bigarreau, *Bigarreau Napoleon, *Nouvelle Royale, Bohemian Black, *Dezel, *The Noble, Noir de Schmidt, *Géant de Maltingen, Noir de Guben, *Late Duke Ronalds.

LATEST.—Florence, *Black Tartarian, St. Marret's, *Windsor, *Morello, Guigne de Winkler. Those marked with an asterisk are most desirable for pot culture.

GEORGE BUNYARD.

VEDALE'S ST. GERMAIN PEAR AT GATTON.

Our grand old Pear tree can still be seen in good condition at the residence of Jeremiah Wiman, Esq., Gatton Park, Surrey; a really grand old relic, linking the work of past gardeners with the present, and showing us that those long bygone days gardeners took equal pride in having their walls clothed with well-trained trees—objects that no doubt commanded admiration as much in those days as they do in the present. We have nothing to tell us any guide as to when it was planted, but in my opinion at least two centuries have passed since that operation was carried out, and to-day it is well worthy of the space it occupies. It generally carries a good crop of fruit; last season we gathered between four and five bushels, even after subjecting the fruits to a severe thinning. Many of them weighed over 1lb. each. This year, like others in general here the crop was below average, but we have had some fine fruit;

the one I am enclosing weighed exactly 2lb. when gathered. The present dimensions are 91 feet 10 inches from end to end; the longest branch 48 feet; and the butt, 12 inches from ground level, 8 feet 8 inches, which no doubt places it amongst the largest espalier-trained trees in Great Britain, and in the opinion of many it occupies first position.

Gatton Park Gardens.

W. P. BOUND.

PLANTING A SMALL ORCHARD.

THOUGH there may be nothing very new to be said about the garden orchards, there are scores of old-established homesteads yet orchardless, and new residences spring into being every year round which gardens are formed, and where a portion of the ground may be well set aside for the making of an orchard. We are in a hurry over everything in these days, even fruit culture, and with trees available on dwarfing stocks that are guaranteed to bear fruit in two or three years from propagation, we see a spread of garden and plantation fruit culture at the expense of permanent orchards. Surely this should not be. Quick-bearing dwarf trees are well enough in their place, but compared to permanent standard trees they are short-lived, and the man who establishes an orchard does something for posterity as well as for himself, considering the time over which such trees will remain profitable if given proper attention. Apart from the utility of the orchard I never think it is a robbery of garden space to acquire a part of it for an orchard, because the latter has a singular beauty of its own.

THE BEGINNER'S FAULTS.

I would warn intending planters against errors which frequently lead to loss and disappointment. Suitability of site is often overlooked, and standard trees intended to form an orchard are planted in positions where they are exposed to cold sweeping winds and without a thought to providing any means of shelter. Bad drainage is another cause of failure, and it is disappointing to find a few years after the trees are planted that the soil is cold, water-logged, and wants draining. These points should be ascertained before a start is made, and if the situation is low and the land does not drain itself naturally, proper means should be

adopted for carrying off the superfluous moisture. Let every planter avoid the common error of buying trees and sticking them into holes dug in grass land, with the expectation that they will grow and establish themselves without further attention. The rank grass which grows up to the stems chokes the life out of the trees, and in a few years under these conditions they represent so much money literally thrown away. To form a good orchard it is not enough to plant trees; they must be cared for and attended to afterwards, just the same as any other plant.

Finally, avoid the mistake of planting poor trees. Thousands of specimens are raised every year with thin spindling stems and sold at low prices, but at any price they are dear. It is far more economical to go to a respectable nurseryman at the outset, who has a reputation to keep up, and get him to supply well-established specimens, even if they cost more to begin with.

SOIL AND SITUATION.

In these matters the intending planter has often to be governed by circumstances. Possibly the best site for a permanent orchard is a slope having a southern or south-western aspect, but in any case if the enclosure is exposed to cold winds a break of some kind should be planted along the open side as a means of protection. The advantage of a slope is that frost is not felt so severely as in a bottom, but if the orchard must needs be formed in a low-lying situation, it is well to plant late blooming varieties of fruit. Those people who enjoy the possession of an ideal fruit soil have points in their favour, but if the medium is reasonably fertile there need be no hesitation about planting, if due attention is paid to drainage and thorough cultivation beforehand. In fact, experience teaches me that the soil is often blamed for neglect and slipshod methods on the part of cultivators.

Experience has also taught me that the quickest and best way of establishing a permanent orchard is to plant trees on land that is under spade cultivation, and to keep it so for the first few years, after which it may be laid down to grass. By adopting this system the ground between the trees may be utilised for a few years for growing Potatoes or other vegetables, or it may be planted with Strawberries or bush fruits, such as Gooseberries and Currants. Let it be clearly understood, however, that fruit trees are the chief consideration, and there must be no hesitation about forfeiting other crops when the former demand the space. On no account must the roots be interfered with by planting close up to the stems. If for any particular reason it is necessary to plant the trees on grass land, it is most important that the turf should be removed from round the stems for several feet, and not be allowed to grow for a few years till the trees are well established. When the time comes for seeding down the orchard or letting the turf grow up to the stems of the trees, let there be no growth of rank grass, but keep the herbage down to a short, close pasture by feeding it off with sheep.

The question of manuring when preparing the ground before planting must also be considered, and this is largely a matter of conditions. When old pasture land is turned up for orchard planting manure is rarely necessary, but if the ground is at all poor it may be applied, though I do not advise placing it underneath the roots of the trees, but in the form of a mulch on the surface, as this induces the fibres to work in an upward rather than a downward direction. In preparing land for planting I am strongly in favour of bastard trenching, which, of course, consists of turning over the top spit of soil and breaking up the sub-soil to the depth of another foot or so, but keeping it in its former position, not bringing it to the surface. Whether the whole of the ground is

THE FAMOUS ESPALIER PEAR TREE UVEDALE'S ST. GERMAIN IN THE GARDEN AT GATTON PARK, REIGATE.

LILIIUM SZOVITZIANUM.

being dug over or only the stations for the trees, this method may be put into practice.

PLANTING.

I have already pointed out how the ground between the trees may be profitably used for the first few years, and may say here that I have no faith in the practice of planting trees at double the ordinary thickness with the idea of thinning them out when they overcrowd each other. Few people have the courage to cut down a fruit tree just when it has arrived at a profitable state of bearing, and consequently the necessary thinning is never done, and the orchard is practically ruined. Generally speaking, autumn is the best time for planting fruit trees provided the soil is workable, but if it cannot be done at this time it may well be delayed till February. It is never advisable to have fruit trees on order when we are liable to spells of severe frost, as they may have to remain out of the ground for many weeks and therefore suffer.

A space of 30 feet in all directions should be allowed between Apples, Pears, and Cherries, and even more in the case of very vigorous varieties. Plums will do well at 24 feet apart, and common varieties of this fruit or Damsons planted on the boundary for shelter may be arranged at 15 feet apart. The preparation of the stations is not an intricate business, but it should be performed with proper care. Having marked out the position of every tree with a stake, shovel out broad, shallow holes that will readily accommodate the roots when spread out horizontally. Deep planting should be avoided in all cases, and, after cutting back any long tap-roots and placing the trees in position, about 6 inches of the best soil should be carefully worked over the fibres. I have found wood ashes and burnt refuse to be very good for working into the soil placed over the roots, as this material encourages surface-rooting. Planting should always be done at a time when the soil is dry enough to allow firm treading down without being sticky, and some support is necessary for standard trees directly they are planted. A simple method is to fix a strong upright stake on each side of the tree, and twist a couple of hay-bands round the stem and fasten them to the stakes. These are generally sufficient to keep the trees in position till they have got hold at the roots, and the hay-bands do not injure the bark. If the trees are furnished with good heads and are planted in the autumn the leading shoots may be shortened back the following spring, but if the planting is not done

till the latter season the trees can be allowed to grow for a season without being shortened back. It is always well to mulch trees on the surface after planting with decayed manure, or, if the soil is rich and fertile, loose stable litter will serve the purpose of preserving the moisture and protecting the roots. In the majority of instances the surface should be quite level after the completion of the planting operations, but in exceptional cases, where the soil is of stiff clay, it is sometimes advisable to plant on the surface and mound the soil over the roots. This method of planting is adopted with great success on the retentive soil in some parts of the Weald of Kent.

SELECTION OF VARIETIES.

It is for the planter himself to decide whether his small orchard is to be one confined entirely of Apples or a mixture of this fruit, together with Pears and Plums. I do not advise planting Cherries in mixed orchards, for, though the fruit is luscious and acceptable, unless Cherries are grown in sufficient quantity to merit the expense of tending when the fruit is ripe the greater portion of it will be devoured by birds. As a rule, the owner of a small orchard wants variety and succession. He wants some Apples for cooking and others for dessert, and varieties for early use and others for keeping, so he must select accordingly. At the same time he must grow varieties that are suitable for forming standards, bearing in mind that an orchard is an institution expected to go on for an indefinite period. Out of the great host of varieties in cultivation I append the names of a selection suitable for the purpose we have in view:—

Apples.—Early dessert: Devonshire Quarrenden, Mr. Gladstone, Beauty of Bath, Irish Peach, Lady Sudeley, and American Mother. Keepers, dessert: Allington Pippin, Blenheim Orange, Cox's Orange Pippin, King of the Pippins, Sturmer Pippin, and Allen's Everlasting. Early culinary: Duchess of Oldenburg, Domino, and Lord Grosvenor. Keepers: Lord Derby, Beauty of Kent, Warner's King, Cellini, Newton Wonder, Wellington, Bramley's Seedling, and Bismarck.

Pears.—Hardy and suitable for orchards: Beurré de Capiaumont, Fertility, Hesse, Jargonelle, Jersey Gratioli, and Louise Bonne of Jersey.

Plums.—Rivers' Early Prolific, Monarch, The Czar, Green Gage, Pond's Seedling, and Victoria.

Damsons.—Farleigh Prolific and Bradley's King.

In giving the above selection it is obvious that many excellent varieties are omitted, and the list may be readily supplemented or curtailed. Before planting fruit I always think it a good plan to make observations in the near locality and note the varieties that succeed. By doing this and selecting accordingly disappointment may often be avoided, because in the case of most fruits certain varieties have a habit of doing better in one locality than in another, though there does not appear to be any reason why this should be the case. Finally, let me say that the individual who is responsible for the establishment of a good, though perhaps a small, orchard does something for himself, and increases the value of his property.

G. H. H.

NOTES ON HARDY PLANTS

LILIIUM SZOVITZIANUM.

ALTHOUGH not taken when at the zenith of its beauty the accompanying reproduction of a group of *L. szovitzianum* gives a very fair idea of how well it flowered this year in spite of the unfavourable conditions prevailing. All the six bulbs composing the group sent up a single healthy spike (I have not hitherto had more than one from any of them), the best carrying fifteen perfectly developed flowers. I think this is one of the most satisfactory Lilies in cultivation, though it takes a year or two to establish itself, and I should certainly choose it if unfortunately restricted to one single species. Its only drawback is its somewhat powerful and peculiar smell, though, personally, I do not object to this, in fact I rather like it.

CRINUM MOOREI.

APPARENTLY the past wet summer has suited the constitution of this *Crinum* remarkably well, for it flowered much better than in any previous year, and at the time the photograph was taken was the proud and luxuriant possessor of six fine spikes. One of these, however, was unfortunately broken off by accident when the camera was being brought into play. It is a single bulb, planted about six years ago against the south-east wall of a viney in a considerable depth of light, rich soil. Here it has grown apace and produced annually a wealth of handsome glossy leaves, but usually only one spike (rarely two), and this so late in the autumn that it has been quickly ruined by frost. This year, doubtless influenced by the extra amount of moisture, the flowers were practically all over by the middle of September, a much more satisfactory result in every way. In memory of so much bloom there now remains a single seed-pod only, but from this I hope to raise a few seedlings in due course. It seems to me that the unusually fine flowering of this *Crinum* affords a hint as to the necessity for plenty of water all through the summer months, and I shall be careful to give attention to this point in future. I may add that a goodly heap of ashes and peat is piled over the dormant bulb in winter, and the new growth sheltered from winds and late frosts with a few evergreen boughs.

Yalding, Kent.

S. G. REID.

ALLIUM MARGARITACEUM.

THE Alliums are increasing in favour, the introduction of some new species having brought them more into prominence of late years. Apart from their odour—not very pronounced, by the way, in some species—many are of considerable value, though there are also some of no garden beauty whatever. In the remarkably interesting and beautiful garden of Mr. W. D. Robinson-Douglas, at Orchardton, Castle Douglas, N.B., I came across one in the course of last summer which I had never seen before, and undescribed in current works of reference. This is *A. margaritaceum*, a South European species. It is unlike almost any other in general cultivation, and is, although not so pure white as one would like, of some value either as a group in the border or on rough rockwork, or, better still, for planting in the grass. It grows about 1 foot high at Orchardton, bearing round

CRINUM MOOREI.

heads of small, creamy flowers. The heads are about 2 inches across. The leaves were over when I saw the plants, as, like many other *Garlics*, *A. margaritaceum* loses these before the plant is fully in flower. I find from the "*Index Kewensis*" that this *Allium* is described in Sibthorp and Smith's "*Flora Græca*," but I have not access to that work here at present. The bulbs are of a pretty silvery appearance, and the specific name probably refers to this feature.

Carsethorn, by Dumfries, N.B. S. ARNOTT.

GRAPES AND MELONS IN THE CHANNEL ISLANDS.

It is safe to say that the Grape introduced the Channel Islands as a fruit-growing district to the English markets, and it illustrates in a striking manner how pregnant with big results are sometimes those matters which appear of small importance at the moment. In a little book entitled "*Culture of the Vine under Glass*," by W. A. Crousaz, published in Guernsey in 1873, the last chapter is called "*Remarks on Exportation*." Mr. Crousaz was really the father of the fruit-growing industry as far as the Channel Islands are concerned, for it was he who, seeing Grapes fit for the London market, set about surmounting the difficulties of delivering them. Had it not been for him the progress of the industry would at least have been delayed years. We have gathered the following facts from Mr. Crousaz's book.

INCEPTION OF THE INDUSTRY.—About 1847 a small quantity of Grapes was sent to Covent Garden Market. In the same year a range of houses with boilers and pipes was erected as a speculation. The third season after planting (1850) the crop was about 500lb. But the principal exporter declined to purchase, the quantity being too large, and further declared such a crop could not be disposed of at any price. The only alternative was to sell in the local market, but this proved a failure. So, after all, it was decided to try Covent Garden. But the mail-boat's agent declined to enter these goods, as the mails and passengers alone were allowed, and not cargo. The exporter determined that the Grapes should be whatever the consequences might be, and a boat was hired, the fruit was packed beneath the seats, and then, being taken to the steam-packet, the packages of Grapes were quietly handed over the side of the ship and placed out of sight. The crew were busily engaged with passengers' luggage and mail-bags. But each returning mail-boat brought strict orders that fruit should be shipped unless cleared through the Customs. This was overcome by providing a printed form which had to be signed by the Lieutenant-Governor and a magistrate of the Royal Court (fee 2s. 6d.), and the complete taken to the Custom House officials. It is disappointing to read that after so much determination the season closed with a loss, and to prices Mr. Crousaz says: "Arrived at Covent Garden, the fruit realised very little money, and at little was a long time coming." The season of 1851 yielded a heavier crop; Covent Garden was again resorted to, and the same ordeal gone through, but prices were not remunerative.

In 1852 still finer crops were produced, and Covent Garden prices were rather better. So, when the forced crops were disposed of and cold house Grapes were ripe, growers, who hitherto had not known how to turn theirs into cash, were advised to try London. Mr. Crousaz here points out that only the choicest portion of the crop was exported, the result being that the demand for Guernsey Grapes increased, and nearly 3 tons were exported in 1855. So, we see, selection and grading were not overlooked in those days, though some

growers of the present foolishly treat these matters with contempt. In 1857 4 tons were sent; in 1858, 4½ tons, with good prices for first-class fruit; in 1859, 6 tons; and in 1860, 7 tons were sent, and the demand for good Grapes had increased. This justified the erection of more greenhouses. In 1861, 9 tons, and in the following year 12 tons, were shipped, with steady prices for good fruit. In 1863 a fair quantity was grown, but owing to shippers and salesmen having so increased, the market was occasionally glutted, and prices were consequently less. The regulating of the market was now out of the question. It was feared this state of things would diminish the value of the fruit; so the original exporter visited Paris, hoping to find a market there, but the prices would not have been remunerative, and the quantities required were too insignificant to justify the attempt.

FORMER QUANTITIES.—In 1864 the quantity sent was 12 tons, and, other fruit being scarce, steady prices were obtained. In 1865 the prices were not so good, good Grapes selling at 9d. per lb., the depreciation being attributed to glutted markets. In 1866 about 16 tons were sent, good prices being realised from the commencement of the season,

much lighter, as 216 houses only produced 16½ tons, whereas 200 houses the previous season produced 21½ tons. Since the publishing of Mr. Crousaz's book Grape culture has gone ahead; but it is now impossible to know the quantity exported, as the growers nearly all consign directly to the British markets.

VINE BORDERS.—The Vines in the Channel Islands were formerly nearly all in outside borders. Muscats and all others were treated so. Now, however, many are planted in inside borders. Some houses have arched walls, so as to allow a free passage for the roots to either inside or outside borders, but the majority are still outside. When Grapes were first cultivated for market, and since, borders in many cases were much too deep. Then, later, many growers troubled little how the border was made; but now more care is taken in this matter, and nearly all methods have been tried. The English horticultural Press has been closely read by the local grower, and he has tested nearly everything suggested, from carrion to hot-water pipes, in the border; both of these he has long since abandoned.

VINERIES.—Formerly lean-to houses were considered best, but now large span-roofed houses are

A CHANNEL ISLAND VINERY.

selling at 1s. 6d. to 2s. per lb. These prices continued till the month of August, and, owing to scarcity of other good fruit, prices were maintained throughout the season.

In 1867 the season opened well, but owing to an over supply the prices did not hold firm. In many instances good Grapes, after remaining some days on hand, were sold for 6d. and 8d. per lb. Mr. Crousaz here quotes a market report, which states "that from the number of houses recently built and in course of construction, the quantity of Grapes will considerably increase and prices probably fall; and that, as the English, and particularly the Scotch, are developing this branch of fruit culture to a large extent, we may reasonably suppose many towns will cease drawing their supplies from London."

The total quantities exported after 1867 are not given, but referring to the season 1871 it is stated that the quantity sold by one salesman was 21½ tons, independently of what was sold elsewhere. In 1872 the prices were very satisfactory. Early cold house Grapes obtained 1s. 9d. to 2s. per lb., choice fruit even higher. Grapes of inferior quality made as much as the greater part of the best had done in 1871. The crop, however, was

most in favour. A larger area of land can thus be covered at less expense than with the lean-to. Considerable expense in wall building is thus avoided. Of course, more piping and heavier firing are required, for the solid walls of the lean-to keep warmth better in cold, wintry weather.

VARIETIES.—Nearly all new varieties have been tried as they appeared. The majority, however, have proved failures so far as suitability to market culture is concerned. The following may be taken to represent the standard sorts grown in the islands: Black Hamburgh, Muscat of Alexandria, Black Alicante, Gros Colmar, Gros Maroc, Applay Towers, and Canon Hall Muscat. This last is not yet largely grown, but many good growers consider the local conditions as being peculiarly suited to this variety, and hold that, space for space, it will be among the most profitable Grapes. If the hope is borne out by results, there is no doubt Canon Hall will find plenty of growers ready to take up its culture. At present the majority view it somewhat as a "will-o'-the-wisp variety."

PLANTING.—Formerly the canes were planted much too thickly (in some cases 15 inches apart), with the natural result that the fruit grown was

of poor quality, and as the Vines aged so the quality was worse. Now, however, in the majority of cases this evil has been corrected; more space is afforded each cane, although many say that more room still is required. But the grower has to consider this with the present prices of Grapes. He must have a fair crop of Grapes or the vinery will not pay; indeed, the prices of inferior grades have already fallen so low that they leave no profit to the producer, so that in many cases the Vines have been cut out and the houses turned over to Tomato culture. This winter (1902) many more vineries were about to undergo the same treatment. Without doubt this is a wise course as far

and it is now not unusual to hear of a Melon crop being a failure so far as profits are concerned.

When Melons were first started many growers used to allow one plant to cover a good roof space by taking several shoots from it. This is still favoured by some, but the majority now prefer single or double-stemmed plants with the idea of getting a small number of fruits on each, and gathering a crop rapidly so as to allow time for a second planting. In favour of the extension system it is argued that the greater energy of the plant promises better "setting" and that if the plants remain healthy their fruiting season is longer; but the risk is that the stem may canker

intended to give a few useful hints to those buying fruit trees—more especially Apple trees—this planting season.

Unfortunately, the fruit tree catalogues are not the help to the intending purchaser that they might be. The nurserymen publish what they call select lists of Apples; it may be from 50 to 200 varieties, and, having included any given variety, they seem to hold a brief for that particular Apple as for all the others, and its good points are all mentioned—often exaggerated—and nothing said about its defects. When a man praises everything we do not attach much importance to his commendation. It is no uncommon thing to see an

Apple described in one list as one of the best and omitted altogether from another list. It is doubtful if the perfect Apple has yet been raised. Every Apple seems to have some failing, more or less important, and, if catalogues should mention these, we should be helped in our choice of varieties for our particular conditions. If our soil was a wet one, for instance, we should not be led into planting Wellington (syn. Dumelow's Seedling or Normanton Wonder), Lord Suffield, Mannington's Pearmain, Cor's Orange Pippin, Devonshire Quarrenden, King of Tompkins' County, or Norfolk Beaufin if the catalogues told us that these varieties did especially badly in such a soil, but as a rule they do not mention this fact about these particular varieties; neither do they tell us that Blenheim Orange as a standard shades more ground than almost any other sort, and therefore should not be planted in a garden; that King of the Pippins, which is so much praised for its good looks, is somewhat flavourless unless grown in a warm situation; that Lane's Prince Albert and Stirling Castle in most soils fruit so heavily on the Paradise stock that they make little growth, and should, therefore, be on Crab stocks; that Bramley's Seedling, Striped Beaufin, and Emperor Alexander grow very strongly in good soil, and are a long time becoming fruitful unless well root-pruned; that Old Nonpareil, Marj, Sturmer Pippin, Irish Peach, and Golden Harvey are such feeble growers that they should be planted in very good soil; or that Cornish Gilliflower, Northern Spy, and Bess Pool are shy bearers at any time.

These instances might be extended indefinitely, but enough has been said to show that nurserymen do not tell us everything they know, and that, having put the tree in their catalogues, as a rule they act on the principle of *nil visi bonum*. There are many sorts which might well drop out of the catalogues altogether, and nurserymen would be only too glad to be able to reduce their enormous stocks of trees, while the perplexity of the intending purchaser would be to that extent lessened.

Now it would be rash on my part, or on the part of anyone else, to tell anyone what Apples he should plant. Let a man tell me what he wants to plant, and what his conditions are, and then I may be able to give him some advice which may save him making mistakes. It does not follow that the sorts which are the best for one person are the best for another. One wants dessert Apples for the spring, another for Christmas; one wants handsome Apples to set off the table, another wants the best for the kitchen. We see handsome Apples at shows, and at once think how much we should like to grow those same sorts, not knowing at all how these fine Apples have been grown—perhaps on a wall, or in the most favourable situation possible, neither of which conditions they would have in our gardens. Some of these very beautiful Apples we see are quite ordinary to look at unless grown in the sunniest aspect possible on a warm mellow soil. Similarly some of the finest dessert Apples need very good conditions, not only to bring them to perfection, but to make them thrive at all. Newtown Pippin is a case in point, an Apple which needs a very good summer in this

A HOUSE OF MELONS IN A GUERNSEY NURSERY.

as the grower is concerned, for the only use of inferior Grapes is that they occasionally have been the means of introducing a new retailing customer, who may ultimately become a buyer of the best article. Though this is poor satisfaction to the grower of inferior Grapes, it will be beneficial if it helps to increase the retail market.

THE MELON.

The cultivation of Melons for market purposes was, we believe, practically introduced into the Channel Islands by Mr. James Davis, at one time gardener to the Rev. J. Watson, at La Favorita, St. Martin's, Guernsey. At the commencement of this new branch of the industry small houses with sharp pitched roofs and plenty of piping were employed, and the results were highly satisfactory to the grower. As time went on larger span-roofed houses were planted with Melons, and the plants trained up trellises almost as with Tomatoes. While small houses had a good arrangement for bottom heat, the larger spans had no such provision. Heavy crops were produced by either system; for very early gathering the small house is better. Melons are still largely grown, and in many instances very profitably, though now the profits are less than formerly. The varieties grown are several, and many new ones are tried, but most are the same as those first grown by Mr. Davis, without doubt a selected form of the old Golden Perfection.

In the years following the introduction of Melon culture for market a good profit could be relied upon. Prices were high and very steady, but as more growers began the prices commenced to fall,

at the soil level, whereas with the single or double leader system the risk is much less, as the life of the plant is only half as long. Anything which tends to reduce the risk in a Melon crop is looked upon with favour by the Channel Islanders, as the margin of profit is very different now to the days when a good Melon would make 5s. to 8s. at the end of June, as was the case eighteen or twenty years ago. Those were, of course, the early days of Melon culture in the Channel Islands.

A CHANNEL ISLAND GROWER.

CHOOSING APPLE TREES.

THERE are many different pleasures connected with fruit growing—the choice of varieties and of trees of these varieties, the planting and pruning of the trees, watching the fruit grow, and last, but not least, gathering the fruit. It is the first of these we are principally concerned with here, and, pleasure though it is, it needs no little thought and judgment. Probably all of us have trees in our garden that we would not plant if we had our time over again. We have bought our experience, and this tells us that such and such varieties are either not adapted to our soil or are not such good sorts as we might have for quality or productiveness, or both. When we are planting an Apple tree we are putting something into the garden which we shall probably never do away with if it continues healthy and fairly productive, and as we shall have to look at it, and possibly consume the fruit from it for years to come, we cannot exercise too much care in deciding what to plant. This article is

country to come to perfection, even in the most favourable position. We must first make up our mind what purpose we want the Apple to serve, not only whether as cooking, dessert, or double-purpose Apple, but what season we want it for. The season of a cooking Apple is often much more elastic than that of a dessert Apple, for the Apple which is at its best for cooking in March is probably good in November also, though not perhaps of its full flavour; but it is very rare for a dessert Apple to be really at its best for more than a couple of months, though very favourable storage may increase this duration by a month. Cooking Apples are not necessarily in season as long as they will keep, any more than dessert Apples are in season when they begin to get woolly and mummified, or to smell "at a hundred yards." Such varieties as Warner's King, Stirling Castle, New Hawthornden, and others may be kept till February or March with good storage, but they will have lost their flavour and juiciness. It is much better, instead of trying to keep such Apples out of their season, to grow some sorts which really are at their best in March and April, such as Striped Beaufin, Bramley's Seedling, Royal Late Cooking, and Dumelow's Seedling. Another thing to make up our mind about is whether we want standards or dwarfs. The former are slow to come into bearing, and are very subject to loss of fruit by autumn gales before the fruit is properly matured, but are a valuable asset when once they have reached the age of productiveness. Bushes and pyramids on the Paradise have the advantages of early bearing and of producing fine fruit which can hang till it is fully matured, and they are easy to give slight protection to on just that one critical night which so often comes when Apples are in bloom in the middle of May. These dwarf forms are undoubtedly the best for most purposes; at any rate, for a garden. They possess an especially great advantage for mid-season and late dessert Apples, which are so much improved by hanging on the trees as late as possible, say till the end of October, which is impossible on standard trees. Standards after some years' growth are very handsome when in bloom, getting more so year by year, though the fruit is seldom in any quantity for eight or ten years. As compared with this the following account of the produce of a Warner's King as a pyramid, which was planted at Ramden in Essex in November, 1871, may be interesting. The account is taken from Mr. Cheal's book on "Fruit Culture":—

1872 .. 3 large Apples	1877 .. 7 pecks
1873 .. 1½ pecks	1878 .. 2 or 3 Apples
1874 .. 2 "	1879 .. 6 pecks
1875 .. 4 "	1880 .. 5 "
1876 .. 6 "	1881 .. 4 "

The average for the ten years works out to nearly a bushel a year. I was recently speaking to the owner of the tree—which, by the by, has since died of canker—and he told me that the figures above only included those which were actually picked about Michaelmas, and that the quantity that fell off during the summer and were used for cooking amounted to nearly as much more. This is, of course, an exceptional amount of produce, even for a big Apple like Warner's King, and there is no doubt it was the weakening of the tree from over-cropping which made it fall a prey to canker. But it is very interesting, as showing what may be done with a dwarf tree, and if it kills itself from over-cropping in ten years it has still served us very well in its generation. ALGER PETTS.

(To be continued.)

RUBUS LACINIATUS.

(THE PARSLEY-LEAVED BRAMBLE.)

This is one of the best of the Blackberries. At this season of the year not only is the fruit

acceptable, but the foliage assumes such brilliant tints that one could not wish for anything better for decoration. *Rubus laciniatus* is a delightful plant for covering arches, as the illustration well shows, or for training over fences and old tree stumps. It also fruits more freely than most of the Blackberries. A correspondent writes that he has not met with much success with the American varieties, and does not recommend them, but *R. laciniatus* is an exception, and worth culture in every garden. It grows splendidly when supported by a fence and allowed to ramble at will, and the fruit, which ripens together, not one here and one there, makes a delicious preserve.

AUTUMN STRAWBERRIES.

The alpine varieties are well worth the attention of those who like Strawberries over as long a period as possible, though the fruits are much smaller than on plants which fruit in summer. It will, however, first be interesting to refer to the value of the larger fruited for autumn. The plants give a double crop. Anyone who saw the very fine Royal Sovereign exhibited the end of last month by Mr. Hudson can understand what a valuable addition we have to the autumn fruits when the forced plants are utilised in this way. There is nothing new in obtaining a second crop from forced plants. The method usually adopted is to harden the plants. After the forcing give

flowers. Strawberries that fruit in April would give a crop in July, and May-fruited plants in August, and even later, if desired, by planting for that purpose. But for later supplies the

ALPINE SECTION

is the most valuable. The alpine Strawberries, of which there are now some excellent varieties, should receive more attention. They can be grown without the trouble forced plants entail, and even a small garden may be made interesting, as the alpine require so little space. At the same time to get the best results they need care at the start. The plants when raised from seed are very small, and, of course, need care in handling. There is a diversity of opinion as to which give the best return, seedlings or the runners; but no one who has grown this section will prefer runners, though these give less trouble than seedlings.

Another important point is to consider the best time to sow the seed. This depends upon circumstances. I have seen splendid results both from autumn-sown and spring-sown plants. Doubtless the last is the best time, as the seedlings then make their growth during the most favourable part of the year. Seedlings from seed sown in autumn do not make such rapid progress, but the plants will give fruits at a later date, and a succession is maintained.

With regard to spring-sown plants either March or April is a good time to make the sowing, and large pans or shallow boxes may be used. The soil must be rich and light and the seed sown thinly. The plants when large enough are pricked

AN ARCADE OF THE CUT-LEAVED BRAMBLE IN THE GARDENS OF SLINFIELD MANOR, NEAR BASINGSTOKE.

ample supplies of water, and plant out in land well enriched with manure. Planting is done as soon as the plants are available after the forcing, but care is necessary that the plants are healthy, the roots at the base opened out, the soil well firmed as planting proceeds, and ample moisture given in dry weather. From this date the culture is simple indeed; the first few stray flowers are removed, and none allowed until the plants have got a good hold of the soil in their new quarters. Then, say through July and early August, the flower-spikes are encouraged and fruits secured as required.

The chief points in culture are ample moisture, a rich root run, early planting, and thinning of

out into boxes, say, 2 inches to 3 inches apart, and placed in frames near the glass where a little warmth may be given for a short time, after which cold frame treatment is more suitable. When the seed is sown give a little heat to assist germination, say, an intermediate house temperature, and also after the pricking off for a short time, but do not use strong heat, as it weakens the plants at starting; 50° to 60° are ample at this stage. When a fair growth is secured, say, by June, the seedlings may be given free exposure and be planted out as soon as possible after this date. Place the plants in a sunny, well-drained quarter and in soil not too clayey, but well manured some time in advance

THE GREAT VINE AT CUMBERLAND LODGE.

of the planting if possible. Firm planting is essential, and there should be no lack of moisture in dry weather; indeed, after hot sunshine I have found that Strawberries benefit greatly by a damping overhead late in the day during August and September. The following summer the plants should not be allowed to fruit till required, that is, the first trusses must be removed till the end of July if fruits are needed in September, if earlier the flowers must be allowed to set earlier or none removed after the early part of June.

With regard to the space between the plants, allow, say, 18 inches between the rows. The plants must be kept free of runner growth the first season till the first fruit is set, and later ones will give later crops if too many are not allowed. The second season the same treatment should be followed. More feeding will be necessary and more runners taken away to prevent crowding. The fruits will be plentiful and smaller unless given food, but mere size is no advantage. It is best to slip the fruits from the plant and gather into small bowls or baskets ready for the table to avoid handling them more than is necessary, as being small they should be kept as tempting as possible.

The plants after the second year's crop is taken should be destroyed. Though they would fruit heavily another year younger plants would give much better fruits, and there is no gain in the end. I have referred to runners; if these are grown the culture is almost the same, but I have found the results much poorer. The plants are grown very easily from runners; they should be kept to a given space, as if allowed to run wild the return is very poor. Runners planted in summer will produce fruits the following year, and the space given for seedlings should be allowed with ample food. More room may be given and the late runners retained, or if made in June or July they will fruit in September.

VARIETIES.

I place the St. Joseph in the front rank, as this is a perpetual; it was obtained by crossing the small alpine with the garden variety, and has given good crops from May to October. The later formed runners give the late fruits, as these growths are made while the plants are ripening the first crop. St. Antoine de Padoue is another fine autumn fruiter of the same family, and valuable for late supplies if the runners are taken off and placed in

pots in summer, and the plants grown in frames for the latest supply. The true alpine is a little smaller, but newer additions, such as the Sutton Large Red and a fine seedling grown by Mr. Hudson at Gunnersbury, are valuable additions to this race. The Rouge Ameliore is a true alpine fruit. The Louis Gautier, a white fruit, makes a splendid autumn variety, and La Constante d'Automne is worth room in all gardens. G. WYTHES.

FAMOUS VINES.

ALTHOUGH in the British Isles we can boast of Grapes of the highest quality, we cannot record many notable Vines, and this fact denotes that the extension system in this country is not practised to any great extent. Judging from the few specimens we have there is no doubt that this principle has much to commend it. Perhaps the most recent successful example we have is that of Mr. Shingler's, which was noted in your issue of the 3rd ult.

Of the few famous Vines in England the

one at Hampton Court is the best known, but it is by no means the finest example. This is unfortunate, as it is visited by people from all parts of the world, who have not the opportunities of seeing our best produce, and who, I am afraid, must carry away with them a very poor idea of British-grown Grapes. Those who have seen this Vine must have been struck by the totally unsuitable conditions under which it has to exist. But it is pleasing to know that something is about to be done, which no doubt will place the old veteran in more genial surroundings. This Vine is the oldest in Britain, having been planted in 1768. It is planted at the end of the house, and its roots are mainly outside. The stem at the base is nearly 4 feet in circumference. The Vine covers a house 65 feet long by 30 feet wide. It has been known to carry 1,500 bunches in one year, but of late the crop has been greatly reduced owing to the unsatisfactory condition of the Vine.

The great Vine at Cumberland Lodge, which is an offspring of the one at Hampton Court, revels in much happier surroundings in Windsor Great Park. This year it is in

THE STEM OF THE HAMPTON COURT VINE.

splendid condition, which was shown by the twelve grand bunches exhibited at Chiswick recently. It fills a house 138 feet long by 20 feet wide. Unlike its parent at Hampton, it is planted in the centre of the house, and has the advantage of a good inside border, which has lately been renovated, and this no doubt is the cause of its present robust condition. It was planted in 1778; this year it is carrying 700 bunches averaging 1½ lb. each.

Perhaps the finest example of training on the extension principle is the famous Manresa Vine at Roehampton, and this, I believe, owes its existence more to accident than design. It was originally grown against an outside wall, and now covers a narrow house over 200 feet long, and annually bears large crops of splendid fruit. No doubt this Vine derives a lot of its sustenance from the roots of several Alicante stocks, which have been inarched upon the main stem at intervals. It was planted over forty years ago by the late Mr. Davis, who had just cause to look upon it with great pleasure and pride.

The Vine at Silwood Park, Sunninghill, is not so well known, but it is a splendid example of good culture. It is a descendant of that at Cumberland Lodge, and fills a house 125 feet long by 12 feet wide, and furnishes fine fruit every year. Scotland, I think, can lay claim to the largest Vine in Great Britain. This is the famous one at Taymouth Castle, Lord Breadalbane's seat in Perthshire. It fills a house 172 feet long by 25 feet wide, and is a grand example of methodical training. It was planted in 1830, and annually carries large crops of good Grapes. There is no doubt that the extension system of training gives the best results. It is a well known fact that the fruit from these old Vines is far superior in flavour to that from younger plants. All the above are of the Black Hamburg variety. H. W.

ORCHIDS.

LÆLIO-CATTLEYA NORBA SUPERBA.

CATTLEYA MOSSIÆ and Lælia xanthina are the parents of this hybrid Orchid, which received an award of merit from the Royal Horticultural Society on the 13th ult. The sepals and petals are pale ochre yellow, while the front of the lip is lilac-rose and the throat deep yellow. The marking on the lip is very pretty, consisting of lilac-rose dots, almost merging into each other, upon a paler ground. It is a flower of medium size, in which the soft tints of sepals, petals, and lip associate pleasingly. Messrs. James Veitch and Sons, Limited, Chelsea, were the exhibitors.

THE CALANTHES.

THESE are among the most beautiful of Orchids, and are divided into two sections, evergreen and deciduous, the latter being the more beautiful and useful for decorative purposes, and are in consequence more largely grown. The deciduous species and hybrids, which are the subject of this note, have distinct pseudo-bulbs, often 9 inches high, bearing broad plicate leaves which fall about the

flowering period. The flower-spikes which issue from the base of the bulb are from 20 inches to 30 inches long. They bear numerous flowers, which expand during winter, and last long in perfection when away from smoky centres. The following are some of the most beautiful:—

Calanthe rosea.—Typically rose-pink, but varying from white to dark rose.

C. rubens.—Flowers dark red, lip ruby-red, medium size.

C. labrosa.—The scapes are about 15 inches high, the flowers small, sepals and petals rose-purple, lip of a similar colour, dotted with purple, whitish at base.

C. vestita.—Flowers creamy

offspring in consequence require a high temperature and a moist atmosphere throughout the growing season, and to be cooler and much drier during their resting period.

As soon as the plants begin to grow they should be repotted. Shake away the old compost, and cut off the majority of dead roots, leaving a few to help support the bulb when repotting. The pots must be quite clean (of sufficient size to allow the last made bulb to develop fully without coming into contact with the rim of the pot) and filled one-third their depth with crocks, and over these a thin layer of moss. Fill the pot one-third more with compost. The latter should consist of good fibrous peat freed from all the finer particles, peat, and leaf-mould in equal proportions, with about a sixth part of well-dried cow manure. Add sufficient finely-broken crocks, charcoal, or coarse silver sand to ensure porosity. Mix the whole well together, place the base of the plant a little below the rim of the pot, and fill up with the compost evenly and level to the base of the plant.

Place the plants in a temperature of 65° to 70° by night, and from 70° to 75° by day by fire-heat, allowing a rise of 10° to 15° more by sun-heat, with a moist atmosphere. Admit air according to the weather.

After repotting, though the young growths rapidly advance but little water will be needed until the new roots have well penetrated the fresh compost. The plants may only require watering two or three times during the first five or six weeks, which is the most critical period in the cultivation of deciduous *Calanthes*. Beginners must bear this in mind, and err on the side of dryness rather than water the plants too much in the early stages of growth. If the soil is kept too moist the tips of the roots, as they issue from the base of the young growths, turn black and fail to penetrate the compost. The foliage becomes badly spotted, and the pseudo-bulbs develop unsatisfactorily; the spikes are weak and the flowers small, and seldom properly expand.

When the plants have become well rooted and the growths well advanced the water supply must be gradually increased until the new pseudo-bulbs are beginning to form. Then until the bulbs have fully developed they should be watered with weak liquid farmyard manure. It is almost impossible at that time to give too much heat and moisture both at the root and in the atmosphere. Maintain a temperature of 70° by night and 75° by day, artificially allowing a rise from 10° to 20° by sun-heat, or even more when the house is closed for the afternoon. Ventilate as freely as circumstances will permit, and shade only to prevent the leaves scorching. Keep the plants free from scale, and occasionally fumigate the house as a remedy against thrips.

When the pseudo-bulbs have fully developed (though much less water will be needed), it must not be entirely withheld until the spikes have ceased to grow and the flowers are fully expanded. When the flowers have faded and the spikes taken from the plants withhold the water entirely, and place the plant in a light position near the glass, in a temperature that does not fall below 60° during the resting period. Where space is limited the plant may be shaken out of the compost and placed closely together in boxes in a similar position. F. W. THURGOOD.

Rosslyn Gardens, Stamford Hill, N.

CATTLEYA BOWRINGIANA LILACINA.

THOUGH not so showy as the type, this variety is very delicately coloured and attractive. It has been frequently shown at the Drill Hall recently. It is unfortunate for metropolitan growers that this plant flowers so late. T.

LÆLIO-CATTLEYA NORBA SUPERBA.

white, sometimes with a coloured eye; in this respect very variable. There are a number of varieties of the last-named species, including *gigantea*, bright red blotch at base of lip, a fine variety; *Luteo-oculata*, lip with yellow eye; *Regnieri*, sepals and petals white, lip rose-pink, variable; *Regnieri sanderiana*, flowers large, white, with dark crimson blotch; *Rubro-oculata*, lip blotched in the centre with crimson; *Turneri*, flowers white, rose eye; *Turneri nivalis*, flowers entirely white.

HYBRIDS.

Calanthe Bella.—A handsome hybrid, sepals white, petals blush, lip blush pink, with a deep carmine-crimson blotch at apex of tube.

C. Bryan.—Flowers pure white, excepting the throat and basal portion of the labellum, which are deep purple-maroon.

C. Clive.—Flowers rosy carmine, sepals shading into white, the throat pale orange, the basal part of the lip white, shading into deep rose-carmine.

C. Florence.—Flowers deep rose, with purplish markings.

C. sandhurstiana.—The flowers resemble those of *C. Veitchii* in shape, but are more closely set on spike, and much darker in colour.

C. Veitchii.—One of the most popular and useful of hybrids, flowers rich rose colour.

C. William Murray.—A very fine hybrid, sepals and petals pure white, lip crimson.

CULTIVATION.

The deciduous *Calanthes* are not easy to grow, yet if care and strict attention be given to every cultural detail the plants may be brought to perfection, and they will repay the care bestowed upon them. The deciduous species are natives of the hottest parts of the world, and they and their

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

CINERARIA STELLATA IN THE FLOWER GARDEN.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—It may appear strange to many to see this *Cineraria* recommended for the flower garden, but I do so without the least hesitation, and I believe we shall see it in general use in a few seasons hence. This *Cineraria* has a free habit of growth, quite unlike the florist's type, and flowers somewhat earlier. For several years I have grown Vilmorin's Sky-blue outside with the best results, but as I have previously stated it must of course have a shady as well as moist soil in which to grow. This year I have given *C. stellata* a trial on a small scale, and am delighted with it. If the plants have a fault it is in their irregular height; they vary very much. Some of the plants will grow from 3 feet to 4 feet high, while others will not reach 18 inches. Therefore they cannot be depended upon for formal beds, but they are well suited for mixed borders, especially where a little shelter is forthcoming during autumn, just sufficient to ward off the early touches of frost.

Of course this is against their general use, but this is the case with hundreds of other annuals and sub-tropical plants. The one thing to be remembered with the *Cineraria* is an early start. The seed must be sown in January or February at the latest in order to give them time to form good plants and to flower early. Those I have planted commenced flowering in August, and are still looking well at the present date, independent of the wretched weather we have had the whole of the summer. They are really first-class wet weather plants, far better in this respect than Michaelmas Daisies, to which they are good companions, or early-flowering Chrysanthemums. I do not know whether it is yet possible to get *C. stellata* in separate colours; if so this would be a good thing, as there are so many objectionable colours in the mixed ones from seed. The colours most suitable for the flower garden are the greys, blues, whites, and mauves. These mixed with Michaelmas Daisies are splendid. We have had just sufficient frost to cut the Begonias down in the open garden, but the *Cinerarias*, which are sheltered by trees, have not yet suffered. There are some laggards among them, and these have been lifted and placed in pots, and are standing in a cold frame, where they are fast expanding their fine heads of flower. They lift with good balls of earth and suffer very little indeed. The lights are removed on dull days, and they soon become established and flower freely for a long time. *Cinerarias* like rich soil with an ample supply of moisture; drought will soon ruin them.

Cirencester.

T. A.

FRUITING OF ARAUCARIA IMBRICATA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—On page 289 Mr. Strugnell draws attention to the somewhat rare occurrence of the fruiting of this Pine in Britain. That this should be a rarity is remarkable considering that when a tree once begins to fruit it continues to do so with great regularity afterwards, whereas others growing near, though equally as large and healthy, never produce the semblance of a cone. Then, again, one tree may mature perfect seeds freely, while others are very remiss in this respect. The instance cited by Mr. Strugnell is that of a tree growing in England. I am, however, acquainted with one in Scotland which is in many respects very similar. This tree, which is growing upon the lawn at Castle Wigg, Whitthorn, in the lower district of Wigtownshire, is about 50 feet in height, and has for at least twenty-five years past produced cones and fertile seeds almost annually, from which seedlings, some of which have now attained con-

siderable size, have been raised from time to time. It is probable that this tree was planted shortly after the introduction of the species into Britain, and, occupying as it does a sheltered situation in soil that is rich, deep, and moist, it has thriven most satisfactorily, and forms a very conspicuous object at any season, but more especially so when from twenty to thirty large cones bearing a close resemblance to Cocoanuts are dotted about at irregular intervals upon its branches. In near proximity are other trees apparently of equal age, but with the single exception of one male plant I believe none of them have ever been known to produce a cone of either description. On the Galloway House estate adjoining there were formerly some very fine plants of *Araucaria*, but the severe storm that swept over the country a few years ago spoilt many of them. Of all these there was but one plant, and that a male, which still survives, that ever, so far as I am aware, produced a cone. To produce fertile seed both sexes must, of course, be located near each other; the absence either of one or the other is in many cases probably accountable for the infrequency of cones, and, consequently, seed production. Could

MR. F. Q. LANE.

this be foreseen when the plants are young so that an equal distribution might be made when planting it would greatly simplify matters, and the interest in this somewhat peculiar tree would be enhanced.

DISEASE-RESISTING POTATOES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I quite agree with your correspondent, A. Dean, when he says that no variety of Potato in existence in its leafage is quite disease resisting. There have been many varieties introduced in recent years called disease resisters, but a season like the one just passed has shown how few are the varieties that can claim this merit. At the time the late Mr. Clarke gave us (through Messrs. Sutton and Sons) his famous *Magnum Bonum* almost all other varieties then in commerce looked like being exterminated by disease, and certainly for a number of years *Magnum Bonum* might truly

be called disease resisting. Evidently the cause of its freedom from disease might be found in its possessing an abundance of wood tissue in its stems, with a small amount of leaf surface. I have invariably found that the more luxuriant the leafage the greater the amount of disease. For a number of years the earlier varieties escaped the disease owing to the earlier ripening, as the fungus cannot live on a ripening leaf, but with the cold springs we have experienced in recent years the growth of early varieties has been so checked that they with the late varieties have been in full leafage in August, when the disease generally makes its appearance, especially with such wet weather as we had last August; consequently early and late varieties suffered equally from the disease, with few exceptions. The varieties that came out best here were as follows (the figures after the name denotes percentage of diseased tubers):—

Fidler's Seedling	0
Kerr's Bobble Burns	1
Findlay's Evergood	1
" Royal Kidney	1
King Edward VII.	1
Sutton's Favourite	1
Kerr's Duchess of Buccleuch	2
" Model	2
" Cigarette	2
The Factor	2
Kerr's General Roberts	2
Sutton's Windsor Castle	3
" Reliance	3
Sir John Llewelyn	3
Webb's Industry	3
" Goldfinder	4

The above were the best out of 100 varieties, but, taking the last four years, I have had nothing better than Kerr's Cigarette for crop, quality, and handsome appearance.

MISCELLANEOUS.

NOTES FROM BERKHAMSTED.

IF from no other cause, Mr. Lane and his Berkhamsted nurseries have earned a wide reputation by the introduction of that universally popular Apple Lane's Prince Albert. The origin of this famous Apple is somewhat obscure, but it first appears to have been heard of in the early forties, when the late Mr. Lane discovered it growing in a local garden, and, recognising what a good thing it was, secured the stock, propagated and distributed it. The merits of this Apple have been so generally recognised and so favourably commented upon that to-day it would be difficult to find a garden of any size that does not contain trees of it.

The original tree is still in existence in a Berkhamsted garden, which, by the kindness of Mrs. Barratt, we were enabled to see. An attempt was made to photograph the tree, but it was raining heavily and the wind was high, so that our efforts were almost foredoomed to failure, and so it proved. The tree still bears good crops of fruit, although this year, in common with most other Apple trees, its yield of fruit has been a scanty one. This Apple came by its name in the following way: Her late Majesty Queen Victoria and the Prince Consort were driving through Berkhamsted in state upon the occasion of some local incident of importance, and as about that time the Apple had been discovered by Mr. Lane and was not yet christened, the visit of the Prince Consort suggested a name, and so Prince Albert was decided upon. The introducer's name, however, has always been closely identified with this Apple, and one usually hears it spoken of as Lane's Prince Albert. To its enormous cropping capacity when grown as a bush in garden soil we can speak from personal experience, and we have heard equally good accounts of it as a standard.

The nurseries of Messrs. Lane and Sons have other claims to distinction besides the introduction of this valuable Apple. Pot Vine culture has long been a feature there, and still is largely practised. Upon a recent visit we were shown several houses full of "cut-backs" and of canes from eyes inserted this year. Both show the results of good culture, for one might go far without seeing stronger canes and better buds. Some of the houses are already partially cleared, for the demand for pot Vines is always a regular one. It is interesting to note the variation of colour in the foliage of the different varieties; some are most brilliant, while others are simply green and yellow. The two whose leaves are most richly coloured appear to be Madresfield Court and Gros Colmar. Both these are almost worth culture for the autumn tints of their foliage alone. Several sorts of Grapes not usually met with in gardens are grown by Messrs. Lane; for instance, the Strawberry Grape, Grizzly Frontignan, Dr. Hogg, Ferdinand de Lesseps, and others. Fig culture in pots is another noteworthy feature in the Berkhamsted nurseries, and a representative collection of varieties is grown. It is not our intention now to refer at length to the outdoor fruit trees in this nursery, which, however, are grown by the thousand, and a large portion of the extensive nursery ground is devoted to them.

Mr. F. Q. Lane, whose portrait we are pleased to be able to publish, is well known in the horticultural world as head of the firm of H. Lane and Son. Mr. Lane is a prominent member of the fruit committee of the Royal Horticultural Society, and, although not a frequent exhibitor, always has something of unusual interest to show when he sends an exhibit from the Berkhamsted nurseries. Mr. Lane has for long taken a deep interest in local affairs; he is a Justice of the Peace, and since 1894 has been chairman of the Berkhamsted Board of Guardians, and also of the Rural District Council.

GARDENING OF THE WEEK.

KITCHEN GARDEN.

ASPARAGUS FORCING.

PROVIDED that plenty of good strong roots that have been several years in the bed are obtainable, there need be no difficulty in producing abundance of this much-valued vegetable throughout the winter. The plan of erecting a bed of stable manure and leaves in a sheltered part of the garden and placing thereon a frame is as good as any, and the excellent results I have always obtained by this simple method induce me to recommend it. The material need not be turned before putting it into a bed, for by using about half tree leaves the warmth will be steady and last for a long time. Now that the tops have died down some roots may be lifted as soon as the bed is ready to receive them. A layer of half-decayed leaf-mould should be first placed in the frame for them to rest upon, and some of the same material be worked in the interstices of the roots. Assuming that an ordinary sized three-light frame is utilised and the number of heads required at one time is not great, then one light may be filled with roots now and the second and third at intervals of a week or ten days. A regular supply may then be obtained, and when the produce is cut from those

first inserted they may be turned out and destroyed, and after removing two or three barrow-loads of the fermenting material and replacing with fresh warm manure another batch of plants may be put in that may be expected to produce heads to follow up those inserted last. Frequent linings will be necessary to maintain an equable temperature. As each batch is put in afford a good watering with warm water, and, whenever any more is required, let it be of the same temperature as the frame, viz., about 55° or 60°. To hasten the production of young heads the lights must be kept close and covered with mats for a few days, but when they appear through the soil gradually inure them to light and air.

BROCCOLI.

Two really good varieties with us this year are Self-protecting and Michaelmas White. Both are excellent in quality, and, although not large, are of a nice size for the dining-room, and, following up closely the Autumn Giant Cauliflower as they do, prolong the season considerably. Look well to affording protection to any remaining heads. Later varieties will now need protection, for should we experience severe frosts and snow in the near future, as we may now reasonably expect, the soft stems will become injured. Heeling the plants over with their heads facing the north is an old-fashioned plan of protecting them, and I know of nothing more effectual.

Stonleigh Abbey Gardens.

H. T. MARTIN.

FLOWER GARDEN.

PLANTING.

NOVEMBER is one of the busiest months in the flower garden in many respects. After the soaking rains we have had lately careful note should be taken of the conditions of the soil in regard to its drainage. If the soil is of a sticky, muddy character, and remains so long after rain has ceased, be assured that the drainage is not sufficiently perfect to produce healthy plants, and should be seen to at once. General planting may now be proceeded with in soils that are reasonably workable. It is certainly of no use planting in mud, nor when water is found to drain into the holes dug for the plants. In such cases it would be better to wait until the ground is sufficiently dry. Not yet should planting be proceeded with in wet weather.

APPLE LANE'S PRINCE ALBERT.

If plants happen to arrive at such a time just heel them in and wait until circumstances are conducive to successful planting, then get in as quickly as possible all Roses and general shrubs it is desired to grow, especially of those kinds that are usually drawn from the soil. At this period of the year the majority of plants are dormant, and can be lifted without injury to them. Of course, it is advisable to plant as soon after lifting as possible, and not to expose the roots to the weather more than is necessary.

SPRING FLOWERS.

Many of the beds that now have been cleared of summer-bedding plants and are to be utilised for a similar purpose another year may be planted with spring flowers that are waiting removal from the reserve garden. A great point in the planting of these temporary things is to regulate the work in such a way that beds required early another year may be filled with plants that are quickly over or the sacrifice of which while yet in flower is not much regretted. Wallflowers I consider the most useful spring flowers we have, and the variety of shades has undergone considerable improvement within the last few years. They also, generally speaking, stand our ordinary winters well. Polyanthus may be used largely if plenty of time is available in late spring to clear them away and prepare the beds for summer plants.

WALLFLOWERS, POLYANTHUS, AND MYOSOTIS.

In places where there are no means of forcing plants of the usual forcing type there is no need for an absolute dearth of flowers in spring or immediately preceding spring. If only a batch of these sown at the usual time and transplanted once were now lifted with good balls of soil and carefully potted up, well watered, and stood under a north wall for a few days they will scarcely lose a leaf. They could then be placed in a cold frame to be brought on gently later.

Ashwellthorpe Gardens, Norwich.

T. B. FIELD.

FRUIT GARDEN.

PEACHES.

To have May Peaches the house should be ready for closing by the end of this month. If the roots of the trees have the range of internal borders it will be necessary to see that the soil is in a nice

growing state quite down to the drainage, while those running outwards will require some kind of covering to protect them from the chilling influence of rain and snow. It is not, however, at all imperative that the roots have an external border, as the finest fruit may be grown for a great number of years where the internal space is extremely limited, provided the borders are frequently renovated with fresh maiden loam, top-dressed with good rotted manure, and well fed with a liberal hand throughout the growing season. This will require turning occasionally to liberate moisture, and the trees must be syringed twice a day when fine, care being taken that the second syringing is performed early in the afternoon, as it is not well to have the buds loaded with moisture at nightfall. Let the temperature at the outset range from 40° to 45° at night, and 10° higher by day.

HARDY FRUITS.

When the root lifting of pyramids and bushes has been brought to a close the renovation of older ones should receive immediate attention. In many old gardens we often find trees of large dimensions to which the modern system of root lifting cannot be applied, or, if it is attempted, one side only should be operated upon in any one season, and when the strong roots which have been cut have made new roots into fresh compost the other side may be treated in a similar manner. If the trees are healthy and crop well, and disturbance at the tap-root is not considered necessary, the quality of the fruit may be greatly improved by the entire removal of the surface soil quite down to the roots, replacing it with fresh compost consisting of good loam, road scrapings, charred refuse, and rotten manure. The heads of standards may be thinned preparatory to the removal of loose bark and moss, when all the strongest branches may be washed with a mixture of soot, lime, and stiff loam reduced to the consistency of paint with strong soap water, 2lb. to the gallon.

PRUNING.

Where much of this work has to be performed advantage should be taken of the mild weather which generally prevails through November for getting this operation well advanced. Commence with Currants, Plums, and Cherries; thin out and tie up Raspberries, but defer shortening the tops until the spring. Mulch heavily with rotten manure when the weather is favourable for wheeling, and avoid all digging or disturbance of the surface roots. If new plantations have to be made now is a favourable time for getting in the canes. The Raspberry enjoys a light, rich soil, and produces the finest fruit when grown in single rows running north and south, and trained to a V-shaped trellis, which admits of the young growths rising up the centre.

Madresfield Court.

W. CRUMP.

INDOOR GARDEN.

THE continued wet and dull weather will render the use of a little extra fire-heat necessary in all houses that are filled with plants requiring a stove or intermediate temperature or the atmosphere will become stagnant and heavy, and under such conditions soft-wooded plants are liable to damp. For Malmaison Carnations a little heat in the pipes, excepting during bright intervals through the day, is very important; this must, however, be accompanied with free ventilation night and day. Should any sign of rust appear on the foliage out off the affected parts and burn them at once; and should the attack be severe it will be necessary to go over them daily. Several remedies have been suggested for the destruction of this parasitic fungus, and, apparently, with only partial success. Some few years ago the plants under my direction were affected seriously with it, but by adopting a certain method of treatment for about two years I was rewarded with a clean stock. The section of

PERPETUAL FLOWERING CARNATIONS

will thrive perfectly during the winter with practically the same treatment as recommended for Malmaisons, but with this difference: that should bloom be required a temperature 8° to 10° higher will be necessary. As an autumn and winter-

flowering variety of the Malmaison I have not yet found one to surpass Sir C. Freemantle. Nerines now in flower should be grouped in a light and dry house to prevent the flowers being affected by stagnant moisture.

CHRYSANTHEMUMS

now coming into bloom should receive regular supplies of clear liquid manure, of which soot forms an important constituent. Salvias in pots also require a liberal allowance of stimulant, and should not become dry at the root or the foliage will drop prematurely and the effect of the plant be lost.

BEGONIA GLOIRE DE LORENAINE

requires free ventilation with a genial temperature of 60°. Avoid packing the plants too closely, as a free exposure to abundance of light is necessary to develop the embryo flower-buds, and guard against an excessive use of stimulant, or the plant becomes too sappy. B. Gloire de Sceaux should now have a stove treatment and be allowed plenty of room to enable the plants to develop fully their fine foliage. Pay every attention to the stock of young Crotons; remember that heat, moisture, and light are three important essentials. Adopt means to keep in check red spider, which is a great pest to this plant; if a bottom-heat of 75° can be given them the plants retain their foliage much better.

SWEET PEAS

in pots for spring flowering should now be sown; 8-inch or 10-inch pots are the most suitable sizes in which to grow them. A good friable loam with one-sixth part of old Mushroom-bed manure will meet their requirements as to soil. Sow the seeds thinly after the pots are filled two-thirds full with the compost, and place them in a cool house until germinated.

Wendover.

J. JAKES.

CHRYSANTHEMUMS.

NEVER can I remember such an unfavourable season as the present one for the developing and perfecting of large Chrysanthemum flowers, and I fear shows which are fixed for a late date will suffer. The flowers expand rapidly, owing to a large extent to the unripened wood, and before they are properly developed the flowers begin to show signs of distress. It is absolutely necessary with the continuous wet, dull weather to keep the pipes warmed to prevent damping, and unless we soon get a spell of drier and cooler weather the season will be a very short one.

Examine the flowers daily and carefully remove those petals which show the slightest tendency to damp, and those which are nearly expanded should be removed to a dry room and very little water given if required for any special date, when they will be found to keep fresh for some time.

Many of last year's novelties are grand acquisitions, that fine variety Miss Mildred Ware being exceptionally good, especially on the second crown bud. I regard this as one of the finest varieties of recent years. H. Perkins is also another very pleasing variety, the colour being fine when taken on the second crown bud, and the type all that can be desired. It reminds me of Le Sceptre Toulousain when at its best, except that the colour is better and the blooms rather larger. There are also many others of great merit.

POMPONS.

These are promising well, and, fortunately, do not suffer from damping. Medium-sized bush plants make a splendid show, and no attempt at stiff training should be made. Merely support the growths by looping them up to one central stake. A moderate amount of feeding should be given till the blooms are fully developed.

SINGLES.

These are more popular annually, and rightly so. During recent years a great improvement has been effected in this section, both in the growth of the plants and colour of the flowers. Those varieties which hold themselves erect and are of medium size are the most beautiful and useful, and either for conservatory or cut decorations are invaluable, many of them under artificial light being exceed-

ingly useful. These require similar treatment to the Pompons, and by late stopping may be had in perfection in midwinter.

LATE-FLOWERING SORTS,

which have been specially cultivated for decoration during the coming winter, and have been so far under temporary shelters, should now be removed to a place of safety under glass. Arrange these in the coolest houses available; late fruit houses are best adapted for them. The plants should be thoroughly cleaned and the necessary tying done just sufficient to prevent them from breaking. Moderate disbudding should be done, care being taken not to do this too severely, and the varieties, of course, should be taken into consideration. Thoroughly fumigate the plants to rid them of all insect pests several nights in succession, and use plenty of sulphur on the under sides of the foliage to prevent the spread of mildew. Should rust be present syringe the growths with a solution of paraffin and water as advised in the earlier part of the season. Large plants in small pots will require liberal feeding with manure water, and give occasional doses of Clay's or some other reliable patent manure. Many of the late border varieties are promising well, and should the weather continue open these will brighten up the outside garden for some time, and are worth a little protection should severe frosts be imminent. Any which are planted at the foot of south or west walls, and a capital plan it is, especially when glass accommodation is not sufficient, should be protected both from wet and frost, which can easily be done when in such a position.

E. BECKETT.

Aldenham House Gardens, Elstree.

NURSERY GARDENS.

MESSRS. WARE'S TUBEROUS BEGONIAS.

BEAGONIA time in Messrs. Ware and Sons' Bexley Heath Nursery reminds one forcibly of Tulip time in Holland. It may perhaps seem something like exaggeration to state this, and before visiting this firm's tuberosus Begonias we ourselves should have been sceptical as to the accuracy of such a statement, but now we have no hesitation in allowing it to pass. One enters Messrs. Ware's Begonia fields from the public road, in fact the beds are visible to passers-by, and during the season they avail themselves of the invitation extended by the firm to make a tour of the nursery. Tuberosus Begonias are here grown by the thousand, we might say hundred thousand, and are planted in long narrow beds running from one side of the oblong-shaped field to the other, paths, of course, separating the beds so as to allow of attention to cultural work. The Begonia field covers almost three acres of land, and is some 240 yards long, with a walk down the centre. As seen from the entrance to the nursery

THE DISPLAY OF COLOUR

is altogether remarkable. On either side of the central path, in an endless variety of pure and rich colouring, are masses of tuberosus Begonias, the singles on the one side, the double varieties on the other. Of the doubles the whites are immediately in front of the onlooker, and allowing the eye to wander farther afield, stretches of scarlet, pink, salmon, red, orange, yellow, bronze, crimson, and rose come into view in quick succession. On that side of the field devoted to single varieties the wonderful display of colour ranges through magenta, pink, white, crimson, scarlet, yellow, bronze, orange, salmon, on to the fancy varieties, which comprise flaked, splashed, and striped Begonias. Truly it would be difficult to find a more brilliant display of plants in flower in the country than Ware's tuberosus Begonias made a few weeks ago. The range of colouring is such as is possessed by few hardy flowers, and in addition to this

THE INDIVIDUAL BLOOMS

are in most cases of great excellence, both as regards form and habit, that is to say, they are held well

above the foliage upon strong, stout stalks, and do not hang their heads. Some of the double blooms, in fact the majority of them, have been made of such perfect form by skilful and long-continued

SELECTION AND HYBRIDISATION

as almost at a little distance to make it difficult to say whether they were tuberous Begonias, Camellias, or even Rose buds. This, again, may appear to be a somewhat exaggerated statement, but we doubt if anyone would question its reliability who had paid a visit to Messrs. Ware's Begonia fields when the plants were in full flower. The form of the double whites was particularly good, and the centres of the flowers were perfect. Messrs. Ware's manager at Bexley Heath has long been a worker among tuberous Begonias as well as other flowers, and his painstaking and well-directed efforts in the improvement of these popular summer-blooming plants have met with great, we might almost say unique, success. It seems almost incredible that

THE REMARKABLE DISPLAY

of some three acres of plants in brilliant bloom is the result of seed sown on January 27 and 28, 1903; thus only some eight or nine months elapse between the time of seed sowing and the plants being at their best. When one realises what can be done in the way of imparting beauty and rich colouring to a garden at the cost of comparatively little outlay and labour, it seems strange that more advantage is not taken of such opportunities, and, taking the case before us, that tuberous Begonias are not more largely planted. They have the

ADDITIONAL ATTRACTION,

if any were needed, of doing even better in a wet season than in a dry one; and when gardeners are almost at their wits' end to know what to plant for the best, now that wet summers appear almost to be a certainty, the tuberous Begonia will undoubtedly prove a most important and valuable plant. What a long time it remains in bloom! Flowers appear in quick succession over quite a long period; so that from August to November one need never be without. Messrs. Ware save all their seed from plants carefully tended under glass.

BEGONIA SEED

is very minute and easily lost, and, moreover, the various colours must be kept distinct, so that it becomes essential to keep under close observation those plants from which the seed is obtained. We were initiated into the mysteries of seed saving from double flowers, from certain unusually good varieties (for it is notorious that the best varieties are mostly shy seed bearers) and from what we may call freak varieties, which include the crested forms and those whose petals are splashed, striped, and flaked. The plants are starved so as to arrest leaf growth and encourage the formation of flowers and, eventually, seed pods. It would take too long to enter fully into the work of selection and hybridisation, which Messrs. Ware practise so carefully and with such good results, but we have probably said sufficient to give the impression—an impression that we left the Bexley Heath Nurseries with—that Messrs. Ware's tuberous Begonias may be equalled, but are not surpassed.

CHRYSANTHEMUMS AT MERSTHAM.

Messrs. W. Wells and Co., of Earlswood Nurseries, Redhill, owing to the rapid expansion of their business, have found it necessary to increase the accommodation for their large stock. An extensive range of glass and 4½ acres of land at Merstham have therefore been acquired, and the whole collection of show blooms is staged this autumn on the new ground and in a large double-span greenhouse 126 feet by 54 feet. Size and quality are always strong features in the Wells' collection, and, although the wet season has proved to be a very trying one, yet the high average quality has been maintained, and the display is a remarkably fine one.

At certain intervals large groups of one variety are placed together, forming a most striking feature. Of these one of the grandest is that composed of big Japanese incurved blooms of the

Colonial crimson W. R. Church. Then we come close by to another in which Mrs. George Mileham makes a fine display. W. Duckham is one of those massive Japanese incurved flowers with very broad florets, colour fine rosy pink, with a silvery pink reverse, and a group of about fifty blooms of this variety all together has a most effective and unusual effect. Mrs. Rumble is a finely-shaped flower with drooping florets, colour a pretty pale shade of bluish. Of a rich purple amaranth with rather broad florets and a silvery reverse is F. A. Cobbold; Mr. Higga, golden ochre yellow, tinted chestnut. In brilliant full-sized crimson of bold Japanese incurving form Meynell will certainly occupy a foremost place. It has substantial grooved florets, with a fine golden bronze reverse. Several others—Mrs. J. Wells, S. T. Wright, Godfrey's Pride, and Lord Alverstone—take high rank in this colour. Britannia is one of the modern yellows, clear and bright in tone; Beattie Godfrey is another, and is large and attractive, these and all those previously mentioned belonging to the Japanese type. Very large in size is W. A. Etherington; it has long intermingling florets, the colour being a peculiar soft salmon rose tinted pale purple. Calvat's seedlings of the past season include Mme. L. Chevrant, one of the prettiest of the modern Japanese. The colour is a charming shade of pale soft rosy pink. Another of his recent acquisitions is the variety named after the celebrated grower Mr. F. S. Vallis. This is of good size, with long reflexing florets, forming flowers of deep build, the colour being a remarkably pale shade of pure canary yellow. Mrs. T. W. Pockett, to our taste, is a prettier bloom, for the florets are not so straight, but curl and twist in a graceful way that relieves the blooms of any appearance of strict uniformity such as is characteristic of the previous named variety.

Miss Mildred Ware is rosy bronze, a large, drooping-petalled Japanese of recent introduction. Here and there throughout the collection we get glimpses of many fine-looking novelties, but these in many cases are unnamed seedlings that have yet to be proved. Certain it is that the majority of them are destined to come sooner or later to the front. Mrs. E. Thirkell, a tall back-row plant, has fine flowers with long, drooping petals; colour bright shade of golden canary-yellow. In the same glowing colour is Louis Leroux, a wonderfully deep flower with broad, grooved florets; and close at hand, towering high above its neighbours, is General Hutton in numerous examples, all of immense size, with rather stiff florets of great length, the colour yellow, slightly tinted carmine.

A brief mention of just a few others that find a place in our note-book must be made, and then our remarks must draw to a close. Mr. T. Carrington, Miss Stopford, a big white; Miss O. Miller, pale rosy purple; Lelia Filkins, lilac-mauve; James Fraser, yellow; and Merstham Yellow, a new seedling to be sent out next spring, are all varieties more or less likely to be heard of again.

Down one side of the house in which the collection is staged is a remarkably fine bank of seedling singles; for the purposes of decoration there is nothing at this season to equal them. They range from the purest white through all shades of yellow, buff, pink, and rose to the deepest crimson, and we do not remember ever seeing so fine a display composed entirely of these charming subjects.

PUBLIC PARKS AND GARDENS.

CHRYSANTHEMUMS AT WATERLOW PARK.

ONE is amply repaid for their pilgrimage to this prettily-situated park in North London when the Chrysanthemum season proper begins. As a rule the plants are very well done here, and the present season's display is no exception to the general rule. No less than 2,075 plants are grown in pots for the annual display, and in the collection almost every

type of the flower is represented. Mr. D. Carson, the able superintendent, shows much wisdom in making his collection so representative. There are some 133 Japanese varieties, 35 incurved, and a goodly array of pretty free-flowering decorative varieties, besides those of the Anemone and hairy types of the flower. The plants, which are much dwarfer than usual, are neatly grouped in the unusually spacious glass structures. Many old and familiar sorts were in evidence, and in several instances appeared to be doing well. Mrs. A. H. Neve, a rather tall plant at the back of the group, was developing handsome Japanese blooms of a silvery bluish colour, and was proof of the splendid character of this variety that was introduced a decade since. The blooms of Mrs. Coombes were splendidly coloured, a pleasing pink aptly describing it. W. R. Church, a rosy crimson incurved Japanese, was in good form, as were the blooms of Vivian Morel and Charles Davis. Soliel d'Octobre had been in good form, and was just finishing, the soft canary yellow blooms being much admired. Florence Molyneux, grown on single stems and flowered on the break bud, was giving large and handsome white blooms of good quality. Buds of Mrs. W. Mease, the primrose sport from Mme. Carnot, were promising well, and the near future should see very fine blooms of this variety. Phœbus, the reliable yellow Japanese that has so long maintained its high position, was represented by pretty blooms. Hairy Wonder, the best of the Japanese blooms, having hirsute appendages to the petals, again asserted its superiority; its pretty cinnamon colouring is pleasing. A Continental variety named M. Roissard, which we do not remember seeing catalogued anywhere, is a promising plant. The colour is a purple amaranth, with a silvery reverse. Plants of Margot are grown in large numbers, and are flowering freely in order to cover up the bareness of the walls in the vinery, and they create a delightful effect.

Mr. Webb, the enthusiastic grower here, complained of the damping of the blooms, and he, like many other cultivators, fully expects trouble in this respect generally this season. Green and immature wood invariably results in the blooms damping.

SOUTHWARK PARK.

ALTHOUGH we have for many years paid an annual visit to the Chrysanthemum exhibition at Southwark, we do not remember ever to have seen the plants in so fine a condition as they are this year. Speaking of them as a whole, the quality and size of the blooms are distinctly above the average, the plants are in a healthy condition, and the colours bright and clean. Considering the disadvantages of the neighbourhood there is good ground for congratulation, and the variety at Southwark is always considerable, for most of the sections are very evenly and well represented. In plants there are about 2,000 on view, and these comprise upwards of 340 varieties of incurved, Anemone, hairy, and Japanese sorts.

To such an extent is the show appreciated in this busy, densely crowded part of South London, that on the first Sunday the show was opened this season visitors formed one continuous throng the whole day through. This deep interest is not, it must be understood, confined to Southwark alone, for on Saturdays and Sundays we have experienced on many occasions great difficulty in viewing the shows in some of the other parks. Whatever may be said as to the decline of the Chrysanthemum from a purely competitive exhibition point of view, it is abundantly evident that the general public in the vicinity of these gratuitous County Council displays very highly appreciate them. So on the first Sunday of the present season 8,496 persons passed through the T-shaped greenhouse, near the Gomm Road entrance to Southwark Park, where the collection is, as usual, staged.

As most of the varieties are well-known favourites, we need not do much in the way of describing the individual flower. Old-fashioned growers whose tastes still linger with the incurves will find good examples of Queen of England and many others.

Large-flowering Anemones lend a pleasing variety to the display, more particularly in the case of Descartes, a very large wine-coloured variety of great attractiveness that is constantly being used so freely in the decorative arrangement of the group.

Hairy varieties, once a striking and effective feature of this display, are now represented by reduced numbers, a few of the best only being retained, King of the Hirsutes, Hairy Wonder, and Beauty of Truro being those that appear to call for the greatest commendation.

In Japanese, what can we say but that the Southwark collection comprises all that is interesting and best for such purposes as a public display? In the richer and deeper tones of purple, amaranth, and crimson, there is an abundance of colour in all the best varieties. Altogether the collection is extensive, interesting, and peculiarly attractive, and we are not at all surprised at the great interest displayed by the inhabitants of this large and busy district, many of whom have no other opportunities of seeing gardening in so attractive a form.

BROCKWELL PARK.

THERE is a small collection of Chrysanthemums on view again this year at Brockwell, but the display is marred to a large extent by the very inadequate accommodation allotted to the plants. Only a very few persons can gain access at one time to the conservatory adjoining the refreshment-room, once the residence of the former owner, and even when entrance is effected, the place is so constructed that a near inspection of many of the plants is out of the question. This is all the more regrettable when we consider the locality, which is populated by a class of resident that must be highly appreciative of a good autumn display of Chrysanthemums, such as the other more favoured parks can boast of. The collection is largely comprised of big show blooms, with here and there a few plants freely flowered and tastefully arranged for decorative effect.

BATTERSEA PARK.

THE autumn display in this park is unquestionably one of the most effective in the Metropolis. The specimen blooms are beautiful, bright, clean examples that are above the average standard of development. The collection is arranged in a long undulating bank of bloom interspersed with a few large foliage plants, the ends and front of the greenhouse being almost carpeted with the blooms of a large number of freely-flowered Pompons and decorative Japanese. The old show incurred is grown here in much the same way as at Victoria Park, and there are some very nicely-finished blooms of several members of the Queen family, Baron Hirsch, the rich golden-chestnut variety; Jeanne d'Arc, Mrs. W. Shipman, Globe d'Or, Prince of Wales, and other members of this old-time favourite section.

Anemones, although somewhat sparsely represented, have some noble examples of the section. When we come to the Japanese, there is an immense wealth of colour, and finely-finished blooms of great merit. We notice the eminent French raiser, M. Calvat, is strongly in evidence, the following seedlings of his, all too well known to need description, being those that are the most conspicuous: Soleil d'Octobre, Mme. Gustave Henry, Mme. Ed. Roger, the green variety; President Borel, very rich bright purple; N. C. S. Jubilee Louise, a noble solid-looking pearly-white Japanese incurred of great merit; President Nonin, Le Grand Dragon, Souvenir de Petite Amie, and others.

Varieties from other sources are numerous and not less meritorious. In whites the gigantic Florence Molyneux is an object-lesson in size, and Lady Byron and Mermaid are others. Among the monster back row flowers Mrs. White Popham is eminently attractive; Mr. T. Carrington and Australie are worthy companions from that standpoint. The Viviani Morel family has all its members in good form. Some of the softest and most delicate shades of rosy pink and silvery blush

are shown in Emily Towers, Mrs. George Mileham, a grand variety, and Mrs. Coombes. Some of the best of the fairly recent yellows are Vicar of Leatherhead, very large spreading Japanese; Mrs. T. W. Pockett, a beautifully-built flower, and certainly an ideal form in every respect; and Mrs. Greenfield. We well remember the time when crimson was a colour rarely to be met with in the Japanese type. Now when we look round a show we see the colour, rich, deep, and gorgeous in ever-varying tones. William Seward is not new, but Henry Weeks and W. R. Church are two of those that are brilliant examples of highly-coloured crimson modern-raised varieties.

In bringing these notes to a conclusion we will mention Duke of Wellington, a massive Japanese incurred with broad grooved florets; Matthew Hodgson, and Eastman Belle, which, besides possessing the once-desired colour, have also the further advantage of size, which enables them to be used with great effect in miscellaneous groups.

AUTUMN RASPBERRIES.

THE season for these fruits has been one of the worst I remember, even in the southern part of the country, and this will make growers who have only a small quantity regard them as unprofitable; but such is not always the case, as in a favourable autumn the plants give a good return and little trouble. The Raspberry, when grown for an autumn supply, needs an open position away from trees, as the fruits are produced in the shortening days, and by this it will be seen that as the fruits mature the plant needs every encouragement. As regards position, an open quarter where the soil is loamy and well drained is the best. The plants will grow freely in a light soil, even on gravel in such seasons as we are now experiencing, with rain almost daily, but in hot and dry years I have found that the plants in a good depth of soil give the best results, but by this I do not advise a clay soil, but that which grows good fruit, such as Strawberries. The cultivation differs from the summer fruiters, as the latter fruit on the wood of the previous year's growth, whereas the autumn plants fruit on the new wood made the same season. This, to give a full crop, should be sturdy and not too soft. To get wood in fruiting condition the soil must be deeply dug, or, what is better, trenched, well manured, and not have borne Raspberries for some time. Planting is best done in autumn, and ample space given the plants. The best autumn Strawberries I have ever seen were planted to screen a vegetable quarter, trained to iron supports and open to light and sun, much better results are always secured by giving a wide space between the plants. Have dwarf vegetable crops between. If rows are necessary, quite 6 feet should be allowed between, and half that distance between the plants, or even more if room is no object.

When planting it is well to make the plants firm. Mulch over the surface, and if the plants are at all long shorten a little and tie together. Pruning is best done in the early spring, according to the season, that is, just before growth is active, and the plants are not merely shortened like the summer fruiters but cut down to within 6 inches of the ground level, and the new shoots from the base are the fruiting wood for the season. It is also well to reduce the number of shoots at the base; they will not be very numerous the first year, but later, as the plants get older, they are very prolific. If at all crowded they do not give such good fruit.

The best method of training is doubtless that which allows each growth being spread out either upon strained wires or a trellis or hurdles. It is not well to tie to stakes in a bunch, as only the outer branches would be exposed. The plants are best the second year as regards crop, and will continue to yield for four or five years, but if possible make a new plantation every three years, as after the third season the fruits, though they are numerous, are much smaller. After the first crop is cleared there should be partial thinning of the canes if at all thick, but do not prune or cut down until autumn.

A good dressing of manure should be given as a mulch, and this forked into the ground in the spring. The best sucker growths at that time are selected, and all others destroyed at the pruning. It will be seen that any plant that occupies the soil so long needs ample food at the start and deep cultivation. Raspberries may be planted from October to March if done carefully, but I prefer October to December. It may not be generally known that what we call the summer fruiters will furnish autumn crops treated as advised, that is, cut down in spring. The large Superlative is one of the best treated thus, but the true autumn varieties are the most reliable, of which Belle de Fontenay, a red fruit, is one of the best. There is also a white variety which is very good, it is much sweeter than the red one named above, and is a great bearer; this is called the Four Seasons or Autumn Yellow Raspberry. There is also the October Red; this fruits with us into November in a fine season. There is a very dark fruit, and though not much grown in this country, it is a favourite on the Continent, viz., Noire d'Automne, and the fruits are well flavoured, though to do it justice it requires a warm soil.

Doubtless the two best for general use are the October Yellow and Belle de Fontenay. The partial failure of the crop this season was not solely due to the rains, but in May the new growths were badly injured and the plants had to make another start. The bad weather did not assist the growths made so late. It is a good plan to grow some of these fruits under a permanent 1 inch wire protector, and covered thus there is no trouble with birds. The wire netting should be sufficiently high to allow the fruit to be easily gathered. I found this season that plants grown thus were little injured by late frosts, those in the open being cut to the ground.

G. WYTHE.

SOCIETIES.

DULWICH AND NORTH PECKHAM CHRYSANTHEMUM SOCIETY.

LECTURE ON CHRYSANTHEMUMS.

UNDER the auspices of the Dulwich and North Peckham Chrysanthemum Societies, who amalgamated for the occasion, Mr. Molyneux delivered a lecture to a crowded audience at the Public Hall, Peckham. The lecturer dwelt at considerable length on the necessity of propagating early, not later than December; also the advantage of rooting the cuttings under cool treatment, and of securing good ones. The short thick cuttings from the base of the plants were the best, and in choice sorts, or those known to fail to give good cuttings at the right time, it was recommended that the side shoots taken off the flowering plants in June should be utilised. These, if rooted and grown on, would give cuttings when the older plants might fail. The lecturer further recommended that they should be rooted singly in small pots, that they should be potted on as soon as sufficiently rooted, and alluded to the necessity of keeping the young plants well exposed to the light, and giving plenty of air to avoid anything in the way of drawn growth. He also alluded to the necessity of giving early attention to thinning out superfluous growths and side shoots as early as possible as pointed out. In referring to the compost for potting, it was suggested that good loam and stable manure, with the addition of charcoal, crushed bones, and sand, according to the nature of the loam, would make a good compost, but the compost was not of so much importance as attention to feeding, or giving stimulants later on. Animal manures were recommended in preference to artificial compounds, though the latter might be used, the most important point being to use all manures with discretion, and not to think that because a little was good a lot must be much better. Soot was also alluded to as a valuable stimulant, but should be used in a clear state. To use anything on the surface of the soil which would form a coating and stop the permeating air passing, was a great disadvantage. The use of the syringe in dry, warm weather was strongly advocated, also the necessity of keeping all insect and fungoid pests at bay.

With regard to taking the buds the lecturer pointed out that it was a matter of personal experience in the various localities rather than any definite rules, and that grown should have sorts in duplicate and treat each differently, so as to have a double chance of getting good blooms at the right time. It was pointed out that while many of the older sorts could be depended upon to come from first bud or second bud, as the case might be, even with these under different conditions there was considerable variation, and with new varieties it was impossible to give definite instructions. "Use your own brains" was the lecturer's advice on this point.

Coming to finishing off the blooms, it was strongly recommended that the plants should be taken under glass early, and that in the case of bright sunshine shading should be given. The advantage of removing any florets not perfect, or where the centre is too close, this being done while the blooms are in the course of development, is of much

more importance than dressing the blooms after they were cut.

The importance of adding new varieties every season was touched upon; also the selection of blooms for exhibition. It was pointed out that deep blooms of moderate width should be selected in preference to shallow blooms of greater width. Many other interesting points were touched upon. The lecture was delivered in a pleasant and entertaining manner, and was much appreciated by the large audience. A most hearty vote of thanks was accorded to Mr. Molyneux.

TORQUAY CHRYSANTHEMUM SHOW.

LAST year it had to be regretfully recorded that the finances of the Torquay District Gardeners' Association did not admit of money prizes being given at the annual Chrysanthemum show, and it was pointed out that this was a blot on the fair fame of the beautiful town that its residents should, in their own interests, speedily efface. Whether or not our words were taken to heart we cannot say, but certainly the affairs of the association are now in a far more prosperous condition, and this year good prizes were offered in all classes. Happily the day of the show in the large hall of the Bath Saloons was bright and sunny, and from the throngs that inspected the attractive display of flowers the committee should have realised a handsome profit.

Cut blooms compared badly in numbers with the crowded array of stands in bygone years, but the unpropitious season has been, doubtless, chiefly responsible for that. In the premier class, for twenty-four Japanese, distinct, the first prize was won by Mr. J. N. Whitehead with a stand of fresh blooms, some of which needed another week to attain absolute perfection. In this stand, to which was awarded the National Chrysanthemum Society's certificate of merit, Godfrey's Masterpiece and Percy were especially good; second, Miss Congreve. For twelve Japanese, distinct, the first prize was won by Mr. W. J. Godfrey, his Lord Alverstone, Kimberley, Elsie Foulton, and General Hutton being very good; second, Dr. J. Quick. Six Japanese, yellow, one variety: First, Dr. J. Quick, with Kimberley; second, Mr. J. N. Whitehead, with Soleil d'Octobre. Six Japanese, any other colour: First, Dr. J. Quick, with Lady Hanham; second, Mr. J. N. Whitehead, with Vivand Morel. Twelve Japanese, incurved: First, Dr. J. Quick; second, Mr. J. N. Whitehead. Epergne of cut Chrysanthemums, arranged with autumn foliage: First, Mr. G. Emmet. Vase of cut Chrysanthemums: First, Mr. J. N. Whitehead, with an artistic arrangement of fine blooms; second, Mr. J. French; third, Mr. G. Emmet. Dinner table decoration: First, Mr. Minifie, with an arrangement of Niphetos Roses, Cattleyas, and Asparagus; second, Mr. G. Emmet, with Tropaeolum tuberosum, T. canariense, grasses, and sprays of Maidenhair Fern. This arrangement would have easily occupied the premier position if it had not been for the glided receptacles, which quite spoilt the effect; third, Mr. F. Perret, with Chrysanthemums pink and yellow.

Semi-circular groups of Chrysanthemums arranged against the wall were very good, first prize and the National Chrysanthemum Society's certificate of merit going to Mr. Dundee Hooper; second, Dr. W. Ford, Edgelow; third, Colonel T. Gardner; fourth, Lady Macgregor. Prizes were also given for a group of miscellaneous plants, trained Chrysanthemums, vases of cut Chrysanthemums, table plants, Ferns, Begonias, Solanums, and also for vegetables and fruit, the classes being well filled with good exhibits, while a handsome group of Palms, Crotons, and flowering plants was shown, not for competition, by Mrs. A. Bell.

Nurserymen's exhibits formed a feature in the show. The Devon Rosary, Torquay, staged a collection of Chrysanthemums, pot Carnations, winter-flowering Begonias, Ericas in variety, and Acacias, set off with Ferns and foliage plants, and their Fruit Farm contributed a fine display, the Apples, considering the unfavourable season, being particularly good. Fine examples were shown of Warner's King, Calville St. Sauveur, Queen, Cox's Orange Pippin, Betty Geeson, Peasgood's Nonsuch, Golden Noble, Smith's Pippin, Tyler's Kernel, Hambleton Deux Ans, Swedish Reinette, Lady Henniker, Beauty of Kent, Lane's Prince Albert, Wellington, Cox's Pomona, Northern Greening, Winter Peach, Emperor Alexander, Blenheim Orange, Lord Derby, and others. There were also some good Pears, as well as Figs, Mushrooms, Tomatoes, Cucumbers, Chillies, splendid Grapes, and punnets of Raspberries and Strawberries from the open. Violets were shown in abundance, as well as dozens of cut blooms of Iris stylosa and plants of the same Iris in flower in pots. Messrs. B. Velich and Son, Exeter, staged a quantity of cut Chrysanthemum blooms and an interesting collection of flowering plants, amongst which were Sarracenia Drummondii, Bouvardia, Nerines, Caryopteris Mastacanthus, Dimorphotheca Ecklonia, Kalanchoe flammea, Correa magnifica, Begonia Ideala, Browallia speciosa major, Daphne blagayana, Corydalis thalictrifolia, Linaria trinotroptera, Grevillea alpina, Loropetalum chinense, Acacia platyptera, Euellia macrantha, Fuchsia triphylla superba, Primula labellina, P. obconica plena, P. megasefolia, and P. cashmeriana. The firm also showed a number of variegated species of conifers. Mr. W. B. Smale, Torquay, had Chrysanthemums, Acalypha Sanderi, Plumbago capensis, Cannas, and other flowering plants. Mr. J. Heath, Kingskerswell, showed a collection of the best Violets, and Mr. W. H. Allward, Torquay, had Salvia splendens, Arums, Begonias, and a good assortment of flowering and foliage plants.

BRISTOL GARDENERS' ASSOCIATION.

"HARDY Fruit Culture, Past and Present," was the subject of a lecture given before the Bristol Gardeners' Association

on the 29th ult., the lecturer being Mr. J. Basham, jun., representing the Newport Gardeners' Society. A number of the Bristol gardening fraternity availed themselves of the opportunity to hear such an authority on hardy fruits. The subject is undoubtedly of the greatest interest to those connected with horticulture, and was handled by the lecturer in a masterly way. Many interesting points concerning the cultivation of our hardy fruits were ably thrashed out. It deserved, he said, much more attention than was usually given. Careful planting was most important, thinning the fruit (except during such seasons as this, when, unfortunately, there is none to thin), mulching, feeding, and pruning all demanding careful attention. He strongly advised all those intending to plant not to have too many varieties, and to select only those which suited the locality, giving shelter if necessary, and careful staking and tying must not be overlooked. A list of Apples, Pears, and Plums which were in cultivation 500 years ago was given, as also a selection of the best present day sorts. His lecture proved a great success. Mr. Basham, sen., occupied a seat on the platform, and was cordially welcomed by his fellow gardeners of Bristol. Prizes for six culinary Apples were awarded: First, Mr. J. B. Brain (gardener, Mr. Atwell); second, Lady Cane (gardener, Mr. Poole); third, Mr. G. A. Willis (gardener, Mr. Barwell); and an extra one to Mr. Gilbert Howes (gardener, Mr. White). A certificate of merit was also awarded to Mr. Gilbert Howes for three Odontoglossum grandis. Mr. Basham also staged a collection of a score or more dishes of Apples, which were much admired. The chairman for the evening was Mr. E. H. Poole.

ONE OF MESSRS. WARE'S DOUBLE BEGONIAS.

(See page 324.)

CROYDON CHRYSANTHEMUM SHOW.

THE sixteenth exhibition of the Croydon Chrysanthemum Society was held on Tuesday and Wednesday last in the Public Hall, Croydon. Although the display was not very extensive many excellent blooms were shown. The exhibition was opened by the Mayor-elect of Croydon, and there was a good attendance during the afternoon. The hard-working secretary is Mr. W. B. Beckett.

OPEN CLASSES.

Mr. G. J. Hunt, gardener to Pantia Rahli, Esq., Ashted Park, Epsom, won the first prize challenge cup for eighteen distinct varieties of Japanese and the same number of incurves. He showed remarkably fine blooms, the Japanese were large and shapely, Miss Stopford (the premier Japanese bloom in the show), F. S. Vallis, Mme. P. Radaelli, and Miss Olive Miller being particularly good; of the incurves, C. H. Curtis (the premier incurve in the show), Duchess of C. H. Pearl Palace, and others were very well shown. Mr. C. J. Salter, gardener to Mrs. Haywood, Reigate, was second; his Japanese blooms lacked depth, the incurves were good, notably C. H. Curtis and Lord Wolesey. Mr. Frank Bible, gardener to H.R.H. Prince Hatzfeldt, Draycot Park, Chippenham, was third. Mr. Hunt becomes the possessor of the challenge cup, having won it three years in succession.

Mr. W. Collins, gardener to Alderman R. V. Barrow, J.P., Engadine, Park Hill Road, Croydon, was the only exhibitor in the class for a group of decorative plants, and was awarded first prize.

Mr. G. Lawry, gardener to Mrs. Blake, Duppas Hill, was

first for six plants of Begonia Gloire de Lorraine. Mr. J. King, gardener to W. C. Gunn, Esq., The Red House, Bickley, was second, and Mr. W. Collins third.

For a group of Chrysanthemum plants Mr. W. Collins, gardener to Alderman Barrow, J.P., was first with a creditable display, the blooms of good size. Mr. E. Puxted, gardener to S. Taylor, Esq., Park Hill House, Croydon, was second with smaller blooms, and Mr. W. A. Cook, Shirley Park Gardens, Croydon, was third.

Eighteen Japanese blooms, not less than twelve varieties: First, Mr. G. Halsey, Ridding's Court Gardens, with a very good exhibit. Mrs. E. Cadbury, Australia, Mrs. Mease, and Mrs. G. Mileham were among the best. Mr. C. Lane, gardener to E. H. Coles, Esq., Caterham Valley, was a good second, and Mr. J. King, gardener to W. C. Gunn, Esq., The Red House, Bickley, was third.

Ten Japanese blooms in vases: Mr. C. Lane, gardener to E. H. Coles, Esq., Caterham Valley, was first, and showed some excellent blooms, notably Mrs. W. Mease and Mrs. W. R. Church. Mr. G. Halsey, gardener to J. Lyon, Esq., Ridding's Court, Caterham Valley, was second, with very good blooms of Mrs. Mease and Mrs. G. Mileham. Mr. Frank Bible, gardener to H.R.H. Prince Hatzfeldt, Draycot Park, Chippenham, was third. There were several more exhibitors.

Twelve incurved blooms: First, Mr. C. Lane, gardener to E. H. Coles, Esq., Caterham Valley, with Hanwell Glory, Queen of England, Miss Annie Hills, and C. H. Curtis as the best of a somewhat uneven lot; second, Mr. J. King, gardener to W. C. Gunn, Esq., The Red House, Bickley, Lady Isabel being his best bloom; Mr. G. Halsey, gardener to J. Lyon, Esq., J.P., Ridding's Court, Caterham Valley, was third.

Mr. C. Lane was first for nine foliage plants suitable for table decoration, Mr. J. King being second, and Mr. G. Lawry, Duppas Hill, third.

Six blooms of Japanese: First, Norman Wrightson, Esq., 55, Elgin Road, Croydon, with fairly good blooms; second, W. Philpot, Esq., 57, Church Street; third, Mr. G. Prebble, gardener to E. M. Preston, Esq., Shirley, Croydon.

Six blooms (incurved): First, Mr. W. Collins, with very good C. H. Curtis; second, Mr. G. Prebble, with fairly good blooms of Lady Isabel; third, Mr. A. Dyer, gardener to F. Peacock, Esq., Croydon.

Two bunches of black Grapes: First, Mr. W. Lintott, Marden Park Gardens, with very good Alicante; second, Mr. J. Friend, The Gardens, Rook's Nest, Godstone; third, Mr. William Taylor, Tewkesbury Lodge Gardens, Forest Hill.

Mr. W. Taylor was first for two bunches of white Grapes, and Mr. Lintott second, both showing Muscat of Alexandria.

The first prize for twelve dishes of Apples was won by Mr. W. Lintott, Marden Park Gardens, his exhibit included some well coloured dishes; second, Mr. W. Jones, Wallington Bridge, Carshalton; third, Mr. E. Phillips, The Brandries, Beddington.

Mr. W. Jones was first for four dishes of dessert Pears; and Mr. W. A. Cook, Shirley Park Gardens, second.

Four dishes of dessert Apples: First, Mr. O. Jeal, The Gardens, Waddon Lodge, Croydon; second, Mr. G. Lawry; third, Mr. J. Johnson.

Four dishes of kitchen Apples: First, Mr. W. A. Cook, with good Twenty Ounce; second, Mr. O. Jeal; third, Mr. C. Perrett.

SINGLE-HANDED GARDENERS.

Mr. C. Perrett, gardener to Mrs. Fuller, Duppas Hill, was first for a miscellaneous group of plants; Mr. A. Dyer, gardener to F. Peacock, Esq., was second; and Mr. J. Galvin, gardener to W. H. Butcher, Esq., Russell Dene, Purley, third.

Six blooms. Japanese: First, Mr. L. Gooch, gardener to T. Wickham-Jones, Esq., South Norwood, with some good flowers; second, Mr. J. W. Wheeler, gardener to J. D. Tannahill, Esq., South Norwood; third, Mr. A. Dyer, gardener to F. Peacock, Esq., Bramley Hill.

A second prize was given to Mr. A. Dyer for an exhibit of six incurved blooms.

Six bunches of Pompons: First, Mr. Dyer, with some good blooms; second, Mr. C. Perrett, gardener to Mrs. Fuller.

AMATEURS.

Norman Wrightson, Esq., Elgin Road, Croydon, was first for ten blooms of Japanese, arranged in vases, showing very well indeed. J. G. Mills, Esq., Croydon Road, Anerley, was second; and R. E. Mason, Esq., Vincent Road, Croydon, and Mr. F. Wells, 181, Albert Road, South Norwood, were equal thirds. There were other entries.

Six Japanese blooms: First, Mr. F. Wells, South Norwood, with a good exhibit. Mr. R. E. Mason, Vincent Road, Croydon, was second; and Mr. John Kaehler, Elgin Road, third.

Mr. R. E. Mason was first for six Japanese, not more than two of a sort.

Mr. J. Pittman, Dingwall Road, Croydon, won second prize for six incurved blooms.

Mr. G. Snelling, Jarvis Road, Croydon, won the first prize for a collection of vegetables in the class open to cottagers and allotment holders.

In a similar class for single-handed gardeners Mr. C. Perrett, gardener to Mrs. Fuller, Duppas Hill, was first.

MISCELLANEOUS.

Mr. Thomas Butcher, South Norwood, showed bouquets, floral arrangements, baskets of Chrysanthemums, &c., very tastefully.

Messrs. John Peed and Sons, West Norwood, exhibited a collection of hardy fruit and Chrysanthemum blooms.

Mr. Norman Davis, Framfield, Sussex, showed some splendid cut blooms in boxes, notably Mrs. W. Mease, Mme. Carnot, Beauty of Leigh (new, rich yellow Japanese), Miss Mildred Ware, F. W. Vallis, and others, making a striking display.

NATIONAL CHRYSANTHEMUM SOCIETY.

ON Monday evening last the executive committee of the above society held a meeting at Carr's Restaurant, Strand, when Mr. Thomas Bevan presided. After the reading of minutes and correspondence, the foreign secretary announced that arrangements were now completed for the visit of a deputation from the society to the exhibition and conference of the French National Chrysanthemum Society at Lille, on November 6. Particulars of the programme were given, and it was explained that part of the deputation would start in advance, visiting the Paris Chrysanthemum show, which would take place two days earlier. He also called attention to the recent publication, by the French society, of a book and coloured plate illustrative of the various diseases and insect pests that affect the Chrysanthemum. This has been issued under the auspices of the French National Chrysanthemum Society, and was considered extremely interesting. It was also announced that since the last meeting the supplemental catalogue had been published.

The secretary presented an interim financial statement, which was considered satisfactory. The ensuing show at the Crystal Palace necessitated the election of stewards, and various arrangements for the assembling of the floral, classification, and arbitration committees.

The annual dinner is definitely fixed for Wednesday, the 26th inst., at 6.15 p.m., at the Holborn Restaurant, Caledonian Saloon, when the president (Mr. C. E. Shea) has promised to take the chair.

The election of new members, among whom was Mr. Frederick H. Lemon, secretary of the Chrysanthemum Society of America, brought the evening's proceedings to a close.

SHERBORNE GARDENERS' SOCIETY.

THE annual meeting of the above society was held in the St. John's Hall recently, when Mr. John Dean presided over a good attendance of members. Prizes had been offered for plants and fruit, for which there was rather keen competition. The prizes were awarded to the following:—

Gardeners.—Group of plants: First, Mr. Witherington; second, Mr. Lane. Dish of fruit: First, Mr. Halliday; second, Mr. Witherington.

Amateurs.—Group of plants: First, Mr. Chubb; second, Mr. Cooper. Fruit: First, Mr. Lewis.

At the next meeting prizes will be given for three distinct Chrysanthemums and three specimen blooms.

After the meeting had been formally opened by the President, Mr. Cecil B. Brett gave the annual report and balance sheet. From the latter it was gathered that the society has a credit balance of just over £8.

BECKENHAM HORTICULTURAL SOCIETY.

"EXPERIMENTS with Manures on Bush and other Fruit" was the text of a lecture by Mr. F. W. Shrivell, given at the Church House on the 23rd ult., Mr. Rippengal in the chair. Mr. M. Webster, Kelsey Park Gardens, was awarded the society's award of merit for Allia Craig Onions, splendid examples of high culture. A similar award was given to Mr. Cole, Youlgreave Gardens, for very fine and well-flowered specimens of Begonia Gloire de Lorraine.

READING AND DISTRICT GARDENERS' ASSOCIATION.

THE last fortnightly meeting of the above association was held on the 26th ult., and was very largely attended, upwards of 100 members being present. The occasion was the visit of a representative from the Bristol Gardeners' Mutual. Mr. J. H. Vallance was the member selected, and he chose for his subject "The Renovation of Old Vines." His paper was full of interest and of original ideas in carrying out the work. Minute details were given as to the lifting of the trees, replanting, soil, manures, treatment of the young canes, &c. Some of the methods of procedure met with adverse but pleasant criticism, and a lively and animated discussion followed, in which Messrs. Barnes, Hinton, Wilson, Turnham, Neve, Exler, Pole-Routh, Prince, Fry, Alexander, Judd, House, and Stanton took part. A hearty vote of thanks was accorded to Mr. Vallance for his excellent paper, and for the most interesting evening he had afforded the members.

In replying, Mr. Vallance and Mr. Groves, the hon. secretary of the Bristol Society, both expressed the wish that the interchanging of lecturers between the two associations would last for many years. There were two or three fine honorary exhibits, fourteen dishes of Apples, the fruits large and of splendid colour: the most noticeable varieties were Warner's King, Lane's Prince Albert, Stirling Castle, New Hawthornden, Cox's Orange Pippin, King of the Pippins, and Fearn's Pippin. These were staged by Mr. E. Fry, The Gardens, Greensands, and he was congratulated on having such fine fruits in so bad a season. Three plants of well-grown Clendendron fallax were raised from seed sown in May by Mr. F. W. Exler, The Gardens, East Thorpe. For certificate, six dishes of splendid fruits of Warner's King Apple, entered by Mr. H. House, The Gardens, Oakfield (certificate awarded), and a very large plant of Impatiens Sultan, by Mr. E. S. Pigg, Fernbank, Kopley.

ROYAL HORTICULTURAL SOCIETY.

SCIENTIFIC COMMITTEE, OCTOBER 13.

PRESIDENT: Dr. M. T. Masters, F.R.S. (in the chair), Messrs. Saunders, Wordell, Massee, Gordon, and Holmes, Drs. Rendle and Cooke, Revs. W. Wilks and G. Henslow (hon. secretary).

Chrysanthemum leaves, spotted.—Mr. Saunders exhibited leaves apparently encrusted with some mineral. Mr. Holmes undertook to examine them.

Male Figs.—Dr. Masters observed that he had several instances of Figs sent to him that had failed to ripen. They were remarkable for containing entirely male flowers, ordinary Figs being entirely female, but ripening without

fertilisation, except in the case of the Smyrna Figs, which require "caprification."

Potato disease.—Dr. Cooke replied to enquiries as to the transmission of the mycelium from the leaves down the stem being the only means of reaching the tuber. His opinion was that the disease may be communicated direct to the tubers while young and with a delicate skin, or when bruised or wounded.

Clematis parasite.—He also reported on a new disease, which Mr. Chittenden named *Oularia clematidis*, and exhibited at the last meeting. Dr. Cooke supplied a technical description of the fungus, and adds: "No experiments have been made to check this parasite. If it should establish itself it would be well to try powdered sulphur at first, and if this be not successful to use Bordeaux mixture."

Vegetable monstrosities.—Mr. Wordell exhibited a spray of *Polargonium* with foliaceous bracts at the base of the umbel, and a fasciated peduncle; also flower-heads of *Scabiosa purpurea* with proliferous axils. Mr. Wilks observed that this is particularly common on German plants.

Lilac injured by insects.—Mr. Gordon showed branches attacked by some insect, on which Mr. Saunders has reported as follows: "The Lilac leaves were injured by the caterpillars of a small moth, one of the *Tineina*; but nearer than that I cannot say. The caterpillars had taken their departure from the leaves, and had no doubt buried themselves in the ground beneath the bush and become chrysalides within a couple of inches of the surface. I should recommend that a good dressing of kailit should be given, and that it should be chopped in with a hoe; this would probably kill a number of them. When the leaves are opening in the spring another dressing would be useful to prevent the moths making their way to the surface."

Potatoes diseased.—Mr. Gordon also exhibited Potatoes badly attacked by *Chrysophyctis endobiotica*. This fungus was introduced from the Continent, and first appeared in Cheshire. It has completely destroyed crops in allotments this year in Nottinghamshire.

Wound parasite of Apple trees.—Dr. Cooke also reported upon some examples brought by Mr. Chittenden. The fungus is *Hydnum Schiedermayeri*. It formed a strip of about 4 feet growing through the bark. This fungus is said to be very destructive to Apple trees, the spores entering through a wound in the bark.

Tomentum on Vine leaves.—Dr. Bonavia sent leaves to show how closely natural wooliness, or tomentum, resembled the red spider's web, and that it was impossible to distinguish them by the naked eye. Mr. Saunders observes: "I should not think it could be possible for anyone to distinguish between the tomentum on the leaves and the web spun by the red spiders with the naked eye unless the webs only covered parts of the leaves, in which case the under sides of the leaves would have a patchy appearance; but the similarity between the web and the tomentum is so great that otherwise no ordinary eye could detect the difference. Under the microscope the threads of the tomentum are twisted, and do not lie so straight as the threads of the webs."

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

A RARE GARDEN ROSE—CHARLES BONNET.

Mr. Bernard Thomasset, West Wickham, Kent, sends flowers of this fine old garden Rose. It is very sweet, and the colour a good red. The shoots sent were loaded with bloom. With the flowers came the following note: "A few blossoms of a Rose Charles Bonnet, which is, I think, seldom seen in this country. In my garden it is more floriferous than any other Rose—the first and the last in bloom. It possesses all the qualities of a good decorative climbing Rose, and is invaluable for cutting. The wood is entirely thornless."

A BEAUTIFUL YELLOW CARNATION SEEDLING—CERES.

Mr. Watts, Bronwylla, St. Asaph, sends again his seedling yellow Carnation as a reminder of its beauty late in the year. The flowers are large, without any tendency to coarseness, a clear yellow colour, and the petals are held well within the calyx. Mr. Watts sent several flowers, none of which were split, and also the following note: "Mrs. Martineau's letter in THE GARDEN of the 17th ult. will be read with interest by many lovers

of the border Carnation. A really good yellow variety that will stand wet weather is wanted badly. If Miss Audrey Campbell does as well in other soils and districts as it has done at Hurst in Berkshire it will be a valuable addition to this delightful race of flowers. Mrs. Martineau compares it to the white George Maquay, and says it beats that variety in her garden. Anyone who knows the latter will appreciate the value of a plant that can beat it in any way. I shall give Miss Audrey Campbell a good trial against my new yellow Ceres, of which I send you a few blooms. It has flowered profusely all through the season, and still has plenty of buds to open."

CARYOPTERIS MASTACANTHUS.

Mr. Ellwood sends from the interesting gardens of Swanmore Park, Bishop's Waltham, a bunch of this blue-flowered shrub with the following note: "Caryopteris Mastacanthus should be grown in every collection where hard-wooded plants are valued. It lends itself to wall, border, or pot culture, and, indeed, makes a very effective plant under any of these conditions. The flowers are of a delicate pale blue and freely produced. In spring the old flowering and all weak growth should be pruned back to good buds, thus forming compact bushes for the following season's flowering. The stock can be increased by cuttings of half-ripened wood."

ABELIA RUPESTRIS

also comes from Swanmore Park. "It is an ever-green shrub, and forms a capital plant for a wall or for roaming over a sheltered rock. It produces sprays of pink and white flowers on every growth. The plant mentioned is fully 5 feet high and a far through, and, despite the incessant rains, it is a perfect sheet of bloom. A bushy habit should be encouraged; the growth is pendent, and the shrub forms a beautiful object with its Myrtle-like growth at all seasons. Cuttings strike freely in summer."

AMARYLLIS BELLADONNA AND ANTHOLYZA PRÆLATA.

Mr. Ellwood kindly sends flowers of these with the following information: "Amaryllis Belladonna particularly should be grown wherever space is available at the foot of a south wall, flowering as it does so freely from September to November, with spikes of soft rose-coloured flowers. Many of the spikes carry from nine to twelve blooms. Every bud, too, expands after being cut, which is an advantage, as it is a gem for decorations. The culture is simple, a fairly rich soil well drained, and an annual top-dressing with short manure supply its wants. Plant 4 inches to 6 inches deep. Increased by young bulbs in autumn. Antholyza praelata, like the above, is a Cup bulb, and perfectly hardy here growing in the same position. It throws spikes freely, quite 3 feet high, of beautiful orange-coloured flowers throughout September and October. It resembles an enlarged Montbretia, and makes a good flowering succession to that plant. A light, sandy soil suits it admirably. Increased by offsets."

PHYTOLACCA DECANDRA.

Mr. Field sends from Ashwellthorpe Gardens spikes of Phytolacca decandra with the following note: "I am sending for your table sprays of the very interesting plant Phytolacca decandra. It is, perhaps, scarcely refined enough in leaf to justify its being recommended for use in the herbaceous border, but no plant is more worthy of a place wherever a rich herbaceous vegetation is desired, whether near the rougher approaches of a hardy fernery, open glades near woodland walks, or any similar position. Its greatest beauty is in the numerous bunches of black and red berries. These are very pretty at this time of the year. It grows freely in any rich soil, and in almost any aspect. It is easily raised from seed or by division of the roots. Now is the best time to plant. The Phytolacca is sometimes called the red ink plant, owing to the red colour of the young fruit."

FLOWERS FROM BEDFORD.

"B. M. B." sends from Bedford a welcome gathering of many flowers with the following note: "A few flowers typical of the four seasons. It is not often, I imagine, that one can pick on the same day of the year the following flowers: Spring.—Primroses, Violets, Polyanthus, Auriculas, Wallflowers, Anemones, Erysimum, Aubrietia, and Myosotis. Summer.—Roses, Honeysuckle, Sweet William, Heliotrope, Sweet Peas, and perennial Poppy. Autumn.—Chrysanthemums, Pinks, Michaelmas Daisies, and Dahlias. Winter.—Laurustinus. The latter is in full bloom. Of course there are many other flowers in the garden, but the above twenty are sufficiently representative to be interesting to other readers. May I mention that the Wallflower is Barr's Extra Early Parisian, and the plants are flowering profusely."

FICUS REPENS.

We received last week from Mr. Strugnell fruits of *Ficus repens* (see page 308). We illustrate the fruit sent, and refer our readers to the above-named page.

AUTUMN TINTS.

We have received what are to us always a great pleasure, shoots of some of the more brilliantly autumn-tinted trees and shrubs; they come from the Combe Wood Nursery of Messrs. J. Leitch and Sons, and comprise the following:—

The American Scarlet Oak (*Quercus americana coccinea splendens*).—This is superb for colour; every leaf is a warm old crimson. A noble tree at all times, but especially in autumn and into winter. Owners of large estates should think of this beautiful tree when planting; it is not so common.

Aspidodora virens.—Always a pleasure to see in early autumn for the sake of its rich colouring.

Pavia macrocarpa.—We value this shrub for its late flowering, but has an autumn tawny, too.

Azalea pontica.—A group of this in autumn has special charm, and this is due to the warm leaf colouring.

Viburnum Opulus sterile (Guelder Rose).—Colours markedly well at Combe Wood.

Acer platanoides Schwedleri.—One of the best of the Maples; has its beautiful leaves coloured with yellow and green at this season. We are glad to see that this fine Maple is being more planted in British gardens.

Hamamelis arborea (the Tree Witch-Hazel) is quite yellow in autumn, and when the leaves have dropped the rich orange-crimson sepalled flowers are in flower. A tree of this *Hamamelis* in bloom early in the year is a refreshing winter picture.

Acer rubrum (the Scarlet Maple), also called *A. spicatum*, is one of the brightest of all trees in its autumn colouring.

Acer tataricum Ginnala is a Maple we never tire recommending for its prettily shaped leaves and right scarlet colouring. It should never be omitted from the shortest list of "autumn tints."

Acer palmatum and the variety *sanguineum*

remind one of the splendid colouring of these Maples in autumn.

Liquidambar styraciflua (Sweet Gum) is already famous for autumn colouring.

We are very pleased to draw attention to these trees and shrubs for their autumn colouring, especially in such a disappointing autumn generally as this.

AURICULAS.

THE fine named show varieties, together with the leading alpine, are now commencing to lose some of their oldest leaves previous to falling away into the rest of winter. Not that the late summer growth is over, for that still goes on, and every lover of the Auricula rejoices to notice in the plants the presence of a stout, firm, Filbert-like centre, as in it lies the promise

plants, while enough water should be given to keep them in a healthy state of existence. Too much water should be avoided, as it may bring on the deadly rot, though if the soil be porous and the drainage perfect, and water can pass away freely from the roots, there is not much danger of harm from this cause. The finest varieties, even though the utmost care be bestowed upon the plants, will sometimes decay. Our most successful cultivators and exhibitors have their losses from this and other causes.

While the moist weather lasts it is well to keep the plants clear of decaying foliage. Occasional stirring of the surface-soil is of value in cases where it has settled down and shows signs of sourness. Clean pots and shelves are also helps to good health. The woolly aphid will gather about the stems of plants in the best cared-for collections. Excessive dryness at the roots also favours the clustering of the aphid upon the points of the roots next to the sides of the pots. It may be brushed away where it has clustered about the stem near the surface of the soil. I can scarcely say that the presence of the aphid has killed a plant, but it exercises a debilitating influence upon it if unchecked. Green fly is also troublesome at this season of the year, and it can be kept under by fumigation, or, if it is found only on a few plants, an artist's brush is useful to clear the leaves and centres of their presence, or they may be blown into space through a tube.

Two insidious insect enemies are sometimes at work among the Auriculas at this season of the year; one is a small white grub, the larva of which is concealed in the manure or leaf-soil at the time of potting, and which will eat its way through the main stem just beneath the surface of the soil. As soon, therefore, as a plant exhibits signs of failure it should be at once examined for the cause, and the intruder be summarily ejected. The other scourge is a small green caterpillar, which, commencing by devouring the leaves, will eat its way through the heart of the plant and downwards, destroying the possibility of a good truss of bloom in the spring. When this caterpillar has made its home in the base of the heart of the plant, it is only possible to dislodge it by means of a needle or pointed wire. Plenty of free ventilation should be given to the plants at this time of year.

This is also the time of the year to obtain a collection by anyone disposed to enter upon the fascinating culture of the Auricula. Should anyone feel diffident as to their capabilities to cultivate successfully, they should make a commencement with inferior sorts, a few of which may be obtained at a cheap rate. Those who wish to start with a collection worthy of their very best efforts in cultivation will find the following a selection difficult to improve upon:—Green edges: Shirley Hibberd, Mrs. Henwood, and the Rev. F. D. Horner. Grey edges: George Lightbody, George Rudd, and Richard Headly. White edges: Aome, Conservative, and Mrs. Dodwell. Selfs: Gerald (dark), Mrs. Potts (blue), Ruby (red), and Buttercup (yellow). Beautiful as Buttercup is, it does not rank high on the exhibition table, but I have added it for the sake of variety. Alpines: A set of six very fine gold centres will be found in Mrs. Martin Smith, Firefly, Dean Hole, Duke of York, Mrs. Gordon, and J. J. Keen. White centres: Thetis, Bessie Wheelwright, J. F. Kew, Winifred, Mrs. Harry Turner, and Pantaloon. R. DEAN.

FICUS REPENS IN FRUIT. (One-half natural size.)

of a good head of bloom six months hence. It is usual in the case of those who can give their plants a north aspect during the summer months to change them over to a south aspect during the winter months. The frequent rains and heavy storms of the summer have made it necessary to keep the lights on the frames much more than is usual in the case of a drier season, but an abundance of air has been allowed to circulate about and above the

NOTES FROM THE MARKETS.

USEFUL MARKET PLANTS.

ERICA GRACILIS NIVALIS.—This is a pure white variety of the well-known early-flowering *E. gracilis*, and should become a good market plant. A year or two ago Messrs. Gregory and Evans of Sidcup had a sport which was white, except for a slight shading of pink. *E. g. nivalis*, which comes from the same firm, is a further advance. It was submitted to the floral committee of the Royal

Horticultural Society and gained an award of merit. When *E. byemalis alba* was first seen it was thought that it would not prove constant, but as it is now grown for market it appears even whiter than when first introduced.—H.

Nephrolepis Westonii.—The *Nephrolepis* has been recognised as among the most useful Ferns for market, and any new sorts are welcome. The above will be sure to make a valuable market Fern. At first sight it closely resembles *N. davallioides furcans*, but it is of better substance. It occurred among a batch of seedlings of *N. Acuta (ensifolia)*. The fronds grow rather more erect, and all the pinnae are created or furcated, but rather shorter than in *N. furcans*. All the fronds are fertile, while in *N. furcans* spores are rarely produced. Seedlings have been raised which have come true. This came from Messrs. Cragg, Harrison, and Cragg, and gained an award of merit. *Nephrolepis Westonii*, another variety from the same parentage, is somewhat intermediate between *N. ensifolia* and *N. zollingeriana*. It has rather long, narrow pinnae, which are deeply lobed. This also produces spores freely, and may be regarded as a distinct and useful Fern.—A. H.

AN AFRICAN GARDEN IN ENGLAND.

AMONG the many beautiful private gardens in Oxfordshire, those at Headington Hill House are conspicuous, both for their extent and the many novel features which they present. The natural formation of the grounds and their size afford ample scope to the designing capabilities of Mr. Singleton, the head gardener, who has already successfully modelled a Japanese garden, which, as time and attention improve the size and individuality of the component shrubs and plants, will add considerably to the beauties of the garden.

The success attending the Japanese garden and the interest attached to a collection of plants representing the flora of a particular country, probably suggested the idea of devoting a portion of ground to plants from Africa. Though the above title is, perhaps, at the present time (September 9) slightly premature, the progress made is strongly indicative of the final result.

African plants, however, speaking broadly, present one great difference to those from Japan. The latter, in the majority, are hardy, but the number of known plants from Africa which will withstand both the damp and cold of England is very limited. Consequently it was decided, at any rate for the first year or two, not to keep the African garden strictly to plants indigenous to that country. Their collection must necessarily be a work of time, and in the meantime, that the ground might appear furnished, other plants, hardy and half hardy, are, and will be included, provided that their general appearance harmonises with those from Africa. Later, the name will be strictly representative of the garden, but though half hardy plants are admitted, glass accommodation being limited, the really hardy species are planted in larger and bolder masses. The portion of ground selected is in juxtaposition to the Japanese garden, faces south, and is backed by a crescent-shaped belt of shrubs, conifers, Spruce, purple Beech, Bays, Laurels, Cupressus, Mahonias, &c., forming a complete shelter from the north. Protection from easterly winds is gained by a few bold clumps of similar shrubs, which, though sufficiently near to shelter, are not so much so as to obstruct the view.

The plants at present are arranged in clumps, several smaller leading up to or surrounding one of much larger dimensions, with grassed walks in between. Though simple the arrangement is effective, and, further, will allow of extension in practically any direction, while such plants as require protection or removal during winter are easily reached. Few plants were actually in flower at the time these notes were taken, but when finished it is evident that during the greater

part of the year, in addition to flowers, a peculiar but striking vegetation will be obtained.

The most conspicuous plant in flower was a specimen of the American Agave, having an inflorescence some 12 feet high with thirteen umbrella-like clusters of its cream, yellow-green tinted flowers. The genus *Kniphofia*, both in species and garden forms, was well represented, and abundance of space having been given to each plant a brilliant effect should result when maturity is reached. A bed of *Galtonia candicans*, carrying numerous superb spikes, showed to advantage their white, bell-like flowers, while near was a small bed of *Tuberose*. The bulbs had been planted in April, but owing to the inclement summer had not grown to perfection. Masses of *Gladioli*, African *Marigolds*, *Montbretias*, *Freeseias*, &c., were interspersed between clumps of *Lobelia*; the blue and white *Agapanthus*, in fine specimens; different *Acacias*, *Campanulas*, *Plumbago capensis*, *Dracenas*, *Phoenix dactylifera* and *canariensis*, *Crinum Powellii* and *C. capense*, the latter bearing a few late spikes. Good use has been made of *Eucalyptus globulus*, *Ricinus zanzibarensis*, and a few Palms; and a few small beds arranged with *Opuntias*, *Gasterias*, *Crassulas*, and *Sedums*, added to the effect of the whole. Good use has been made of *Ixias*, *Watsonias*, *Sparaxis*, *Ornithogalums*, &c., but there yet remains a large number of bulbous plants, the different *Cycads* in which South Africa is so rich, *Asparagus*, &c., to be utilised, but the main difficulty will be to obtain a typical African flora without drawing too heavily on the green house accommodation. Still, it is evident that a beginning has been made in the right direction, and possibly in a more favourable season a greater variety of plants may be tested and compared.

ARGUTUS.

Chrysanthemum Crimson Source d'Or.—No plant belonging to the decorative group is better known than *Source d'Or*, and the variety under notice will be more fully appreciated when it is stated to be a sport from it. The colour may be described as a brilliant crimson, with a pale bronze reverse to the petals. There is, however, a slight suffusion of yellow at the base of the petals. This is the second season in which I have grown it. With the old-gold colour of the original, the rich golden-yellow of the sport named *Lizzie Adcock*, and the variety described in this note we have a trio of decorative Japanese sorts unequalled by any other. *Source d'Or* is not troublesome to grow.—D. B. C.

Decorative Chrysanthemum Martinmas and its bronze sport.—*Martinmas* was first introduced as a Pompon variety, and until last year was catalogued and distributed as such. The classification committee of the National Chrysanthemum Society, on the occasion of their meeting at the October show in 1902, decided to withdraw the parent variety and its sport from the Pompon section and transfer them to the decorative, which was formed about that time. It was demonstrated at that same show that these varieties when disbudded and well grown developed quite large blooms not unlike a reflexed type of the flower, and altogether unlike the small blooms peculiar to the Pompon Chrysanthemums, the characteristics of which are so clearly defined in the Jubilee edition of the society's catalogue. The flowers of the parent variety are light pink, tinted and edged white, and the sport is bronze. When left to develop their blooms naturally they make a dense cluster of flowers on short flower-stalks, and to be seen at their best they should be partially disbudded. It is a good plan to pinch back the plants several times during the growing season, by which means numerous branching growths are developed. They should then each be disbudded to one bud on each shoot, the result of this system of culture being very satisfactory. The plant attains a height of about 2½ feet, and is at its best during October. For border culture during the period just mentioned they are excellent, and the growth is robust.—D. B. C.

Salvia azurea grandiflora.—This *Salvia*, which Messrs. Veitch showed so well at the

meeting of the Royal Horticultural Society on the 27th ult., was introduced about a quarter of a century ago under the name of *Salvia Pichei*, and as such was soon extensively grown. It is a native of Arkansas and Texas, and though included in the "Kew Hand List of Herbaceous Plants" is best seen as a greenhouse plant; indeed, under the same conditions as the popular and showy *Salvia splendens* it is quite happy. *Salvia azurea grandiflora* differs from most of the others in growth, the shoots being long and slender, and clothed with narrow, greyish green leaves, while the flowers, which are freely borne, are of a charming shade of blue. Its rather loose growth fits it for grouping, while it furnishes quite a distinct colour to the Chrysanthemums which form the bulk of greenhouse flowering plants at this season. Given a fine autumn it will often flower out of doors before sharp frosts prevail, and on this point I may mention that two or three years ago some beds of it at Kew were very showy, the flowers being richer in tint than those under glass. Like the other members of the genus it is easily propagated and grown, and, as with most *Salvia*, it allowed to suffer from want of water or kept in too dry an atmosphere red spider attacks the leaves.—T.

Japanese Rhododendrons.—The numerous hybrids of this section are in many cases now flowering freely, but to be seen at their best they need a temperature somewhat above that of an ordinary greenhouse. Many attractive varieties of their own raising are now very beautiful in Messrs. Veitch's nursery at Chelsea, and, as befits a class of plants all raised within the smoke-laden area of London, they resist the adverse conditions too often experienced there much better than most subjects; indeed, they frequently pass unscathed, or nearly so, through fogs sufficiently dense to rob Indian Azaleas of their leaves, and cause nearly all the buds of the Himalayan section of hybrid Rhododendrons to drop. All the Japanese hybrids have smooth leaves, and on this point I find that, generally speaking, such plants resist fog and smoke much better than those with hairy foliage. The Japanese Rhododendrons are very free flowering, for plants in 5-inch pots will often bear several clusters of bloom, and in addition to this, their flowering period is not limited to any one part of the year, for where a collection is grown there is always a certain number of blossoms. If potted in good sandy peat and care is taken not to over-pot them, these Rhododendrons give but little trouble. Apart from growing in pots, the success attending their culture when planted out in the Mexican house at Kew shows them in a somewhat new light.—H. P.

Early-flowering Chrysanthemums.—At Gunnersbury Park Mr. George Reynolds plants out on a shaded north border batches of plants of the following varieties of early Chrysanthemums, and from them he obtains a very ample supply of cut bloom during September and October, the local harvest celebrations of all denominations being largely indebted to him for flowers on such occasions. The sorts are *Bouquet Feu*, reddish terra-cotta, a variety which produces charming sprays of bloom; *Coral Queen*, coral-rose or deep pink, the florets tipped with gold, a delightful tint of colour; *Harvest Home*, bronzy red, tipped with gold, which was seen to be brighter in colour under glass, and very free; *Horace Martin*, very free and fine, colour deep yellow, a sport from the crimson *Mme. Marie Masse*; *Jules Mary*, of a bright shade of crimson velvet, and is well described by Mr. Wells as "a beauty"; it is a great favourite with Mr. Reynolds, both in the open and under glass; and *Mme. Marie Masse*, an old favourite and an early bloomer, colour lilac-mauve. Many new additions are made to the group, but some of the older ones hold their own for the inestimable floral service they render, and they are likely to be grown for years to come.—R. DEAN.

Obituary.—We much regret to learn of the death of Mrs. Jackson, the wife of Mr. J. R. Jackson, of Claremont, Lympstone, Devon, and late curator of the Museums, Royal Gardens, Kew.

BATH'S

GORGEOUS

PEONIES.

FOR IMMEDIATE PLANTING.

ALL the Plants offered by me are exceptionally strong and healthy, and many thousands are annually supplied to the Park and Kensington Gardens. The following will be securely packed and CARRIAGE PAID for CASH WITH ORDER.

BATH'S GORGEOUS PEONIES.

No garden should be without Peonies. The huge, brilliantly-colored and delicately-shaded flowers produce an effect which is scarcely equalled by any other flower. Commencing to bloom in May and continuing to end of June, they come at a time when other flowers are by no means plentiful.

If planted at once all the following will flower in 1904.

SET G.

One of the Best Varieties in Cultivation, all of large size, free flowering, and the most delicate tints, for 30/-.

	each—s. d.
Mr. Dumas—Bright rose and cream; fragrant	2 6
Madras—Large, pure white	2 6
sch. de Nemours—Snow-white, large; rose-scented	2 6
sch. de Theba—White, tipped crimson; rose-scented	2 6
Mrs. Chas. Lovejoy—Delicate blush; extra fine	3 0
Mrs. de Gaihan—Beautiful soft pink; extra	5 0
Mrs. de Gaihan—Pink, centre blush	3 6
Mrs. de Gaihan—Pink, white, full double	3 6
Mrs. de Gaihan—Rose-pink, white centre	2 6
Mrs. de Gaihan—Pure white	2 6
Mrs. de Gaihan—Pearly-white and sulphur; extra	2 6
Mrs. de Gaihan—Pure white, slightly tipped purple	2 6

SET H.

One of the Best Varieties in Cultivation, all of large size, free flowering, and the most delicate tints, for 30/-.

	each—s. d.
Marie—White, tinted sulphur; one of the best	2 0
sch. de Modena—Rose; rose-scented	1 3
sch. de Modena—Soft lilac blush, centre salmon-yellow	2 0
sch. de Modena—Satin-rose, centre salmon and rose	2 0
sch. de Modena—Silver-pink, slightly edged crimson	2 0
sch. de Modena—Leonora Bramwell—Silver-rose; a grand flower	2 0
sch. de Modena—Pink, shading to blush; rose-scented	1 6
sch. de Modena—Rose, shading to pink; fragrant	2 0
sch. de Modena—Carmine, tinted salmon-rose; fragrant	2 0
sch. de Modena—Blush-white, slightly flaked crimson	2 0
sch. de Modena—Rich silver-pink	2 0
sch. de Modena—Soft satiny-rose and sulphur	2 6

SET I.

	each—s. d.
sch. de Modena—Rose-lilac, bordered white	1 6
sch. de Modena—Primrose-yellow, soft peach guard petals, rose-scented	1 0
sch. de Modena—Rich purple-lake; very large	1 6
sch. de Modena—Blush, striped carmine; fragrant	1 6
sch. de Modena—Pure white; very large	2 6
sch. de Modena—Bright rose; rose-scented	1 6
sch. de Modena—Rich velvety amaranth; large	1 6
sch. de Modena—Deep rose, edged silver; fragrant	1 6
sch. de Modena—Peach-blossom, soft yellow centre	1 6
sch. de Modena—Rose; strongly rose-scented	1 6
sch. de Modena—Rich silver-pink	2 0
sch. de Modena—Pink guard petals, blush centre	1 6

BATH'S POPULAR SET.

This Set consists of Twelve Fine Named Peonies, all quite distinct, free-flowering varieties, for 10/6.

The above Four Sets complete for £3 12s. 6d. Carriage Paid.

Trees and Shrubs for English Gardens,

By **E. T. COOK,**
Editor of "The Garden."
12s. 6d. nett.

Sootman.—"In this beautifully-illustrated volume Mr. E. T. Cook puts in a strong plea for a more intelligent cultivation of beautiful trees and shrubs by the owners of English woodlands, pleasure grounds and gardens. The perusal of these interesting and informative chapters make absolute the conviction that an immense variety of flowering and green shrubs lies almost neglected by the majority of garden cultivators, while as a means of breaking up and darning the parks and demeanes of the rich their possibilities we only rarely appreciated."

NEW BOOK by Miss **GERTRUDE JEKYLL** and **Mr. E. MAWLEY.**

Roses for English Gardens

Illustrated with 190 full-page Plates.
12s. 6d. nett.

Daily Chronicle.—"All the roses of England, blossoming in a counterfeited summer of black and white, seem to be gathered together into Miss JEKYLL's charming book. The pictures are really pleasant to look at; near or far, a rose photograph quite as well as a beautiful face, and carries with it its own individual look. No one can fail to be captured by Miss JEKYLL's enthusiasm and fine discrimination."

SWEET VIOLETS AND PANSIES.

AND VIOLETS FROM MOUNTAIN AND PLAIN.

A New Book written by several authorities and Edited by **E. T. COOK,** Editor of THE GARDEN, Author of "Trees and Shrubs," etc.

PRICE 3/6 nett.

VOLS. I. and II. NOW READY.

GARDENS OLD AND NEW.

(The Country House and its Garden Environment.) Over 450 Superb Illustrations in each Volume, printed on treble thick Art Paper, portraying in a manner never before attempted the greatest and most interesting Gardens and Homes in England. £2 2s. Nett. each.

Published at the Offices of COUNTRY LIFE, 20, Tavistock Street, Covent Garden, W.C.; and by **GEORGE NEWNES, Ltd** 7-12, Southampton Street, Strand, W.C.

National Chrysanthemum Society.—The annual dinner of this society will be held at the Holborn Restaurant on the 25th inst. The president of the society, Mr. C. E. Shea, will occupy the chair.

National Rose Society.—Tuesday next will be a busy day for this society. At two o'clock the General Purposes Committee meets, and at three o'clock there is a general committee meeting. All take place in the rooms of the Horticultural Club, Hotel Windsor.

Horticultural Club.—The usual monthly house dinner will take place on Tuesday next at 6 p.m. After dinner, Mr. G. S. Saunders, F.L.S., will read a paper on "Vegetable Curiosities."

Chrysanthemums in the Royal Botanic Gardens.—The Chrysanthemums grown in the Royal Botanic Society's Gardens, Regent's Park, are now in full flower. They are arranged in the conservatory, and make a display that is well worth visiting.

Royal Horticultural Society.—The following dates have been fixed by the society for 1904, but are liable to alteration on account of the possible uncertainty of the new hall opening and other contingencies: January 5, 26; February 9, 23; March 8, 22; April 5, 19 (National Auricula and Primula Society's show); May 3, 17 (Royal National Tulip Society's show); May 31 and June 1 and 2 (Temple show); June 14, 28; July 12 and 13 (Holland House show); July 26 (National Carnation and Picotee Society's show); August 9, 23; September 6 (National Dahlia Society's show); September 20 (National Rose Society's show); October 4, 5, and 6 (fruit show), 18; November 1, 15, 29; December 13.

Woodhatch Lodge, Reigate.—For many years past a number of horticulturists have been invited to spend a day in the Woodhatch Lodge Gardens, the residence of Mrs. Haywood, to see the Chrysanthemums, zonal Pelargoniums, and other plants that are exceptionally well grown there. Many pleasant days have been spent there at the invitation of the late Mr. T. B. Haywood, and the invitation since his death has been continued by Mrs. Haywood and Mr. C. B. Haywood. On the 4th inst. a most enjoyable day was passed by those horticulturists who visited Woodhatch. They were hospitably entertained by Mrs. Haywood and Mr. Haywood, and found much to admire in the plants and flowers Mr. Salter so well knows how to grow.

A new race of Dahlias.—A Dutch horticulturist, M. H. Hornsvelt of Baarn, by crossing the Cactus with the single Dahlias has obtained some interesting results, and the flowers are sufficiently distinct it appears to form a new race. The flowers have long stems, are single and semi-double, and much larger than the ordinary single Dahlias. Among the varieties shown before the Dutch Horticultural and Botanical Society at Amsterdam, the following were thought the most highly of: Baron de Grancy, pure white; Roem van Baarn (Gloire de Baarn), violet; Koningin Wilhelmina, white; and Prins Hendrik, red.

Polygonum molle.—This is a useful plant for cut bloom. I have seen it used effectively for table decorations. It produces loose branching panicles of small white flowers on reddish brown stems, is rather brittle, but otherwise stands well in water. It may be used in a similar manner to the Gypsophila, and as it comes in after this is over it should be well worthy of attention. Mr. A. Perry exhibited some large bunches of it at a recent meeting of the Royal Horticultural Society, and I have seen it used on several occasions in cut flower arrangements. It belongs to the hardy herbaceous section of these useful plants.—A. H.

Midland Reafforesting Association.—This association has been formed to promote the reafforesting of waste grounds in the Midlands, particularly in the parts of Staffordshire and Worcestershire known as the Black Country. It is the result of a public meeting held in Birmingham on February 12 last, and greeted with marked approval by the Press throughout the country. Once the Black Country was forest, and the association does not claim to be the first to attempt its replanting. It seeks rather to make

the knowledge gained from previous attempts, their successes and their failures, the basis of a great public movement, which shall restore to the district some of its ancient beauty, and render back its waste places to the service of men. Independently of the help so freely given by the Press, the association proposes to spread its views by means of pamphlets and lectures. It is prepared, moreover, to give expert advice on planting, to point out the trees most suitable for any locality, to assist and inform all who may contemplate planting on their own account, and further, if opportunity offers, to establish model or demonstration plantations. Fully to attain these ends many members and many helpers will be needed, and in the first place all public-spirited persons are invited to co-operate with the association in forming local committees and in making arrangements for a series of lantern lectures, to be delivered in the Black Country towns during the coming winter season. Sir Oliver Lodge is president; Professor Hillhouse is chairman of council; Mr. P. E. Martineau, Bentley Heath, Knowle, is hon. secretary to the council; and Mr. Herbert Stone, Bracebridge Street, Birmingham, is general hon. secretary.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—Mrs. E. L. E.—*Gilia laciniata*.—M. M.—The flowers sent are those of *Tasmania mollissima*.—Castlebar, Reigate.—Not a *Colchicum*, but *Crocus speciosus*.—R. Lake.—*Hedysarum coronarium*.—A. M. Rolfe.—*Astrantia major*.

Fungus (A. W.).—The floor boards of your room are evidently attacked by the dry-rot fungus (*Merulius lacrymans*). This fungus seldom infests wood that is in a well-ventilated position. Probably the air stagnates under the floor being in the basement. Can you not adopt some means to remedy this? The ends of the joists or boards which come into contact with the wall should, if the latter be at all damp, be creosoted, and the rest of the woodwork either creosoted or painted with a strong solution of sulphate of copper (blue-stone), say, 2lb. to 15 gallons of water, if the water will dissolve that quantity. Do not use a metal vessel to make the mixture in.—G. S. S.

Potting Roses (G. EMER).—The best results in forcing Roses are always got from established plants, but, where there is no very hard forcing adopted, plants from the open ground potted up now could be had in bloom earlier than those growing outdoors. Market growers adopt the plan of bottom-heat for newly potted up Roses. If you prepare a bed of leaves and tan or stable manure in your cold greenhouse, and plunge the new potted plants into some cocoanut fibre placed upon the hot bed after the fierce heat has subsided, you will find they quickly make new roots, and are then able to answer to the call which the top growths make upon the roots. Maiden plants are the best for potting up. Select bushy, well-ripened specimens, cut off all the foliage, and shorten growths by one-half. Slightly trim the roots, then pot up into 7-inch and 8-inch pots. A good compost is two parts fibrous loam, one part well-decayed animal manure, with a 5-inch potful of bone-meal to each two bushels of compost. No liquid manure is wanted until growth is well advanced; in fact, it is best to wait until flower-buds are seen, even on established plants. Firm potting must be practised. It is best to allow a day to intervene before watering newly-potted Roses. Should there be a good rain they will not need any other water; otherwise give them a moderate supply with a Rose can. Plunge them in the open in partial shade for a few weeks. For this purpose ashes or cocoanut fibre is preferred. No further watering will then be necessary. Keep them outside until frost threatens, then bring the plants under cover. Prune them back to four or five eyes in January or February, then plunge in the gentle hot bed as advised. At this time of the year air should be given very cautiously, and this on top ventilators only. It is well to subject the plants to a regular system of ventilating, not fluctuations between abundance and none at all. The temperature of the cold house will be about 45° to 50° on sunny days, and this is quite sufficient for the Roses at commencement. When new growth is advanced a few inches it would be advisable to introduce the plants into your warm greenhouse, where a temperature of 50° to 55° can be given. If you have a pit or frame inside this house where you can make a gentle hot-bed, or if you can contrive a frame over the hot-water

pipes, you will find the Roses succeed much better by this little bottom-heat, even after you have removed them to the warmer house. The plants need not be reported every year, but much depends upon their condition. If the pots are full of roots repotting would be the best course to take; this should be done at midsummer. Top-dressing is performed by removing with a pointed stick about 1 inch or so of the old top soil and replacing this with some good compost such as already mentioned. Pot Roses are considerably helped if, when they have made 5 inches or 6 inches of growth, the soil is covered to a depth of 1 inch with well-rotted manure, and if they appear to want some extra stimulant a sprinkling of bone-meal before applying the manure. You may remember it is the strong, healthy plants that really need extra feeding. It is baneful to apply manures, liquid or otherwise, to weakly plants. What such require is some nice sweet compost consisting principally of good turf loam.

Grouping Roses in long border (DEINA).—The narrowness of the border prevents your making a really good arrangement. As the border is 12 feet wide and 126 feet long we should advise you to have circular and parallel beds alternately down the centre of the border. By parallel beds I mean circular beds 5 feet in diameter this would allow of a grass walk 2 feet wide between the beds. The parallel beds should be 10 feet long, having half circular ends. By so doing a narrow border 18 inches wide could be formed the whole length of the piece of ground. Grass walks between the beds give a most refreshing appearance to the garden. This border, if laid out as advised above, would contain seven circular and six parallel beds. As to how these should be planted is a matter of individual taste. It is now fashionable to plant beds of one kind, but this would give you but a very small variety, and we note that you would prefer Roses of all kinds. The circular beds would look well filled with short standards, or perhaps a few of such plants in the centre and surrounded by bushes. These should mainly consist of the freest blooming Hybrid Perpetuals, whose blossoms, generally so fragrant and of such brilliant colours, would give that quality of flower which so many of the modern artistic-coloured Roses lack. Then the parallel beds could be filled with Tea-scented and Hybrid Teas of the most popular kinds, endeavouring as far as possible to plant Roses of the same shade of colour in the one bed, and also to plant the strongest growers down the centre of these parallel beds. The narrow border skirting this long piece of land would look well planted with the delightful little Polyantha Roses or the beautiful Moulins such as Mme. E. Rosal, Aurora, Queen Mab, &c. Another plan would be to plant this narrow border with Roses such as W. A. Richardson, Billiard et Barre, &c., and train them horizontally to low lattice work or wires. By so doing you ensure an abundant blossoming of a very lovely type Rose. Pillar Roses planted at intervals of 8 feet along the narrow border would also have a nice effect, especially if each pair were induced to form arches running parallel with the border. There would be ample space to introduce beds of other tribes of this Rose, such as Rugosas, Austrian Briars, Mosses, Bourbons, &c., if you have a desire to do so. As the border slopes to the west we think you should plant the Tea-scented kinds at the highest point. We should be pleased to advise as to varieties of the various tribes if you state what you decide to plant.

GARDENING APPOINTMENTS.

MR. P. COLOMAN, late foreman at Derry Ormeau, has been appointed head gardener to Sir Piers Moyn, Bart., Talson, Prestatyn, Flintshire.

MR. J. UDALL, for the last ten years fruit foreman to S. Heilbut, Esq., The Lodge, Holyport, near Maidenhead, has been appointed head gardener to M. C. Pilkington, Esq., Hutton Hall, near Brentwood, Essex.

TRADE NOTES.

MESSES. WILLIAM BULL AND SONS, new plant, seed, and bulb merchants, of King's Road, Chelsea, have appointed Mr. George H. Sage, late head gardener to the Most Hon. Marquess Camden at Bayham Abbey, Lamberhurst, as one of their representatives.

MR. J. AMBROSE.

WE are sorry to hear that Mr. Ambrose, of Chessington, met with an accident recently, and has badly injured his arm and shoulder. He hopes, however, to be able shortly to attend to his correspondence. Mr. Ambrose was awarded a silver Banksian medal at the Royal Horticultural Society's meeting on the 27th ult.

CATALOGUES RECEIVED.

Carnations, Picotees, &c.—Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath.

Autumn Catalogue.—MM. Lemoine et fils, Nancy.

Trees and Shrubs.—MM. Desfontaines-Thullier fils et Co, 23, Route d'Orléans, Orléans.

Seeds.—Sluis and Groot, Enkhuisen, Holland.

Roses, Fruits, Trees, and Shrubs.—Messrs. William Watson and Sons, Clontarf Nurseries, Dublin; Messrs. W. Smith and Sons, Aberdeen; Messrs. James Cocker and Sons, Aberdeen.

Chrysanthemums.—Messrs. W. Wells and Co., Redhill, Surrey; Messrs. John Peed and Sons, West Norwood, S.E.

American Seeds.—Messrs. J. M. Thorburn and Co., 35 Cortlandt Street, New York, U.S.A.

Alpine Plants.—Jardins Correvon, Chêne-Bourg, Geneva.

General Plant List.—Damman and Co., San Giovanni a Teduccio, Naples.

Autumn and Winter Catalogue.—MM. Brant, Pottiers.

THE GARDEN

No. 1669.—VOL. LXIV.]

[NOVEMBER 14, 1903.]

OVERGROWN FLOWERS, FRUITS, AND VEGETABLES.

ON Tuesday afternoon a lecture was given before the Royal Horticultural Society on the above subject, and it may be interesting to know the conclusions arrived at. They are comprised in the following summary: Quality always rather than size.

If the judges of vegetables would adopt a common-sense standard and make their awards in favour of the vegetables they would pick out for consumption at their own tables, it is doubtful whether the large ones in the show would be those most honoured. They would, for instance, in the case of a Cauliflower, choose one that was fairly compact, not one of huge size that had the appearance of being pugged with manure and bloated with liquid.

The standards of the best class of country house, where the mistress is a good housewife, should be borne in mind; where the diameter of a Brussels Sprout must not exceed five-eighths of an inch, and no large over-grown vegetables are allowed to come to table.

Of course such a standard could not be adopted as a general one, for the larger number of consumers require more bulk; but it is doubtful whether anyone really wants the very large overfed examples. They merely indicate a certain skill in pushing the thing as far as it will go, the article, when produced, being relatively valueless.

THE OVER-DOUBLING OF FLOWERS

was also pointed out as an evil, and is a matter that is often fatal to beauty. Many a flower is the better for a judicious degree of doubling, but when it is carried too far it turns what should be a handsome flower into a mis-shapen absurdity. This has been done in the case of Zinnias. In this fine thing moderate doubling is a gain on a well-grown plant a couple of feet high. But there is a monstrous form where many rows of petals show one above the other. In this the flower is robbed of all its natural beauty, and becomes an absurd cone of quite indefensible ugliness, and it is all the more deplorable an object when this monstrous flower is grown on a dwarfed plant. The orthodox Hollyhock is also much too tightly doubled, so that it becomes a tight wrinkled hemisphere. The beautiful Hollyhock has a distinct wide outer petticoat, and the inner

portion is not so tightly packed but that its component petals, though closely grouped and loosely crumpled, admit of the free play of light and colour.

The undesirable influence of the rage for novelty, rather than a calm judgment of what is most beautiful, is also seen in the matter of colour. Some flowers have naturally only a tender tinting, which seems to be so much a part of their true nature that attempts to force them into stronger colouring can only detract from their refinement. Such a plant is the delicious Mignonette, with a tender colouring that seems like a modest self-deprecating introduction to its delicious and wholesome quality of sweetness. The slightly warmer shade of the anthers in the plant of normal tinting, with a general absence of any positively bright colouring, is exactly in accordance with the plant's true character, and with that modest charm that gives it a warm place in every good gardener's heart. But when, as in some of the recent so-called improvements, the graceful head is enlarged and condensed into a broad, thickened squatness, with large brick-red anthers, that modest grace that formed the essence of the sweet flower's charm is entirely gone, and in its place we are offered a thing that has lost all beauty and has only gained a look of coarseness. These broad, thick blooms have also a suspicion of rank quality about their scent that was never apparent in the older forms.

The lecturer also strongly condemned the practice of dwarfing plants for the mere sake of creating something novel, but paid a warm tribute to the labours of seed growers at home and abroad for the many grand plants that are due to their many labours and to the hybridist.

The lecturer had received many opinions from raisers and growers of flowers, fruits, and vegetables. The following is a letter received from that excellent old gardener, the Rector of Kirby-Lonsdale (the Rev. Francis Horner, M.A., V.M.H.); it is a refreshing criticism of the subject under consideration; it was received too late to be read at the meeting on Tuesday.

"In flowers, fruits, and vegetables I think that size as against quality is a poor advantage. It is easier to produce what is too big than what is too good. The former may be overdone; the latter never over-reached. I would rather have two half-crowns than one ponderous five-shilling piece. The two are worth as much, and are the handier.

"The proverbial big Gooseberry is an accepted symbol of bulk as against flavour,

though not a trustworthy illustration, because this fruit is never of unmanageable size, and some of the show varieties are by no means short of flavour. But the big Potato, somewhat hollow inside, the big Onion that splits, the cumbersome Cabbage, the gigantic Pumpkin—the things that carry coarseness the more they carry size—these are truer examples that size is not the great desideratum in fruit and vegetables. As the boy said when he had mastered the alphabet, 'Whether it was worth while to go through so much to gain so little he didn't know!'

"In the wide world of flowers the subject is naturally so expansive that it is hard to condense it. In floriculture there are so many different aims and objects, and of course size comes in, and colour, and form, and other attributes. In Nature's types, many flowers are small, but with powers of variability in size, substance, and form, and it is no outrage to lead them on.

"When, however, we come to doubleness in flowers, I think we do not always improve upon Nature, however much we may gain in size. Double Snowdrops, double Daffodils, double Tulips, and double Campanulas are (e.g.) not so winsome as the beauty of simplicity in their single forms. In other instances, however, a double form has the advantage of a longer duration. For instance, the single Dahlia lasts no longer than the brief life of its one row of petals, and so, too, the single Rose. In plants which, like the Begonia, bear monœcious flowers it is only the male blossoms that can be double; the female form is strictly single, and it is very interesting to see both in their highest distinction upon the same plant.

"Though I have loved plants all my life, and grown a great many kinds in half a century of it (without any head gardenership but my own), I am, perhaps, not the fairest judge of the real value of mere size in flowers as against other rarer and more difficult gifts and properties in them. For I began, and largely continue, in the love and nurture of our old classical 'Florist Flowers,' such as the Auricula, Tulip, Ranunculus, Pink, Carnation, and Picotee. The Auricula and Tulip are not likely to be lowered in their higher qualities, the Ranunculus and Pink, I fear, are largely lost from the standard they once were at, while in the Carnation and Picotee I am afraid that size and confusion, through too much doubleness, have wrought great havoc.

"My opinion—for the little it is worth—is that size is often oversought, overwrought, and overworshipped to the oversight of properties more difficult, more worthy to attain, and more satisfying.—FRANCIS D. HORNER, M.A., V.M.H."

THE VEGETABLE AND FRUIT GARDENS OF THE FUTURE.

The well-known grower of vegetables, Mr. Beckett, alluded to the importance of the fruit

and vegetable in the economy of the household. We thoroughly agree with his remarks.

"Though vegetable culture is generally regarded as the lowest grade in horticulture, it is certainly not the least important, and, unless I am greatly mistaken, the production of high-class kitchen garden produce will take a much more prominent part in the future than it has hitherto done, and this can only be accomplished by educating both the producer generally to a higher standard than has so far been the case. Our young men who have made up their minds to become gardeners far too often consider that the details in connexion with vegetable culture are beneath their notice, and can be acquired, if required, when they are placed in responsible positions as head gardeners, a sad mistake which they often find out to their cost. I am perfectly convinced that there is no department in horticulture which demands more care, skill, and thought than this if high-class vegetables are to be produced all through the year.

"Many vegetables which are offered for sale are really not fit for human food, and as with fruit, so with vegetables—many of the products tempting to the eye are scarcely worth cooking. The selection of varieties is of the utmost importance, whether for private or market use, and in making awards at our exhibitions judges do not take into consideration the quality of the varieties nearly as much as they ought. Large and coarse sorts should be rigorously excluded from all lists, as they are neither good nor profitable. Especially does this apply to Potatoes, Cabbage, Savoy, Beet-root, Turnips, and many others.

"I am quite at a loss to understand why our market gardeners do not cultivate the better varieties, many of which are much more prolific and as easily grown. For illustration Peas and Runner Beans. It is almost impossible to get the first-named fit to eat at any of our hotels or restaurants during the season, and why not grow the new and improved sorts, which are certainly vastly superior in every way. The highest system of culture should be the aim of the producer, whether it be flowers, fruit, or vegetables of all the best known kinds, so that each specimen may be of the highest excellence."

Letters were also read from Mr. F. W. Burbidge, M.A., V.M.H., Mr. C. E. Shea, Mr. E. H. Woodall, Mr. C. E. Pearson, the Rev. G. Engleheart, Mr. George Bunyard, Mr. Rivers, Mr. S. W. Fitzherbert, Mr. E. Molyneux, Mr. Owen Thomas, Mr. George Wythes, and others. Their conclusions were practically the same as those of the lecturer.

THE EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

NERINES FROM IRELAND.

The garden of Mr. W. E. Gumbleton, at Belgrove, Queenstown, Ireland, is well known to contain a large number of rare and beautiful plants whose culture is neglected. We have on several occasions received interesting flowers from

Mr. Gumbleton, but few more so than the Nerines brought for our inspection last week. The following were among them: *Nerine Meadowbankii* × *atro-rubens*, a hybrid raised by Mr. F. W. Moore in the Glasnevin Botanic Gardens; it is a striking flower, rich scarlet in colour; *N. amabilis* × *grandiflora* is a fine rich pink form of *N. amabilis*; *N. ingens* has the largest flowers of all, they are carmine coloured (Herr Max Leichtlin introduced this Nerine to cultivation); *N. sarniensis* × *Moorei* is another Glasnevin hybrid remarkable for the distinct blue tinge that suffuses the pink petals; *N. sarniensis rosea* has deep rose-pink flowers, while a *sarniensis* seedling (unnamed) raised by Mr. Elwes has dark stripes down the centres of the pink petals. Of *N. Novely* there are two forms, the best of which is very fine; the individual flowers are very large. *N. atro-rubens* is one of the richest coloured of all, a dazzling scarlet; *N. coruscans* has flowers of brightest red, while *N. c. pallida* is a very attractive pale coloured variety; the paleness is not dull, however, but quite a sparkling tint. *N. excellens* has crimped, narrow-petalled pink flowers, the petals being lined with red, and the heads of bloom very large; *N. Plantii* is a glowing scarlet colour, and very beautiful; *N. Lady Guise*, one of Mr. Elwes' hybrids, produces flowers that are almost salmon coloured; while *N. Lady Clementine Mitford* is a lovely flower of a delicate and beautiful pink, the petals crimped; *N. Miss Woolward* bears pale blush blooms with dark lines down the centres of the petals; *N. Carrei* is the first to bloom of all, while *N. Mansellii*, which is the latest, was, Mr. Gumbleton informed us, showing flower when he left Belgrove. Rarely have we seen a gathering of flowers at this time of year that contained such brilliant and distinct colours; plants that flower at this time of year are always welcome, and when they produce flowers of such delicate beauty and rich colouring as these Nerines they are invaluable in a garden where glass house protection is available.

SOLANUM JASMINOIDES.

The Rev. P. Clementi-Smith writes from St. Andrew's Rectory, Doctor's Commons, E.C.: "I was greatly interested in seeing the *Solanum jasminoides* growing and flowering freely out of doors against the west side of a house at Dorman's Land, Lingfield, Surrey. It is generally supposed to be a hot house perennial climber, though I think some reference was made in THE GARDEN a year or so ago to its thriving out of doors near London, at Hendon, and since then I hear it may be seen at Chiswick. But until this week I have never seen it growing out of doors in England. In the South of Spain, at Ferey de la Frontera, where I spent six months a few years ago, I frequently saw it festooning trees or covering rustic arches in the gardens. The clusters of white flowers are lovely, and are called by the Spaniards 'The Virgin's Tears.'

A beautiful climber, which is a success in many gardens. It festoons houses sometimes in the South of England and in Ireland.

THE BEAUTY OF BEECH TINTS.

Miss A. Smallpeice, Crosslane, Guildford, writes: "Two correspondents lately have mentioned the lack of autumn tints this year. Here at Guildford they are very fine, particularly the Beech trees, which are all shades, from bronze and burnished copper to golden. I enclose a few leaves from one of our trees. The Sycamores are bright yellow, and the tints on the woods around are beautiful."

ROSA LUCIDA AND ASTER SALICIFOLIA TRESSERVE.

Mr. Smith, Daisy Hill Nursery, Newry, writes: "The statement in THE GARDEN that autumn tints in England are either absent altogether or poor surprises me. Here generally they are superb, in fact some of the prettiest gardens I know are just now glowing pictures of autumn colour, as I think the specimens sent will show."

R. lucida, with its crimson leaves and hews, is always beautiful at this time, and the *Aster* is quite

a treasure; the flowers are a fresh pink colour, and make quite a show when the plants are put fairly closely together; they are 1 foot high.

RECENT PLANT PORTRAITS.

THE *Botanical Magazine* for November contains portraits of

Clerodendron cephalanthum.—Native of Zanzibar Island, also known as *C. capitatum* var. *cephalanthum*. This is a handsome climbing shrub, with large, open bunches of pure white flowers with long, protruding purple anthers; it is a vigorous grower, and flowers freely in the Palm house.

Impatiens falcifer.—Native of the Sikkim Himalaya, also known under the synonym of *I. serrata*. This is an exceedingly pretty Balsaminaceae with golden yellow flowers, the upper half of which is minutely spotted with red.

Fendlera rupicola.—Native of South-Western North America. This is an exceedingly ornamental and, when happy, free-flowering shrub whose flowers are pure white, sometimes in its native country shaded with rose. The conspicuous yellow stamens add to the beauty of the flower. It was introduced into European gardens in 1865 by Herr Max Leichtlin of Baden-Baden.

Spharocodon obtusifolium.—A native of tropical Africa, also known under the synonyms of *Natalense* and *S. cafrum*.

Tylophora Caffra and *Gongronema Welurtschii*. This is a curious trailing shrub, with axillary bunches of reddish purple tubular flowers of great beauty.

Iris gracilipes.—Native of Japan, also known as *I. sibirica*. This is a delicate and pretty slender growing, fibrous-rooted *Iris*, with small lilac-purple flowers with white centres to the falls. This plant was sent to Kew in September, 1902, by Herr Max Leichtlin of Baden-Baden.

W. E. GUMBLETON.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

November 18.—Hull (two days), York (three days) and Bristol (two days) Chrysanthemum Show.

November 19.—Scottish Horticultural Association's Chrysanthemum Show.

United Horticultural Benefit and Provident Society.—The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last, Mr. C. H. Curtis in the chair. Three new members were elected, making a total of eighty this year to date. Seven members were reported on the sick fund. The amount of sick pay for the month was £21 12s.

Polygala Chamæbuxus purpurea. Since its introduction in 1658 *Polygala Chamæbuxus*, commonly called the Bastard Box, has been growing in favour with lovers of alpine, and is now regarded as one of the most desirable of dwarf rock shrubs. During recent years, however, it seems to have become rather scarce, and the purple form *P. C. purpurea* is apparently the commoner of the two. Both flower profusely from early spring till late autumn, and in a mild winter they never seem to be without a few blossoms. The former has white flowers with a cream-coloured centre, and the latter, as the name implies, purple with a yellow centre, which greatly enhances its beauty. I recently saw the variety *purpurea* growing luxuriantly in Mr. Pulham's nursery at Epsom. Mr. Pulham told me that it had been a mass of colour since the spring, and any quantity of flowers were still appearing. Almost any position on the rock garden will suit these plants, providing it is well drained and slightly shaded from the hottest rays of the sun. A suitable compost for growing them in is a mixture of sandy peat and leaf-soil. These *Polygalas* have a neat, compact habit, and seldom grow more than 6 inches in height; they are evergreen, and in every way two of the most beautiful dwarf shrubs for the rock garden.—A. E. THATCHER.

Birds in a city rectory garden.—*rogodytes Parvulus*, *Europæus*, or *Vulgaris* visited our rectory garden and made itself very much at home for the whole of the day of Monday, October 26. But, alas! it had taken its flight before we got up early next morning, in obedience to its migratory instincts, though it is difficult to realise so tiny a bird taking a long solitary journey. Most of our city readers have seen and heard the hen with its loud notes, so bright and cheerful and from its tiny size, brown dress, and short tail asked on high, more often heard than seen), flitting restlessly in the bushes and undergrowth along the country lanes. Some, perhaps, like the rector in his youth, have found its domed nest of dead leaves, apparently so needlessly large for the size of the bird. Writing from personal observation, it seems to be custom of the cock bird to build more than one nest, and then for the hen bird to carefully select and feather the one she likes best. Hence one often finds in the near vicinity of the nest warmly lined with feathers, other nests unlined. In the March, 1895, number of the *Parish Magazine* I recorded the visit of a chaffinch and a cock redstart, or firetail (*Ruticilla Phœnicirris*), on Sunday morning, April 26, 1896.—*Parish Magazine of St. Andrew-by-the-Wardrobe* (Rector, the Rev. P. Clementi-Smith).

Heath and Tamarisk.—It is such groups as shown in the illustration that give refined beauty to the garden. It is quite simple grouping, this of Heath and Tamarisk, one of the loveliest of shrubs, and with a background of *Rhododendrons*. Colonies of *Daffodils* here and there have a spring freshness, when perhaps cold winds have browned the leaves of the surrounding shrubs.

The Hampton Court Vine.—A paragraph has been going the rounds of the general Press calling attention to the decrepit condition of the old Vine at Hampton Court. It has been stated that it was planted in 1678. Whilst that paragraph has given the old Vine an age exceeding its years by 100, there is also no special reason for concern at its present condition. The grand old Vine at Cumberland Lodge, which I saw not long since, is being renovated in a remarkable way, and that was planted as a young Vine from the Hampton Court stock. Only ten years later, whilst the Cumberland Lodge viney was encumbered with its mass of brick flues, little could be done to the inside border, in which are some roots, although the greater portion are outside, and doubtless far away. Since the removal of this brickwork, as it is seen in the illustration on page 320 of *THE GARDEN*, and has been replaced by hot-water piping, it has been found possible to top-dress and greatly help the roots that are inside, and so effective have been these operations that no better Black Hamburgh Grapes have been seen this year than were the dozen bunches sent up to Chiswick recently from Windsor out from this famous old Vine. That it will increase in productiveness and in the fine quality of its bunches and berries there can be no doubt. The Vine is, it is true, planted in the centre of the house, but the roots must have passed outside largely long since, as have those of the older Vine at Hampton Court, which is planted at one end of its viney. If the Board of Works would find the money the Frogmore authorities, who still have control of this Vine, would soon deal with it drastically. All the stone flagging which floors the house should be removed, the inside soil made into a well-renovated border, and every encouragement given for the formation of new roots. Severe pruning to compel the formation of new and stronger growths is needful, and, for a year at least, visitors should be rigidly excluded. The free admission creates a dry and impure atmosphere, and also clouds of dust, which coat the Grapes.

Big blooms.—When a grower of *Chrysanthemums* of the calibre of Mr. E. Beckett laments the difficulty in keeping large *Chrysanthemum* blooms this year owing to the unripe condition of the wood and the dampness of the season, one is tempted to ask why grow them. Look at the labour involved in growing a collection of big bloom plants; think also of the expense. Is the game really worth the candle, and is it absolutely essential to our complete enjoyment of the *Chrysanthemum* that these huge, mop-like flowers should be grown? Would anyone take the trouble to grow them were it not for the tempting prizes offered? When I called on one of the great growers the other day I found him busy pulling out imperfect petals. *Chrysanthemum* shows, I think, have to a large extent demoralised public taste. Is it not time that refinement took the place of size in growers' estimation?—A. D.

***Artemisia arborescens*.**—A handsome half-shrubby plant, with finely cut tripinnate leaves of a silvery grey hue. It is closely allied to the common Wormwood, but is more bushy and far more effective as an ornamental plant. It is a

seed. This is the time to sow it, if quite ripe. Being late flowering, it is often well into November before the seed is ripe. It is best sown as soon as ripe, and kept rather cool for a while. Sown in a box and placed under a stage in a cool greenhouse is a good place for it. Place glass over the box to keep out bugs and dripping water. Sown in November it may be left undisturbed until toward spring, when, in March, perhaps before, it may be brought from its winter quarters and placed on top of a stage, but keep the glass over the box and the whole shaded. The object in bringing it up is that it may get more heat to start the seeds growing. The seedlings should soon appear, and if potted or pricked off into boxes they make nice plants for selling when a year old.—*Florists' Exchange (America)*.

***Gypsophila paniculata flore-pleno*.**—Double flowers do not generally commend themselves for lightness, but this is an exception, having all the graceful branching habit of the type, with pure white, tiny, bell-like flowers, which last a long time. I was at first under the impression that the whiteness of the

GROUPING OF HEATH AND TAMARISK.

native of the Mediterranean region, where it grows in open stony places, and will not stand our winters without injury. Cuttings root readily, and these may be kept in a cold frame. Planted out in the spring they soon attain a good size, branching freely, and eventually reaching a height of 4 feet to 5 feet.

***Liriope spicata*.**—This interesting species, belonging to the natural order Hemodoraceæ, is often grown in a cool greenhouse, and is exceedingly useful as a decorative plant. It is, however, a perfectly hardy perennial, forming tufts of long, narrow evergreen leaves, and from amongst the foliage arise the livid purple stems, bearing spicate racemes of small violet-blue flowers. These are carried well above the leaves, and reach over 1 foot in length. With its neat, evergreen, tufted habit it is a desirable plant as an edging for beds or for groups in front of taller plants in shrubbery borders. A native of China and Japan, it does not flower till the latter half of October. It is easily grown, and flourishes in any good garden soil.—W. IRVING.

Sowing Clematis seeds.—The *Clematis paniculata* seeds so freely that anyone having a strong plant will be almost sure to have a lot of

flowers was due to the plant being grown under glass, but I find it is equally as white when grown out of doors. It may be propagated from cuttings early in the spring. Plants started in a little warmth will soon give good cuttings. They should be taken when about 2 inches long, a few of the bottom leaves removed, and the cuttings put in firmly in light sandy soil. In a frame with a slight bottom-heat they will soon root. Cuttings rooted last March made good plants for 8-inch pots and flowered about the middle of September. It appears to do much better outside than under glass, and strong plants, when established in the open ground, should produce an abundance of bloom, which for bouquets, vases, or any cut flower work will be most acceptable. Grown in pots it is very effective in the conservatory or for exhibition groups. I may add that this was sent out early in the year by Messrs. Thompson and Son of Wimbledon, but as there is a little difficulty in propagating it is not likely to be very plentiful for some time to come.—A. H.

Mr. R. Wallace of Kilnfield Gardens, Colchester, was returned for the North Ward of Colchester in the recent municipal elections with an overwhelming majority.

Aster mongolica.—For distinct beauty this Siberian Aster is, perhaps, one of the best of all the species. The leaves are quite unlike those of the Aster tribe generally; they are lanceolate, and roundly serrated at the margin. The dominant colour is in the ray florets, which are white with a bluish tone, the solitary heads being $1\frac{1}{2}$ inches to $1\frac{3}{4}$ inches across. It is one of the most elegant of Asters for its size. Ample space is required for its development, and the species is not of the weedy type. After many weeks of flowering this plant was in good bloom at the close of October at Kew.

Galanthus nivalis octobrensis.—So far as the latter name is concerned this form at Kew has been a failure this year, for October has come and gone and it is not in bloom. But a little tuft would in a few more days be expanding its flowers.

Russelia juncea.—This scrophulariaceous plant is very different in appearance to either the Calceolarias or Pentstemons, both members of the same order, for in the Russelia the long slender Rush-like branches are almost without leaves, and the entire specimen is exceedingly graceful. The flowers are tube-shaped, about an inch long, bright scarlet, and borne at this season. It is a native of Mexico, from where it was introduced in 1833, and in this country succeeds best in an intermediate or stove temperature. The peculiar style of growth admits of this Russelia being treated in different ways, for trained to a rather the slender drooping shoots hang down like a fringe, while if the principal branches are secured to a good stake, and the minor ones are allowed to arrange themselves at will, a very graceful specimen is the result. As a basket plant, too, it is seen to advantage. For its successful culture the soil must not be too adhesive, a suitable compost being equal parts of peat, loam, and leaf-mould, with an admixture of sand. Thorough drainage and a liberal supply of water during the growing season are essential. A garden form sent out by M. Lemoine of Nancy, under the name of R. Lemoinei, is very pretty, and even more pendulous in growth than the preceding.—H. P.

Shrubby Veronicas.—The merits of these as flowering plants for this season of the year have scarcely been recognised to the extent that one might expect, for they are almost hardy, and when at their best are very beautiful. Of late years some forms with particularly large massive spikes have appeared, and of these Mr. H. B. May of Edmonton has once or twice this season exhibited some charming little examples, all grown in $4\frac{1}{2}$ -inch or 5-inch pots. The variety *Reine des Blanches* is the finest white-flowered form I have yet seen, while other good varieties are: *Diamant*, deep purplish crimson; *La Seduisante*, a beautiful rich purple, leaves shaded bronze; and *Le Merveilleux*, amaranth red. These are all easily propagated, and, grown and treated much as Chrysanthemums, are valuable for the greenhouse at this season. Our brethren in the extreme West of England and in Ireland can enjoy them as outdoor shrubs, but in less favoured districts they are greenhouse plants. Where plants of sufficient size are available these Veronicas are useful for cutting, as they last well in water, and the neat glossy foliage is very pleasing.—T.

Polygonum capitatum.—Owing no doubt to the congenial moist weather we have experienced this season, which is somewhat akin to that prevailing in its native habitat, this pretty little plant has been charming, forming a cushion of foliage studded with a profusion of dense round heads of small pink flowers. A half-hardy perennial, it is generally killed by frost in winter, but reproduces itself freely from self-sown seeds. These seedlings grow rapidly under favourable conditions, and form carpets with long, trailing, red-brown stems, which root as they spread. The ovate leaves 1 inch to 2 inches long, dark green, are marked with a V-shaped band extending from the midrib at the centre to the base of the leaf. Borne on long stalks well above the foliage, the flower-heads are produced in abundance in the axils of the upper leaves. Given sufficiently moist conditions it is a useful plant for covering the bare

ground beneath taller growing subjects, keeping up a long succession of bloom during the summer and autumn. Spread over the sub-tropical and temperate Himalayas from Chamba to Bhotan at an elevation of 3,000 feet to 8,000 feet, it is generally found on rocks and old walls.—W. IRVING.

Cheiranthus Allioni.—Not the least attractive feature of this plant at this time is the rich orange colour of the flowers. In the rock garden generally we have not too much of this colour. Its true flowering season is spring and summer, but a few stray sprays are very welcome just now at Kew, the colour striking and exceptional.

Oxalis lobata.—Among the varied hardy plants from Messrs. Cutbush and Son at a recent Drill Hall meeting was the low carpeting to the group of *O. lobata*. Unfortunately, there was no sun, and the glistening golden flowers remained closed. The plant is about 6 inches high when in flower. The species is suitable for a snug, warm corner or sunny ledge in the rock garden, and when in bloom is very bright. Those who have sunny gardens and hot soils should grow this *Oxalis*.

Polygonum affine.—This low-growing, free-flowering alpine requires no special soil, but it delights in a sunny exposure in the rock garden. In such a place the leaves and the almost endless inflorescences render it one of the most conspicuous of autumn-flowering plants for the rock garden, though for the rock garden advisedly inasmuch the plant will succeed quite well in the ordinary border. In the richer and deeper soil, however, the leafage is wanting in colour. With deep and rich soil and practically an unlimited root-run the plant will grow apace. Given a warm or sunny position, limited root-run, and high and well-drained soil it is a picture of colouring in leaf and flowering.

Chrysanthemum Bronze Soleil d'Octobre.—This sport when shown before the Royal Horticultural Society two seasons ago obtained an award of merit. How much this award was influenced by the fact that the original form was a good plant is, perhaps, a doubtful point, yet it had something to do with the variety obtaining the award. After growing the so-called bronze variety for two seasons I am inclined to the belief that the award was not merited, and for the simple reason that the bronze colouring under glass is far too fleeting. Naturally the group of plants set up for the award is judged on its merits without knowledge other than that presented by the group at the moment. That this is insufficient, and that there is need for such things to be tested by some disinterested authority, is, I think, proved by the fact that this so-called bronze sport when placed under glass as lifted plants from the open almost immediately reverts to the yellow form of the original, or, at least, something not so good. At the present time I have a few hundred plants that have hardly a flush of bronze in them, while *Sources d'Or*, given the same treatment, is the delight of all. Cuttings starved in boxes of the above, carrying one flower each or less, are beautiful in colouring, and if the majority were of this order the variety would be passable enough. That this evanescent character is not wholly due to placing the plants under cover may be gathered from the fact that a few plants left in the open have also reverted in a similar fashion.—E. J.

La Societe Nationale d'Acclimatation.—The last bulletin issued by this society, whose headquarters are in Paris, consists of "Notes on some Palms that may be grown in the Open Ground in the neighbourhood of Nice," by M. A. Robertson-Prochowski. These notes afford extremely interesting reading. Writing of the *Chamedorea*, the author says: "This plant is dioecious, and, in order to obtain fertile seeds, one must have plants of both sexes, and they must flower simultaneously. Most of the plants I possess being still young, I have only been able to obtain seeds this year, and these are from a species I believe to be *C. gemoma formis* (Wendl.). My young plant, which is flowering for the first time, is carrying four bunches, each one containing about 200 fruits perfectly developed, and which ripened in April. They are about half the size of an Olive,

black and shining. These black fruits, together with the orange-coloured fruiting stems, have a very ornamental effect. Some species have red fruits. This is the first time, so far as I know, that a *Chamedorea* growing in the open ground in Europe has produced fertile seeds.

The "Hurst and Son" Musical Society.—A concert under the auspices of this society will take place at the Holborn Restaurant on the 18th inst. A donation will be given from the proceeds to the Gardeners' Royal Benevolent Institution. We wish the society success. The hon. secretary is Mr. F. A. Washington, 132, Houndsditch. Mr. N. N. Sherwood is president.

Ophiopogon Jaburan variegatum. Two specimens of this plant in pots have been standing upon two pedestals in my front garden for three months past. Exposed to all weathers, they are brilliantly coloured and blooming freely. It appears to be much more of a moisture-loving plant than is generally supposed. The pans in which the pots are standing are almost constantly full of water, yet there is an entire absence of the decayed points to the leaves one sees on plants grown in a warmer and drier temperature of the greenhouse.—R. D.

Scottish railway rates for horticultural produce.—The efforts of the railway companies throughout the kingdom to restrict the light loading of waggons are proving troublesome to market gardeners and farmers in many districts. The Scottish railway companies are now endeavouring to prevent the consignment of less than one ton of horticultural produce by goods trains, and Mr. Douglas, market gardener, East Duddingston, Edinburgh, has laid the matter before the Scottish Chamber of Horticulture. The question was discussed by the Chamber at a meeting held on November 4, when it was remitted to a committee to meet with the market gardeners and consider the matter with a view to action being taken to prevent the proposed regulations from being carried out. It appears that the object of the companies is to secure that small consignments should be sent by passenger trains. It is obvious that the increased rates would be very injurious to market gardeners and agriculturists, and it is to be hoped that the action of the Chamber will lead to good results.—S.

Rubus roseifolius.—The note of "T." on page 312 seems to leave it doubtful whether this Himalayan ground shrub is hardy in English gardens. It lived through two winters in the cold soil of my garden in Cheshire in an open border, and was then unwilling to be ejected, because it showed a disposition to monopolise the border, throwing out strong underground runners 3 feet long the first year, and multiplying them the second. It flowered each August, but did not attempt to set fruit. Two or three years ago some ripe fruits of *R. roseifolius* were exhibited at the Shrewsbury show in August by Messrs. Smith & Worcester. They were just like Strawberries of moderate size and very bright scarlet. The attendant told me they were ripened in the open air, but I thought he must be mistaken. There seems to be an erroneous belief amongst Continental nurserymen that the plant is a hybrid between a Strawberry and a Raspberry. It came to me from abroad, with the name *Fraisier-Framboisier*.—C. WOLLEY DOD, *Edge Hall, Malpas*.

Decorative Chrysanthemum Kitty Crewe.—We have none too many pretty decorative Chrysanthemums, and therefore this variety, which was distributed last spring, is all the more welcome. Flowers of it have just arrived from Mr. W. J. Godfrey of Exmouth; it is a charming acquisition. Mr. Godfrey has been growing this variety in pots under glass, and the flowers are just over. The blooms that he has sent to me, however, were cut from the open, where the plants have developed quite naturally. The sprays are freely flowered, some being partially open and others fully developed. Each bloom is borne on a good length of sturdy foot-stalk, so that each one may be used without interfering with its neighbour. The petals are of medium width and pointed and loosely incurved. The inside colouring is a rich shade of reddish

with a golden reverse, a very charming

The height of the plant is about 2 feet, hardly requires staking.—D. B. C.

rodendron nutans.—This is an old, and uncommon *Clerodendron*; it flowers the autumn months, and forms rather a rowing shrub, clothed with dark green lanceolate leaves, which are wavy at the tips. The flowers, which are in drooping racemes at the points of the shoots, are individually an inch across and pure white, while, as in other members of the genus, the large corolla whence each flower protrudes is of a tint, thus forming a striking feature by the marked contrast between the two. This, which is a native of India, was figured in *Botanical Magazine* as long ago as 1831, but did not appear after that to have been lost to gardens, and was unknown to most of the generation till brought from Calcutta by Mr. Head, for several years superintendent of the horticultural department of the Crystal Palace.

It was given a first-class certificate by the Horticultural Society in the autumn of 1886, a time was often met with, but during the years it has become far less common. *Clerodendron* is essentially a stove plant, in structure it needs a light position, as if shaded the calyces are not nearly so brightly coloured as if in a good light. Cuttings of young growing shoots strike root very readily if placed in a close propagating case. Red is the only insect pest that gives any trouble.

lanthemum Jubilee.—*Helianthemum* are among the best of our June and July for the rockwork. They revel in the sun and can stand more dry weather than most flowers, though it must be said that they suffer in bloom when they are fairly well set. By this I do not mean that they must have much water. The brief life of their flowers is a drawback, but this is not so pronounced in the varieties with double flowers, of which there are several. Most of these, however, their flowers too far down, so that unless they are above the level of the eye the flowers are not enjoyed. One old double variety, called *double fl.-pl.* or *H. venustum fl.-pl.*, though it is under several purely garden names, has a defect, and holds its perfectly double flowers boldly out from the plant. It was the best of all the double forms for low rockwork and has proved a great favourite wherever used. The want of a set of varieties of this habit, but with different colours, has been remedied by the appearance of the bright yellow one *Jubilee*, which I observe is now in common. It has been welcomed by those who like *Helianthemum*. I have had it here for several years now, and I admire it even more than the old double scarlet, from which it is a sport. It is in the garden of Mr. P. Hill-Norman of Hill, Aberdour, and we owe much to Mr. Hill for having propagated and fixed this beautiful sport along with a more recent one of a yellow. *H. Jubilee* is a beautiful, clear, light yellow flower, which pleases everyone for profusion of flower, its full, but not heavy, flowers, its fine colour, and its habit of growth.—S. ARNOTT, *Carsehorn, by Dumfries,*

(3 inches long) at the middle of the stem, dark glossy green, rough beneath, lance-shaped, scattered, ascending. Flowers two to five in a loose umbel, horizontally poised or drooping, trumpet shaped, 3 inches across, 4 inches long, white, spotted brown low down the distended funnel, coloured greenish externally, especially on the midribs; the petal tips slightly recurve, and the anthers are yellow; very variable. Flowers in July. The Burmese forms are mainly smooth-leaved, and the Yunnan forms rough on the under side. We have seen specimens heavily spotted with claret nearly up to the petal tips, and others scarcely at all spotted and with a faint lilac flush at the throat. A few only are fragrant. Inhabits varied sites on high mountain ranges 4,000 feet to 6,000 feet above sea level. Upper Burma and Yunnan. Its suppressed leaves at the base of the stems indicate association with scrub.

CULTURE AND USES.—This plant prefers a warm bed or border, and to grow among the Heaths and peat-loving plants in the warmer parts of Britain, especially where the soil is light and sandy. It is perfectly hardy, but in cold, wet clays and the extreme north it should be grown in an open frame or cool house. It thrives well in the light soil at Kew, but in heavy soil overlying clay a frame is necessary for it. If one can make certain of securing the Yunnan plant cultivation becomes an easy matter, for this form will grow well among sun-loving Ferns or strong-growing alpines in rocky recesses. Indoor cultivation should be cool, with shade from strong sunshine only, and the staple should be loam rather than peat for pot culture. The bases of the stems should be shaded in every case, or stem-roots will not develop.

L. Beerenii, Beeren's hybrid Turk-cap Lily (*L. chalcidonicum* × *testaceum*).—A richly-coloured garden Lily scarcely distinguishable from a slender *testaceum* in its bulbs, leaves, and stems. Flowers brick-red, nodding and recurving as in *chalcidonicum*, and with the fragrance of *testaceum*. Flowers in July. Rare in cultivation. Culture and uses as for *chalcidonicum*, which see.

L. Bolanderi (S. Watson) Bolander's Martagon Lily.—A dainty species from Western America, but in no wise showy and of doubtful garden value. Bulbs ovoid, white, as large as a hen's egg; scales much pointed and closely arranged; roots stout and few. Stems slender, green, 2 feet long, hollow, sparsely rooted below. Leaves in three to four whorls of ten or more each, confined to the lower portion of the stem, pale green, of thin substance, 2 inches long, broadly lance-shaped, widest near the tips. Flowers three to six in a loose umbel, under good cultivation in two tiers of four or five each, trumpet shaped, sub-erect, not reflexing, 1 inch to 2 inches long, 1 inch across, coloured dull red, and spotted dark purple internally, a lilac sheen suffusing the flowers one to two days after expanding. Not common in cultivation. Inhabits open woods of Humboldt County, California, and Oregon, growing amid a tangle of dwarf scrub.

CULTURE AND USES.—This is a shade-loving Lily that would associate better with Ferns in a cool situation, the bulbs being very liable to decay from excessive damp; it is almost necessary that the Fern's roots should encircle them. Where *Trillium grandiflorum* will thrive, *Lilium Bolanderi* will do so also.

L. Browni (Brown's Trumpet Lily).—A very beautiful garden Lily long grown in Europe, but whose origin is somewhat obscure, probably China. Bulbs 6 inches to 10 inches in circumference, much wider at the top than

at the base, white, composed of clasping thickened scales, almost flat on the top. Stems stout below, flexible, 2 feet high, curved towards the flower, the growing point nodding in a young state, purplish, producing masses of roots and one to three bulbils at the base. Leaves lance-shaped, three nerved, 6 inches to 8 inches long, longest, broadest, and recurving near the inflorescence, the lower ones mere bracts, which fall away early, leaving 6 inches to 8 inches of the stem bare. Flowers one to two, more rarely three, trumpet-shaped, of stout substance, nodding or horizontally poised, 6 inches to 8 inches long, tapering gradually from the base to the expanding mouth, coloured a rich ruddy brown externally, greenish internally when it first opens, changing to a pure white; the three inner petals and the margins of the outer ones not exposed to the sun in a bud state pure white externally, the coloured portions seen in strong contrast. Petal tips reflexing, stamens hairy at the extreme base. Agreeably fragrant. Not to be confounded with the Japanese *L. Browni* (*L. japonicum colchesterense*). Common in cultivation. Flowers in July. A very beautiful Lily, requiring a full exposure to the sun to develop its rich external colouring. Forced to flower under shade early in the year, it is pure white throughout.

Var. chloraster (Baker) is a robust variety collected by Dr. Henry in Central China in 1888. Bulbs, leaves, and stems as in *sulphureum*, but the stems do not bear axillary bulbils, and the leaves are mainly shorter and broader. Flowers 6 inches to 7 inches long, shaped like those of *sulphureum*, keeled green on the mid-ribs on both surfaces, yellowish white internally, flushed ruddy brown near the base externally, often covering the lower half of the flower. Filaments markedly hairy at the base. Closely resembles *L. sulphureum* in all superficial characters, differs in its green-striped petals, its hairy filaments, and in its internal whiter colouring. Not common in cultivation. Flowers in August and September. Inhabits mountains and glens in Ichang, growing in sheltered but not shady places.

Var. leucanthum (Baker).—See *L. leucanthum*.

Var. odorum (Baker).—See *japonicum colchesterense*.

Var. platyphyllum (Baker).—A strong-growing form, 4 feet high, with thickened, broad leaves, purplish stems, and two to three flowers of stout substance. Not common in cultivation. Flowers in August.

Var. viridulum (Baker) proves when cultivated side by side with *L. japonicum colchesterense* to be identical with it.

CULTURE AND USES.—The type plant, although we do not know its native habitat, bears unmistakable signs of association with low-growing shrubs in its suppressed leaves at the bases of the stems and its masses of stem roots. That the position is open we can gather from the fine development of the leaves at the top of the stems and from the poor growth it makes when grown in shady green-houses. The cultivation of this plant hinges upon protection of its bulbs, whose closely compressed scales hold water at their bases, and the bulbs decay as a consequence. We have tried many ways of preventing this. Planting the bulbs on their sides reduced the losses slightly, but with this species, as with many others, we have found a low carpet of vegetation helpful, and that each bulb thrives better if placed on an inverted pot (a small one, technically known as "thimbles," is a useful size). This scheme is the best known to us. Our practice is to plant deeply, to

THE LILIES.

(Continued from page 297.)

M. BAKERIANUM (Collett and Hemsley), a Lowi (Baker), Professor Baker's Lily.—An ant and valuable addition to our garden, though known long ago. Very distinct in shape and colouring of its flowers. 4 inches in circumference, white, purplish exposed, globose, very fibrous, roots stout of several years' duration. Stems very dry, smooth or slightly rough, 3 feet long, bearing one to three bulbils and a few roots at base. Leaves mere bracts below, largest

place the bulb on the inverted pot and surround it with sand, affording the site a mulch later, and finally to plant Pansies, Arabis, or other carpeters whose roots descend deeply, and in default of better plants to allow weeds to grow to a certain limit. Soils for this Lily should be light, and no manure should surround the bulbs.

POT CULTURE for greenhouses is a repetition of the treatment of *L. auratum*, the small inverted pot being again used instead of drainage, and soil added little by little as the stem roots develop. The forms of *L. Browni* more resemble sulphureum in growth and in cultural requirements. These prefer a well-tilled, well-drained soil, for their basal roots are unusually stout and active. Their bulbs are not liable to decay, and are altogether more hardy. We can recommend these for association with border plants of stronger growth, and for use in cultivated shrubberies. Their tall stature, greater vigour, and love of sunshine render them excellent garden plants, and quite easy to grow. They produce huge masses of stem-roots, hence should be buried deeply and shaded at the base, and they are excellent plants for pot culture, succeeding under treatment recommended for the type. Those forms whose beauty lies in their external colouring require full exposure to sunshine and air for two or three weeks whilst developing their buds, or the colouring will be scanty and irregular. October and November are the best months for planting.

L. bulbiferum (L.), the bulb-bearing Lily.—A familiar species, widely spread throughout Central Europe, and long known to cultivation. Its flowers are neat and of refined colouring, brighter and more pleasing than those of *Croceum*. Bulbs white, globose, 6 inches to 8 inches in diameter, roots mostly annual. Stems 2 feet high, slightly downy when young, bearing one to four copper-tinted bulbils in the axils of the leaves, especially near the top, basal roots numerous and strong. Leaves lance-shaped, scattered, 4 inches long. Flowers, five to eight in a compact umbel,

or dense spike if more than eight, erect, 5 inches long, 5 inches across. The petals spoon-shaped, forming a cup-shaped flower, coloured pale red, orange near the base, and minutely spotted black, the spots raised on petaloid processes near the base merging into the orange ridges which run down the base of each petal. Common in cultivation. Flowers in June. The probable parent of the garden race of erect-flowered Lilies known as *umbellatum*, which see.

CULTURE AND USES do not differ in any respect from those of other European erect-flowered Lilies. This plant grows in any good soil, and it associates well with the rank and file of border plants in full sunshine. It is very vigorous, and its stem-roots are numerous and strong, hence a carpet of low-growing herbs is desirable, though not essential.

G. B. MALLETT.

(To be continued.)

NOTES ON HARDY PLANTS

A FLOWER GARDEN ON A WALL.

SEND you a photograph of a part of a wall garden. The pink Hollyhocks and *Lilium speciosum album* are in the border behind. Growing in the wall are single Pinks, and on the left Hyssop, with *Saponaria ocyroides* below. On the right is *Arabis alpina*, and at the foot of the wall *Nepeta* (Cat Mint). This piece of wall was very pretty. I think the *Nepeta* is one of the best of wall plants; it remains in bloom for a long time. S.

DICENTRA CHRYSANTHA.

ALTHOUGH small in the number of species comprising it, the genus *Dicentra* contains several ornamental plants, one of the best known being probably the useful perennial *D. spectabilis*. A less common one is *D. chrysantha*, a handsome plant from California, where it is found growing on arid hills from Lake County to San Diego. Beginning to flower early in July, a plant which occupies a position at the foot of a south wall is still producing an abundance of its golden yellow flowers at the

end of October. It is not a suitable plant for the ordinary herbaceous border or for exposed situations, but requires a warm sheltered position in light soil. Under these conditions it makes a handsome bush-like plant 3 feet to 4 feet high, with finely divided tripartite leaves of a glaucous hue and long branching panicles of flowers. Apart from its flowers it is worth growing as a foliage plant alone, its freely branching habit and rigid leaves commending it for that purpose. A very shy seed producer; this fact may account for its scarcity in cultivation, and imported seeds do not generally germinate for a year after sowing, often failing altogether. With all these faults it is a plant that will well repay the extra care and attention necessary for its success. W. LEVING.

FUNKIA TARDIFLORA.

THIS comparatively new Funkia, which is illustrated on page 297 of THE GARDEN, was, as then stated, first sent to this country by Herr Max Leichtlin of Baden-Baden. Being much struck with its beauty at Kew two or three years ago, I wrote to Baden-Baden for particulars of its origin, and Herr Max Leichtlin, with his usual kindness and courtesy, sent me the following notes, which were at that time published in THE GARDEN, but which it may be interesting to repeat. Herr Max Leichtlin wrote: "About 1870 Mr. Thomas Hogg went to Japan and brought a large collection of Japanese plants to New York. That Funkia was among them, and the stock went to Woolson & Co., a nursery firm at Passaic, New Jersey. Anxious as I was, and still am, to procure novelties even from remote corners, I bought half a dozen plants, which were sent over under the name of Funkia sp. Thomas Hogg. I named it *tardiflora* on account of its late flowering." From this it may be gathered that the Funkia in question is one of many good things that are known for years before their merits are generally recognised, while on the other hand numerous plants become popular at once. T.

POLYGONUM CYMOSUM.

THIS is one of our best hardy plants, and can be highly recommended for the flower garden. The growth is rapid, and in good soil the plant will attain a height of 5 feet or 6 feet; it is never shabby in appearance at any season. It is one of the most useful of our autumn-flowering plants. It is at the time of writing (October 27) covered with beautiful white flowers, filling the air with its perfume. When planted away from other subjects it has a rather pretty arching growth, and therefore is not quite fit for forming centres or using in groups, so much as for planting singly on the turf, thus leaving it to take care of itself. It is also good for any position in which a bold and distinct type of vegetation is desired. When we come to have fine groups of hardy foliage plants in our gardens the use of such plants will be much extended. The soil should be deep and good. If the plant is to develop strongly labour necessary to grow it well should never be begrudged.

T. B. FIELD.

COLCHICUM TENOREI.

As winter draws near the few Meadow Saffrons still in bloom become the more interesting; they are happier in the bad weather than the Crocuses, though far less refined in their way than these charming flowers. Among the latest of the Colchicums to bloom in late autumn and early winter is *C. Tenorei*, which has been introduced to British gardens as *C. Bisignani*. It came into flower here towards the end of October, and given ordinary conditions will last in beauty for some time. It is not so large as some of the Colchicums, but

NEPETA AND OTHER FLOWERS ON A WALL GARDEN, THE RESULT OF EIGHTEEN MONTHS' GROWTH (COUNTY BERKSHIRE).

is bright and effective with its warm tone of deep-purple, while its sturdy habit enables it to stand more bad weather than some of the others. It is now making a bright patch of colour at the top of one of my rockeries. It is still rather pensive.

Carsenhorn, by *Dumfries*, N.B. S. ARNOTT.

THE ROSE GARDEN.

CRIMSON AND SCARLET ROSES FOR AUTUMN.

VALUABLE as these are in summer, how much more precious the brilliant red and scarlet varieties become in autumn days, when there is so much yellow and blue among mixed and annual flowers. The list of really excellent

ones for massing is comparatively small; I mean regards the bright-coloured Roses alluded to. In a fine bold bed there is no variety to compare to

Grües an Teplitz.—Its trusses of vivid flowers, though somewhat drooping, produce quite a gay mass of colour if planted fairly close and then hard pruned. This variety on standards is a splendid feature, and for a terrace wall 4 feet high there is no Rose more suitable, especially when the beautiful flowers come just over the wall, as they will the second season after planting.

Princesse de Sagan is another excellent variety, though one wishes its growth were more upright, but it makes amends for this in the intensity of its coloring. For a rich glow of colour the beautiful Rose

Noir des Rosomanes might be more frequently planted. It would be as well to treat it somewhat the same way as *Grües an Teplitz*. The two brilliant Monthly Roses

Cramoisi Supérieure and *Fabvier* cannot be omitted. The latter has the better habit of the two, being more rigid in growth, consequently more decorative. A splendid bed could be formed by planting *Fabvier* in the centre, then a circle of *Cramoisi Supérieure* or the old crimson China. There is another China Rose of rich colouring not to be met with, namely,

Marie Wolkoff.—Its flowers are of a very distinct shade of gooseberry-red. It has a peculiar effect in its green-centred blossoms, although towards autumn not so evident.

Marquise de Salisbury maintains its own as a brilliant bedding Rose. I am persuaded that such ones give far greater satisfaction when hard pruned each spring. This results in a more compact growth, and not only this, but those fine notes are produced from the base that always terminate in showy bunches of blossom.

Princess Bonnie and *Ma Tulipe* are doubtless closely related. Both are worth growing for their delicious fragrance alone, but apart from this their use, informal flowers produced so freely have a vocation for many individuals.

Francis Dubreuil is a lovely red Tea, best seen, perhaps, on a standard.

Sou. de Thérèse Level is another fine red Tea, so best on standards. The handsome Niphetos-sped buds can always be turned to a useful purpose.

Papa Gontier may, perhaps, be included here, though it approaches rather near the rich pinks in autumn, but any Rose even of this tint is very noticeable at this season of the year.

Liberty is somewhat disappointing in late September. There is a lilac shade to the older flowers, which is rather objectionable. I think this would not be so noticeable if we had a sunny time and the old flowers were frequently picked off.

Perle des Rouges must not be omitted from my list of brilliant autumn-flowering Roses. The great mass of colour, if open to improvement, is very useful just now. Among the Hybrid Perpetuals, a class that contains so many gorgeous specimens, there are few really good autumn-blooming ones. Some produce fitful if splendid individual

flowers, and, if space can be afforded, we should not omit them, as they undoubtedly hold the palm for fragrance. One variety especially brilliant just now is

Louis van Houtte, the rich coloured maroon shaded flowers being quite up to their summer excellence. Then there is another good sort,

Mme. Victor Verdier, whose globular-shaped double and sweetly fragrant blossoms, even though not so numerous as the Teas, are very precious. Other good bright-coloured H.P. sorts that will yield a fair number of autumn blossoms are *Senateur Vaisse*, *Dr. Andry*, *Ella Gordon*, *Duchess of Bedford*, *Alfred Colomb*, *Duke of*

NIPHETOS ROSE AS A POT PLANT.

Albany, A. K. Williams, Lord Bacon, Comte Raimbaud, Fisher Holmes, Victor Hugo, and Ulrich Brunner. The whole planted in one bed, giving most space to the last-named, would have a good autumn effect, especially if some of the sorts were in standard and half-standard form.

TEA ROSES IN PILLAR FORM.

I THINK we lose much of the beauty of Tea Roses when grown as pot plants by the stereotyped fashion in which they are usually trained. Perhaps the tying out of each growth to a stick is necessary where the perfect development of every bloom is required for exhibition, but apart from this a pot

plant is quite as elegant when growing upright, as shown in the illustration of *Niphetos*, and, moreover, one is enabled to grow several more plants in a house. Let anyone visit any large market establishment and he will find the invaluable old favourite *Niphetos*, together with *Bridesmaid*, *Perle des Jardins*, *Sunrise*, &c., all growing in this pillar form. How charming they are with their large perfect blossoms, so free from all artificiality. Just a centre cane is sufficient, the side growths as they develop being gently looped to the cane. There are some who decry the drooping blossoms of certain sorts of Tea Roses, such as *Souvenir d'un Ami*, but to me they are delightful, and seem specially designed to protect the exquisite flowers from rain, so that I should never condemn a Tea Rose because its flowers drooped, but would use all means to counteract this by growing such sorts on standards or training them in the form illustrated above.

ROSE FRAU KARL DRUSCHKI.

UNMISTAKABLY this Rose is the finest novelty of the last few years. What a pity its original name of *Snow Queen* was not adopted, for it is the most regal of all the white Roses grown. The grand half-open flowers with their deep rigid petals are models of beauty. The tarnished outer petals are unavoidable in our climate outdoors unless the blooms be protected; but under glass this disappears, so that we have in this variety a forcing Rose of the first order. If we can obtain Hybrid Perpetual novelties such as this, with its splendid autumn-flowering habit and extraordinary vigour, the Hybrid Teas will find formidable competitors for popular favour. But after all is not this Rose as much of a Hybrid Tea as some others already in the group? I think the words "Hybrid Tea" will soon need to be revised. Cannot some one coin a word that will express all that is necessary without opening the door to dissension as to which group certain free-flowering Roses should belong to?

ROSE KILLARNEY.

THE delicate fragrance of this delightful Rose never seems so noticeable as in the October days, when the deep-petalled flowers remain on the plant quite a long time, considering the semi-double nature of the variety. There is this peculiarity about the Rose that, instead of its colour being heightened in autumn, as is the manner of most Roses, they come several shades paler, and are, if anything, more beautiful. The pale pink tint is suffused with a flesh-white just now, quite too beautiful to describe. The Rose appears to be one of those that must grow freely. If at all stunted, then the huge petals diminish in size, and the flower is not nearly so attractive. To maintain the necessary vigour and substance of petal the plants should be transplanted when the vigour seems to be on the wane, taking the precaution when so doing to work into the soil a little bone-meal, say about a handful for each plant. Killarney makes a fine standard or half-standard. Anyone desiring a long-budded pink Rose for a coat flower should grow a good number of this variety.

PHILOMEL.

ROSE ETOILE DE FRANCE.

THE Rose growers have been waiting, like queenless bees in a hive looking out for a new ruler, for a good red Rose to have the qualities of an exhibition bloom on one hand, an abundantly free and continuous blooming habit on the other, a decidedly good colour, a sweet perfume, and vigour. All these qualities are embodied in the new Rose *Etoile de France*, which Mr. Pernet Ducher of Vennissieux-les-Lyon, France, now gives to the world. It is just what was wanted to put beside *Kaiserin Augusta Victoria*, *Caroline Testout*, *Mme. Ravary*, *Mme. Pernet Ducher*, *Hon. Edith Gifford*, and the other beautiful and continuously flowering Roses which form our growing kingdom of the decorative Roses. *Etoile de France* will be as popular among the dwarfs as *Gloire de Dijon* has been among the climbers. As a matter of fact in colour it nearly approximates to *Fisher Holmes*

with a glow of scarlet bloom on its petals, which suggests Victor Hugo, while as for perfume it is the true otto of Roses, which we all like, with just a reminiscence in it of the bouquet of La France, which may possibly enter into its pedigree. Its advent marks a great advance in our gardens, and it is just what was wanted. THE HERMIT.

ROSE JERSEY BEAUTY.

THIS, one of the most elegant of the wichuraiana Roses, is now so well known that little need be

ROSE JERSEY BEAUTY AS A POT PLANT.

said in its praise. Its glossy foliage and large creamy white single blooms are very beautiful, so wonderfully like a Cherokee Rose in all save colour. The illustration shows what may be obtained by growing the plants in pots and in columnar form, and doubtless they will be almost as largely grown for this purpose in the future as they are for clambering over rocks and banks. Although the single varieties are remarkably handsome, I imagine it will be such sorts as Dorothy Perkins that will be in most request. I know nothing more elegant in

the way of Rose sprays than this lovely variety, and, of course, being double, the flowers are more lasting than the singles.

ROSE WHITE LADY.

THIS splendid Hybrid Tea is as yet unsurpassed, not only for exhibition, but for garden decoration. In June it is probably seen in its most beautiful form, for then the grand creamy white petals have a purity of tint not quite so pronounced later on. But at all times, even in the October days, good blooms may be culled that cannot be equalled by any other Rose of its colour. Somehow the very vigorous Roses, such as Margaret Dickson, are embarrassing in their vigour, whereas with White Lady one may plant them quite close, even to 1 foot apart, and a most effective mass of blossom results. If a taller centre were desired to the bed a few plants of Admiral Dewey would harmonise with White Lady. PHILOMEL.

ROSE MME. ISAAC PEREIRE AT ARBIGLAND, N.B.

ALTHOUGH the more recently introduced Roses are well represented at Arbigland, Dumfries, none of climbing or semi-climbing habit has proved more useful than this Bourbon Rose, which appears to be at its best in cool yet sheltered situations near the sea. In some places it is a poor summer Rose, and it is only in autumn that it is in perfection there. This summer it was unusually fine in some gardens, but at Arbigland it seems to come in good condition every summer as well as in autumn. I saw it there in the second week of October, and the blooms were of splendid colour and size, just as they were in the earlier months, and as they were in my own garden. Close to it on an arch was the Hybrid Tea Duchesse D'Auerstadt, but this, although of lovely colour, has not produced its blooms with any degree of plenty. It seems more suited for a warm wall when in cool gardens, while Mme. Isaac Pereire is perfectly at home in these on an arch or trellis. In the south-west of Scotland, especially near the sea, this Bourbon Rose is almost always a success in any form, and I know a garden where, as a standard, it is one of the best features of a fine border of hardy flowers. S. A.

TREES AND SHRUBS.

PRUNUS SPINOSA PURPUREA.

NOT many varieties of shrubs with red-tinted leaves are found in our gardens. Not to mention those which are brilliant only in autumn, there are some, such as the purple Hazel, the purple Berberis, and the purple-leaved Myrobalan Plum (better known as Prunus Pissardi), which preserve their colours during the whole season, taking a slightly greenish tint only towards the end. A Plum tree with leaves of a deep violet, and of vigorous and arborescent vegetation, is also found in the St. Julian. But we have not yet seen any variety of the hedge Sloe (Prunus spinosa) assume the red colour. The varieties of this known in collections are confined to those with double flowers, to P. s. fruticans, and to the equally vigorous P. insignis, which Carrière has already made known, and which resembles P. insititia L. This last seedling indicates that our common Sloe has a tendency to variation which may perhaps be put to profit. By cultivation its appearance changes, its branches become more slender, its thorns partly disappear, and its dimensions increase. It is no longer the Blackthorn, dwarfed and spreading—the plague of bad soils, so difficult to extirpate, but a bush which rapidly becomes civilised.

The variety which we would draw attention to is a proof of this. It is Prunus spinosa purpurea. Though discovered amongst a number of seedling Sloes, it is more vigorous than the type, less thorny, quite as floriferous, and has rather larger foliage. Its branches are erect, tapering and

striated with deep reddish violet, as are also the short petioles and the under surfaces of the leaves, covered with down while young, though afterwards smooth. The upper surface of the leaf is deep green marked with red, the under surface entirely wine red. The flowers, which we have not yet seen, are said to be pale rose. This number red tint will make a pleasing change among the foliage of our shrubs. If the plant preserves the propensity of the type to branch out and spread, it could be utilised among rocks in the driest soil. This novelty has been obtained by one of the cultivators employed by M.M. Barbier et Co., horticulturists of Orleans.—ED. ANDRÉ in *Revue Horticole*.

POLYGONUM BALDSCHUANICUM.

POLYGONUM BALDSCHUANICUM, which came originally from Turkestan (where it was found in 1860 by Regel), is a plant whose branches, woody at the base, may attain a length of 7 yards or 8 yards in the course of a year. The leaves are alternate, small, heart-shaped, glabrous, and of a beautiful green colour. The flowers are white, slightly tinted with pink. "Winged" fruits succeed the flowers. These are at first white, afterwards black, and contain one seed each. About the end of this creeper is covered with flowers, and blossoms again from August until the frost comes. It is therefore, in flower during the whole of the summer, and its use for garnishing arbours, trellis work, walls, or the stumps of old trees is self-evident. It grows vigorously, and cares but little for the nature of the soil, though it does not like soils which are too dry. For decorating walls it is preferable to plant it on the east or the west, for on the north it gives but few flowers, and on the south the leaves are often scorched during the summer.

During the summer pinch off the shoots which are useless. The buds which develop on the pinched shoots generally expand late in the season. Pruning consists in cutting out the dead wood and in suppressing the branches which have become tangled, as well as those which have become

Contrary to what has often been said, propagation is very easy and its methods numerous: First, by heeled cuttings about 25 centimètres long, made in winter from well-ripened shoots, and put into light soil in the greenhouse (since 1890 I have operated in this manner, and have been successful with seven or eight out of ten); second, by heeled cuttings 5 centimètres or 6 centimètres long, taken in January or February, and placed in soil in the propagating house; third, by small cuttings of half-ripened wood, 5 centimètres or 6 centimètres long, taken in August, and put in sand under bell-glasses in the shade. Layering in winter the woody branches give good results. This plant can also be multiplied by seed, but this method is rarely employed, for the seeds are seldom fertile in our climate. Polygonum baldschuanicum is hardly planted in a cool soil, in the Department of Flakou on the banks of the Creuse, at an altitude of about 300 feet, it has since the spring of 1899 withstood a temperature of 14° below zero (Centigrade).—RENE RAMBAULT in *Le Jardin*.

PLANTING TREES AND SHRUBS.

PREPARATION OF THE GROUND.

THE preparation of ground for the planting of trees or shrubbery is as much a matter for consideration as the question of when to plant or what to plant. Due importance is frequently not given to this fact. Trees and shrubs are often crowded into holes that are not large enough to permit even their roots being extended. Such planting generally is accompanied by a lack of subsequent cultivation, and the result is failure.

A proper preparation of the ground (when intended for mass planting) entails ploughing and subsoil ploughing, continued in cross directions until the ground is thoroughly broken up and reduced to a mellow condition. Should humus or organic matter be deficient in the soil, this should be corrected by a dressing of stable manure, peat,

or other organic matter. This treatment will ensure a condition of the soil which will make it hold moisture and assimilate fertilisers. In dry, sandy, or gravelly soils too much importance cannot be given to the value of surface mulching, or constant cultivation, after planting.

For single specimen trees, or for widely spaced trees, holes for planting should be prepared of not less than 15 feet square and 3½ feet deep. If the soil is good a simple loosening up, with an admixture of stable manure or peat, will be sufficient; if of sand or sterile gravel, and the best results are desired, it would be better to excavate the whole and substitute loam. "A silk purse cannot be made from a sow's ear," neither can a tree be grown to fine proportions unless the proper conditions are given.—J. A. PETTIGREW in *Bulletin New England Park Superintendents*.

THE INDOOR GARDEN.

THE TURK'S CAP OR POPE'S HEAD CACTUS.

(MELOCACTUS COMMUNIS.)

NOT uncommon in the West Indian Islands is this very remarkable Cactus; in some of the islands it grows in large quantities, covering tracts of dry, apparently barren soils with its conical, fleshy, spined stems, bearing long-sleeved red caps. The view here shown is in the small island of Barbuda, one of the group known as the Windward Islands, where this Cactus finds all it requires in shallow pockets of soil in the hard rock. Some of the plants shown must be of great age, judging by the rate of growth of cultivated examples, the largest, according to Sir Joseph Hooker, being two or three centuries old. Additional interest attaches to this species from its having been the first Cactus introduced into Europe, living plants of it being known in London in 1581. Its manner of growth is peculiar. The stem is at first globose, becoming cone shaped with age, and it consists of a mass of solid sappy flesh enclosed in a thick skin formed into ridges, on the edge of which are clusters of short, stout, sharp spines. On the summit of the stem, when old, there is developed a cushion-like growth of thickly matted white hair and crimson spines, nestling among which are the small fleshy tubular red flowers, generally succeeded by the red berry-like fruits containing seeds. In the first year this cushion is only about a quarter of an inch high, the next year half an inch, and so on. The largest plant I have seen in Europe was at Kew in 1897, its dimensions being: Height, 20 inches; diameter at base, 15 inches; number of ridges, twenty-two, with twenty starlike clusters of spines on each ridge; the "cap" measured 8 inches high by 5 inches in diameter; and the weight of the plant was about 1 cwt. There are several very good examples of this Cactus at Kew now. Large plants are difficult to establish in this country; Kew is, therefore, fortunate in being able to obtain a supply from the curator of the Botanic Garden at Antigua (Mr. W. N. Sands), to whom we are indebted for the photograph here shown.

W. W.

EARLY-FLOWERING BULBOUS PLANTS.

Among desirable bulbs and roots for forcing, and with the object of producing a regular supply of flowers from Christmas onwards, the various forms of Iris are most valuable. Their cultivation is easy, very little forcing is required, and the price is low. For a few pounds a collection of bulbs may be had which will produce a charming lot of flowers during the period named.

A gritty, sandy loam, with a little leaf-soil or old Mushroom bed manure and some silver sand spread about the bulbs or rhizomes suits them well. Iris reticulata and others of this section require only a cold frame and the protection of a mat in frosty weather to have them in bloom by Christmas; six to eight bulbs in a 5-inch pot will produce a charming pot of choice small flowers. These may be followed by *I. persica* Heldreichi and the Spanish Iris, which require but little forcing. They make more foliage, and the flowers are borne on stout, fairly long stems, which make them useful for cutting. The flowers are durable, and also stand for a long time after being cut. *Allium neapolitanum* is another bulbous plant worthy of more general cultivation. These may be potted three to five bulbs in a pot, and if placed in a cold frame and covered with fibre or fine ashes until root action is well established, then they may be removed to a light greenhouse and given a temperature of 45° to 50°. *Anemone coronaria*, *stellata*, and *fulgens* may be had in bloom during midwinter by planting the roots 2 inches to 3 inches apart in boxes filled with light rich soil, placing them in a cold frame until growth is well advanced, when they may be removed to a light position in a greenhouse, where they will produce a mass of useful flowers for cutting.

The Calochorti, beautiful as they are, are not yet in general favour. They may be grown in pots in light, sandy soil, and should be plunged 3 inches or 4 inches overhead in fine ashes, and during the winter be protected from damp by having a light supported on brick piers placed over them until growth commences, when they may be placed in a pit or cool house until they come into flower. One of the most useful for early spring is the early-flowering section of

Gladiolus, such varieties as *Blushing Bride*, *cardinalis*, *Colvillei*, *formosissima*, *insignis*, *Prince of Orange*, *Lucretia*, *Ne Plus Ultra*, &c. There should be potted five to seven bulbs in a 6-inch pot in light rich soil. The pots may be plunged in fine ashes on a sound dry bottom out of doors or in a

cold frame. As growth commences raise them out of the plunging material and gradually inure them to light. Then force them gently according to the time they are wanted. *Lachenalia pendula gigantea* is also a desirable bulbous plant for either pot or basket cultivation. This should be grown in a greenhouse and introduced to a little heat as growth progresses.

Fritillaries.—*Aurea*, *Meleagris*, *imperialis*, *kamschatka*, and *pubica* should also now be potted up, placing three to six bulbs in a pot in almost any ordinary soil. Treated similarly to the *Gladiolus* and other things named above they add variety and interest to the show houses or conservatory during the early months of the year. J. JACQUES.

SOME NEGLECTED PLANTS.

CLERODENDRON DISPARIFOLIUM.—This is rarely seen, yet well worth including in a collection of warm house plants. It grows 5 feet or 6 feet high, and at the ends of the shoots and upon short lateral growths also panicles of white faintly-scented flowers are produced, and make a pretty display. In the Water Lily house at Kew this *Clerodendron* is planted in a narrow border quite close to the side of the house, and there, with little soil and plenty of moisture, particularly in the atmosphere, it thrives well. It is a native of Malay.

Ipomœa digitata, in the same house, affords an excellent example of the luxuriant manner that tropical climbers will grow even in hot houses in this country, for it has almost encircled the Water Lily pond that occupies the centre of the house. During the summer and even well into the autumn flowers are never absent so continued is the succession, for the individual blooms do not last long. They are of a lilac-purple colour. The appearance of pillars in the stove would be much improved if covered with this *Ipomœa*, for besides the attractiveness of the flowers, the deeply divided leaves are handsome in themselves. The plant grows freely during the summer, and needs to be pruned hard in winter.

THE TURK'S CAP CACTUS IN THE WEST INDIES.

Sanchezia nobilis is well worth growing as a foliage plant; its chief value lies in the leaves, which are fairly large, green, and prettily striped with yellow. It grows to about the same size as a Croton, and, in fact, might well be made use of with Crotons, Dracenas, &c., for decorative purposes, although probably it would not withstand much exposure to cold and draughts. It is worthy to rank among the best ornamental foliage plants, even if always kept in the stove. The yellow tubular flowers are enclosed in reddish green bracts, and add not a little to the plant's attractiveness.

Ruellia macrantha, with rather large rose-coloured flowers, is comparatively rarely seen in gardens, yet it is a plant of considerable beauty. The flowers, which remind one a good deal of a single bloom in a Rhododendron truss, are of a very attractive colour, and being of good size at once attract attention. This *Ruellia* is of easy culture, and

cuttings inserted in the spring strike readily. A stove or intermediate house is necessary for the best results to be obtained.

Ipomœa rubro-cerulea. — Several notes have lately appeared in THE GARDEN about this beautiful climbing plant and its value out of doors in the south-west counties of England. From experience of it under glass I can only say that it is worthy of every encouragement. No hot house climber that I know has more lovely flowers. They are a rich, rather pale blue (sky blue would, perhaps, best describe them, if a sky such as one sees in the south of France or Italy would be understood), fading as they age to a reddish colour. They last but one day, but fully make up in beauty what they lack in persistence. A pillar or rafter covered with this *Ipomœa* in flower is a lovely sight, and one that to be appreciated must be seen. In the T range at Kew several plants are grown,

and at the present time are flowering well. Private gardeners might with great advantage introduce a few plants of *Ipomœa rubro-cerulea* into their hot houses, for one does not often see it outside botanic gardens. It is the case with this as with many more valuable and beautiful plants; if they were only better known they would be more widely grown.

Eranthemum Andersoni may also legitimately be classed among neglected plants. It does not make a striking display it is true, but its flowers are very pretty, freely produced, and make the plant a valuable one for decorative purposes. They are white, except for the lip, which is covered with purple spots, and are produced in small heads at the apex of the shoot. Like other *Eranthemum*, *E. Andersoni* is easily propagated by means of cuttings. It is, perhaps, hardly necessary to mention another *Eranthemum* (*E. pulchellum*), now known as *Dedalacanthus nervosus*, a most useful plant that bears blue flowers, and is especially valuable in late autumn and winter. It continues to flower throughout a long period; it may be easily increased by cuttings also. Old plants cut back and grown on again the following year produce a profusion of flowers.

Stigmaphyllon ciliatum. — This may be briefly described as a stove climbing plant, bearing *Oncidium*-like flowers. These are of a rich yellow colour, and in shape much resemble those of an *Oncidium*. It has the merit of flowering for many weeks. Brazil is the home of this climber, whose growth is rather slender. Careful watering is more necessary than with plants of a robust habit of growth. A. P. H.

GARDEN ORNAMENT.

LEADWORK.

(Continued from page 301.)

AS might be expected, in England, where marble is rare, and may not be exposed to our humid climate with impunity, leadwork for garden decoration soon began to be very popular, and there are still to be found in many old Caroline and early Georgian gardens admirable and exceedingly well-preserved leaden casts of renowned statues. Unfortunately, most of these statues were coated with white or cream-coloured paint, and even bedaubed in all the colours of the rainbow. Not many years ago I was surprised to find in an old garden in Norfolk that some large vases which looked as if they were made of terra-cotta turned out, on being scraped with a knife, to be in reality lead. There is no necessity for concealing this material, since nothing makes a finer effect against a background of that rich yet soft and varied green which is so peculiarly English than the dull silver grey of lead. Gray evidently admired our older sort of English garden, with its leaden statues and vases, for he says in one of his letters dated from Pembroke College, 1769: "How charming it must be to walk in one's own garden and sit on a bench in the open air with a fountain and a leaden statue, and a rolling stone and an arbour. Have a care, though, of sore throat and the ague" (*sic*). Throughout the last century leaden statues reigned supreme, not only in lordly gardens in the country, but in those of the metropolis, and to this day in the dilapidated gardens at the back of many old houses in Bloomsbury there may be found leaden statues and vases and some extremely large tanks. In the house No. 12, Buckingham Street, Strand, is a very handsome leaden tank of the time of Queen Anne, bearing the initials "A. R." and the date 1707.

The Dutch modeller Van Nost established himself towards the middle of the last century

LEADWORK: MERCURY AT MELBOURNE HALL, DERBY

in St. Martin's Lane as a lead statuary in succession to Mr. Cheere, who had served his time for many years with his brother, Sir H. Cheere, in the same business. It seems that both predecessor and successor did a very important business, and cast in lead figures, as large as life, which, Heaven forgive them! "they frequently painted to resemble Nature." Their stock included representations of Venus, Juno, Minerva, and the Apollo Belvedere, as well as Mr. Punch, Harlequin and Columbine, Moors, haymakers "resting on their rakes," gamekeepers, and Roman soldiers "with fire-locks." They seem, above all, to have done a specially brisk trade in the reproductions of a certain African slave upholding a sundial on his head, a specimen of which is still to be seen in the Temple Gardens. This particular statue appears to have been brought from Italy late in the seventeenth century by Holles, Lord Clare. I think, however, it will be found to be a cast of a bronze by Petro Tacca, the sculptor of the famous group of galley slaves in the Piazza at Leghorn, identical with it in every way, which I have seen in several Italian gardens, notably at Florence. It is quite evident that this African is an old stager, and a very admirable one, and it is a great pity some of our modern lead workers do not reproduce him, for he is highly decorative, looks admirable in the Temple Gardens, and would doubtless appear even more picturesque amid the sylvan surroundings of a country garden. Very delightful, too, are the pretty groups of Cupids at Melbourne, which, judging from their style, are apparently of French workmanship of the eighteenth century.

(To be continued.)

FLOWER GARDEN

THE ACONITUMS.

ENTIRELY confined to the Northern Hemisphere is this extensive genus, its species being chiefly European and Northern Asiatic, a few only being found in North America. The nomenclature is in a state of some confusion owing to the great number of names and various opinions of different authorities. While the "Genera Plantarum" gives eighteen as the number of species contained in the genus, the "Kew Index" recognises over sixty. Reichenbach, who made a critical study of the genus, described and figured about seventy species. Many of these, however, closely resemble each other in habit and form of flower, the specific

differences being founded on small characters which are not always constant. Seven is the number given as inhabiting the Himalayas in the "Flora of British India," but if critically revised on Reichenbach's lines the number from that region would probably be trebled. The genus is also well represented in China,

Mostly tall growing perennials of handsome appearance, some are inhabitants of woods, others are alpinists growing in mountain pastures, while some are found in moist, humid places as those in the Himalayas. Few flowers are more curiously formed than those of this genus. Their ornamental part is the calyx, which is divided into five sepals, the upper one of which forms a kind of helmet, supported by two large side sepals, while the other two, which are much smaller, hang down behind. Beneath the helmet are the petals, curiously folded up so as to form a kind of pouch at the upper end, while the other is drawn out into a kind of claw, these curiously formed petals being called nectaries.

The flowers are produced in paniced racemes of varying density and length, the colour ranging from blue to purple, pale yellow, and white. The leaves are variable, being finely divided into linear lobes in some species, whilst the leaves of others are almost entire. The roots are partly fleshy, generally forming small Radish-like tubers just below the surface of the ground. These tubers are poisonous in most of the different species.

Most Aconites grow with luxuriance in good rich soil, but this is not essential, as they are not at all particular, flourishing in the most indifferent soil. The stronger growing species and varieties are especially suitable for planting in open woods or for use in the herbaceous border, soon making strong clumps, which are very effective. By lifting the plants and separating the tubers in the late autumn after flowering, or in the spring, the former for preference, they may be rapidly increased, as also by seeds, which should be sown as soon as they are ripe. The following is a selection of some of the most distinct species in cultivation:—

A. Anthora (Wholesome Wolf's-bane).—Rather a dwarf species, with palmate leaves cut into linear lobes, and yellow flowers in a lax raceme. The upper sepal of the flowers of this plant is exactly in the shape of a helmet, having even a little peak in front like a traveller's cap. There are several varieties of this species, probably due to its wide distribution, which extends over Europe and Northern Asia. It flowers from June to August. Introduced before 1596.

A. barbatum (the Bearded Wolf's-bane).—In cultivation since 1807, this singular species has yellowish flowers, densely bearded at the lower part with long white hairs. The helmet is conical, forming a long, narrow pointed cap. It varies in height, according to the richness of the soil in which it grows, from 2 feet to 6 feet

ACONITUM WILSONI. (Natural size. From a drawing made at Kew.)

eight species being enumerated in the "Flora Sinensis," but since this was published other species have been found and described, considerably increasing the total. In North America only five species are found.

high. Known also as *A. squarrosus*, this species is a native of Siberia. July.

A. Carmichaelii.—This species is met with in cultivation under the name of *A. autumnale*, growing from 3 feet to 4 feet high, with dark blue-purple flowers in August. China.

A. chinense.—A very handsome species, known also under the names of *A. Fortunei* and *A. japonicum*. Its stout, branched stems attain a height of from 4 feet to 6 feet, bearing large compound racemes of intense bright blue flowers. The lower leaves are large, on moderately long, channelled petioles, deeply cut into three cuneate segments almost to the petiole, the upper leaves being almost sessile and gradually passing into more or less entire bracts amongst the upper flowers. A native of China, whence it was introduced in 1833. August.

A. columbianum.—Rather a weak-growing plant, 2 feet to 4 feet high, bearing lax, pubescent panicles of small, pale dull blue flowers, the helmet of which is higher than broad. Known also under the name of *A. nasutum*, this species inhabits moist ground from British Columbia to California and east to the Rocky Mountains.

A. heterophyllum.—This distinct and ornamental species is found on the lofty mountains of the Himalayas, 9,000 feet to 10,000 feet above sea level. It is remarkable for its leaves, the upper ones being sessile, cordate, with a toothed margin, and the lower ones on long petioles, deeply toothed, and sometimes slightly lobed. The flowers, which are disposed in a paniced raceme, are large and roundish, with a semi-circular, pubescent helmet. The entire leaves of this species are characteristic of all the Nepal species, two other closely allied ones being *A. ovatum* and *A. cordatum*. Introduced in 1840.

A. Lycoctonum (common Wolf's-bane).—A rather slender-growing plant, with stems 4 feet to 6 feet high, bearing pubescent, branching racemes of good-sized, livid violet flowers. The bottom of the helmet is cylindrical, with an elongated beak. A native of Europe, it flowers in July. 1596.

A. Napellus (common Monk's-hood).—Perhaps few plants are more common in gardens than this species in its various forms, its tall and vigorous habit of growth and its showy flowers making it a general favourite. Distributed over the Northern Hemisphere, it has been in cultivation for several centuries, and is frequently found wild in England, though these are probably escapes from gardens. There is a white variety of this species, and also one with variegated blue and white flowers.

A. orientale (pale yellow Wolf's-bane).—Closely allied to *A. Lycoctonum* and *A. vulparia*, this hardy perennial is a native of the mountain pastures of the Caucasus, flowering in July and August. It is sometimes met with in a wild state, having white flowers. Also known as *A. ochroleucum*. 1794.

A. paniculatum.—A very pretty species from the lightness of its elevated helmet, its hairy or pubescent panicles of large violet flowers and flexuous stems 2 feet to 3 feet high. Flowering in August, it is a native of the European Alps, and was introduced in 1800. A closely allied species is *A. cernuum*.

A. reclinatum.—An inhabitant of wet woods on mountain sides in the Alleghanies, with stems 2 feet to 3 feet high and loose, leafy, rather few-flowered panicles of dull white or yellowish flowers varying to purple.

A. rostratum (the Beaked Monk's-hood).—A very distinct and pretty species, known by its elongated, compressed helmet. Flowering in July and August, it only gets from 2 feet to

3 feet high, producing its numerous violet-coloured flowers in a spreading panicle; a native of the Alps of Central Europe, it has been in cultivation since 1752; variable in the colour of its flowers—there is a pure white variety, and another one white, slightly tinged with violet or blue.

A. stierckianum.—A very showy plant, which produces its large purple-shaded flowers in August. When grown in good soil it attains to a height of 4 feet to 5 feet. It is a native of Austria, whence it was introduced in 1820. *A. s. var. bicolor* is a native of Switzerland, with blue and white flowers.

A. uncinatum.—A handsome tall-growing species, with panicles of large deep purple flowers. It is the best and most showy of the American species. The broad, lobed leaves are firm in texture, and the flowers are borne on loose panicles, with diverging branches. The hood of the flower is half an inch high and strongly saccate. It grows in moist ground along the mountains from Georgia to Pennsylvania, and flowers in late summer.

A. variegatum.—A very elegant little plant, varying in its different forms from 1 foot to 6 feet in height. The typical plant grows about 2 feet, having flowers variegated blue and white. There is a form with white flowers. Native of the Alps of Central Europe; it was introduced in 1597.

A. volubile.—A Siberian species, distinct on account of its twining stem, a character not at all common in this genus. The flowers are blue, with a sub-conical helmet, the boles of the leaves being pinnate, with linear lobes.

A. Vulparia.—Somewhat similar to *A. Lycoctonum* in form of flower but not in colour. It is sometimes met with under the latter name. The pale yellow flowers are produced in crowded racemes on stems 1 foot to 3 feet high. The helmet of the flower is cylindrical, with a stretched-out beak. A native of Europe; it was introduced in 1821. There are several well-marked forms of this species, two of the most distinct being *A. V. carpaticum*, with flowers of a lurid colour sometimes variegated with yellow, from the Carpathian Mountains; and *A. V. moldavica*, with violet flowers, from Moldavia.

A. Wilsoni, the subject of the illustration, is one of the finest of all the late-flowering kinds. It is a tall, handsome, erect-growing plant, commencing to flower in the beginning of September. After the terminal raceme is over branches are produced lower down the stem, extending the flowering season till the end of October; well known by the name of *A. Fischeri*, under which it is figured in the *Botanical Magazine*; this plant is also met with as *A. autumnale* and *A. californicum*. When collecting in China Messrs. James Veitch and Sons' collector, Mr. H. Wilson, found this plant and sent it home. Flowering at Coombe Wood nursery in 1902, it proved to be identical with the plant figured in the *Botanical Magazine* as *Fischeri*. *A. Fischeri*, however, as figured by Reichenbach is a different plant, so a new name was necessary for this, the name adopted being *Wilsoni*, after the finder; flowers violet in colour on stems 5 feet to 6 feet high.

Keew.

W. IRVING.

AN HOUR WITH THE HOLLYHOCK.

(Continued from page 299.)

In preparing the ground for planting, it should be dug two-spit deep. Where spring planting is intended, throw up the earth in ridges in autumn, that it may become mellowed by the winter's frost. In all cases this practice is bene-

ficial, but it is especially so where the soil is of close texture or retentive of moisture. A good dressing of manure, not too far decomposed, may be strewn over the soil previous to ridging, and mixed in during the operation. One advantage of this is, the manure will keep the clods light and give the sun and air a free entry; and, further, the soil will become more evenly impregnated with the nutritious properties of the manure as they are washed down by the rain. One point, when planting of too great importance to be overlooked, is the state of the ground. To use a common gardening phrase, the earth should "move like an ash-heap" at the time this work is done; rather would we wait a fortnight beyond the most advantageous season than plant when the ground is wet or clammy. The plants should be set firmly in the ground 3 feet apart, not too low, pressing the soil well round the neck with the hands or by a gentle stroke of the foot. This done watering must be attended to if the season be dry, using weak liquid manure, breaking the surface of the ground with a hoe the day after the water is given. Frequent loosening of the surface of the soil is indeed an important part of culture, and should be attended to throughout the whole of the growing season.

Autumn planting is very good for hardy free-growing sorts, provided the plants are sufficiently strong to be planted out early in October; otherwise we should advise their being kept in pots under glass during winter, and transferred to their permanent places early in May. Vigorous healthy plants of hardy sorts, when well established, seldom suffer much from the frost of winter when growing in the open air provided the soil be well drained; but where the sorts are delicate, the plants feeble, or not well rooted, it is far otherwise. We know an instance of an amateur losing nearly one-half of his stock during winter, the plants being in the condition last described. In all cases it is a wise precaution to earth up the plants remaining in the ground at the close of autumn, that the rain may not settle around them; and if a few small hand-glasses can be spared to shelter any rare or delicate kinds so much the better. Bloomed seedlings are almost invariably strong, and may be transferred to a permanent situation in the garden immediately that the flowering is over; other seedlings, whether raised in autumn or spring, should never be planted out until the end of April or early in May.

When transplanting is done in autumn, the plants should be guarded during the first winter against the injurious effects that may arise from changes of the weather. When a sudden thaw succeeds frost it is no uncommon thing to find the plants upheaved, and their roots partially exposed. It may sometimes be advisable to replant them; but in most cases the necessary end may be attained by drawing the soil around them when dry and pressing them gently back with the foot.

It is worthy of remark that the season of flowering may be greatly prolonged by striking and transplanting at different seasons. There is a great difference in the period of flowering between plants removed early in autumn and late in spring; and of this we may avail ourselves to lengthen the succession or to obtain a full bloom early or late, as particular circumstances may require. Early-rooted cuttings and old plants may be induced to bloom in July, and late-rooted cuttings and spring-grown seedlings in November. Hence there will be no difficulty in obtaining a supply of flowers for four successive months. This is a feature in the Hollyhock well worth noticing.

As is well known, many of our noble mansions are little visited by their proprietors except in the autumn and winter months, and every effort is required to make the garden as attractive as possible at those seasons. In such cases the Hollyhock is an indispensable flower, and should be planted in masses of colour, especially in those situations where seen from the principal walks or windows of the mansion.

Every flower has its enemies. The Dahlia has to battle with the thrip and earwig; the Pink and Carnation require protection from the wire-worm; the enemies of the Rose are "legion," and the Hollyhock suffers from the slug. It is in winter and early spring that these creatures feast on the leaves with most relish; and as a preference is shown to the youngest the loss is all the greater, for they are most actively engaged in administering to the wants of the plants. Happily for us our enemy is not remarkable for agility. Slug-traps are numerous and well known to all who

protection. For this purpose an inverted flower pot answers admirably. It may be placed over the plant in the evening, and removed again with the rising of the sun. It should be borne in mind at this stage of culture that the Hollyhock is a lover of moisture, and water should be given abundantly, especially during dry weather.

WILLIAM PAUL, F.L.S.
(To be continued.)

THE FRUIT GARDEN.

HARDY FRUITS IN SEASON.

PEAR MARECHAL DE LA COUR.

UNDER the name of Conseiller de la Cour this Pear is equally well known. Although it has been grown in this country for at least half a century I do not think its merits have ever been fully recognised by fruit growers. In the southern counties I consider this variety one of

season a month earlier or later than those from the other. It is always a temptation to plant the finest Apples that can be got—though there is pretty great diversity of opinion as to which are the finest—but, as stated above, the very finest sorts, like the most beautiful strains of certain flowers, need a deal of culture, and unless one has very favourable conditions indeed for Apple culture, and is prepared to give them a good deal of personal attention, or to commit them to the attention of a skilled gardener, it is better to be contented with good and well-tried sorts that are hardy and prolific. It does not always pay to buy the newest Apples, for every Apple at its introduction is very much puffed, especially by the nurseryman introducing it, and it very often does not justify afterwards the encomiums bestowed upon it. As an instance, I may mention that I happen to live in the district where the Queen Apple was introduced. It was much talked of, and everybody in the district who was planting Apples then planted one or more trees of it, and though it is one of the most delicately beautiful Apples on the exhibition table, I imagine few of those who have the tree would plant it if they had their time over again. Certainly I should not do so, but my tree has been planted twelve years, and I do not care to do away with it. Before buying trees it is advisable to go to an autumn fruit show, where much may often be learned. For instance, there is a great deal in the weight of Apples, and though this is not of so much importance in the case of dessert Apples, yet it is not without significance, as a heavy Apple means firmness of texture and juiciness, while a light one means woolliness or pithiness. But with cooking Apples it is of much importance. We have all heard the remark upon cutting into an Apple pie, "How these Apples have gone down!" When this takes place to an exceptional degree, it is because the Apples are of a light texture, whereas when Apples of a good solid texture are used the fruit sinks much less, and there is much more juice. At the Chiswick fruit show of the Royal Horticultural Society last September I was looking at a dish of Striped Beaufins, and upon lifting one was struck by its great weight. I lifted a Warner's King of about equal size, perhaps larger, and found it weighed appreciably less. The difference in weight in a bushel of each of these must be several pounds. I remarked upon the fact to a grower, and he said it did not want a very big Striped Beaufin to weigh a pound, and I could well believe him. This is one of the things that make some cooking Apples so much more valuable than others that will keep just as well, but do not weigh so much, and consequently do not go so far nor yield so much juice when cooked.

Another thing to be looked to in choosing cooking Apples is their shape. Everyone knows how much easier it is to peel an Apple that is perfectly round, with only a small cavity for the eye, than it is an irregularly shaped one. Some cooking Apples, notably Lord Derby, are very angular and have a deep and wide depression at the eye. In peeling such an Apple there must be a deal of waste both of the Apple and of time, whereas with such Apples as Golden Noble or Lane's Prince Albert there is no inequality of surface, and with the former, especially the whole of the peel, including the eye, may be removed before the Apple is cut open. My visit to the Royal Horticultural Society's show impressed me with another fact, and that was that no nurseryman can grow every Apple well, as there are bound to be some which are not adapted to his soil. The poor specimens of some Apples there were almost unrecognisable on account of their smallness, want of colour, and bad shape. There were Queens no bigger than Scarlet Nonpareils, Sturmer Pippins no bigger than Crab, and Marie Louise and Louise Bonne of Jersey Pears no bigger than Winter Nellie. In this respect there must always be some uncertainty as to how the Apple trees we choose will succeed, it being somewhat unlikely that every one, even of a dozen different sorts, will succeed

PEAR MARECHAL DE LA COUR. (Slight reduction.)

possess a garden. A pair of keen eyes, aided by a bright light in the morning or evening during moist weather, proves a most effective method of checking their ravages. A less troublesome one is perhaps to strew a few Cabbage leaves around the plants. Beneath these the little creatures take refuge, and may be easily caught and destroyed. Some are exceedingly minute, and to guard against them it is well to strew lime, wood-ashes, or soot around the plants.

Fogging of the leaves in winter is very prevalent among Hollyhocks. The plant is then in a state of comparative rest; the leaves are very apt to decay, and if they are not speedily removed the contagion spreads. As a preventive of this evil the frame should be set in a sunny place, and too much air can scarcely be given, provided moisture and severe frost be excluded.

As frost is not unusual in the months of April and May—the time we recommend for spring planting—the plants which have been brought from a frame will still require some

our best early November Pears, and though of course it cannot compete with Doyenné du Comice as regards flavour, it is excellent when well grown. Many like its sub-acid flavour. The fruits are very handsome when gathered from wall trees, but I find our best flavoured fruits are those grown on pyramid trees in a well-drained soil. The late Mr. Blackmore thought this one of the finest Pears grown. For heavy land I do not recommend it; the tree is hardy and a good grower. On a chalk soil it does well as a standard if grown on the Quince stock, and is much valued as a market variety during early November. S. W.

CHOOSING APPLE TREES.

(Continued from page 319.)

HAVING decided upon the form of the tree it is intended to purchase, and the time of the year the fruit should be in season, there are still several other things to be thought of. As regards the season the catalogues are, as a rule, sufficiently helpful, though if the same Apple is grown in two different soils in the same year in the same part of the country—for adjacent fields sometimes differ as to soil—the Apples from the one may be in

perfectly. One safe rule to follow is never to plant an Apple which you find is a failure with some of your neighbours under fair treatment. Conversely, if you find a particular Apple which is good enough to satisfy your requirements growing and bearing splendidly in your neighbour's garden, include that in your collection. ALGER PETTS.

(To be continued.)

NURSERY GARDENS.

CHRYSANTHEMUMS AT SWANLEY.

MESSRS. HENRY CANNELL AND SONS have, in accordance with their usual custom at this season of the year, an excellent display of novelties gathered together from all parts of the globe—English, Colonial, and Continental varieties—from raisers whose names have long since become famous in the annals of the popular autumn favourite.

Taken as a whole, the Swanley collection is a magnificent object-lesson in the art of effective and artistic arrangement, and the large span-roofed greenhouse in which this cosmopolitan display is set up has seldom or never been surpassed.

It is obvious that anything like a detailed description of everything that is newest and best is quite beyond the space at our command, and so we shall be compelled to confine our observations to very narrow limits. A brief general survey of the whole is all that can be attempted, and on this line we will deal firstly with the season's novelties received from Continental sources. These are principally seedlings from M. Ernest Calvat and M. Aug. Nonin.

One of the noblest is unquestionably Etienne Bonfond, a huge Japanese incurved, very deep in build, and having grooved florets of a fine deep golden yellow, tinted purple. Mlle. Alb. Bertrand is another monster, very deeply built, and of the same kind of colour as the old-time favourite James Salter. Mme. Henri Douillet is a worthy companion to the others, a fine Japanese incurving bloom, very close and compact, and of a beautiful shade of rosy amaranth with a silvery reverse. Henri Second is big, deep, and globular, crimson and gold in colour, with sharply-pointed lips. Very attractive from the show-board point of view is M. H. Martignier, a closely reflexing Japanese, very solid and substantial in build, colour deep golden yellow, shaded pale chestnut. In soft pale delicate shades we know of few things likely to surpass the new Mlle. Marthe Morel. Then Lohengrin has long drooping florets forming a most deeply built flower, and of a striking shade of orange yellow, tinted reddish chestnut. In Jean Calvat, the eminent French raiser gives us ample proof of his continued ability to supply us with colossal show flowers. This is a massive globular bloom, with florets of medium width, pointed at the tips, and reflexing. The colour is deep orange yellow, shaded carmine. Among others we can only mention Emile Loubet, a new white; Phédre, Souvenir de Calvat père, and Chrysanthémiste Choulet, as being very promising and worthy of further attention.

Of course there are many other examples of this great raiser's cultural skill, although not of so recent date as those just referred to; but these have the merit of another season's trial, and we think Mme. L. Chevrant, Princesses Bessaraba de Brancovan, Mme. Paolo Radaelli, Mme. Waldeck-Rousseau, Mme. C. Nagelmackers, and others may safely be pronounced upon as well worthy of our growers' attention.

Colonials have always been a strong feature in Messrs. Cannell's autumn show. Lord Hopetoun, a brilliant crimson Japanese, with a gold reverse, is most dazzling and effective; Camden, a fine pale lilac rose; Mrs. A. G. Hubbuck, rosy flesh, deep and compact, is also a fine addition from Antipodean sources; Daniel Lambert, so far not particularly justifying its name in size, a silvery white, tinted purple, but which is said to be one of the biggest; Mrs. T. W. Pockett, already well known; W. R. Church, rich and fine in its peculiar shade

of purplish crimson; Mr. James Marshall is another Australian of high merit, a big substantial bloom of pale rosy amaranth, reverse silvery, and many more beside.

From miscellaneous sources we must not omit the new Miss Mildred Ware; in size this is decidedly a rival to some of the big drooping petalled Japanese, but it certainly lacks the beauty and refinement of a Lady Hanham. A few good yellows are General Hutton, very large; John Fraser, almost a yellow counterpart of Mme. Gustave Henry, which it resembles very closely in build; General Buller, Britannia, Mrs. Harry Emmerton, and F. J. Taggart, a hairy variety of a distinctly pale lemon yellow tone.

Rosy pinks and salmon minglings of colour in varying shades are seen in some pretty examples of Mrs. G. Mileham, Mrs. Coombes, Mrs. Rumble, Byron, and Lady Hanham, while many of the good standard crimsons are effectively used for brightening up the collection. In this shade S. T. Wright is particularly noteworthy. Godfrey's Masterpiece is also an excellent variety in this colour.

Round the sides of the house are various new seedling singles, decorative and other sorts, the whole forming one of the finest displays we have seen for a long time past.

MESSRS. PEED AND SON, WEST NORWOOD.

CHRYSANTHEMUMS are a new feature here, this being the first season they have been grown for exhibition blooms. The exhibits at the National Chrysanthemum Society's show at the Crystal Palace on the 6th and 7th ult., and again at the Drill Hall on the 13th ult., induced me to pay a visit to the nursery to see what was being done there. I found that though the stock was not so large as in some nurseries, it was in fine condition, and Messrs. Peed are undoubtedly on the way to further success. I was told that it was rather late in the season when they first entertained the idea of growing Chrysanthemums for exhibiting, nevertheless they have done very well. Their stock would consist of some 800 to 1,000 plants, and almost all of them are producing good blooms with clean, healthy foliage, which appeared to be quite free from rust and other disease. It was also noticeable that up to the present the blooms showed no sign of "damping." The grower (Mr. Gover) told me that he kept up just sufficient fire-heat to ensure a good circulation and plenty of top air night and day. This is evidently the secret of preventing what appears to be one of the greatest troubles to growers of Chrysanthemums this season, though perhaps other cultural details may also have some influence.

Among the varieties noted the most promising were: Lord Alverstone, deep crimson, with a bronzy yellow reverse; Lord Hopetoun, another fine crimson; Miss Olive Miller, clear mauve-pink, long, drooping florets, fine blooms on dwarf plants; Mrs. C. M. Paige, long, narrow, drooping florets, pure white on first bud, but later flowers have a pink shade; Godfrey's Masterpiece, bright red tipped, shaded golden yellow; S. T. Wright, rich crimson; Captain Percy Scott, a very fine yellow; Mrs. Greenfield, another good yellow; Miss N. Pockett, very fine white; Charles Langley, crimson, with a shading of purple, very distinct in shade of colour and fine bloom; Miss Lucy Evans, pink, with shade of mauve, slight yellow shade on young florets; Mrs. J. R. Thornecroft, very large blooms of a bronzy orange shade; Le Grand Dragon was also good; Miss Stopford, white, large flowers, with long, drooping florets; Countess Arran, fine pink; Lord Ludlow was good; Britannia, a promising yellow; and Mildred Ware, which promises to make a very fine flower.

Of other subjects worthy of note the winter-flowering Begonias Gloire de Lorraine, Mrs. Leopold de Rothschild, Turnford Hall, Winter Cheer, Ensign, and others were all in good condition. Gloxinias were excellent for the season, and the strain is good. The Caladiums, for which this firm is so well known, were in the last stage of ripening off, and represented a large stock of plants. A house full of the best varieties of Cyrtipedium

insigne were just coming into flower. On the roof of one house a fine plant of Schubertia grandiflora was flowering freely. The tuberous Begonias were past their best, but the strain of both double and single varieties is very fine. V.

NOTES FROM WALTHAM CROSS.

WE made a few notes of Roses in beauty at Waltham Cross in early October.

Field Marshal.—We saw this splendid new climber very fine under glass. The flowers are a vivid in colour as the monthly Rose Cramoisi Superieure, but they are as full and as large as a Hybrid Perpetual. The elegantly recurved petals and globular high centred form appeared to us a most attractive feature in this new climber, and we should say it will be most useful as a fast growing companion to Maréchal Niel, either under glass or on south walls. Some of the plants in pots had made a growth this year of fully 15 feet in length. Another fine novelty in free-growing Roses is

Golden Queen.—This has all the characteristic attributes of Réve d'Or, such as abundant foliage, growth well branched right from the base, and the flower colour of a deeper golden yellow. We thought the petals larger than those of Réve d'Or. When well established this Rose must prove a great acquisition, rich golden yellows such as this being very rare. A remarkable floriferous Rose is

Floribunda, apparently a hybrid Noisette, somewhat resembling the Polyantha Roses in its abundant blossoming, but the individual flowers are fairly large and very perfectly formed. The colour is delicate rosy flesh, with a yellowish shading. We believe this Rose will be of great usefulness for massing and for forming low hedges. Even when the flowers are absent the plants are cheerful to look at owing to their glistening foliage.

Corona is evidently a descendant of that grand Waltham Cross Rose White Lady. Some hundreds of plants, as seen early in October, were making a good second crop of the beautifully formed flowers, and, judging from the numbers of old blossoms upon the plants, they had evidently been very showy in July. The wax-like appearance of the flower, and the pretty pointed form of the outer petals, combined with a substance as remarkable as is found in Tennyson, points to Corona as a Rose of much usefulness. The colour is of a deeper hue than Tennyson or White Lady, being almost flesh pink in the centre, shading to creamy pink on the outer petals. There is the same uniform growth which we find in White Lady, and the success of this latter as a decorative Rose, where an extra vigorous kind is not required, augurs well for the future of Corona. We saw a fine novelty named

Earl of Warwick, which, we understand, is to be put into commerce next May. This Rose was recently alluded to in these columns, and we can thoroughly endorse all that our correspondent Mr. Molyneux has said about it. In colouring it seems to be a blending of the beautiful tints found in Mme. Eugénie Bouliet and Mme. Abel Chateaux, but there is certainly a distinct salmon-pink hue which we cannot recall in any other variety. Another attractive novelty named

E. T. Cook was in fine condition, and, judging from its neat and compact growth and beautiful corymbs of blossom, we have a decorative variety of much value. The colour in the young state is a beautiful shell-pink, merging to fawn and white as the flowers expand. It is a cross between Mme. Cadeau Ramey and Antoine Rivoire, and apparently partakes largely of the characteristics of both well-known varieties. One remarkable trait in this Rose is the fine corymbs of blossom the plant produces, and each flower expands almost simultaneously, so that a highly decorative effect is produced.

Arethusa is the first clear deep yellow Monthly Rose yet obtained. It is as profuse in flowering as Queen Mab, the habit of growth and size of blossom being very similar. We were very pleased with a pretty decorative Hybrid Tea named

Elizabeth Kitto, and we feel sure it must prove a valuable bedding Rose. It is of a very neat,

compact habit, every flower well displayed on stiff shoots, and the colour is of that lovely salmon-pink hue so much admired in Mme. Abel Chatenay. A fine novelty is the almost pure white Hybrid Tea.

Irene. — Apparently this Rose is even more vigorous than Caroline Testout, from which, we believe, it was raised, this latter being crossed with Mme. Jules Finger. It is larger and more double than Caroline Testout, and of a beautiful ivory-white. From plants we saw in bloom we believe this Rose will far surpass such sorts as Admiral Dewey, the bloom being nearer the exhibition standard.

Other Waltham Cross novelties were flowering freely, very conspicuous being the brilliant orange-crimson Morning Glow, the charming little primrose-yellow Dainty, and the variable coloured Chameleon, which promises to be a good bedding kind. Of older varieties, Corallina was well to the front. We believe this Rose has again given the utmost satisfaction even during a season such as we have experienced, and the delightful pale yellow Sulphurea is a peerless gem among Roses of this colour.

Of the newer Roses from other raisers I much liked Mme. Antoine Mari, Mme. Jean Dupuy, Prince de Bulgarie, Pharisuer, Pauline Bersez, Prefet Montell, Souvenir de Pierre Notting, Mme. Vermorel, Dr. Felix Guyon, and La Tosca.

VISITOR.

THE KITCHEN GARDEN.

THE CUSTARD MARROWS.

A NEW TYPE.

I THINK the Custard Marrow can be grown to better advantage than is often the case, and owing to its size in comparison to the larger variety it is at times overlooked. The ordinary Marrows are, however, stronger in growth, and probably give a better return in the market. But mere size in vegetables is not everything when quality is absent. The Custard Marrow is certainly worth more attention for home supplies, in spite of its drawbacks, such as tenderness and a short season. It likes warmth and moisture combined. This year has not proved an ideal one, and some new seedlings, some of which the Editor of THE GARDEN is good enough to illustrate, have not had so good a chance as I should have liked. I heard it stated the other day that we had so many vegetables that it was a mistake to add more. Such a foolish remark does not for one moment deter those whose idea is quality in comparison to mere size. In this country I contend we do not make enough of our vegetables. Take Spinach, for instance. How often is this used by the working classes? But, given care in cooking, it is one of the most wholesome vegetables grown. I must now consider the value of the Custard Marrow for use from May to November, or what may be termed a six months' supply, if frame culture can be given at the start.

There are not many varieties, and in the whole family about a dozen sorts will embrace both the Long White, the Oval Cream, and round or globular fruits, and the Bush and Custard varieties of the latter. There are very few, and they are worth growing, as they are quite different from the ordinary Marrow; the flesh is less watery and the flavour more delicate.

GROUP OF NEW CUSTARD MARROWS.

In crossing to get new sorts it is well known that some of the crosses are of no value, and soon abandoned if not superior or even equal to one of the parents. In the new varieties illustrated I do not claim that they are all better. I like the Oval and Pear-shaped best. The Long Custard, though the quality is good, I have so far failed to seed, and I include it with the others just to show variation.

I much regret that it is seedless, as the quality is good. It has one excellent point, and that is it does not age so soon as the old Custard or the others, but, on the other hand, it is much larger, and in a Custard I do not think this is any gain. It was raised from the same cross as the new Oval, but the parentage reversed. The parents here were the White Bush with Sutton's Improved Custard. The latter is a trailing Marrow, and one of the best of the Custard family. The Oval fruit noted above was the result of crossing as described, and here I think there is an advantage. The fruits when cooked are of excellent quality, and they are very shapely and prolific. In the Pear-shaped variety there is, perhaps, less variation than in the others, as this is more like the older Custard; but there is an absence of the warty excrescence at the sides. It is of excellent quality, and is, I consider, a gain in the right direction, as when cooked in a young state the flavour is delicious. This was obtained by crossing the old Custard with another variety, and it is more prolific than the parent. I now come to the

OLDER KINDS.

There are few of these, but it would be difficult to surpass any for crop or quality. It is large enough for all purposes, and that is one of the plants referred to earlier, viz., Sutton's Improved Custard. This is excellent in every way, and as regards quality far in advance of the ordinary Marrow. It has a trailing habit, and is very prolific; it fruits at all the joints, and these are quite short, and owing to this the plant is very productive; the fruits when cooked young are, in my opinion, delicious. I do not consider the old Custard can approach the last named either for quality or crop. I do not know if any of my readers

have ever compared in flavour the Bush Cluster or Chusan Marrows, as they are called, with the ordinary long Marrows. The Bush, when cooked small, is well worth room in all gardens; they are also well adapted for small gardens where space is limited, as they do not trail, and being of such compact growth the fruits are formed close to the stem.

There must be glass culture at the start to get so long a supply as has been mentioned. We certainly cut a few fruits at the end of May from seed sown in March and given frame culture, but the Custard Marrows do not take kindly to frame culture after the plants have got a good start, as unless given ample ventilation the flowers do not set well and time is lost. I noticed this year that as soon as we gave our plants full exposure they cropped well, and the same plants in a favourable autumn, that is, with a sunny dry October, will give fruits to the end of the month.

As the plant is tender there is a great gain by giving frame protection or shelter from hand-glasses at the start. If a little warmth from stable manure can be afforded there will be earlier fruits, but give ample ventilation later on to secure a sturdy growth. I find we get the best results from raised beds, as in wet seasons the plants get dry more quickly, and not so much manure is needed as is often given, but good loamy soil and ample room. The Sutton Improved Custard is a strong grower needing much space. I have seen the Custard Marrows put to good use as climbers over screens or hedges, and also for growing on a trellis.

G. WYTHES.

GARDENING OF THE WEEK.

INDOOR GARDEN.

CAMELLIAS,

WHETHER growing in pots or tubs or planted out in borders, require close attention to be paid to the watering at this time of the year. Any tendency to dryness of the soil in which the roots are growing will be followed by the dropping of a large proportion of the flower-buds. It is

equally as important to see that the plants do not suffer through imperfect drainage; large pots or tubs in which Canellias are growing should be raised an inch or so above the floor level by three small blocks of wood placed under the bottom rim of each. The plants should now be given light applications of manure water made from cow manure and soot. Where there is no tendency to bud dropping it will be necessary to thin them, performing the operation gradually; this will benefit the plants as well as improve the quality of the flowers. Old plants of

CYCLAMEN PERSICUM

may now be cleaned over, also have their pots washed, and be given a top-dressing of light, rich soil, in which a little Clay's Fertilizer has been mixed. This should be made firmly with a blunt-ended stick; then place the plants in a light position, with a night temperature of 45° to 50°. They will soon begin to grow and may be had in bloom early in the new year. Young plants from seed last season must be kept steadily growing through the winter and they will produce a few good flowers in the spring.

CINERARIA STELLATA,

now in 6-inch or 7-inch pots, should be placed in a cool house near the glass and allowed full light, shading them only from the brightest sun. As the flower-stems progress give the plants weak liquid manure once or twice a week. These and Calceolarias are somewhat soft this season, in consequence of the saturated condition of the atmosphere for so long a period. Therefore give air as freely as the weather will admit. Late successional plants should be potted on as soon as ready, and at the same time remove all damped or decaying foliage.

THE EARLY BULBS,

such as Roman Hyacinths, Paper White Narcissus, &c., will require to be looked over occasionally, as to allow them to remain too long in the material in which they were plunged when potted will result in permanent injury. Therefore, as the young growth reaches 1 inch to 2 inches in length remove them to a cold pit or frame, where protection can be given as required.

ROSES IN POTS.

Where a large stock of these is grown, particularly of the Tea and Noisette varieties, good flowers may be cut for a considerable time by placing a number of plants in a cool house where frost can be excluded. A vinery or Peach house, where most of the foliage has fallen, would be suitable. In such a position many buds now in various stages of development would open.

Plants intended for forcing should now be pruned. For the earliest batch select such plants as have been forced during one or two previous seasons; prune out all the weak shoots entirely, and even strong ones if the plants have become too thick; shorten the remaining shoots by about one-third. In cases where the wood is vigorous and well ripened the weak points only need be removed.

Wendover.

J. JAQUES.

KITCHEN GARDEN.

GLOBE ARTICHOKE.

THERE should be no further delay in affording the plants protection. Bracken is an excellent material; it should be packed thickly round the stools, and some should be worked about the crowns in the centre with the hand, but they must not be covered entirely, as when the material becomes wet it will cause decay in the heart of the plants. As advised in a previous calendar some plants taken from the outside of the old stools should be lifted, potted up, and wintered in a cold house or pit.

SEAKALE.

This vegetable requires but little room in which to force it; large pots, tubs, or bins with lids to exclude air and light are utilised, all of these may be recommended as suitable. Heat must be applied in moderation, especially in the early part of the winter, or the produce will be spindling and flavourless. The crowns should be plunged in tan or similar material, and this should be replenished

every year. The bottom-heat should range from 50° to 55°, and the temperature of the structure should be kept at about 60° to 65°, with abundance of humidity. Seakale that is to be forced requires rest, and until this has been adequately afforded the produce from the forced crowns will not be first-class, therefore it will be obvious that as the winter advances the results will become more satisfactory. The better grown and matured the crowns at lifting time the finer heads may be expected when forced. Introduce a few crowns every few days in order to maintain an unbroken supply so far as is necessary. As soon as the leafage has decayed the whole of the crowns should be lifted. The thongs taken from the sides of the plant are utilised for sets for another year, and these make excellent plants. They should be broken off as lifting proceeds and laid on one side, afterwards breaking them up into 3-inch lengths, selecting those of about the thickness of one's forefinger. These may be bedded in thickly in rows in any spare piece of ground. The thickest end of the thong should be uppermost, as this will form the top or crown of the future plant. The crowns for this winter's forcing may be laid in rows and just covered with soil for use as required. On the approach of severe weather some litter must be laid over them for protection. When plunging the plants in the tan let the crowns protrude an inch or two and keep quite close and dark.

MUSHROOMS.

In gardens where a constant and plentiful supply has to be maintained a bed should be made as frequently as material can be obtained and room afforded. Much fire-heat is harmful as it tends to dry up the moisture in the house which is so essential to success in growing good fleshy Mushrooms and for prolonging the cutting. A slight warmth in the pipes at night will, however, hasten the production of the Mushrooms, and if the beds be covered with sweet hay, with the seeds shaken out, the surface will not become unduly dry.

H. T. MARTIN.

Stoneleigh Abbey Gardens.

FRUIT GARDEN.

VINES.

As soon as the leaves are down, Vines infested with insects must be made thoroughly clean. Stop all suspicious holes and cracks with pure Gishurst, and paint with a solution of the same, 8 ounces to the gallon of water, thickened to the consistency of cream with sifted loam. On the other hand, Vines which have not been infested with insects may be passed over with a good washing, as nothing is gained by dressing where there is nothing for the dressing to destroy. Of all the insects the Grape grower has to contend with the mealy bug is most to be dreaded. Spirits and oils of various kinds have been used, and all of them kill where they touch; but it generally happens that some escape, and the only way in which they can be successfully exterminated is by careful watching and searching in the spring, and dressing with Gishurst compound or methylated spirits of wine.

LATE HOUSES.

If the laterals and extension growths have not been removed, take them off at once, as they hold moisture and keep the sap in motion. Remove the ripe foliage as it parts freely to the touch, but not before. In damp or foggy weather keep the front ventilators closed, and give a chink of air at the apex, with just sufficient fire-heat to expel moisture. On bright dry days create a circulation of air by opening the top and bottom ventilators for a few hours, warm the pipes to set it in motion and shut up in time to prevent the temperature from descending below 45° after the heat is turned off. Get all external borders well covered with Fern or litter, and place lights or shutters over all where the Grapes are intended to hang until after Christmas.

THE ORCHARD HOUSE.

Though the weather is still favourable, yet the little frost we have had is a proof that the time has arrived for getting all pot trees now standing out of doors well plunged to protect the

pots from injury by the expansion of the soil. When thus taken care of the general stock may remain out in the open air until the middle or end of January, when they will be the better under glass. Meantime steps must be taken for cleansing, painting, and preparing the interior of the house, particularly where it is, or has been, used for soft-wooded plants like Chrysanthemums, which sometimes leave an unwelcome legacy of insect eggs behind them. The general pruning having been performed early in the autumn, shortening back and washing will, as a matter of course, be deferred until the time arrives for housing, but on no account allow the last-named operation to be neglected. A few words may here be said with regard to shortening back, as serious mistakes are sometimes made by cutting the dormant trees into shape, when shy bearing sorts, like Noblesse, which only makes terminal wood-buds, lose some of their most promising shoots by this removal. Practical men, who know that it is always safe to prune to a triple bud, can make no mistake; but the amateur, whose great delight is centred in the performance of his own knife-work, will do well to wait until the buds begin to swell, or if he leaves it until the fruit is set no harm will be done.

W. CRUMP.

Madresfield Court.

FLOWER GARDEN.

RENOVATING HERBACEOUS BORDERS.

THE vigorous life of the majority of our herbaceous plants averages from two to five years, by which time they outgrow their usefulness, and should be superseded by fresh young plants; hence the necessity of renovating the borders every third or fourth year, either by adding fresh soil and manure to vigorous-growing subjects, or by transplanting them entirely. So many plants quickly exhaust the soil about them that without renovation the flowers get gradually smaller, and the plants are ragged and unhealthy. To renovate the borders, dig up those plants that appear weakly, retaining a small portion of the outside of the clump to be replanted. Never replant from the middle of any clump of a herbaceous subject like Chrysanthemum maximum, Pyrethrum uliginosum, Phlox, or Asters, but select instead the sucker-like growths from the exterior. Remove the soil 1 foot deep and as wide again as the size of the root to be put in; replace the soil with some from quite another part of the garden, adding manure in a half-rotten state. The whole of the border between the subjects not requiring fresh planting should be forked over lightly near the plants, so as not to interfere with the roots more than is absolutely necessary. Afterwards, mulch the surface of the border 2 inches thick with a compost of old potting soil, wood ashes, and leaf-mould: a little quicklime added will be of service to the bulk of the plants. If this material is not present in the soil, this will give new life to the plants, rendering the foliage more robust in appearance, increasing the strength of the flower-spikes, and aiding the development of the blossoms also. It is not wise to retain two large clumps of any plant; it is far better to have two small ones together. Not only are those of extra size difficult to support in growth, but the flowers are not nearly so fine owing to want of light.

DAHLIAS.

Though an early frost may have blackened the foliage of Dahlias, it is not wise to be in a hurry to lift the roots, for the longer they can be left in the ground with safety the better. When the weather renders it absolutely necessary, they should be taken up. Choose a dry day for the purpose, and, if possible, cut the stems to within 10 inches or 12 inches of the ground. Dig up the roots, and place them with the stem downwards, so that the water which drains from them may not lodge upon the tubers. In the course of a day or two they will be ready for storing in their winter quarters. Any dry, cool place from which frost can be excluded will suit them well.

SCHIZOSTYLIS COCCINEA.

This useful old plant should now be lifted from the borders, and planted in boxes or pans, and if

removed to a cold vinery or Peach house, and placed in a light position, will give a long succession of brilliant spikes, and prove most useful for cutting. It will last a good time if only given a change of water. Scarlet flowers are none too plentiful at this season, and it would, I am sure, pay all who need variety in cut blooms to adopt this method. Replanting may be done in March, in any light, loamy soil, and a west border suits them best.

Ashwellthorpe, Norwich.

T. B. FIELD.

SOCIETIES.

SOUTHAMPTON CHRYSANTHEMUM SHOW.

THE anxiety which the continuance of the very wet season caused the council of the society was early dispelled on the 3rd inst. by splendid sunshine, and, notwithstanding the adverse season, there was a grand show. Looking at the extent and quality of the exhibits it was difficult to realise that the season had been so disastrous to growers. The Skating Rink, in which the show was held, is one of the largest and best adapted halls for a flower show in the south of England, and this was completely filled in every part. The vase classes made a grand display, occupying 162 vases arranged on step tables down each side of one of the central passages, 84 feet long, the step for the front row being 22 inches from the ground, and for the back row 6 inches higher, these being backed by another step, on which were arranged light Palms and other suitable plants, and between the vases were small Ferns, the whole forming a beautiful avenue, which called forth the admiration of the judges and the public.

Groups of Chrysanthemums were arranged round the end of the hall, Mr. C. Hovey, gardener to J. C. E. d'Esterre, Esq., Elmfield, once more securing the first prize with a collection showing grand flowers and foliage; Mr. B. Hamley, gardener to the Masonic Hall, Woolston, being a close second; and Mr. T. Hall, gardener to the president of the Society (Sir S. Montagu, Bart.), third. In the class for four plants Mr. Hovey was first and Mr. Dymott, Freemantle Nurseries, second. For four bush plants, not detached, the order of merit was reversed, Mr. Dymott securing first and Mr. Hovey second, both showing splendid specimens 3 feet to 4 feet through. Mr. A. Cooper, an amateur, was a creditable third.

The amateurs deserve credit for the groups they arranged, Mr. T. Brown securing first, Mr. F. Chandler second, and Mr. R. Parnell third.

In the class for thirty-six blooms, Japanese, twelve varieties, shown three in a vase, five competed. In this class the winner of the first prize is entitled to hold the Victorian challenge trophy, value £40. Mr. George Hall, gardener to the Dwyer Lady Ashburton, of Melchet Court, was for the third time victor, thereby securing the society's gold medal in addition to the first prize of £7. His blooms, which were in grand condition and of immense size, included F. S. Vallis (premier Japanese bloom in the show), Beale Godfrey, Mrs. J. Lewis, Mme. P. Radaelli (grand blooms), General Hutton, Marquis de Venosta, W. R. Church, Calvat's Gem, Ma. Mease, Mme. Carnot, Mrs. G. Mileham, and Mme. Berwege. Mr. L. Dawes, gardener to Mrs. Ogilvie, Rosneath, Hambleton, was a good second. For six Japanese, two varieties of white, Mr. Henley was first with fine blooms of Gustave Henry and Mutual Friend; Mr. L. Dawes second, with F. Molyneux and Guy Hamilton; Mr. W. Valentine, gardener to H. E. Sugden, Esq., Ingersley, Chilworth, third. For six Japanese, two varieties other than white, Mr. B. Hollis, gardener to Major Chichester, Embly Park, was first, and Mr. Dawes second.

In the class for twelve incurved, six in a vase, Mr. G. Hunt was first with grand blooms, Mr. A. J. Marsh, gardener to M. Hodgson, Esq., Morton House, Kingsworthy, being a close second.

For eighteen blooms, open to gentlemen's gardeners and amateurs, Mr. H. Pearce, gardener to Mrs. Tragett, Abridge Dunes, was first, Mr. Marsh second, Mr. Henley third. In the class for eighteen incurved, confined to gardeners and amateurs, six in a vase, Mr. Marsh was placed first and Mr. Valentine second.

For twelve Japanese, four varieties, open only to the district, Mr. H. Pearce was first, Mr. Henley second, and Mr. F. Chandler, amateur, third.

In the class confined to amateurs, twelve Japanese shown in four vases, Mr. J. Love, of Cowes, was well in front, Mr. F. Chandler being second.

For two vases of single Chrysanthemums arranged for effect, only one was staged, viz., Mr. G. Ellwood, Swanmore Park Gardens, who was awarded first prize.

In the classes shown on boards the most important was, of course, the twenty-four Japanese; of the first prize box the judges expressed the opinion that better would not be seen this season. They were shown by Mr. Hollis of Embly Park, and included Edwin Molyneux (very fine), M. Louis Bemy, Graphic, Mr. J. Bryant, Mme. Gustave Henry, Mrs. G. Mileham (grand), Lord Ludlow, &c.; Mr. G. Hunt second, and Mr. Dawes third.

For twelve Japanese, distinct, Mr. Hollis was again to the front with Mr. J. Lewis, Godfrey's Triumph, Mrs. G. Mileham, Mrs. Mease, Lord Ludlow, The Princess and others.

Twelve incurved Japanese: First, G. Hall; second, L. Dawes; third, Mr. N. H. Muse, Belmont Nurseries.

Twelve Japanese, eight distinct varieties, confined to gardeners and amateurs: first, A. J. Marsh; second, H. Pearce; third, B. Henley.

For six Japanese, open to amateurs, J. Love was first, F. Chandler second, and N. D. Deborough third.

In the novices' class for twelve Japanese, any variety, F. Moore was first, N. D. Deborough second, and F. H. Lowman third.

The silver-gilt medal for the most successful exhibitor in the open cut bloom classes was secured by Mr. B. Hollis. The silver-gilt medal in the classes open to gardeners and amateurs was won by Mr. A. J. Marsh, and the silver medal, for amateurs only, by Mr. J. Love.

There was some spirited competition in the miscellaneous classes, the most important being the groups in which Chrysanthemums were to be a prominent feature. In our opinion the exhibitors failed to adapt themselves to their surroundings. Their groups would probably have looked very well against the side of a tent where the height is only 7 feet, but against a wall some 50 feet high they looked puny; they would certainly have looked better if larger Palms had been used and the back plants raised much higher. Mr. E. Willis, nurseryman, Shirley, was first, T. Tyler, Waterloo Nurseries, second, and Mr. T. Hall third.

Palms, table plants, and fibrous-rooted Begonias were numerous, and all were well grown, the first prize in each going respectively to Mr. T. Hall, Mr. G. Best, and Mr. T. Tyler.

The vases of Chrysanthemums and baskets of autumn foliage, open to ladies only, were also very pretty, Miss M. Snelgrove being first for the vases and Mrs. Ladham for the baskets. In the division for

FRUIT AND VEGETABLES

the Grape classes were well filled, the general quality of the exhibits being of the highest order of merit. For three varieties Mr. Mitchell, gardener to J. W. Fleming, Esq., was first with large and well finished bunches, Mr. O. Eastwell, gardener to Walker Munro, Esq., Rhinefield, Brockenhurst, being a good second.

For any other variety of black, Mr. W. Mitchell was first, O. Eastwell second, and Mr. T. Hall third. For two bunches of white, Mr. O. Eastwell was first with grand bunches, Mr. W. Mitchell second, and Mr. George Ellwood third. Single bunch, white: O. Eastwell first, W. Mitchell second, and G. Ellwood third. Single bunch, black: W. Mitchell first, O. Eastwell second, and T. Hall third. In the Apple and Pear classes just under 100 dishes were staged, against 250 last year. In the four dishes Mr. T. Hall secured the first prize both for dessert and kitchen varieties, and second for single dish. Mr. F. W. Smith, an amateur, took two seconds for dessert in the open classes. Miss Brewer, Major-General Nisbett, and Mrs. Maltby were also prize-takers in these classes. For Pears there were only thirty dishes, Mr. B. Hollis securing the first in each class. Amateurs were represented by four entries, Mr. Smith taking first.

For Messrs. Toogood and Sons' prizes there were eight entries for eight varieties, and fourteen entries for six varieties. For the first-named Mr. Best received the first, and Mr. B. Hollis a close second. For six dishes Mr. George Ellwood was a long way in front, and Mr. G. Best second. Amateurs and cottagers were well represented in this division by sixty-one entries.

The attractiveness of the show was much helped by a number of

TRADE EXHIBITS.

the principal being: Messrs. B. Ladham, Limited, silver-gilt medal for rockwork and hardy flowers; Miss L. Willis, silver-gilt medal for floral designs; Messrs. Toogood and Sons, silver medal for some fifty varieties of Potatoes and other roots; Messrs. W. H. Rogers and Sons, silver medal for collection of conifers and hardy shrubs; Messrs. John Feed and Sons, bronze medals for cut blooms and fruit; Mr. C. Dymott, silver medal for large group of Chrysanthemums in pots (well-grown market plants); and Mr. C. W. Blackmore bronze medal for stand of Gladioli and collection of Potatoes. A finish was given to the exhibition by a large number of fine Palms and other decorative plants lent by Sir S. Montagu, Bart., and W. Garton, Esq., Roseland, Woolston.

The whole of the staging and other arrangements made by the secretary, Mr. C. S. Fudge, gave the greatest satisfaction, as might be expected, with his thirty-two years' experience. The show was attended by between 5,000 and 6,000 during the two days, and the gate receipts were the highest for six years.

WEST OF ENGLAND CHRYSANTHEMUM SOCIETY.

ON the 3rd inst. the show of this society was held in the Guildhall, Plymouth, a marquee in the adjacent square providing additional accommodation. The unprecedentedly wet season has told against Chrysanthemum growers, and complaints of damping off have never been so prevalent as this year. In spite of this, however, the Plymouth show was an unqualified success, and many hundreds of fine blooms were staged in the hall. The society was exceptionally fortunate in having two perfect days for its exhibition, and the crowds that filled the hall augured well for the finances. Considerably over £200 was awarded in prizes, and the competition was keen in almost all classes.

Forty-eight Japanese blooms: First, Mr. F. S. Vallis. This stand was an easy first, but was scarcely so good as that with which Mr. Vallis won the same prize last year. Many of the blooms were very fine, amongst the best being Beale Godfrey, F. S. Vallis, Mrs. J. Lewis, Sensation, Elsie Fulton, W. R. Church, and Brightness. The judges were long in deciding on the destination of the second prize, and it was only by the narrowest margin that it fell to the lot of Mr. G. W. Drake, whose stand contained very fresh but slightly undersized blooms. Of these the best were Mrs. G. Mileham, Matthew Smith, Mafeking Hero, and Mildred Ware. Third, Mr. G. Foster, whose flowers were larger, but some a trifle lacking in freshness, particularly fine blooms being Mme. Paolo Radaelli, General Hutton, Princess Alice de Monaco, and Calvat's Sun.

Twenty-four Japanese blooms: First, Mr. F. S. Vallis, in whose stand Sensation, F. S. Vallis, Beale Godfrey, and Mrs. F. W. Vallis were extremely fine; second, Mr. J. R. Gulson; third, Mr. T. Martin.

Twelve Japanese blooms: First, Mr. G. Foster, whose Mme. P. Radaelli, General Hutton, Godfrey's Pride, and Wonderful were of high merit; second, Mr. J. R. Gulson; third, Mr. W. MacAdam Smith.

Six Japanese, white: First, Sir J. Shelley, with Mrs. J. Lewis; second, Mr. G. J. Gulson, with the same variety; third, Mr. G. Foster, with Mme. Carnot.

Six Japanese, any other colour: First, Mr. J. R. Gulson, with General Hutton; second, Mr. T. Martin, with Mrs. Mease; third, Mr. G. Foster, with F. S. Vallis.

Six incurved Japanese: First, Mr. J. R. Gulson; second, Mr. G. Foster; third, Sir J. Shelley.

There were twelve classes for cut blooms confined to residents within fifteen miles of Plymouth. First prize in the premier class, for twenty-four Japanese, was won by Mr. T. Martin with a stand of great excellence.

Group of Chrysanthemums, 12 feet by 8 feet: First, Mrs. Cottrell Dormer, with a collection of fine-flowered plants; second, Dr. Aldous; third, Mr. S. T. Tall.

Miscellaneous group of stove and greenhouse plants: First, Messrs. J. Webber and Sons, with a group containing Poinsettias, Bouvardias, Carnations, Orchids, Ericas, Arums, Clivias, Begonias, and Lilium longiflorum, interspersed with Crotons and other foliage plants, and edged with Ferns and Asparagus, the central feature being a spreading Phoenix; second, Admiral Parker, with a more graceful group, in which were tall specimens of Cocos plumosa, Humea elegans, Hippeastrums, Pancratiums, Lilium auratum, Poinsettias, and other flowering plants; third, Mrs. Cottrell Dormer.

Floral decoration was one of the features of the hall, Messrs. J. R. Williams being awarded a silver cup for an artistic arrangement surmounted by a huge crown, at a height of 12 feet from the ground, composed of orange Chrysanthemums, and covered at the base with floral designs, which included harps, lyres, wreaths, crosses, stars, a shield with armorial bearings, a violin and bow, shower bouquets, and flower baskets.

Group of Orchids: First, Messrs. J. Webber and Sons; second, Dr. Aldous.

Six Orchids: First, Mr. A. Williams; second, Mr. S. H. Phillips.

Six Begonias, Gloire de Lorraine: First, the Earl of Morley, with large and splendidly-flowered plants; second, Messrs. J. Webber and Sons.

Prizes were also given for Primulas, Cyclamens, Roman Hyacinths, zonal Pelargoniums, and table plants, and twelve classes were allotted to specimen pot Chrysanthemums.

The silver cup presented by the president for eighteen dishes of Apples, open to market gardeners, was won by Mr. A. H. Callaway.

Collection of twenty dishes of Apples: First, the Earl of Morley; second, the Earl of Mount Edgumbe. In the thirty other fruit classes the prizes were chiefly won by the Earl of Mount Edgumbe, Sir John Shelley, Mr. Gulson, the Earl of Morley, and Admiral Parker.

The chief prizes in the vegetable classes were won by Sir John Shelley.

Messrs. T. Challice and Son, Plympton, were awarded a certificate and silver medal for an interesting stand, containing many species of Echinocacti and Opuntias, Orchids, Casuarina sumatrana, Asparagus myriocladus, Browallia speciosa, Ruellia macrantha, and a collection of flowering and foliage plants. Mr. H. Hodge, St. Austell, was given a certificate of merit for his single and double tuberous Begonia blooms, of which plants he grows over 12,000. Messrs. B. Veltch and Son, Exeter, exhibited Chrysanthemum blooms, Cattleyas, Lælias, Cyrtopodiums, Bouvardias, Nerines, Fernettyas, Correas, and Begonias. Mr. W. J. Godfrey, Exmouth, showed exhibition blooms of Chrysanthemums of his own raising, and trusses of zonal Pelargoniums, of which Scott Turner, scarlet; Mary Felton, salmon; and Captain Holford, crimson, were particularly good. Messrs. Rositer, Paignton, staged a good collection of Apples.

EXETER CHRYSANTHEMUM.

THIS show was held on the 5th inst. in the Victoria Hall, and a very attractive exhibition was provided, although, owing to the unpropitious season, entries were scarcely so numerous as in former years. However, quality was well represented, and both in flowers and fruit the winning exhibits left little to be desired.

For circular groups of Chrysanthemums 10 feet in diameter: First, Mr. J. Townsend, with a fine collection of large-flowered plants, the blooms being of great size and very fresh. To this group the National Chrysanthemum Society's certificate was awarded; second, Mr. W. Brock.

Semi-circular groups: First, Mr. C. M. Collingwood; second, Mr. W. Brock.

Miscellaneous collection of plants arranged for effect: First, Mr. W. Brock, with a handsome group containing tall specimens of Cocos plumosa, Poinsettias, Arums, Cosmos bipinnatus, Cattleyas, Oncidium, and other Orchids, Begonias, Pelargoniums, and Crotons; second, Mr. W. B. Heberden, with a group including Carnations, Nerines, Gladioli, and Salvias.

Primulas: First, Captain Radcliffe; second, Mr. H. Turner. Cyclamens: First, Mr. T. Kekewich; second, Sir J. D. F. Davis.

Six dinner-table plants, 5-inch pots: First, Mr. W. B. Heberden; second, Mr. B. H. Hill. Three dinner-table plants: First, Mr. H. Turner; second, Sir D. King.

Six dinner-table plants, 8-inch pots: First, Mr. H. Turner; second, Mr. W. B. Heberden.

Bouvardias: First, Mr. W. Brock; second, Mr. H. Turner. Poinsettias: First, Mr. T. Kekewich; second, Mr. W. Brock.

Begonia Gloire de Lorraine: First, Mr. J. Townsend. Cut blooms—thirty-six Japanese: First, Mr. F. S. Vallis, who followed up his Plymouth success with an excellent stand, in which Mrs. J. Lewis, Beale Godfrey, Brightness, F. S. Vallis, Mildred Ware, Elsie Fulton, Nellie Pockett, and Valerie Greenham were exceedingly fine. This stand was awarded the National Chrysanthemum Society's certificate

of merit; second, Mr. G. Foster, whose blooms totalled only one point above those of the third prize stand. In this stand Mme. P. Radaelli, General Hutton, and Mafeking Hero were especially good; third, Mr. H. N. Harrison, whose W. B. Church, Lord Ludlow, and Mme. Waldeck Rousseau were fine; fourth, Mr. B. H. Hill.

Eighteen Japanese: First, Mr. B. H. Hill; second, Sir J. Shelley; third, Mr. J. E. Gulsom.

Twelve Japanese: First, Mr. C. M. Collingwood.

Six Japanese, white: First, Sir J. Shelley, with Mrs. J. Lewis; second, Mr. J. E. Gulsom, with the same variety.

Six Japanese, yellow: First, Mr. W. L. Jones, with Mr. Louis Remy, very fine; second, Mr. B. H. Hill, with Kimberley.

Six Japanese, any other colour: First, Mr. W. L. Jones, with W. B. Church exhibited in its natural form; second, Sir D. King, with the same variety dressed so that the petals were reflexed.

Twelve Japanese, incurved: First, Mr. B. H. Hill; second, Sir J. Shelley; third, Mr. J. E. Gulsom.

Six incurved: First, Mr. C. M. Collingwood.

Five classes for cut blooms were allotted to amateurs not employing a gardener, many of the stands being exceedingly creditable.

Thirty-six Japanese in vases: First, Sir D. King; second, Mr. C. M. Collingwood; third, Mr. T. Knapman.

Six trusses Pompons: First, Mr. J. E. Gulsom; second, Mr. T. Knapman.

Six vases singles: First, Sir D. King; second, Mr. T. Knapman.

Fruit is always a feature of the Exeter show, and no less than fifty-six classes were allotted to it. The exhibits were mostly of first-rate quality, the prize for single specimen Apples being won by one of the largest Bismarcks ever seen. The chief prizes in the fruit classes were won by Sir John Shelley, Sir J. D. F. Davis, and Mr. J. R. Gulsom. A vase of flowers of the blue Shamrock Pea (*Parochetus communis*) from Nepal, but hardy in warm spots in this country, was staged, not for competition, by the Rev. E. E. Heathcote.

The Devon Roostery, Torquay, exhibited a fine collection of over sixty dishes of Apples, for which the firm was awarded a certificate of merit, a like award being made to Messrs. Sutton, Reading, for their Potato Discovery, and to Messrs. Robert Veitch and Son, Exeter, for their stand of plants and flowers, which contained fine exhibition blooms of Chrysanthemums, with Bouvardias, Nerines, Primulas, Arctotis, *Panocratum macrostaphanum*, *Linaria trinornithoptera*, and other flowering plants, as well as an interesting collection of variegated conifers, amongst which were *Retinospora plumosa aurea*, *Cupressus lawsoniana versicolor*, *Thuja Loblii aurea*, *Picea pungens glauca*, *Taxodium sempervirens alba spica*, *Cedrus atlantica glauca*, and *Glyptostrobus heterophyllus*.

KENT COUNTY CHRYSANTHEMUM.

THE sixteenth annual exhibition of Chrysanthemums was held at the Rink, Blackheath. The total number of entries was 158, and some classes were well contested, most of the exhibits being of excellent quality. The vase classes were one of the best features. The premier blooms were Miss Nellie Pockett (Japanese) and C. H. Curtis (incurved).

In the group class there were only two competitors; these were very good, but formal in arrangement. The first prize went to Mr. A. W. Hollands; second, Mr. H. C. Strickland.

For eighteen incurved and eighteen Japanese there were four exhibits, all of high merit. First, Mr. C. Payne; second, Mr. J. E. Poole; third, Mr. H. C. Strickland.

For twelve Japanese, distinct: First, Mr. T. E. Brown; second, Mr. J. Lyne; third, Mr. G. B. Lees.

For twelve incurved: First, Mr. T. E. Couldrey; second, Mr. J. E. Poole; third, Mr. G. B. Lees.

For twelve Japanese reflexed: First, Mr. T. E. Couldrey; second, Mr. J. E. Poole; third, Mr. J. Lyne.

For twelve Pompons in bunches of three flowers: First, Mr. W. Pascoe. The second exhibitor did not conform to the schedule, having some large Anemone-flowered varieties in the stand, but was awarded an extra prize.

For six Japanese, one variety coloured, the variety shown being Mrs. G. Mileham: First, Mr. A. C. Strickland; second, Mr. W. S. Larkin.

For six incurved, one variety: First, Mr. T. E. Brown, with C. H. Curtis; second, Mr. E. T. Couldrey. The above classes were open.

In some of the special classes there was a good competition. The chief prize-winners were Messrs. Couldrey, Poole, Lyne, T. E. Browne, Payne, Hawkins, Lees, G. Judge, J. A. Baker, and F. Sharp.

In the class for two Japanese and two incurved, in vases with any foliage, there were ten entries and some very fine blooms. First, Mr. Pascoe; second, Mr. Couldrey; third, Mr. F. Sharpe.

In the classes for gardeners within a radius of three miles of the Rink, for twelve incurved, distinct, Mr. Couldrey was first; second, Mr. W. H. Culham.

For twelve Japanese, distinct: First, Mr. Judge; second, Mr. Couldrey; third, Mr. Baker. In the amateurs' classes there were some very good exhibits, but in several classes there were no entries.

In the class for a group of miscellaneous plants there were four entries. Mr. Lyne took first with a very tasteful arrangement, in which *Clerodendron fallax* was very effective, also *Anthurium sanguineum*, *Cattleya labiata*, well-coloured Crotons, and other foliage; second, Mr. W. Heath, with some good material, but the best plants were not shown to advantage.

The fruit classes were not well filled. Mr. W. Taylor and Mr. Lyne sent some good Grapes. Some good baskets and trays of vegetables were exhibited.

MISCELLANEOUS.

Messrs. Veitch and Sons put up a very handsome group of foliage and flowering plants, among which were some fine varieties of *Cattleya labiata*, *Oncidium varicosum*, O. Forbesi, and O. incurvum; *Begonia Gloire de Lorraine*, Turnford

Hall, and Mrs. Heal; Lily of the Valley; Crotons included fine specimens of B. Comte, Cheloni, Prince of Wales, Flamingo, and others; *Dracaena Donceiti*, goldiana, sandaraca, Lord Wolsey, and others; *Maranta Veitchii*, *Tillandsia massangana*, Palms, and other choice plants.

Mr. H. J. Jones had an excellent group of Chrysanthemums and foliage; some good singles were among the Chrysanthemums, of *Victoria*, *Rose Queen*, *Pink Perfection*, and *Fairy*; and of large Japanese, *Sensation*, *Mme. W. Rousseau*, and *Mme. E. Chabaneau* were very fine.

Messrs. B. Mallor sent some good floral arrangements in Chrysanthemums and good flowering Heaths, &c.

Messrs. J. Laing and Sons decorated the stage, using some good material effectively. A single pink Chrysanthemum, *Lady Smith*, was very good.

A table of Apples and other fruits from S. Bramford, Esq., Chislehurst, was a great attraction. Twenty-four varieties of Apples were shown, all beautifully coloured. Allington Pippin, Gasconne's Scarlet, Red Reinette, and King of Pippins were very good, as also were the Grapes and Tomatoes.

Mr. W. Gilbert showed some good Kent-grown Apples.

From Mr. J. C. Geiselbrecht came a good new Chrysanthemum, Mrs. G. Judge, a large Japanese, with broad, drooping petals of a bright rose-pink, one of the best of this colour; and a Pompon, *Little Dorrie*, bluish-pink, very pretty.

WINDSOR.

THE annual exhibition was held in the Albert Institute on the 6th inst., and was a little short in entries, but quite up to the usual standard of quality. Mr. C. Sainty, as usual, carried out the arrangements admirably.

For a group of Chrysanthemums and foliage plants there were three competitors. Mr. W. Cole, gardener to Mrs. E. B. Foster, Clewer, was first with an exhibit that little fault could be found with. Mr. W. Lane, gardener to Sir E. Durning Smith, was second with dwarf plants carrying good blooms too crowded in arrangement. Mr. J. Minty, gardener to Sir D. Gooch, Bart., was third.

In a smaller class confined to amateurs only Mr. J. T. Young, Windsor, won easily.

CUT BLOOMS.—JAPANESE.

These were numerous. For eighteen distinct, arranged in a space of 5 feet by 3 feet, with the addition of any foliage, a pleasing effect was produced, and illustrated thoroughly how large Chrysanthemums can be utilised for effect. Mr. G. Lane, with excellent blooms, arranged on a base of Maidenhair Ferns won first place quite easily. Mr. W. Hearn, gardener to Mrs. Gerald Goodlake, was second, and Mr. D. Hayler, gardener to Lady Dalton Fitzgerald, third.

For six vases, three blooms of any one variety, Mr. W. Jinks, gardener to L. J. Drew, Esq., was first with really fine blooms of Mrs. T. W. Pockett, Mrs. Mileham, W. R. Church, and Rev. W. Wilks as the most noteworthy; Mr. Lane, second; Mr. J. Jacobs, gardener to A. L. Wigan, Esq., third.

In a class for twelve Japanese and the same number of incurved a silver cup was offered. Mr. Wilson, gardener to Mrs. Christie, was easily first with large fresh examples of both sections. Of Japanese Rev. W. Wilks, Mrs. Mease, W. R. Church, General Hutton, Mrs. Emmerton, and E. J. Warren were noteworthy; and of incurved Louisa Gilles, C. H. Curtis, Hanwell Glory, Frank Hammond, Duchess of Fife, Mrs. H. J. Jones, Nellie Southam, and Mrs. Judson were conspicuous. Mr. Lane was second, and Mr. Page, gardener to J. B. Fortescue, Esq., Dromore, third.

For twelve incurved, distinct, Mr. Jinks, with large neat blooms was first; Mr. Baskett, gardener to E. H. Beckett, Esq., M.P., second.

For six incurved, any one variety, Mr. Page, with medium-sized, well-finished examples of *Empress of India*, was first, Mr. Jinks, with C. H. Curtis, somewhat rough, was second, while Mr. Baskett, with pretty but small examples of the same variety, took third place.

Mr. Minty was the most successful in the class for six Japanese, any one variety, with Beale Godfrey in grand order, followed by Mr. Jinks, with Mafeking Hero. Mr. Lane, with Mrs. Mileham, brought up the rear.

In the class for twelve blooms, any section, arranged in a vase or basket, with not less than 12 inches of stem, with any natural foliage added, there was quite a brisk competition and satisfactory results. Mr. Jinks, with really fine flowers of popular varieties effectively arranged, easily secured the Dowager Duchess of Sutherland's special prize. F. S. Vallis in this exhibit was awarded the National Chrysanthemum Society's certificate for premier bloom in the show. Messrs. Lane and Page followed in the order here given.

CARDIFF.

THE sixteenth annual autumn exhibition of the Cardiff and District Chrysanthemum Society was held in the Park Hall on the 4th and 5th inst. The great success of the display is undoubtedly owing to the spirited policy of the executive in providing liberal prizes and up-to-date classes, whereby they command the best support of exhibitors. In the immediate neighbourhood of Cardiff there seems to be a wonderful spirit of emulation among growers, as nowhere can such exhibits be seen in the classes devoted to cottagers as here. Cut blooms were numerous and good; groups of Chrysanthemums, as well as miscellaneous plants, were satisfactory. Floral decorations, as wreaths, bouquets, are seen here quite equal in point of quality to those anywhere. The executive is apparently imbued with a determination to still further increase its show. The committee work hard under the chairmanship of Mr. Julian, ably guided by Mr. Gillett, the experienced secretary.

CUT BLOOMS

were the chief attraction, therefore demand a prior notice. The principal class was that for eight varieties of Japanese, distinct, three blooms of each, staged in vases, with Chrysanthemum foliage. The leading prize was a challenge cup

with 25 added. Five competed, making a good display. Mr. Drake, 44, Cathays Terrace, Cardiff, was an easy winner with a grand set of blooms, large, shapely, and beautifully staged. The varieties were *Duchess of Sutherland*, W. R. Church, Mrs. Lewis, Mrs. Barkley, Charles Davis, rich in colour; Paolo Radaelli, huge blooms; Mme. Herwege, and Mrs. Mileham, very fine. Mr. J. Duff, gardener to Mrs. Williams, Newport, was a good second, with high quality flowers if a trifle smaller than the first prize set; Mr. G. Williams, Manor House Nurseries, Cardiff, third.

For twelve Japanese, distinct, Mr. Drake was again premier prize-taker with an even set of high-class blooms, as F. W. Vallis, George Lawrence, Mrs. Mileham, Paolo Radaelli, C. J. Salter, Matthew Smith, and others; Mr. E. Townsend, gardener to H. Pitt, Esq., Abergeenny, was a close second; Mr. J. Williams, third.

Incurved varieties were not strongly represented in point of numbers, but the quality was good. For twenty-four in not less than twelve varieties, Mr. Drake won first place with medium-sized, neatly-finished examples of Mrs. Judson, Mrs. Egan, Mme. Ferlat, C. Curtis, &c.; Mr. Townsend was a close second.

In the classes set apart for amateurs and gardeners the competition was exceedingly keen. In competition for the Courtis Challenge Cup, for twenty-four Japanese in not less than eighteen varieties, there was keen competition and an excellent display. Mr. E. A. Parsons, gardener to Mrs. J. D. Gunn, Cardiff, was the most successful with satisfactory flowers of Mrs. Lewis, Mrs. Mease, W. R. Church, Paolo Radaelli, F. S. Vallis, &c.; Mr. John Dunn, gardener to Mrs. Williams, Bryn-glas, Newport, second; Mr. H. A. Allen, Penarth, a close third.

For twelve Japanese no fewer than seven competed. With a splendid exhibit Mr. A. F. Hill, Cardiff (amateur), secured the leading award. F. S. Vallis, the premier bloom in the show, was included. Mr. Edwards, Severn Road, Cardiff, was second; Mr. H. Frazer, gardener to D. Adsett, Esq., The Hollies, Penarth, third.

For the best twelve Japanese blooms in not less than four varieties, open to those not employing a regular gardener, a silver challenge cup was offered, for which seven competed. Mr. Hill was again successful with grand examples of popular varieties, Mr. Edwards second, and Mr. C. S. Arthur, 149, Albany Road, Cardiff, third.

In the class for twelve incurved the competition was not keen, but the two exhibits staged were meritorious. Mr. E. A. Parsons was the most successful with neat, small, examples.

White-flowered Japanese varieties had a class set apart to themselves. For five blooms, any one variety, Mr. V. Hatherdale, Manor Cottage, Cardiff, won the premier prize with Mrs. Lewis in good condition; Mr. Edwards, with Mrs. Carnot, second.

For five Japanese, any one variety except white, Mr. Hill won with magnificent examples of Mrs. Mileham, Mr. Edwards depending upon Mrs. Mease for second place.

For twelve Japanese in four varieties, staged in vases, Mr. Allen, with Mrs. T. W. Pockett, Mrs. Mileham, Mr. Louis Remy, and Mme. Herwege, won against six others; Mr. Edwards second, Mr. Frazer third.

For six vases, Japanese, three blooms in each, Mr. Thomas Olive, Tockington, Gloucester, won with first-rate examples of popular varieties; Mr. E. Curtis, gardener to T. E. Cartwright, Esq., Fairwater, second; Mr. Geiman, gardener to H. Edworth, Esq., Cowbridge, third.

Single-flowered varieties were well represented. For six bunches, distinct, three sprays to each, Mr. T. Bindon, gardener to Dr. T. Wallace, Cardiff, was an easy first; Mr. I. Williams, 68, Keppock Street, Cardiff, second. Mr. Bindon also had the best arranged vase of single-flowered varieties, followed by Mr. Shackson, gardener to Lord Romilly, Park-kerry Park, second. Several classes were set apart for cottagers; it was surprising to see how well they acquitted themselves, too. Many really fine examples were staged.

PLANTS.

were not numerous but good in quality. For a group of Chrysanthemums arranged with foliage plants for effect, Mr. W. Treseader, The Nurseries, Cardiff, was an easy first prize-winner with plants carrying large fully developed blooms arranged lightly, yet effectively; Mr. G. Williams second.

Bush-trained plants were not numerous. For four Mr. Treseader staged the best; Mr. G. Nurse, 22, Wellington Street, Cardiff, second.

In the classes open to amateurs only for groups of Chrysanthemums 50 square feet and 32 square feet, the competition was keen. In the former class Mr. A. Brown, gardener to J. Howell, Esq., Cardiff, was first. In the smaller class Mr. W. H. Owens, 62, Salisbury Road, Cardiff, was the most successful.

MISCELLANEOUS.

For the best hand bouquet of Chrysanthemums Mr. John Crossling, Penarth Nurseries, was placed first; Mr. W. Treseader was second, but in our opinion he should have been first; Messrs. Ellis and Son, Westfield Nurseries, Cardiff, third. Messrs. Ellis and Son, Cowbridge Road, Cardiff, had the best cross of Chrysanthemums. Mr. W. Baggeen, Albany Road, Cardiff, the best wreath—a magnificent display.

The class for a bridal bouquet produced keen competition. Mr. W. Treseader, with a charming arrangement of *Orchids* and *Lily of the Valley*, secured the coveted position; Mr. W. Baggeen following.

Non-competitive exhibits were numerous, and added much to the interest of the show. Gold medals were awarded to Mr. John Basham, Fair Oak Nursery, Bassaleg, Newport, for a magnificent display of hardy fruit; especially fine were the Apples and Pears. To Messrs. J. Cypher and Son, Cheltenham, for an attractive exhibit of *Orchids*, and to Mr. W. Treseader for a collection of Dahlias and Roses.

First-class certificates were awarded to Mr. H. J. Jones, Rycroft Nursery, Lewisham, for seedling Japanese Chrysanthemum Mrs. J. Dunn, a pure white-flowered variety with exceptionally long drooping florets, most graceful and distinct

even among whites; and to Marie du Cros, a bold handsome flower with long flat florets, straw white on the outer deepening to yellow in the centre of the flower.

BIRMINGHAM CHRYSANTHEMUM SHOW.

THE annual exhibition of the Birmingham and Midland Counties Chrysanthemum Society was held on Tuesday, Wednesday, and Thursday last in the Bingley Hall, and, although the general opinion seemed to be that blooms had been better, it was undoubtedly a grand display of produce. The disposal of the exhibits produced a better effect than in previous years. Mr. J. Hughes, sen., and Mr. J. Hughes, jun., the secretaries, deserve unstinted praise for their arrangements.

PLANTS.

Nine large flowering Chrysanthemums.—First, E. Martineau, Esq., Edgbaston (gardener, Mr. Brasler), Alfred alter and Mme. Ferlat being the best; second, G. Cadbury, Esq., Northfield (gardener, Mr. J. Meldrum); third, J. A. Kenrick, Esq., Edgbaston (gardener, Mr. A. Cryer).

Six large flowering plants, Japanese excluded.—First, G. Cadbury, Esq., with Lady Isobel and Lord Alcester as the set; second, E. Martineau, Esq.

One Japanese Chrysanthemum plant.—First, G. Cadbury, Esq., with a splendidly flowered plant of Charles Davis; second, E. Martineau, Esq., with Colonel Smith; third, A. Kenrick, Esq.

Six Japanese (disimilar).—First, E. Martineau, Esq., with Vivand Morel, J. Thorpe, jun., and Colonel Smith (excellent); second, J. A. Kenrick, Esq.

Three Japanese.—First, E. Martineau, Esq., W. Cursham

One vase each of eight distinct varieties, five blooms in a vase.—First, Colonel Beech, Coventry (gardener, Mr. E. J. Brooks), with a splendid exhibit, F. S. Vallis, Mrs. G. Mileham, and W. R. Church being fine; second, Leamington Nurserymen and Florists, Limited, Leamington, with well-formed blooms; third, Mr. J. H. Goodacre, Elvaston Castle Gardens; fourth, G. H. Hadfield, Esq., Ross (gardener, Mr. J. Rick). There were several more entries.

One vase each of four Japanese varieties.—First, Mrs. Martin, Edgbaston (gardener, Mr. T. W. Davis); second, E. Horton, Esq., Walsall (gardener, Mr. S. Horton).

One vase each of two Japanese varieties.—First, R. Barnes, Esq., Malvern, with splendid Le Grand Dragon and Australie; second, E. Horton, Esq., Walsall; third, Mrs. Armfield, Edgbaston (gardener, Mr. C. Batchelor). There were several more entries.

One vase of a pink Japanese.—First, the Dowager Lady Hindlip, Droitwich (gardener, Mr. C. Crooks), with grand Mme. Paolo Radaelli; second, E. Horton, Esq., Walsall; third, Mrs. Martin, Edgbaston. There were numerous other entries.

One vase of any Japanese.—First, F. E. Muntz, Esq., Umberslade (gardener, Mr. Pritchard), with very fine W. R. Church; second, the Dowager Lady Hindlip, with the same variety; third, L. Lloyd, Esq., Moseley (gardener, Mr. T. Bird).

One vase of white Japanese.—First, A. Heaton, Esq., Handsworth (gardener Mr. F. Biddle), with Mme. G. Henry; second, A. Taylor, Esq., Acoc's Green, with Nellie Pockett; third, the Dowager Lady Hindlip.

One vase of yellow Japanese.—First, the Dowager Lady Hindlip (gardener Mr. Crooks), with splendid deep-coloured

Lady Esther, and W. R. Church as the best; second, W. Manning, Esq., Dudley; third, H. Needham, Esq., Gravelly Hill.

Twelve specimen blooms on long stems with any foliage.—First, R. Barnes, Esq., Malvern, with an attractive exhibit; second, Mr. J. V. MacDonald, gardener to G. H. Kenrick, Esq., with good blooms; third, Mr. R. Bullock, gardener to T. W. Piggott, Esq., Moseley. There were several other exhibits.

Twenty-four blooms (twelve Japanese, twelve incurved).—First, Mr. MacDonald, gardener to G. H. Kenrick, Esq., Edgbaston, with good blooms, especially of Matthew Smith, Mme. Cadbury, Duchess of Fife, and Mme. Ferlat; second, Mr. T. W. Davis, gardener to Mrs. Martin, Edgbaston.

Twelve blooms (six incurved, six Japanese), to be grown within four miles of Birmingham.—First, Mr. J. Eason, gardener to A. Clarke, Esq., Edgbaston; second, Mr. G. Palmer, gardener to W. Clarke, Esq., Edgbaston; third, Mr. G. Bedford, gardener to E. J. Byrne, Esq., Gravelly Hill.

Dinner-table decoration.—First, H. Woolman, Esq., Acoc's Green, with an arrangement of bronze Source d'Or; second, the Leamington Nurserymen and Florists, Limited, Leamington, who used bronze-yellow flowers; third, Mr. C. Thomas, gardener to G. A. Palmer, Esq., Handsworth. There were nine exhibits in this class.

FRUIT.

Collection of British-grown fruit.—First, Mr. J. H. Goodacre, Elvaston Hall Gardens, Derby, with a very handsome display of highly coloured fruit. Grapes Muscat of Alexandria, Gros Colmar, and Barbarossa; Pears Doyenné du Comice, Beurré Fouquieray, and Marie Louise; Apples Twenty Ounce, Cox's Orange Pippin, Allington Pippin, and Peach Golden Eagle were all excellent. Mr. J. Read, gardener to the Earl of Carnarvon, Bretby Park, was given third prize. Gros Colmar and Alicante Grapes were very good, but the hardy fruits were small. There were no more exhibits in this class.

Grapes, six bunches.—First, Mr. J. H. Goodacre, Elvaston Castle Gardens, with very good Muscat of Alexandria, Barbarossa, and Alicante; third, Mr. J. Jones, gardener to Mrs. F. Need, Malvern, with large Diamond Jubilee, Gros Colmar, &c.

Black Grapes, three bunches.—First, Mr. J. Jones, with excellent Gros Colmar; second, Mr. H. Folkes, gardener to the Right Hon. T. F. Halsey, M.P., Hemel Hempstead; third, Mr. Goodacre.

White Grapes, three bunches.—First, Mr. Goodacre, with well finished Muscat of Alexandria. No more exhibitors.

White Grapes, two bunches.—First, Mr. J. Jones, Malvern, with Lady Hutt; second, Mr. J. Rick, with White Queen; third, Mr. H. Folkes, with Golden Queen.

Black Grapes, two varieties (local).—First, Mr. C. Batchelor, gardener to Mrs. Armfield, Edgbaston; second, Mr. T. W. Davis, gardener to Mrs. Martin, Edgbaston.

Culinary Apples, six dishes.—First, Mr. C. Crooks, Droitwich, with very good Peasegood's, Emperor Alexander, &c.; second, Mr. R. Jones, Barford Hill Gardens, with Warner's King and Lane's Prince Albert the best.

Desert Apples, six dishes.—First, Mr. J. Rick, gardener to G. H. Hadfield, Esq., Ross; second, Mr. C. Crooks; third, Mr. E. Jones.

Chinese Primulas and Cyclamen were well and largely shown.

VEGETABLES.

Collection of vegetables (prizes by Messrs. Webb and Sons).—First, Mr. E. Beckett, gardener to Lord Aldenham, Elstree, Onions Allia Craig being very fine, Mr. G. Neal, gardener to P. Southby, Esq., Hampton, was second; W. Pemberton, Esq., Walsall, was third; and Mr. Bastin, Buscot Park Gardens, fourth. There were numerous other entries.

Collection of vegetables (prizes by Messrs. Sutton and Sons).—First, Mr. W. Leith, gardener to Colonel P. E. Middleton, Ross; second, Mr. A. G. Gentle, gardener to Mrs. Dennison, Little Gaddesden; third, Mr. W. L. Bastin, Farlington.

Mr. Robert Sydenham, Tenby Street, Birmingham, gave prizes in many classes for dishes of Cauliflowers, Savoy Cabbage, Red Cabbage, Carrots, Leeks, Onions, &c. Mr. Sydenham offered a £15 silver challenge bowl to the winner of the greatest number of points in the above classes, and if won three times the bowl becomes the exhibitor's property. The winner of the bowl was Mr. Horspool, Old Chirk Gardens, Ruabon, who gained 32 points. Mr. Folkes had 29 points, and Mr. Read 26 points.

The local cup offered by Mr. W. Sydenham was won by Mr. W. A. Marrian, Olton, with 33 points, Mr. Haytree of Solihull having 32 points.

Collection of vegetables (prizes by Messrs. Hewitt and Co., Solihull).—First, Mr. E. Beckett, Aldenham House Gardens; second, Mr. C. Haynes, gardener to W. E. Alston, Esq., Elmdon Hall; third, Mr. J. Read, gardener to the Earl of Carnarvon, Burton-on-Trent; fourth, Mr. H. Wright, gardener to W. Waldron, Esq., Kingwinford.

Collection of vegetables (prizes by Messrs. Thomson and Co., Spark Hill).—First, Mr. Beckett, with a fine display. Potato Up-to-date was very good; second, Mr. F. J. Clark, gardener to Mark Firth, Esq., Leicester; third, Mr. G. Neal, gardener to P. Southby, Esq., Hampton; fourth, Mr. H. Folkes, gardener to the Right Hon. T. F. Halsey, M.P., Hemel Hempstead.

Collection of vegetables (prizes by Messrs. Richard Smith and Co.).—First, Mr. E. Beckett; second, R. A. Horspool, Esq., Ruabon.

NON-COMPETITIVE EXHIBITS.

Messrs. Webb and Sons, Wordsley, Stourbridge, showed a collection of Potatoes in many good sorts, such as Webb's Improved Magnum Bonum, Evergood, Snowdrop, and others. Displays of Potatoes were arranged on either side of a splendid lot of Begonia Gloire de Lorraine and B. Turnford Hall and Cyclamen.

The King's Acre Nursery Co., Limited, Hereford, had an admirable display of hardy fruit, Apples chiefly. Among the best dishes were Stirling Castle, Cellini, Lane's Prince Albert,

PRIZE GROUP OF CHRYSANTHEMUMS AT THE BAKEWELL SHOW.

(This group was shown by Mr. W. Keetley, gardener to Stanley Orme, Esq., Granby, Bakewell, Derbyshire, at the Chrysanthemum show held at Bakewell, November, 1902; it was awarded first prize and a Silver Challenge Cup. Our illustration is from a photograph by Mrs. Stanley Orme.)

and Mrs. J. Kitson being splendid; second, G. Cadbury, Esq.; third, J. A. Kenrick, Esq.

One large flowering (Japanese excluded).—G. Cadbury, Esq., the only exhibitor, was given a first prize for Mme. Ferlat.

Group of Chrysanthemums, arranged with Ferns and foliage plants.—First, G. Cadbury, Esq. (gardener, Mr. Meldrum), with a somewhat compact group of well-grown plants bearing very good blooms; second, A. H. Griffiths, Esq., Edgbaston (gardener, Mr. C. Kelland), with smaller blooms, but a rather more pleasing arrangement; third, A. Clarke, Esq., Edgbaston (gardener, Mr. J. Eason).

Group of Chrysanthemums (quality of bloom, variety, and general effect to be considered).—First, J. H. Kenrick, Esq., Edgbaston (gardener, Mr. J. MacDonald), with a magnificent display of plants bearing fine blooms. The group was boldly yet informally arranged, and was most effective; J. Whitfield, Esq., Moseley (gardener, Mr. W. Thomson), was second, with a less effective group, though still very good, and J. A. Kenrick, Esq., Edgbaston (gardener, Mr. A. Cryer), was third.

VASE CLASSES.

One vase each of four Japanese varieties.—First, Colonel Beech, Coventry (gardener, Mr. E. J. Brooks), with lovely blooms of F. S. Vallis, Guy Hamilton, Mrs. P. Radaelli, and W. R. Church; second, F. E. Muntz, Esq., Umberslade (gardener, Mr. T. Pritchard), W. R. Church being the best; third, G. H. Hadfield, Esq., Ross (gardener, Mr. J. Rick).

F. S. Vallis; second, R. Barnes, Esq., Malvern, with M. Louis Remy; third, A. Heaton, Esq., Handsworth.

CUT BLOOMS.

Eighteen incurved blooms.—First, Mr. J. H. Goodacre, Elvaston Hall Gardens, with a fine lot. Mme. Ferlat, C. H. Curtis, Topaze Orientale, and Perle Dauphinoise were the best; second, Sir A. Henderson, M.P., Faringdon (gardener, Mr. W. L. Bastin), with rather smaller blooms, though of excellent form.

Eighteen Japanese.—First, Colonel Beech, Coventry (gardener, Mr. E. J. Brooks), with somewhat loose blooms. Mme. J. Henry, Henry Stowe, Guy Hamilton, and Ethel Fitzroy were of the best; second, Mr. C. Crooks, gardener to Lady Hindlip, Droitwich, with good blooms, particularly of Miss M. Ware and Mme. Paolo Radaelli; third, the Leamington Nurserymen and Florists, Limited.

Twelve incurved.—First, Mr. C. Crooks, Droitwich, with very good C. H. Curtis, Duchess of Fife, and Mme. Ferlat, though none were of unusual quality; second, Mr. W. L. Bastin, gardener to Sir A. Henderson, Faringdon, with rather small, well-formed blooms; third, W. Manning, Esq., Dudley.

Twelve blooms (six incurved, six Japanese), to be grown within six miles of Birmingham.—First, Mrs. Martin, Edgbaston (gardener, Mr. T. W. Davis); second, T. W. Piggott, Esq., Moseley; third, E. Martineau, Esq.

Twelve Japanese.—First, Mr. R. Jones, gardener to C. A. Smith-Ryland, Esq., Barford Hill, with Mrs. G. Mileham

Warner's King, Tom Putt, King of the Pippins, Adam's Pearmain, King of Tompkins County, &c. Pear Pittmaston Duchess was very fine. The table was tastefully decorated with small Palms, Virginian Creeper, &c.

Mr. John Basham, Bassaleg, Newport, Mon., showed hardy fruit extensively; some of the best dishes of Apples were Peasgood's Nonesuch, Allington Pippin, Lord Derby, and Wellington; and Pears Catillac, Uvedale's St. Germain, and Easter Beurré. This collection of fruit was an imposing one, and arranged with good effect.

Messrs. Richard Smith and Co., Worcester, had some excellent dishes of Apples on view. Warner's King was particularly so. Ecklinville, Peasgood's Nonesuch, and Tyler's Kernel were others very good. Pears Beurré Superfin, Alexandre Lucas, Hazon's Incomparable, and Durondeau were also fine.

Mrs. Whitehouse, 48, Tindall Street, Balsall Heath, showed a collection of cut Chrysanthemums.

Mr. W. J. Godfrey, Exmouth, Devon, showed some fine large blooms of Chrysanthemums and bunches of zonal Pelargoniums. Carnations, too, were included in this display, which was a very bright one. Among the Chrysanthemums Exmouth Bival, Wilfred H. Godfrey, Colonel Weatherall, Britannia, and F. S. Vallis were particularly good. Of Carnations, Waverley (salmon), Queen of Pinks, and General Roosevelt (dark crimson) were very good. The Godfrey Calla, a large, pure white form, was well shown too.

Messrs. W. Wells and Co., Redhill, Surrey, showed a table of decorative Chrysanthemums, that included many choice single and other varieties. Among the large blooms were T. C. Brock, Bessie Godfrey, W. A. Etherington, W. Duckham, Miss Elsie Fulton, and other good ones.

The Vinerias, Limited, Acoc's Green, Birmingham, had a well-arranged group of outdoor Chrysanthemums, among which a yellow variety called La Pluie d'Or was very conspicuous. The plants were finely flowered, and the colours nicely arranged.

Messrs. Cilbran and Sons, Altrincham, exhibited a group of handsome Celosias and cut Chrysanthemums in variety. The latter included large-flowered sorts as well as decorative varieties. Among the singles were Emily Cilbran (pretty red-bronze), Miss Crispy (deep red), Ladysmith (rosy pink), Bronze Mary Anderson, and Mrs. B. Fletcher (white), all very pretty.

Messrs. Pewtress Brothers, Tillington, near Hereford, exhibited a collection of Apples, arranged with suitable decoration upon a table.

Messrs. Yates and Sons, Old Square, Birmingham, showed a good exhibit of vegetables that included well-developed Cauliflower, Allis Craig and Prizetaker Onions, White Turnip, &c.

Mr. J. G. Thompson, Handsworth, showed a collection of succulent plants, Cacti, &c.

Mr. J. Austin, Sparkbrook, exhibited a small group of Chrysanthemums in many of the best sorts.

A magnificent and finely arranged group of miscellaneous foliage and flowering plants was exhibited from the Highbury Gardens by Mr. J. Deacon, gardener to the Right Hon. Joseph Chamberlain, M.P. Begonias Gloire de Lorraine and Turnford Hall contributed largely to the display, while such plants as Lilium Harrisi, Chrysanthemums in great variety, Cyclamen, and Lilies of the Valley, together with suitable greenery, combined to make this display one of the most effective in the show.

Messrs. John Waterer and Sons, Limited, Bagshot, Surrey, showed a group of finely grown hardy shrubs and conifers. Particularly good were *Sciadopitys verticillata*, *Cedrus atlantica* glauca, *Thuja Lobbi* sebrina, standard Hollies, and Portugal Laurels and *Juniperus japonica* aurea.

Messrs. Richard Smith and Co., Worcester, also had a notable group of hardy shrubs, among which were such good things as *Picea pinasapo* glauca, *Thuja Lobbi* aurea, and *Elaeagnus aurea* variegata.

Messrs. Hewitt and Co., Solihull, also had a group of shrubs, as well as a bright display of Carnations.

Messrs. Thompson and Co., Spark Hill Nurseries, showed Chinese Primulas and a collection of miscellaneous greenhouse plants.

The Vinerias, Limited, Acoc's Green, sent a display of leaf skeletons.

Messrs. Gunn and Sons, Olton, showed a splendid lot of crosses and bouquets, and vases of Chrysanthemums.

Messrs. Denville and Co., Banbury, sent a brilliant lot of zonal Pelargoniums.

Messrs. W. B. Child and Co. and Mr. C. H. Herbert showed collections of hardy ornamental shrubs.

Mr. J. H. White, Worcester, showed a group of shrubs and hardy perennials.

From the Worcestershire County Council's Experimental Garden at Droitwich, Mr. Udale showed dried fruits and an object-lesson in the use of manures.

NATIONAL CHRYSANTHEMUM SOCIETY.

THE great autumn festival of this special society was held for the first time in the south transept of the Crystal Palace, and the accommodation there provided enabled the executive of the society to create a show of wonderful interest. Contrasted with the want of light and cleanliness of the Royal Aquarium, the present quarters of the exhibition compared most favourably, and everyone was ready to admit that so far as the actual place of exhibition is concerned the Crystal Palace is ideal. The competition in the respective classes was not as keen as usual, but this may be attributed to the season, which has caused many collections of blooms to damp, to the difficulty of access in the early hours of the morning, and to the new charge of an entrance fee in all classes. The show, as a whole, was very fine indeed, and the quality in many classes was superb.

The great vase class is the chief competition at these meetings, but this year there were only two exhibitors. A magnificent lot of blooms secured leading honours for Mr. Charles Beckett, gardener to Sir W. G. Pearce, Bart.,

Chilton Lodge, Hungerford. The finish of the blooms was superb, and they represented the highest cultural skill. The best varieties were Mr. F. S. Vallis, Mrs. F. S. Vallis, Mrs. J. Bryant, General Hutton, Mrs. Barklay, Mme. C. Naglemakers, J. R. Upton, and Mme. Paolo Radaelli. Mr. R. Kenyon, gardener to Mr. J. R. Twentymann, Monkhouse, Woodford Green, was a good second, having large well-finished blooms of good colour and capital form. Duchess of Sutherland, F. S. Vallis, and Lord Ludlow were three of his best sorts.

The only exhibit from the affiliated societies came from the Epsom and District Chrysanthemum Society, Mr. G. Hunt being responsible for all the blooms, i.e., twenty-four incurved and twenty-four Japanese, distinct. The Japanese blooms were nice and even, though not over large, and the incurved blooms were less even than usual.

The three competitors in the class for forty-eight Japanese blooms, distinct, made a fine display, and there was not much difference between them. First prize was won by Mr. W. Mease, gardener to Mr. A. Tate, Downside, Leatherhead, who showed well. Superb were the blooms of F. S. Vallis, Godfrey's Pride, Guy Hamilton, General Hutton, Mrs. Barklay, Mrs. F. S. Vallis, and Lord Ludlow; Mr. Kenyon was an uncomfortably close second; third, Mr. A. Jefferies, gardener to Mr. John Balfour, Moor Hall, Harlow, Essex. This exhibit was very bright and clean, but somewhat poor in places.

For Mr. W. J. Godfrey's prizes for thirty blooms in ten varieties of Japanese sorts sent out from his nurseries, there were two competitors. Mr. Kenyon was placed first with a heavy lot of highly-coloured blooms; second, Mr. Jefferies, with a much smaller series.

The class for twenty-four Japanese blooms, distinct, is always briskly competed, and on this occasion there were six individual displays. The premier position was occupied by Mr. Jefferies, who had a very even lot of blooms of good form and colour; the veteran Mr. W. Mease, was placed second with clean though rather smaller blooms; and Mr. J. Lock, gardener to Mr. Justice Swinfen-Eady, Otlands Lodge, Weybridge, third, many of his blooms being very handsome. An extra prize was awarded to Mr. George Hewitt, gardener to Mr. Charles E. Green, Theydon Grove, Epping.

Seven entries for twelve Japanese blooms, distinct, were in evidence, Mr. Hewitt taking premier honours with a fine set, although in some cases rather shallow in build; second, Mr. George Halsey, gardener to Mr. Jeremiah Lyon, J.P., Riddings Court, Caterham Valley, who ran the first prize-winner very closely; third, Mr. H. Smith, gardener to Colonel Bowles, M.P., Forty Hall, Enfield.

The class for a vase of six Japanese blooms, white, one variety only, found Mr. W. G. Prudden-Clark, York Road, Hitchin, leading with fine blooms of *The Princess*; second, Mr. G. A. King, gardener to Mr. Kennedy Jones, East Finchley, for *Nellie Puckett*; and third, Mr. George Wilson, gardener to Mr. E. T. Powell, Rose Dene, Christchurch Avenue, Brondesbury Park, N.W., with *Guy Hamilton*.

For a vase of six Japanese blooms, yellow, one variety only, Mr. Jefferies was first with six magnificent blooms of F. S. Vallis; fourth, Mr. A. King for *Le Grand Dragon*.

For a vase of six blooms, Japanese, any colour but white and yellow, Mr. Prudden-Clark was first with neat blooms of Mrs. George Mileham; second, Mr. George Halsey, with heavy blooms of the same variety as the first-named; third, Mr. Jefferies, for handsome blooms of *Edwin Molyneux*.

The four exhibits in the class for thirty-six incurved blooms, distinct, made a fine show of the Chinese type of the flower. Mr. W. Higga, gardener to Mr. J. B. Hankey, Fetcham Park, Leatherhead, for the sixth time in succession secured first prize and the Holmes Memorial Cup with very large, remarkably well-finished blooms of high quality. Charles H. Curtis, Mrs. Bernard Hankey, Frank Hammond, Duchess of Fife, Robert Petfield, George Haigh, and Islene were of the best. Mr. Mease was second with a good though rather uneven set of blooms, C. H. Curtis, Mrs. R. C. Kingston, and Lady Isabel being his best. Mr. G. Hunt, gardener to Mr. Pantia Ralli, Ashstead Park, Epsom, was third with a nice exhibit.

For the prizes offered by Messrs. Mackenzie and Moncur for six vases of incurved blooms, in six distinct varieties, there were three entries. Mr. Higga here again asserted his superiority by taking first prize with a magnificent series of vases. The blooms were large, globular, and splendidly dressed, showing the highest cultural skill—*Nellie Southam*, Charles H. Curtis, Mrs. Bernard Hankey, Duchess of Fife, Hanwell Glory, and Lady Isabel. Mr. Hunt was placed second, also with a nice lot of blooms, but of less quality than the leader; third, Mr. W. L. Bastin, who closely followed the last-named.

Of the three entrants in the class for twelve incurved, distinct, Mr. Bastin was a good first with beautifully finished blooms of good size.

The class for six blooms of one variety of incurved is always an interesting feature, the five exhibits on this occasion being very pretty. Six grand C. H. Curtis secured first prize for Mr. C. Lane, gardener to Mr. E. H. Coles, Burntwood, Caterham; second, unnamed; third, Mr. R. J. Jolliffe, Fern Bank, Bouchurch, Isle of Wight.

In the class for twenty-four large-flowered Anemone blooms, there were three entries, Mr. Charles Brown, gardener to Mr. R. Henty, Langley House, Abbot's Langley, Herts, being first, Le Chalonsale, Sir Walter Raleigh, John Buynan, M. Chas. Leboqz, and Lady Margaret being his best; second, Mr. J. Barrance, gardener to Mr. G. W. Taylor, Hadley Bourne, Barnet; third, Mr. A. C. Horton, gardener to Mr. H. H. Platten, Harwood Hall, Uxminster, Essex.

For twelve large-flowered Anemones, staged six blooms each in two vases, Mr. Barrance was placed in the premier position with some pretty blooms, Mr. Charles Brown following very closely.

For twelve large-flowered Japanese Anemones, distinct, six blooms in each vase, Mr. A. C. Horton was a good first with large blooms, splendidly developed; second, Mr. Brown, with a nice series; third, Mr. Barrance.

For nine varieties of Pompons, six blooms of each variety distinct, arranged in vases, there were three capital exhibits. First, Mr. Charles Brown, with a grand lot set up in bold and handsome bunches; second, Mr. T. Caryl, gardener to Mr. A. G. Melanor, Aldenholme, Weybridge, who followed closely, and Mr. George A. King a poor third. For six bunches of Anemone Pompons, six blooms in each bunch, distinct, Mr. Brown was again first with a charming lot. Mr. Barrance was a very good second, Mr. Astie in his display being very fine.

In the class for six varieties of singles, six blooms in each vase, distinct, there were three entries, and very fine they were. Mr. A. Dear, gardener to Mr. W. Jordan, Hill House, Palmer's Green, was a grand first, with large and handsome blooms. A good second was forthcoming in Mr. H. Reckes, gardener to Mr. G. W. Bird, Manor House, West Wickham, who staged finely; third, Mr. W. C. Pagram, gardener to Mr. J. Courtenay, The Whim, Weybridge.

FLORAL DECORATIONS.

The four contestants for three *epergnes*, arranged with Chrysanthemums and appropriate foliage for decorative effect, made an attractive display. Miss C. B. Cole, The Vineyards, Feltham, was placed first. Mr. D. B. Crane, Highgate, N., was second with a pleasing arrangement. The third prize was won by Miss Mary H. J. Anstey, West Norwood.

For a vase of six Japanese blooms, one variety only, for decorative effect, Mr. W. Burrell, gardener to Mrs. R. Thornton, The Hoo, Sydenham Hill, was deservedly placed first; second, Mr. George King.

Reflexed blooms were represented by two exhibits, each of twelve blooms in a vase. Mr. Charles Brown was placed first, and Mr. Barrance second.

Hairy-petalled Japanese in vases, six blooms in each, had but one representative, and this was a poor lot, and came from Mr. Jolliffe, who was awarded third prize.

THE PERCY WATERER CHALLENGE CUPS.

The first class is open to amateur gardeners who employ no paid assistants. The class is for a table 6 feet by 3 feet, on which is to be displayed the different types of the decorative Chrysanthemum. There were four competitors, Mr. D. B. Crane being first. Mr. Crane now wins the cup outright, having won the same last year. Second prize was won by Mr. P. L. Johnson, North Gate, Bishop's Stortford.

The cup awarded to ladies for a similar class was won by Miss Mary H. J. Anstey, who really made a table decoration, and represented but two types of the flower only. Mrs. D. B. Crane, the winner of last year, was placed second.

Miss Norman Davis, Framfield, Sussex, again excelled in a gorgeous circular group of Chrysanthemums, all types of the flower being well displayed. Vases of specimen blooms of high quality, pleasingly interspersed with *Crotons*, *Fatsia*, and other foliage plants, made a fine effect, and easily won first prize for this well-known grower. A truly noble group won second prize for Messrs. John Peed and Son, Kew Park Nurseries, West Norwood, S.E., whose display was one of this firm's best efforts.

PLANTS.

There was but one exhibit in the class for six bush-trained specimens, the exhibitor, Mr. H. Smith, well deserving the first prize awarded to him. The plants were splendidly grown, each one bearing grand blooms, large and full. *Nellie Puckett*, *Phœbus*, *Souvenir de Petite Amie*, and *John Shrimpton*. The same grower was first for a single specimen with a well-grown plant of *Amy Ensell*.

MISCELLANEOUS EXHIBITS.

Mr. H. J. Jones, Ryscroft Nursery, Lewisham, won a large gold medal for a superb table of cut Chrysanthemums, in which new and old sorts of all types were grandly represented. Mrs. J. Dunn is a grand new Japanese white sort, and this was certificated. The singles were also excellent.

Messrs. J. Ambrose and Son, Chessunt, Herts, had a large group of Roses in pots, *Lily of the Valley*, *Cyclamen*, and foliage plants pleasingly disposed, for which they were awarded a silver medal.

Messrs. T. Rochford and Sons, Limited, Broxbourne, richly merited the gold medal for their beautiful display of related Lilies, all flowering profusely, and rendering the air pregnant with their perfume. *Azalea Mollis* was also done well.

Hobbies Limited, Dereham, put up a huge table of specimen Chrysanthemums, Tea-scented Roses in spray, and double zonal Pelargoniums, as well as decorative Chrysanthemums, for which a gold medal was awarded.

Messrs. H. Cannell and Sons had one of their superb groups of Cannas, specimen Chrysanthemums of up-to-date sorts, decorative varieties also playing an important part. *Gloire de Lorraine* and *Turnford Hall* Begonias were finely represented, as were an immense array of zonal Pelargoniums of the very best sorts. Large gold medal.

A silver-gilt medal was secured by Messrs. J. Peed and Son for Begonias *Gloire de Lorraine* and *Turnford Hall*, a large table being well filled.

Messrs. James Vetch and Sons, Limited, Chelsea, had one of their inimitable displays of Begonias of single, double, and semi-double forms. This was a most attractive feature and well merited the gold medal awarded to it.

From Mr. John Russell, Brentwood, came a charming collection of hardy shrubs, and a welcome feature they were amid all the rich colouring of the flowers. Silver-gilt medal.

Messrs. J. Cheal and Sons, Crawley, had a capital collection of Apples, quite remarkable for the present year. They were representative, of good colour, and a fine sample. Bunches of richly-coloured shrubs and trees were pleasingly interspersed. Silver-gilt medal.

Mr. W. J. Godfrey, Exmouth, secured a gold medal for a grand table of Chrysanthemums in a cut state, in which the newer sorts played an important part. Carnations were also well staged by this exhibitor.

Laves Horticultural Manures displayed their wares, and the Ichthemio Guano, by Mr. W. Colchester, also made a display.

Messrs. William Cutbush and Sons, Highgate, and Barnett, Herts, made a fine exhibit of alpine and bulbous plants, together with a very bright array of winter-flowering carnations and Lobelia tenuifolia, and rightly merited the gold medal awarded. From the same firm came a grand group of retarded Lilies in variety, Salvia, Begonia, Spiraea, Erica in variety, and pleasing foliage plants.

Carnations from Messrs. George Boyes and Co., Leicester, were very good, the colours being very vivid and striking, and their effect delightful. A silver-gilt medal was not a too generous award.

Mr. J. Williams, Oxford Road, Ealing, W., exhibited his pretty rustic table decorations, which were much admired.

A beautiful table of Ericas, set up by Messrs. Gregory and Evans, Sidcup, was an attractive feature. The new Heath (*Erica gracilis nivalis*) on this stand received a first-class certificate from the floral committee.

The classes confined to amateurs and maiden growers were well contested, and blooms of splendid quality were frequently in evidence. Vegetables in competition for the splendid series of prizes offered by Messrs. Webb and Sons, Southbridge, and Mr. Robert Sydenham, Birmingham, respectively, were a fine feature of the great show, and the visitors showed their appreciation of all they saw in these displays by incessant exclamations of surprise. Grapes were well shown, and the arrangement of the whole show reflected considerably to the credit of Mr. Richard Dean, who was responsible for its disposition.

ROYAL HORTICULTURAL SOCIETY.

ORCHID COMMITTEE.

PRESENT: H. J. Veitch, Esq. (chairman), Messrs. J. O'Brien, E. Ashworth, W. B. White, W. H. Young, W. Boxall, H. J. Chapman, T. W. Bond, J. Charlesworth, A. A. McBean, F. W. Ashton, A. Hishop, J. Colman, G. F. Moore, J. Wollesley, W. Cobb, H. Ballantine, and W. A. Bilney.

Messrs. James Veitch and Sons, Limited, had a very pretty group, in which were some of the finest varieties of *Laelio-Cattleya*, among them *Digbyano-Trianae*, *Violetta splendens*, *dominiana* var. *Langleyensis*, *Cattleya Fabia*, and *C. Mantini*. The group also included *Cypripedium insignis* Sanders and a fine example of *C. insignis* Harefield Hall var. *Silver Flora* medal.

M. A. A. Peeters, Chaussée de Forest, Brussels, sent some very fine *Cattleya*, chiefly hybrids, raised by M. Peeters, *C. hardiana* alba (Peeters var.), *C. Peetersii*, *C. Fabia* var. *Mary de Wavrin* [*C. labiata* alba X *C. aurea*], *Laelio-Cattleya* *Henry Greenwood*, L.-C. *gracilis*, *Cypripedium tosum* X *spicatum* var. *Mme. J. Hye*, *Odontoglossum crispum* var. *francisi*, and other good things. *Silver Flora* medal.

Messrs. Hugh Low and Co. had in their group *Cattleya labiata* *ameiiana*, almost white, with a faint bluish mauve tint and rosy mauve lip; *C. dowiana*, and *dowiana* *rosetta*, a fine variety; *C. labiata* *glauca*, a very distinct shade of bluish grey; *Laelio-Cattleya* *King Victor*, a deep-coloured variety; *Cypripedium Ajax* (pollettianum X *lawrencianum*), *Oncidium Forbesii* *splendens*, and *Oncidium varicosum*. *Silver Flora* medal.

Messrs. Sander and Sons showed a handsome group, chiefly *Cypripediums*, comprising a large number of beautiful hybrids; *C. Niohe*, *C. Memoria* *Moenali*, *C. Triumphans*, a very fine var. *C. Fred Hardy*, *C. Chantini* *Lindeni*, *C. gigas* *magnificum*, and *C. Hitchinsii*. The group also included some good *Zygopetalums*, *Laelio-Cattleyas*, and other choice Orchids. *Laelio-Cattleya luminosa* was finely shown. *Silver Flora* medal.

J. Bradshaw, Esq., The Grange, Southgate (gardener, Mr. George G. Whitelegg), sent *Cattleyas*, together with some *Oncidium varicosum*, *O. Forbesii*, and a grand *Cymbidium truncatum*. In the *Cattleyas* the original form of *labiata* *ameiiana* and a hybrid *Mrs. J. W. Whiteley* were very good. *Silver Flora* medal.

Messrs. Charlesworth and Co., Bradford, exhibited a group of choice things, including *Laelio-Cattleya luminosa*, *Cattleya* *Lord Rothschild*, *Laelio-Cattleya blancheyensis*, L.-C. *Cappel*, small, deep amber flowers, crimson lip; *Odontoglossum crispum* *trianae-roseum*, a fine rose-shaded spotted var.; *O. Salicrispum*, pale creamy-yellow, beautifully spotted; *O. Harryana* *triumphans*, and other choice sorts. *Silver Flora* medal.

From H. G. Bischoffshelm, Esq., *Cattleyas* were again the feature. *C. aurea* was in fine form, and there were *Odontopogonums*, *Cypripediums*, with a good display of *Cattleya labiata*. *Silver Banksian* medal.

FRUIT COMMITTEE.

Present: George Bunyard, Esq. (chairman), Messrs. J. Cheal, S. Mortimer, H. Ealing, A. Dean, J. McIndoe, G. Kelf, H. Markham, G. Reynolds, G. Wythes, F. Q. Lane, J. Willard, G. Norman, J. H. Veitch, and W. Poupard.

There was little before this committee, and the only award made was for an unnamed seedling Melon from Captain Holford. This was a green-fleshed variety with a pale netted skin, deep flesh of fine flavour.

From Mr. Allen, the Gardens, Ganton Park, came a good Apple, *Norfolk Beauty*, a large, rather flat fruit, with a clear yellow skin. It looked a promising variety.

Messrs. G. Ambrose and Son again showed their new Grape *Melton Constable* in very good form.

Messrs. Cooper, Taber, and Co. exhibited a long white Japanese Radish, which in appearance closely resembled the early Turnips we get from France.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), Messrs. George Nicholson, C. T. Drury, James Walker, Anne Perry, J. Jennings, William Howe, G. Reuthe, C. R. Fielder, Charles Dixon, Charles Jeffries, H. J. Cutbush, Charles E. Pearson,

Charles E. Shea, W. P. Thomson, E. H. Jenkins, William J. James, J. W. Barr, Edward Mawley, R. W. Wallace, and the Rev. F. Page Roberts.

From Miss Adamson, South Villa, Regent's Park (gardener, Mr. George Kelf), came a very fine group of Palms, *Poinsettias*, *Begonias* of the Lorraine section, *Crotons*, *Dracenas*, and other serviceable material of a similar nature. *Chrysanthemums*, too, were finely shown, such as *M. Gustave Henry*, *C. H. Curtis*, *Phobus*, *Miss A. Byron*, white, and *Mrs. Greenfield*, yellow. These latter, inserted in a setting of *Crotons*, were very attractive. Many graceful Ferns were also used, the grouping as well as the merit of the exhibits reflecting considerable credit on those responsible. It is worthy of note that the plants were grown within two miles of Charing Cross. *Silver Flora* medal.

A large exhibit of cut *Chrysanthemums* came from Lady Plowden, Aston Rowant House, Oxon (gardener, Mr. Clarke). Some of the best things in the group were the cream sport from Nellie Pockett, Lovellness, yellow; *Mrs. Mease*, very fine; *Mme. Carnot*, extra good; *Mrs. G. Neville*, white, very large; *Eva Knowles*, bronze chestnut, &c. There were also many single kinds shown, as also decorative kinds, few of which were named. Some capital plants in pots were the single *F. W. Smith*, mauve-pink, and *Belle of Weybridge*, red-crimson, both kinds very free in flowering. *Silver Banksian* medal.

A large collection of Gourds, Fungi, autumn foliage, and single *Chrysanthemums* came from F. W. Smith, Esq., The Hollies, Weybridge, Surrey. It was an exceptional exhibit, such, indeed, as is rarely seen at the Drill Hall meetings. A good deal of material was employed, and considerable intelligence displayed in the setting up, as also the gathering together of so large a mass of material. As an object-lesson of the effective character of quite ordinary materials when grouped and the rich colouring of the foliage of autumn it was quite a success. *Silver Banksian* medal.

Messrs. T. S. Ware, Limited, Feltham, Middlesex, had a remarkable display of cut hardy flowers. For November 10 we think it worthy to mention that *Galliardia*, *Lychnis vespertina* plena, *Lobelia*, *Verbena venosa*, *Potentilla formosa*, *Chrysanthemum latifolium*, *Gladiolus* in great variety, *Senecio pulcher*, *Coreopsis*, *Tritomas* in great masses, *Michaelmas Daisies*, *Pampas Grass*, *Sidalcea hybrida* *Rosey Gem*, *S. candida*, a big lot of *Pentstemons*, and a collection of outdoor *Chrysanthemums* were among the things shown. *Nerines*, *Anemones*, and many pans of *Cyclamens* were also noted.

A small collection of plants, including *Maranta plectra*, *M. insignis*, *Sesingella africana*, *Ceropegia Woodii*, *Lamprococcus* *Wellbachii*, *Aralia elegantissima*, and *Polypodium tridoides* *ramo-cristatum* came from Messrs. W. Bull and Sons, Chelsea.

Messrs. J. Cheal and Sons, Crawley, contributed a small but showy lot of cut sprays of autumn foliage. *Acers*, *Berberis Aquifolium*, *Rhus typhina*, *Quercus palustris* (very fine), *Azalea mollis* in splendid colour, *Prunus Pissardi*, *Perneytia speciosa* in fruit, *Ribes aureum* with crimson leaves, *Quercus americana* *coccinea*, and *Euconymus europaeus* in fruit were some of the most showy.

Messrs. James Veitch and Sons, Limited, Chelsea, showed coloured leaves of the new Chinese Vines to demonstrate the autumn colouring of these plants, *V. armata* and its variety *Veitchii* are perhaps the finest of the large-leaved section, the colour varying from crimson to purple. *V. Romanetti*, a purple self, is also effective, and *V. henryana*, with digitate leafage, is distinctly veined; a very interesting exhibit.

Messrs. Veitch and Sons, Limited, Chelsea, had a capital display of zonal *Pelargoniums* in pots, about 100 plants were shown. These were remarkable for size of pip and rich colouring. Some good things are *Lady Roscoe*, pink; *Mrs. Brown Potter*, *Mrs. Ewins* salmon; *J. M. Barrie*, cerise; *Mary Seaton*, crimson; *Niagara*, white; *Mme. Charlotte*, salmon; *Mrs. G. Cadbury*, salmon orange; *The Mikado*, rose-cerise, very large; *Cerise*, salmon-cerise, very good form; and *Gustav Ewick*, rich scarlet. *Silver Banksian* medal.

A group of *Nerines* from Mr. O. Reuthe, Keston, Kent, included a large variety of colour, salmon, scarlet, orange, &c. *N. elegans* alba was also freely shown.

Messrs. W. Wells and Co., Limited, Redhill, set up a formidable group of *Chrysanthemums* of all sections, i.e., large flowered, singles, decorative sorts, &c. In the large-flowered lot we noted *W. R. Church*, King of Yellows, *Mrs. J. Seward*, gold incurved; *Cecil Cutts*, deep yellow; *Mrs. F. Hudson*, pure white; *Godfrey's Pride*, terra-cotta; *Bessie Godfrey*, fine yellow; *W. Higgs*, bronze orange; *General Hutton*, rich yellow, large; *W. Duckham*, splendid silvery mauve, fine broad incurving florets; *T. C. Brock*, bronzy red and crimson incurved; *Meratham Red*, very fine; *Mrs. Barnard Hankey*, bronzy red; *Donald McLeod*, rich yellow; and *Mrs. Harry Eland*, an *Anemone*-flowered sort, being among the best. Several seedlings of merit were also shown, the whole making a most imposing display. *Silver Flora* medal.

Mr. George Prince, Longworth, Berks, set up a superb gathering of *Roses*, *The Bride*, *Sunset*, *Caroline Testout*, *Souv. de S. A. Prince*, *G. Nabonnand*, *Corallina*, *Mme. Lambert*, *White Maman Cochet*, *Mrs. J. Laing*, and *Maman Cochet* being in splendid form for so late a date as this. There were also many *Monthly Roses*, and the whole were stated to be cut from the open air. A most attractive exhibit. *Silver Banksian* medal.

Mr. J. Russell, Richmond, again showed a group of hardy shrubs in pots, as *Acubas*, *Skimmias*, *Eurya latifolia* variegata, *Viburnum Awafurki* with red foliage, *Ivies* in pots, *Euconymus*, and such like in great numbers. *Silver Banksian* medal.

Mr. J. Ambrose of Chesshurst contributed an interesting group of pot plants, as *Heaths*, *Azalea mollis*, *Crotons*, *Roses* in pots, *Lily of the Valley*, *Ferns*, *Spiraea japonica*, *Trees* *Carnations*, and other such things in variety.

A group of hardy plants from Messrs. William Cutbush and Sons, Highgate, included *Kniphofias*, *Schizostylis coccinea*, double *Cambrian Poppy*, *Skimmias*, *Crocus ochroleuca*, *Primula acaulis rubra plena*, and with numerous

Sarracenas, *Shortias*, and others contributing their rich foliage a good display was made.

Messrs. J. Hill and Son, Edmonton, had a fine exhibit of Ferns, in which many large plants of *Acrostichum crinitum* were seen. Large examples, too, of *A. aureum*, *A. viscosum*, *A. sorbifolium*, and *A. quercifolium* were also included. A group adjoining was wholly composed of *Asplenium nidus*, and arranged on the floor with a margin of smaller plants and variegated *Ficus* the effect was very good. The broad and handsome shining leaves render this one of the most striking and ornamental of the whole family of Ferns. *Silver Flora* medal.

A fine white *Chrysanthemum* *Mrs. James Dunn* was shown by Mr. G. Carpenter, West Hall, Byfleet. It is a drooping kind, very large, with slight creamy centre.

Chrysanthemum *Distinction*, a sport from *Lily Mountford*, was exhibited by Mr. Dean, Camiobury Park Gardens, Watford.

Crocus caspius, a white-flowered species, *C. c. var. Hiacinus*, and *C. Cambesidei* were from E. Augustus Bawles, Esq., Myddleton House, Waltham Cross.

A small group of *Nerines* came from Mr. J. T. Bennett-Poë of Chesshurst.

Samples of wood painted with the new "Lubross" Paint were on view, the samples, having received two coats, displaying a surface almost equal to varnish. It is said to wear extremely well in the most exposed positions.

AWARDS.

Nerine *Miss Woolcard*.—A beautiful large-flowered *Nerine*, deep salmon with rosy veins. Award of merit.

N. Mrs. Moore.—A very striking flower of a crimson-carmine shade, the flowers nearly erect. Award of merit. Both of the above novelties were from J. T. Bennett-Poë, Esq., Chesshurst (Mr. Downes, gardener).

Chrysanthemum *Kitty Bourne*.—A single-flowered sort of a rich golden hue. It is very showy, 3 feet high, the flower heads all coming to one level, or nearly so. Award of merit. From Messrs. W. Wells and Co., Limited, Redhill.

Chrysanthemum *W. A. Etherington*.—A Japanese of the largest size, the pink shade being in every way good, while the flower is of massive build throughout. Award of merit from Messrs. W. Wells and Co., Limited, Redhill.

In the afternoon Mr. E. T. Cook, Editor of THE GARDEN, gave a lecture upon "The Advantages and Evils of Size in Flowers, Fruits, and Vegetables." Sir Trevor Lawrence, Bart., presided, and there was a good attendance.

ROYAL HORTICULTURAL SOCIETY OF IRELAND.

The winter show of the Royal Horticultural Society of Ireland was opened on the 4th inst., in the Royal University Buildings, Earlsfort Terrace. His Excellency the Lord Lieutenant, who was accompanied by Lord Plunket, C.V.O. (Private Secretary), and attended by Major O'Brien, A.D.C., visited the show during the day, and was received by Sir James Creed Meredith, LL.D. (representing the Senate of the Royal University), and Mr. Henry P. Goodbody, Mr. Ernest Bewley, Surgeon-General Beaumont, Mr. D. Ramsay, J.P., and Mr. Walter Keatinge, jun. (representing the Royal Horticultural Society). His Excellency spent some time inspecting the various exhibits.

The arrangements for the show were capitally carried out by the secretary and the members of the committee. The central hall was devoted to the cut bloom and flower section, while the large examination hall was practically filled with some beautiful collections of all kinds of vegetables and fruits grown at this season in Ireland. It was stated that the number of exhibits was somewhat smaller than that of last year, this being mainly due to the fact that the number of classes was reduced in the section for cut blooms, and that the wretched weather which prevailed during the year was most disappointing to fruit growers and vegetable cultivators. Notwithstanding this latter drawback the specimens exhibited were extremely fine and received very favourable comment. The judges for the cut blooms were Messrs. Goff and Gregory, and for the fruit and vegetables Messrs. Tyndall, Orr, and Knowlind. Mrs. Hume Dudgeon placed the winners in the table decoration competition, a class which was regrettably small.

There was a magnificent selection of flowering plants sent in by Lady Ardilaun, including some remarkably fine *Cyclamens*, and a gold medal was recommended. The professional firms of growers were very well represented—Messrs. Dickson, Newtownards, showed a splendid collection of fruit, and were recommended for a gold medal. A similar distinction was given to Messrs. Ramsay and Son, of the Royal Nurseries, Ball's Bridge. This firm showed a collection of floral designs, comprising bouquets, anchors, crosses, and a handsome collection of *Chrysanthemums*, all arranged with fine taste, while the group of foliage and flowering plants was also most effective. Messrs. Tait and Co. were highly commended for an exceptionally deserving stand of various kinds of vegetables; and Messrs. Edmondson and Co. for a most attractive table of Pears and Apples. Messrs. Watson and Sons of Clontarf were recommended for a silver medal for a group of early-flowering *Chrysanthemums*. In the examination hall, Messrs. Jameson, Royal Nurseries, Sandymount, had a handsome display, showing floral designs and a number of flowering plants. A gold medal was recommended for the former. The firm of Sir James W. Mackey and Co., Sackville Street, exhibited a varied and interesting collection of vegetables and fruit and choice seed Potatoes, among which were the famous Northern Star and Evergood. The selection of hardy fruits was very fine considering the season, and the firm was awarded a gold medal. The Challenge cup, valued at ten guineas, and presented by Messrs. Waterhouse and Co., Dame Street, for *Chrysanthemum* blooms in twelve vases and twelve varieties of three blooms each, was awarded to Mr. John Jameson, St. Markock's, Malahide (gardener, Mr. J. M. Keller).—*Irish Times*.

PLYMOUTH.

THE West of England *Chrysanthemum* Society held their show as usual in the Guildhall on the 3rd and 4th inst. If

the entries were not quite so numerous as in some seasons past, the quality of the exhibits was quite up to the average, especially when the untoward weather experienced is taken into account. The groups of miscellaneous plants arranged in the centre of the hall made a fine display; the Chrysanthemum groups around the sides of the hall also were effective. The cut blooms were placed on cross tables in the hall; altogether it was a pretty display. Mr. C. Wilson, hon. secretary, and an efficient committee, worked hard to make the show what it was—a success.

Cut blooms were an important feature. The principal class was that for forty-eight Japanese in not less than twenty-four varieties and not more than two of any one variety. For the first prize of £10 four competed. Mr. F. S. Vallis, Bromham, Wilts, won the coveted position with an exhibit of blooms which, if not large, possessed much quality, and were well staged; Mr. Drake, 44, Cathays Terrace, Cardiff, was a good second with rather smaller blooms but good in colour and capitally staged; Mr. G. Foster, Giendana Gardens, Teignmouth, was a close third.

No less than seven competed for twenty-four Japanese. Mr. Vallis again winning premier place with a characteristic exhibit; Mr. Brimicombe, gardener to J. R. Gelson, Esq., Teignmouth, was a close second; Mr. Harding, gardener to T. Martin, Esq., Trevorbyn, Plympton, third.

A class was set apart for Japanese incurved varieties, but the results were far from satisfactory; the blooms were not typical examples. Mr. Brimicombe was awarded first place, Mr. Foster second.

For six any white-flowered variety of Japanese there was brisk competition. With the variety Mrs. J. Lewis in good condition, Mr. Mavis, gardener to Sir J. Shelley, Shodbrooke Park, Crediton, was first; Mr. Brimicombe with the same variety coming next in order; Mr. Foster with *Mme. Carnot* third.

For six any other colour, yellow-flowered varieties were prominent, General Hutton winning the premier place; Mr. Harding, gardener to T. Martin, Esq., Plympton, second, with *Mrs. Mease*; Mr. Foster with uneven examples of *F. S. Vallis* coming third.

Single-flowered varieties were but poorly represented, Mr. F. Clatworthy, gardener to F. Bradshaw, Esq., Lipton Park, was first.

Classes for exhibitors within a radius of fifteen miles from Plymouth were numerous and well filled. For twenty-four Japanese in not less than eighteen varieties there was a keen competition for the leading prizes, Mr. Harding winning with a capital exhibit; Mr. H. Doud, gardener to G. F. Winnicot, Esq., Rockville, second.

For twelve blooms, Mr. J. C. Boulds, 6, Albermarle Villas, Stoke, won quite easily with heavy blooms; Mr. Harding, second.

For six Japanese, Mr. Boulds was again successful with popular varieties in capital condition.

Plants were not numerous but good. For a group of Chrysanthemums and foliage plants at the back with Ferns at the front there were three entries. The premier award went to Mr. R. G. Thorn, gardener to Mrs. Upton, Cotterell Dorney, Stoke, for dwarf plants thickly clothed with healthy foliage and carrying handsome flowers; Mr. J. Hoskins, gardener to Dr. Aldous, Charlton House, Mannesland, second, with a good arrangement of smaller flowers.

Messrs. John Webber and Sons, Walstone Nursery, Plymouth, won the first prize for a group of miscellaneous plants in which Orchids, Chrysanthemums, Crotons, &c., figured well; Mr. Selby, gardener to Admiral Parker, Delamare, Cornwood, second; Mr. Thorne third.

Floral exhibits were numerous and good, a like remark applying to vegetables and fruit. Want of space, however, forbids a further notice.

BRIGHTON CHRYSANTHEMUM SHOW.

THIS important southern show was held in the Pavilion on the 3rd and 4th inst., and compared favourably with its predecessors; many fine blooms were exhibited.

Mr. G. Sims, gardener to E. A. Walter, Esq., Brighton, won first prize for a group of Chrysanthemums; Mr. E. Head, Hove, was second; and Mr. J. Hill, gardener to W. Clarkson Wallis, Esq., Withdean, third. For a group arranged by gentlemen's gardeners only, Mr. A. J. Blake, The Gardens, Bleak House, was first; Mr. W. Henderson, second; and Mr. G. Norman, Withdean, third.

In the cut bloom classes the chief interest centred in that for thirty-six Japanese, the winner of the first prize and silver bowl being Mr. J. Harris, gardener to Colonel Henty, Avesford, Arundel, who showed an excellent lot of blooms; Mr. C. J. Dicker, gardener to the Hon. Miss Canning, Frant Court, was second; and Messrs. J. Stredwick and Sons, St. Leonards, third.

The vase class, for five vases, each containing five blooms of Japanese, provided a very good display. Messrs. J. Stredwick and Sons, St. Leonards, were first with fresh and first-rate blooms, Mr. Dicker being second, and Mr. J. E. Hickson third.

Twelve incurved blooms: First, Mr. R. Vinall, Horsham, with well-formed blooms of the best varieties; second, Mr. Hunt, Reigate; third, Mr. Tourle.

Six Japanese blooms: First, Mr. Harris; second, Mr. Duncan; third, Mr. Dicker, all showing well.

The class for six Japanese of one variety usually makes a good show, and this occasion was no exception. Mr. Duncan was first with excellent blooms of *Mrs. Mease*; Mr. Dicker second, with *Mrs. G. Mileham*; and Mr. Hart was third, with *Nellie Pockett*. For six incurved blooms (one variety), Mr. Hart was first with *C. H. Curtis*.

Mr. J. C. Hickson was the most successful exhibitor of single varieties, and showed some very pretty bunches. Mr. Hart was second, and Mr. Alfred Slaughter third. The table decorations of Chrysanthemums were very bright, Miss Howell, Brighton, being the first prize-winner.

Mr. W. E. Anderson was first for four standard Chrysanthemums; second, Mr. J. Hill; and Mr. Lambert won chief honours for pyramid plants. Mr. Anderson was again first for dwarf-trained plants, and Mr. Lambert for Pompons.

For bush plants Mr. Lambert won, and Messrs. Anderson and Blake were second and third respectively.

FRUIT.

Three bunches of white Grapes: First, Mr. W. Taylor, Tewkesbury Lodge Gardens, Forest Hill; second, Mr. W. Kemp, Coolhurst Gardens, Horsham; third, Mr. Simmons, Polegate. Mr. Simmons was first in the class for black Grapes, Mr. Laker, Chesswood Road, Worthing, being second, and Mr. A. Kemp third.

Mr. Thomas, Wannock Gardens, Polegate, was first for four dishes of dessert Pears, Mr. Hickson being second, and Mr. Norman third.

Four dishes of dessert Apples: First, Mr. Duncan, with splendid fruits; second, Mr. Thomas; third, Mr. A. H. Parsons. Messrs. R. F. Blake, Anderson, Thomas, Harris, and Hickson were among the successful competitors in the fruit classes.

Mr. W. Manton, The Grange Gardens, Hurstpierpoint, won the first prize (given by Messrs. Cheal) in the competition for a collection of vegetables. Mr. Tourle was second, and Mr. Cornish third.

Among non-competitive exhibits, Messrs. W. Balchin and Sons, Hassocks Nurseries, had a handsome group of miscellaneous plants. Messrs. Wells and Co., Earlswood, Redhill; Messrs. J. Peed and Son, West Norwood; and Mr. J. Miles, Victoria Nursery, Dyke Road, also exhibited.

Winter protection.—It is conclusive evidence of the absence of frost that we have Dahlias (one of the tenderest of our summer plants) growing and blooming profusely outdoors as late as the second week in November. But whether this absence indicates a mild or severe winter later no one can tell. In previous years, cold, wet summers have been conducive to extremely severe winters, and it will be wise for us all in the matter of protection to err on the safe side, and as far as may be practicable be ready for the frost should severe weather set in. The soil is very wet and unusually cold, and hard frost would be for that reason exceptionally penetrating. It will be wise therefore to have at hand plenty of dry straw litter, of Fern, Heather, Mats, or other material, using soil moulded well up also, to give such protection as can be furnished by its aid.—A. D.

Royal Agricultural Society.—At a meeting in London recently of the council of the Royal Agricultural Society it was reported that the first show held at the permanent Show Yard, Park Royal, last June, was likely to result in a loss of nearly £10,000. The expenditure was much increased by the abnormal weather and by difficulties incident to a new site, while the receipts were disappointingly small. The sites committee recommended that the effective administration of Park Royal would best be secured by making it a separate undertaking from the society's ordinary operations. While remaining under the general jurisdiction of the council, its detailed administration would be entrusted to a small number of persons appointed by the council and removable by them. The committee thought the best way of arranging this would be to create and register a private company, which might be called "Park Royal, Limited." The recommendations were agreed to.

Scottish Horticultural Association.—The monthly meeting of this society was held in Dowell's Rooms, George Street, Edinburgh, on Tuesday, November 3, when there was a very large attendance of members, presided over by Mr. J. W. M'Hattie, the president of the association. The paper of the evening was read by Mr. Peter Loney, the secretary, in the absence of Mr. C. Webster, The Gardens, Gordon Castle, Banffshire. Mr. Webster's subject was "Notes on some of the Newer Sorts of Hardy Fruits," and it was dealt with in a valuable manner, much information being given upon some of the more recently introduced fruits. A summary cannot do justice to the character of the paper, which will be published in the Transactions of the association. Mr. Webster was awarded a hearty vote of thanks. There were a number of exhibits in the room, including Chrysanthemums from Messrs. James Grieve and Sons, Pilrig Nurseries; Messrs. Todd and Co., Shandwick Place; Mr. Lamont, Ashley Terrace; and Mr. Fraser, Kilravock. Mr. Todd showed capital Roses from the open from Musselburgh, and Mr. George Brown, Silverknowes, a vase of good blooms of *Rose Caroline Testout*, also from the open. Other exhibits came from Mrs. Algie, Togher House, County Mayo; Mr. Fraser,

Cramond; and Mr. Henderson, Monkwood. Not the least interesting were the Apples, Pears, and Plums, sent by Mr. Webster, Gordon Castle.—S.

OBITUARY.

MR. WILLIAM OSBORNE.

ON Friday, October 30, this well-known gardener succumbed to a complication of diseases accelerated by cancer of the liver. Mr. Osborne had only two years previously retired from his forty years' charge of the famous gardens of A. H. Smith-Barry, Esq. (now Lord Barrymore), at Fota Island, Cork. Here he made a special study of hardy trees and shrubs, and had a most extensive knowledge of Bamboos, Eucalypti, and Aquatics. The beautiful *Magnolia Campbellii*, which bears the largest and most handsome flowers of its genus, first flowered in our country under Mr. Osborne's care at Fota. Some years ago Mr. Osborne was sent by his employer to Algiers to lay out an estate there which Mr. Smith-Barry acquired for the winter months. This work Mr. Osborne performed with that conspicuous success which attended all his efforts. The deceased was of a very active temperament, and had a most kindly disposition. In addition to his almost unique knowledge of Bamboos, Eucalypti, &c., he had a good practical knowledge of horticultural buildings.

MR. E. SUMMERS.

ON the 31st ult., at Stoke Gifford, in his eighty-fourth year, through being knocked down by a cyclist, Mr. E. Summers, who for upwards of forty-six years was foreman of the Stoke Gifford Nurseries of the late Messrs. William Maule and Sons, Bristol.

* * "Answers to Correspondents" and reports of *Herod* and other shows are unavoidably held over until next week.

TRADE NOTE.

FUEL ECONOMISERS.
